# Contents

|    |                                                                                                                                                         |     |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1  | A United Europe of Everyday Objects: exploring our intertwined past through medieval material culture (AD 1000-1600) .....                              | 12  |
| 2  | But how is that Archaeology? .....                                                                                                                      | 17  |
| 3  | Archaeology of the Forgotten: Recovering Erased Pasts .....                                                                                             | 22  |
| 5  | Out of their element: novel methods of isotope analysis to investigate health and disease in the past .....                                             | 28  |
| 6  | Ontological and epistemological interpretations intertwining archaeology, landscape and the sky .....                                                   | 30  |
| 7  | Surveying the past, prospecting the future of Balkan archaeological heritage .....                                                                      | 34  |
| 8  | Gendering the Balkans-Balkanizing Gender: Archaeological Perspectives .....                                                                             | 40  |
| 9  | It is what you make of it: imperial and private images at the borders of the Empire .....                                                               | 43  |
| 12 | Plants, humans and land use in prehistory and early history of southeastern Europe .....                                                                | 47  |
| 14 | Prehistoric Exploitation of Waterscapes and Aquatic Resources .....                                                                                     | 50  |
| 15 | Contextualizing cremations during the European Late Prehistory and Protohistory .....                                                                   | 55  |
| 16 | Archaeology? Good god! What is it good for? (Absolutely nothing?).....                                                                                  | 61  |
| 18 | Lepenski Vir and Its World: 60 Years On .....                                                                                                           | 62  |
| 19 | Investigating food storage in archaeology through applied natural science methods: proxies, methods and theories .....                                  | 65  |
| 20 | Material traces of totalitarian and dictatorial regimes in the 20th century hidden past.....                                                            | 68  |
| 21 | The social life of crafts(people): exploring the interplay between crafts and social structures and norms in 1st millennium BCE Europe .....            | 73  |
| 22 | Shaped Margins: Morphological and Environmental Evolution of Coastal Areas in Long-Inhabited Urban Spaces .....                                         | 80  |
| 23 | Taming the Balkans: River valleys as communication system for the early farmers settling the Balkan hinterlands .....                                   | 83  |
| 24 | Actor, Action, and Place: The Propagation and Modification of Cult Practice in the Roman World .....                                                    | 87  |
| 25 | The spread of medieval glaze technologies: Cross-craft and cross-cultural perspectives.....                                                             | 89  |
| 26 | Empowering Heights: the Impact of Human Agency on Ancient Upland Sanctuaries between Nature and Ritual .....                                            | 93  |
| 28 | Materiality of studying and presenting ancient religion in museums and other secondary settings.....                                                    | 98  |
| 30 | The foundation of Kyiv and the territories of the southern Rus. Current archaeological and historical research and its reception.....                   | 102 |
| 31 | From Tradition to Crime Scene: Building Best Practices in Forensic Archaeology .....                                                                    | 110 |
| 32 | Entangling the social value of the archaeological record: unruly practices in archaeological heritage management, conservation, and dissemination ..... | 112 |
| 34 | Past moves, present finds: the archaeology of games in their social context.....                                                                        | 117 |
| 35 | Grave reopening in the first millennium CE - connecting European regions.....                                                                           | 121 |

|    |                                                                                                                                                             |     |
|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 37 | ...and the LORD God formed man of the dust of the ground... Neolithic figurines – production, handling, disposal .....                                      | 126 |
| 38 | Past ecosystems as drivers of cultural ecology: new approaches in the analysis of the human-palaeoenvironment interactions .....                            | 131 |
| 39 | Hearths, ovens and cooking spaces in the Mediterranean from the Late Prehistory to the Middle Ages .....                                                    | 139 |
| 41 | Making a Warrior: The Social Implications of Martial Ideologies in the Past.....                                                                            | 143 |
| 42 | Decoding Time: A Transdisciplinary Approach to Address Complex Paleolithic Contexts.....                                                                    | 145 |
| 44 | Replicas, copies, and fakes: moving from issue-free to issue-different solutions. New(-ish) ethical challenges in archaeological professions.....           | 153 |
| 45 | The long lasting end of the middle ages between the Mediterranean and the North Sea. Approaches, methods, models .....                                      | 156 |
| 46 | What can bodies do? The archaeology of experience .....                                                                                                     | 158 |
| 47 | Bioarchaeology of childhood: New Perspectives on children in European Prehistory.....                                                                       | 163 |
| 48 | Reflections of Vučedol Culture: Chrono-Cultural and Interdisciplinary Perspectives.....                                                                     | 169 |
| 50 | New approaches to archaeoacoustic studies.....                                                                                                              | 173 |
| 51 | Serial Crafters. Tools and Methods for Studying Ancient Seriality and Serial Productions.....                                                               | 178 |
| 52 | Shared roads of intertwined communities: shaping points of contact and divide in Islamicate societies .....                                                 | 182 |
| 53 | Neanderthal-Homo Sapiens Subsistence Differences 60,000 to 40,000 years ago in Central and Southeast Europe .....                                           | 185 |
| 54 | Cultural heritage, architecture, and archaeology as intertwined practices: From management to alteration and sustainable design .....                       | 190 |
| 55 | Networks of Care and Neglect in the Archaeological Record .....                                                                                             | 196 |
| 56 | Heritage and Archaeology during Late Capitalism .....                                                                                                       | 198 |
| 57 | Reconstructing the Past: Bioarchaeological Approaches in the Levant, Mesopotamia, and Iran.....                                                             | 201 |
| 58 | Digital tools for surface analysis of archaeological artifacts: integrating qualitative and quantitative approaches .....                                   | 203 |
| 59 | Crafting Identity: A Multidisciplinary Approach to the Relationship Between Material Culture and Gender in the Mediterranean from Prehistory to Us.....     | 209 |
| 60 | Research colonialism and social inequality at frontiers and frontlines.....                                                                                 | 213 |
| 61 | Moving away from forwards: Analysing the metaphorical structuring of archaeological thought.....                                                            | 216 |
| 62 | Other ways to explore the surface. Spatial technologies applied to territorial analysis in Archaeology ..                                                   | 218 |
| 64 | Storytelling Teeth: Insights into Diet, Health, and Lifestyles through Dental Anthropology .....                                                            | 226 |
| 65 | Early nomads of Iron Age around the Black Sea: Networks of exchange and interaction .....                                                                   | 239 |
| 68 | Educating for Tomorrow: Pedagogy and Cultural Heritage Dialogues.....                                                                                       | 244 |
| 69 | Wayfaring and place-making in the Mediterranean Sea .....                                                                                                   | 249 |
| 70 | Prehistoric objects in transition: Cultural transformation in material record .....                                                                         | 249 |
| 71 | Beyond Conquest: Environmental and Cultural Impacts of Roman Expansionism .....                                                                             | 257 |
| 72 | Facing complexity of the urban stratigraphy .....                                                                                                           | 261 |
| 73 | Houses and Material Culture in the Medieval Mediterranean and Beyond: Domestic Spaces and Social Identity in Multicultural Contexts .....                   | 264 |
| 74 | Antiquarian Societies, Quo Vadis? .....                                                                                                                     | 268 |
| 75 | Archaeological adventures: the benefits and challenges associated with working in multiple countries and/or systems .....                                   | 272 |
| 76 | Untangling health and disease status from a multidisciplinary bioarchaeological perspective in European megalithic populations (4th-3rd millennia BC) ..... | 276 |
| 77 | From Fire to Complexity: Kiln Innovations and Socioeconomic Dynamics in Pottery Production .....                                                            | 280 |

|     |                                                                                                                                                                 |     |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 79  | Worlds of Sensation: the human body, the senses and neuroscience.....                                                                                           | 284 |
| 80  | Human remains in settlements: burials, non-burials and...what else?.....                                                                                        | 287 |
| 81  | Connectivity and its impact on Cultural Dynamics during Prehistory .....                                                                                        | 292 |
| 82  | Jewelry and Grave Offerings as Indicators of Ritual and Identity in Prehistoric and Ancient Balkan Funerary Practices.....                                      | 295 |
| 83  | (No) fear of the dark, refracted light, reflections and obstructions. Low-visibility challenges for 3D photogrammetric documentation in archaeology .....       | 298 |
| 87  | Intertwined Narratives: Theory and Practice in Communicating Stories .....                                                                                      | 300 |
| 88  | Reconstructing the history of fire, control and application of thermal energy and its technical, social, symbolic and environmental consequences .....          | 305 |
| 89  | Gender, sexualities and violence in the Ancient World Material Culture.....                                                                                     | 307 |
| 90  | Hunter-fisher-gatherers in a World Becoming Agricultural: Legacy, Persistence, and/or Resistance of Mesolithic Communities during the European Neolithic? ..... | 309 |
| 92  | Beyond burials and bricks - Interdisciplinary Approaches to Unravel Social Complexity in Pre-industrial Cities and Towns .....                                  | 313 |
| 94  | Genre, género, Geschlecht...: navigating sex and gender terminology in European archaeologies .....                                                             | 316 |
| 96  | Bridging the Gap Between Bioarchaeology and Cultural Studies in Understanding Transitions in the Past.....                                                      | 316 |
| 97  | Eastern Mediterranean Cities in Transition: New Archaeological Perspectives on Urban Landscape and Public Architecture from the Roman to Byzantine Era .....    | 323 |
| 100 | Caves and Rock Shelters: the Interactions of People and Natural Environment in the Prehistory .....                                                             | 327 |
| 101 | Shifting Paradigms: the Multiple Facets of Mobility in the Bronze Age Balkans .....                                                                             | 334 |
| 102 | Legal protection of archaeological heritage in times of crisis and social transformation .....                                                                  | 336 |
| 103 | The Amulets, from the objects to the beliefs .....                                                                                                              | 337 |
| 104 | Animal Diet, Reproduction, Mobility, and Health: Insights from Isotope Ratio and Biomarker Analysis                                                             | 343 |
| 105 | Grave Goods: Beyond Identities.....                                                                                                                             | 347 |
| 106 | Mountain Pastoralism Through Time: Archaeological Insights and Contemporary Connections .....                                                                   | 354 |

# Abstracts

---

Abstracts are organised according to the ID of the session which they are associated with. Each entry contains the session abstract, followed by the abstracts of related oral presentations and posters. Oral presentations appear in the order they are scheduled in the conference programme, while poster abstracts are listed at the end of each session.

1 A UNITED EUROPE OF EVERYDAY OBJECTS: EXPLORING OUR INTERTWINED PAST THROUGH MEDIEVAL MATERIAL CULTURE (AD 1000-1600)

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: small finds, material culture, pan-European, inter-regional, everyday people  
Session organisers: Michael Lewis (British Museum) – Jakub Sawicki (Academy of Sciences of the Czech Republic) – Maria Vargha (University of Vienna) – Saša Čaval (Research Centre of the SAZU)

SESSION ABSTRACT

This session builds on the success of the previous discussions at earlier EAA conferences, which explored other pan-European perspectives on medieval small finds. This time, we turn our focus to the shared and diverse experiences of medieval life, emphasising the ability of material culture - especially metal finds - to reveal the interconnected nature of European societies between AD 1000 and 1600. Building upon the analytical, theoretical, and methodological frameworks explored previously, this session invites contributions that transcend traditional scholarly boundaries. We particularly welcome contributions that look at how small finds reveal connections across local, regional, and national boundaries, both in the medieval period and in the modern study of these objects. Topics could include typological studies, insights into materiality, manufacturing processes, trade, or case studies of specific object types or sites. Papers that use these objects to explore larger patterns of exchange and interaction across Europe are particularly encouraged. Our goal is to continue building a fuller picture of Europe’s medieval past by showing how different aspects of material culture can reflect both the unity and diversity of life in this period. By exploring the intertwined connections between objects and the people who made and used them, this session seeks to highlight the shared histories and unique stories embedded in the everyday metal objects of medieval material culture.

CONTRIBUTION ABSTRACTS

546. INVISIBLE CONNECTIONS? A SOCIO-ARCHAEOLOGICAL AND HISTORICAL INTERPRETATION ON NON-HERALDIC SIGNET RINGS FROM MEDIEVAL WALLACHIA

Contribution format: Oral  
Contribution authors: Alexandru Morintz (Vasile Pârvan Institute of Archaeology) – Marian Coman (University of Bucharest)

There is a vast and continuously increasing literature on the late medieval and early modern heraldic rings. These rings, often extremely valuable and very skilfully crafted, were sometimes included in lists of dowries, assets, or wills. The owners were of high status, as they used these heraldic rings as a visual sign of their identity that could be impressed by sealing. What about non-heraldic rings made of alloys with a lower percentage of silver or, in some cases, just bronze or copper? In Wallachia, for example, these are significantly more numerous than gold and silver signet rings. Although the design and techniques of making these rings could differ, they can be grouped by sharing some similar features. Thus, some rings are undoubtedly signet rings because their ornaments and/or inscriptions are engraved as a mirror image to appear correctly when sealed. Also, some rings could be used as signet rings when the original meaning of the ornaments (supplications, amulets, and so on) has been changed or simply forgotten. Who were the people who wore these rings? Our socio-archaeological and historical discussion is based on several signet rings recently recovered from a medieval burial ground from Wallachia (Buftea – La Cârna/Mănești archaeological site, near Bucharest), dating between the end of the 14th century and the beginning of the 17th century. The new finds are compared with other signet rings already known, especially from Wallachia, Moldavia, and Dobrudja, but also from Hungary, Serbia, and Bulgaria. Our paper aims to inquire into the practical usage of these rings and the social status of their owners.

1092. CLASPS AND OTHER DRESS-FASTENERS IN MEDIEVAL AND EARLY MODERN BURIALS OF TRANSYLVANIA

Contribution format: Oral  
Contribution authors: Peter Levente Szocs (County Museum Satu Mare)

Clasps and other similar items used for dress-fastening form a rather large assembly of finds coming from late medieval and early modern burials from churchyard cemeteries of Transylvania. These finds are usually perceived as indicators of clothing and indirectly the status of deceased, an assumption which is generally based on the variety of materials and production techniques used. The comparative overview of finds discovered in rural and in urban cemeteries reveals, however, that several local particularities exist, and burial customs differs

according to the age and the gender of the deceased, too. Furthermore, the material of the discovered clasps varies from common metals to the noble one, and from the simplest forms of bent wire to more sophisticated forms of decorative plates. All these factors might suggest patterns of production and trade, and overall can be taken in consideration in order to establish the chronology and functionality of particular items.

1647. “ÖVPÁLCA” – A UNIQUE GARMENT-RELATED SMALL FIND FROM THE LATE MEDIEVAL PERIOD IN THE CARPATHIAN BASIN

Contribution format: Oral  
Contribution authors: Orsolya Zay (Institute of Hungarian Research)

Most researchers dealing with medieval archaeology in Hungary have encountered the group of objects that often emerges from metal detector research, but so far, no larger, comprehensive summary has been published on the topic. We also have issues with the basics: exactly what is this object, and what could it have been used for in the 15th-16th centuries? The object is clearly a wearable element, representing late medieval belt wear-customes. The “rod”, primarily made of bronze, appears not only as a mass-produced item but we also know of decorated examples made of bone and silver. However, it is puzzling that despite its frequent occurrence, we see little of it in contemporary visual representations. Could it be an ethnic marker or an element characteristic of social groups? In Hungarian costume research, it somehow has been left out of focus so far,even though it is quite a common phenomenon. With this presentation, we would like to bring into focus a group of objects that seems to be specifically from the Carpathian Basin, which appeared in present-day Hungary, Slovakia, and Romania. Additionally, we aim to reconstruct through experimental archaeological methods how our ancestors might have worn this special type of belt.

2382. A SCABBARD BEHIND THE BELT, OR THE HISTORY OF KNIFE SCABBARDS AS EXEMPLIFIED BY ARCHAEOLOGICAL FINDS FROM GDAŃSK (POLAND)

Contribution format: Oral  
Contribution authors: Rafal Openkowski – Jan Jarosz (Nicolaus Copernicus University in Torun)

In the urbanization process of medieval cities, craftsmanship played a special role. An active component of this process was, among others, the production of leather goods, which included scabbards made, among others, by leather craftsmen from leathers of various thicknesses. Most of them were simple forms of various lengths and widths, sewn together in the middle or on the side, sometimes with metal fittings. Some of them were decorated on the outer surface, and those decorated on both sides (back and front) were definitely rare. In this last category of monuments in Europe, there are even more unique examples decorated with a punch. With this tool among others, there was made a horizontally spread flower calyx (it is difficult to determine what flower it was today, but in the symbolism of the Middle Ages it was probably legible to everyone) or a stylized lily resembling the lily of the King of France. The leather of the scabbards in question is thick, which allowed for the ornament to be deeply impressed, making the pattern legible and plastic.

2038. A WITNESS TO EVERYDAY LIFE – A PATTEN FROM ELBLĄG’S OLD TOWN

Contribution format: Oral  
Contribution authors: Mikolaj Dobek – Tomasz Kozłowski (Nicolaus Copernicus University in Toruń) – Urszula Sienkowska (The Archaeological and Historical Museum in Elbląg)

In 2022, examples of medieval protective footwear known as pattens were discovered in Elbląg’s Old Town, a former Hanseatic port city. These wooden overshoes were designed to facilitate movement over muddy side-walks, preventing leather footwear from coming into contact with wet surfaces. Over time, their construction and choice of materials evolved to better suit changing conditions. During the excavations, several pattens were uncovered, including one particularly well-preserved example. Signs of wear, such as worn-out soles, footprints on the surface, and particles of sand embedded in the bases, indicate prolonged use. The analysis of this artifact provides valuable insights into its production and history. The exceptional state of preservation not only enables a detailed study of its construction and function but also offers a rare opportunity to explore the craftsmanship and biomechanical considerations of medieval footwear design. Additionally, it indirectly sheds light on the patten’s owner, including possible postural defects. This study underscores the full analytical potential of such artifacts, emphasizing the crucial role of interdisciplinary collaboration in heritage and material culture research.

2334. HOW TO JUDGE A BOOK BY ITS COVER: BOOKBINDING IN LATE MEDIEVAL CENTRAL EUROPE – A PRELIMINARY REPORT

Contribution format: Oral  
Contribution authors: Zsuzsa Peto (HNM Public Collection Centre, Hungarian National Museum)

This paper is inspired by a recently unearthed collection of stamps that were used to embellish book covers during the late fifteenth to early sixteenth centuries. In addition to these stamps, a variety of other bookbinding tools were uncovered by metal detectorists in late autumn, 2024. The primary aim of this investigation is not only to delve into the material aspects and usage of these finds but also to elucidate their archaeological significance and reconstruct the spatial and cultural context of their provenance, which is the Pauline monastery of St. Catharine located in the village of Göncruszka, Northeastern Hungary. This region is renowned as one of the earliest rural centres of book printing, particularly at Vizsoly, which shares a close historical connection with the emergence of early Protestant movements in the area. The discovery of these artefacts illuminates the varying temporal, cultural, and religious layers that have influenced the dissemination of book culture and the practices surrounding book use. While there are numerous catalogues detailing various forms of book cover decoration, systematic examples of what is referred to as Hungarian binding are primarily documented in early printed books and manuscripts housed within Hungarian libraries, all meticulously collected by Mariann Rozsondai. At this stage of research, contextualising these finds poses a challenge, as such tools have only been sporadically discovered in isolated instances. Remarkably, to my knowledge, this represents the first instance of such a device being found as a depo, offering exciting new avenues for exploration in the field of medieval bookbinding. The most insightful studies on this subject are currently provided by scholars from Germany, Switzerland, and Austria. Their contributions have proven to be particularly valuable, offering extensive research and analysis that enrich our understanding of the topic at hand.

**1816. TAILORING AS A NARRATIVE LANGUAGE, THE FIRST ROBE OF SAINT FRANCIS OF ASSISI AND THE MANTLE OF BISHOP GUIDO**

**Contribution format:** Oral  
**Contribution authors:** Maria Giorgi (Accademia di Belle Arti di Brera | ICOM | IIC)

In the Judeo-Christian tradition, fabrics played a crucial and highly symbolic role. The intrinsic nature of the fabric, flexible, mobile and decorated, it allowed fabrics to play a crucial role in revealing the invisible. The fabric, therefore, delineates the border between the human and the divine, participates in the manifestation of divinity in a form sensitive to a theophany, underlining the supernatural presence. This study deals with a specific artefact consisting of, the first penitential robe of Saint Francis of Assisi and the mantle of Bishop Guido, analyzing the phases that led to the creation of this tunic, in the famous episode of its spoliation narrated in the Legenda Maior of San Bonaventura from Bagnoregio and depicted in the fifth scene of Giotto’s frescoes in the Upper Basilica of Assisi. This theme marks with particular effectiveness the relationship between habit and sanctity and the concept of habit as a system of signs, as the language par excellence used by Saint Francis of Assisi. Clothes are the product and reflection of a habitus, which in its literal meaning is understood as a Latinism used in constitutional medicine as well as in biology and in various other fields, instead of habit, to indicate the complex of morphological or behavioural characteristics of an individual or a species. Clothing can therefore connote a social and cultural tradition in which the individual is immersed. Through a series of historical-artistic and archival studies, as well as scientific investigation on fibres of the artefacts involved in this event of spoliation, we were able to reconstruct the phases that led Saint Francis to the creation of his first tunic.

**929. LESSER TOWNS, GREATER QUESTIONS: RETHINKING CONSUMPTION PATTERNS IN LATE MEDIEVAL CENTRAL EASTERN EUROPE**

**Contribution format:** Oral  
**Contribution authors:** Jakub Sawicki (Institute of Archaeology, Czech Academy of Sciences in Prague)

Later medieval lesser towns in Central Eastern Europe remain among the least archaeologically studied settlements. Major urban centres, fuelled by large-scale investments, dominate researchers’ attention, while castles and villages enjoy a long-standing tradition of academic study. Lesser towns, already challenging to define, represent a significant gap in knowledge. From a material culture perspective, this gap particularly concerns small finds — a category that is highly sensitive to analyses of daily life and social relations. Recent excavations at the market square in Cieszyn, a border town between contemporary Poland and the Czech Republic, provide a compelling case study. The site’s late 15th-century layers (post-1497) challenge conventional typological chronologies, revealing artefacts traditionally considered “terminated” by the 15th century persisting into the 16th. This forces a re-evaluation of poorly defined “late Gothic” and “Renaissance” artefacts, which remain understudied and frequently misidentified in the literature. The finds themselves — everyday items such as dress accessories and utensils, the protagonists of this presentation — are only a starting point for broader questions about consumption patterns in border towns at the turn of the century. They offer insights into the roles played by small towns in regional exchange networks and how these settlements shaped local identities.

**22. TRANSFORMATION OF POPULAR VISUAL CULTURE DURING THE PEAK OF LIMOGES PRODUCTION (1190–1250) FROM THE PERSPECTIVE OF ARCHEOLOGICAL FINDINGS**

**Contribution format:** Oral  
**Contribution authors:** Bernat Racz (Central European University (Vienna)) – István Pánya – Szabolcs Rosta (Katona József Museum of Kecskemét)

At the end of the twelfth century, metalworking in Latin Christendom entered a period of mass production. Various types of objects, such as crosses and copper-alloy bowls, were produced in metalworking centers and transported in large quantities across Latin Europe and beyond. A primary target for these production centers was the thousands of small village churches in East Central Europe and Scandinavia. Around 1200, due to the availability of metals, commercial connections, and ecclesiastical demands, the heyday of Limoges serial production began, significantly altering the everyday visual culture of the masses from the Iberian Peninsula to the Kingdom of Hungary. This paper will examine Limoges and some “German” artworks as everyday objects in small villages, focusing on understanding the preferences of primarily peasant communities in acquiring crosses in the Great Hungarian Plain before 1241. The influence of Limoges in particular was so profound that workshops were established to produce various types of Limoges-inspired crosses for thousands of churches in the region. The subject will be explored not only through archaeological perspectives but also through art history and ethnography. Based on a large corpus of material from the Great Hungarian Plain, it will be shown that villages had choices about what they wanted to purchase from the “European art market,” with their decisions often shaped by their budget. Furthermore, comparisons with larger centers will demonstrate that acquiring Limoges artworks was not out of necessity, but rather a fulfillment of aesthetic needs, which ultimately permeated the lives of two-three generations. Many of the shapes and styles created by Limoges were adapted and incorporated into a more rustic, peasant culture. Over a relatively short period, these adaptations significantly transformed the visual culture of major populations of thirteenth-century Europe.

**1889. ECCLESIASTICAL FINDS IN ARCHAEOLOGICAL SOURCES**

**Contribution format:** Oral  
**Contribution authors:** Martin Cechura (Museum of Prague)

Artefacts of ecclesiastical provenance are of exceptional value in archaeological finds collections. The most frequent group are grave additions found during excavations of medieval burial sites. Other common objects, such as coins, can also take on a specific religious significance in this form. While small devotionals, medallions and crosses are very common in the modern period, these objects are rather rarely found in the High Middle Ages. Another group are the objects found during the excavation of churches and chapels, including specific immovable monuments (e.g. baptisteries, their bases and drains, pulpits, altars, sacrariums, etc.). A special (and rather large) group are religious objects found outside the sacred environment, i.e. cemeteries and monasteries. These include, for example, book fittings with Christian motifs, reliquaries and processional crosses (Limoges), fragments of worship vessels, pilgrimage badges or papal bulls. Examples of archaeological finds from the Czech Republic will be used to present the different types of religious objects and to suggest ways of interpreting them depending on the archaeological context.

**55. PAPAL SEALS AS EVERYDAY OBJECTS**

**Contribution format:** Oral  
**Contribution authors:** Michael Lewis (British Museum | Portable Antiquities Scheme)

Papal bullae are not (typically) everyday objects, although many hundreds (almost 700 public finds from England alone have been recorded by the Portable Antiquities Scheme) are from rural landscapes. Some were evidently repurposed during the Middle Ages as everyday objects, including as seal matrices and spindle whorls. Others have been bent or folded and (likely) purposefully damaged in other ways, perhaps for ritual reasons. Alternatively, this activity might have been iconoclastic, occurring (most probably) during the mid-16th-century (Protestant) Reformation. Intriguing, and explored in detail here, are those that have been pierced. These include Papal bullae made into spindle whorls, those with other central piercings and those pierced elsewhere, presumably for suspension. By examining these pierced objects chronologically (i.e. based on when the bullae were made) and, importantly, in a European context, we might be more confident about why these objects were pierced and better understand whether they are everyday objects (or not).

504. THE ZSENNYE HOARD: A UNIQUE HACKSILVER HOARD FROM WESTERN HUNGARY (10TH-11TH CENTURY)

**Contribution format:** Oral  
**Contribution authors:** Anna Neválovits (Pázmány Péter Catholic University) – Péter Langó (Pázmány Péter Catholic University | HUN-REN Research Centre for the Humanities)

Hacksilver hoards are a widespread phenomenon in both Northern and Eastern Europe in the 9th-12th centuries. Fragmentary or intact silver and gold jewellery, coins or ingots are found in large quantities in northern Europe, parts of Eastern Europe, such as present-day Poland, Russia and Ukraine. The Carpathian Basin, as the southern periphery of this distribution area, has yielded fewer finds, including the gold hoard from Zsennye, the hoard from Darufalva (Austria, Draßburg), the hoard from Etyek-Richádpusztá, the hoard from “Királyfölde” (Romania), and the dirhemhoard of Maramureş County (Romania), This presentation focuses on a unique gold hacksilver hoard from Western Hungary: the hoard from Zsennye. The Zsennye hoard was discovered in 1925 in the garden of the castle in Zsennye, Vas County, Hungary. Three animal-headed gold and electron armrings were found in a poor-quality ceramic vessel. These pieces are distinctive, showcasing influences from northern, Rus, and Polish territories, yet they form a separate subgroup within the hacksilver finds. During the presentation, we will explore the placement of the hoard from Zsennye within a broader context of hacksilver hoards, address the dating of the armrings, and discuss the interpretation of the finds based on existing parallels. In the second half of the presentation, we will consider the function of the site in the 11th century, where the hoard was buried, and how this information contributes to the further research into the phenomenon of hacksilver hoards in Central Europe.

84. BRAND NEW TREND: THE EMERGENCE AND DEVELOPMENT OF GLASSMAKING IN KYIVAN RUS

**Contribution format:** Oral  
**Contribution authors:** Olena Zhurukhina (The Museum of History of the Desiatynna (Tithe) Church)

The specificity of study of Kyivan Rus glassmaking lies in the fact that it emerged as a new craft, not least due to cultural and political processes (acceptance of Christianity, dynastic, diplomatic and trade relations with Byzantium (and the West) through the import of glass products, and of course, the skills and knowledge of the Greek craftsmen). Probably in the 11th century glassmaking workshops were set up near the construction of religious buildings to produce glassware for church decoration (tesserae for mosaics, and windowpanes). But most of workshops have appeared in the 12th century and fixed on the Kyiv Podil district – the craft and trade centre of medieval town. Glassware from the 12th to the first half of the 13th century is the most numerous and diverse group with new product categories – vessels and jewellery (beads, bangles, finger-rings and inserts for metal rings). Numerous traces of the production: ruins of furnaces, raw materials, trade glass ingots, cullet glass for recycling and remelting, crucibles, tools, as well as production defects and finished products – testify to the spread of this craft and the growing market demand for these items. The research aims to identify the types of workshops, the origin of raw materials and the interpretation of the chemical composition of the glass used to make local products. However, not only in Kyiv, but also in several chronicle Rus sites (such as Pereyaslav, Chernihiv and Liubech), some remains of glassmaking production are found, which is also a promising area of research to determine the type of workshops, technical equipment, and volume of production.

1886. VESSELS WITH SGRAFFITO DECORATION FROM SOFIA USED AS CHURCH UTENSILS

**Contribution format:** Oral  
**Contribution authors:** Snezhana Goryanova (National Archaeological Institute with Museum at the Bulgarian Academy of Sciences (NAIM - BAS))

The modern Bulgarian capital of Sofia fell under Ottoman rule around 1382-1385. During the 15th and 16th centuries, when it was for a long time the central city of the Ottoman Empire’s European possessions (Beilerbeilik Rumeli and Rumelian Eyalet), the appearance of Sofia was increasingly dominated by the silhouettes of Muslim religious temples. The largest Christian churches were converted into mosques. The Orthodox churches in the central part of the city numbered more than twelve, but they were small and lost among the surrounding town houses. Most of them were cared for by various associations of craftsmen and merchants, or by the inhabitants of small Bulgarian neighborhoods. The inventory of the churches became considerably poorer. Some of the church vessels were no longer made of precious metals and glass, but of ceramics. A plate and a small bowl made of ceramic with sgraffito decoration were probably used in worship. The Christian symbolism of the images, which is quite unusual for Bulgarian medieval sgraffito pottery of the 13th-16th centuries, points to this interpretation. So far, no analogue of the composition on the inside of the bowl is known. The vessels were dumped in the ruins of a nearby burned house after being broken.

229. EARLY, LATE MEDIEVAL, OR RENAISSANCE? CLASSIC PATTERNS ACROSS TIME AND SPACE

**Contribution format:** Poster  
**Contribution authors:** Zbigniew Robak (Institute of Archaeology, Slovak Academy of Sciences, Nitra)

This presentation invites a discussion on how we analyze and interpret artifacts, focusing on medieval metal fittings for straps and similar applications. The findings emphasize the importance of a critical approach to examining discoveries and integrating tools to reduce common errors in interpretation. Mistakes in dating and understanding medieval fittings often stem from several key factors. Decorative motifs like vine scrolls, acanthus leaves, and geometric patterns were popular across the Early and Late Medieval periods and into the Renaissance. These recurring designs make it challenging to pinpoint when a particular piece was created. Adding to the difficulty is the frequent lack of archaeological context—many artifacts come from surface collections or are found by hobbyist metal detectorists, leaving their origins unclear. Another issue is the narrow scope of some analyses. Studies that focus on a single period or region may overlook broader historical and technological trends. Unusual fittings that defy easy categorization, along with production techniques that remained consistent over centuries, add to the complexity. Compounding the problem, older publications sometimes include incorrect datings, which are then repeated in later research. For example, items attributed to the Carolingian age may actually belong to much later periods. To tackle these challenges, we need modern research tools and integrated approach to better date and interpret artifacts. This poster encourages reflection on current methods and suggests practical ways to improve them, aiming to deepen our understanding of medieval artifacts and the stories they tell.

1697. MATERIAL CULTURE AND TRADE NETWORK: THE SITE OF ARUCH IN THE SILK ROAD CONTEXT

**Contribution format:** Poster  
**Contribution authors:** Elena Fausti (Università Sapienza di Roma) – Francesca Galanti (Università degli studi Roma Tre) – Sergio Ferdinandi (ISMEO) – Astghik Babajanyan (Iae Nas Ra)

The analysis of medieval material culture offers an essential perspective for understanding the interconnections between local, regional and transnational societies. The study of materials from the archaeological mission of Aruch (Republic of Armenia), particularly from the excavation sector near the Basilica of St. Grigor, fits into this broader picture, highlighting the site’s role in the Silk Road trade network between the 10th and 14th centuries C.E. The archaeological record, mainly composed of ceramics, glass artifacts, metal objects, and lithic tools, reflects daily practices, productive activities, and commercial dynamics. Particularly relevant is the evidence of local ceramic production and similarities with artifacts found at other Armenian and Caucasian sites, suggesting a dense network of cultural exchanges and influences. This archaeological mission aims to deepen the socio-economic dynamics of the site, contributing to the comprehension of the spatial and functional organization of the medieval settlement, placing Aruch in a broader perspective on material connections in the Middle Ages between Europe and the East.

2248. UNDER SIEGE BY THE OTTOMAN INVADERS

**Contribution format:** Poster  
**Contribution authors:** Mojca Jancar (Terarhis) – Mateja Ravnik (Institute for the Protection of Cultural Heritage of Slovenia, RU Kranj)

In 1532 after his second failed attempt to conquer Vienna, the Ottoman sultan Suleiman the Magnificent was returning home. His army besieged the town of Maribor because of the bridge over the Drava River. During this time, they also plundered the surrounding area and conquered the Upper Maribor castle outside the town walls. The archaeological excavations in 2011 at the castle site discovered an imprint of a small gun ball in the outer wall of the castle and in the vicinity an iron gun ball that matched the imprint. We tried to connect it with one of the conquests of the castle. The castle was namely conquered twice before in the 15t. century (in a feud of the Styrian nobility against the Holy Roman Emperor and by the Hungarians). Presumptively, it can be a ball for a 100 dirhem (or 0,25 okka) caliber darbzen gun, similar to the ones cast in Istanbul (weighing 73 kg) between 1522 and 1526, before the Mohács campaign. Darbzen guns were the most popular and widely used types of ordnance the Ottomans deployed during their campaigns, but also used in large numbers in battles as field guns.

2 BUT HOW IS THAT ARCHAEOLOGY?

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Archaeological Theory, Unconventional Archaeology, Material Culture, Ontologies,

**Session organisers:** Archaeological Diversity, Interdisciplinary Approaches  
Susana Pacheco (CFE-HTC, NOVA University of Lisbon) – Joel Santos (University of Leicester)

**SESSION ABSTRACT**

In archaeology, many of us have heard or thought, “That’s not archaeology!” when encountering unconventional materialities or approaches. But as the field evolves, it is worth asking: what defines something as archaeological? Should we remain confined to traditional frameworks, or can embracing new perspectives help us enrich and expand our discipline? This session invites participants to explore how less conventional aspects—ranging from digital games, photography, and electronic devices to literature, plastics, and intangible or virtual worlds, among others—can complement more traditional material culture studies. Rather than challenging the core of archaeology, these approaches aim to broaden our understanding of human history and materiality. We will explore how integrating these new elements into archaeological research does not diminish established practices, but instead opens up new levels of inquiry. By discussing diverse case studies and theoretical perspectives, we hope to demonstrate that expanding the boundaries of archaeology can enhance rather than replace traditional methods. National and regional contexts may also shape how innovative practices are received, and this session aims to provide a platform for sharing those experiences. Our goal is to create a space where researchers from all backgrounds can discuss what makes something archaeological, and how different approaches—whether emerging or established—can work together to deepen our understanding of the past. We value openness and collaboration and encourage papers from all time periods, regions, and perspectives. Join us in this session to celebrate the diversity of archaeology, recognising that new perspectives not only enrich the discipline but also help to sustain its relevance in a changing world.

**CONTRIBUTION ABSTRACTS**

**1926. HERITAGE, FUTURES, AND HERITAGE FUTURES**

**Contribution format:** Oral  
**Contribution authors:** Janna Jokela (University of Turku)

Archaeology is most often associated with the study of the past. That is, however, not always the case. There is already a variety of examples where archaeology has been used to study contemporary phenomena. This paper suggests that archaeology can contribute to the study of futures as well. Archaeology is essentially the study of materiality and human interactions with their environments. Given the grim reality of the current environmental situation, there is need for better understanding of those interactions. Futures studies as an interdisciplinary field is interested in uncertainties and unknowns; the emerging, the probable, the possible. Having knowledge of both fields, this author sees many similarities between archaeology and futures studies. Material heritage is used to understand the past, but it can also help envision possible and preferable futures. Archaeology provides knowledge on ways of living in a material world, and there is potential in combining that knowledge to the study of futures as well. This paper reflects on data from two participatory futures workshops conducted in 2024 with the topic of waste. The purpose of the workshops was to explore ecologically sustainable futures by using archaeological material of both the past and present as sources of reflection, discussion and imagining. Through this case study, this paper discusses the relationship between heritage and futures, and the concept of heritage futures.

**2502. HOW AN OUTSIDE PERSPECTIVE BECOMES PART OF ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Catherine Toulouse (Lengyel Toulouse Architects) – Dominik Lengyel (BTU Brandenburg University of Technology Cottbus-Senftenberg)

If one conventional aspect of archaeology is to tell a coherent story from traditional material culture studies, then this process is a synthesis not unlike that of the creative disciplines. In both cases creativity is required, and the methods are transferable. This unconventional approach is a new perspective and can enrich and broaden the discipline of archaeology. It is about the familiar use of abstraction in language when archaeology formulates hypotheses. This uncertainty is considerable in any stage of the design process of architects, when they concretise open-ended initial thoughts for themselves or their clients. What emerges from this process could be described as the intention behind the realisation, in a sense, the intention that preceded the buildings. It appears as abstract forms and volumes that can be visualised as if it was built architecture, and thus intuitively evoke the image of architecture at first glance. This works both within the discipline of archaeology and for the wider public. At the same time, the scientific nature of the work is emphasised by the deliberate choice of a lack of detail. It is this openness to further interpretation that allows archaeology to expand its boundaries, because the dialectical collaboration with architecture has a retroactive effect on archaeology. This innovative practice of

using a different discipline as a catalyst does not change archaeology itself, but it makes the collaboration archaeological and deepens the understanding of the past. From the point of view of archaeology, this strengthens the importance of archaeology to contemporary society. The insights gained from the archaeological hypotheses add to the experience and knowledge from which today’s architects can draw. In this respect, the collaboration helps to maintain the relevance of archaeology. The paper illustrates the method using prominent projects from collaborations with numerous museums, research, cultural and educational institutions.

**1803. PAMPA AND THE PALIMPSEST: MAPPING LISBON’S PIXOSCAPES AS CONTEMPORARY ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Tania Casimiro (NOVA University Of Lisbon)

Pixo (pixação), an urban writing practice rooted in resistance and territoriality, challenges conventional understandings of material culture and permanence. In Lisbon, the prolific pixador known as PAMPA has left hundreds of cryptic inscriptions across the city, creating a spatial and semiotic network of presence, defiance, and ephemeral authorship. But how can we engage with such a practice archaeologically. This paper explores pixo as an archaeological phenomenon, treating it as a contemporary form of inscription that both marks and interacts with the built environment. By following PAMPA’s traces through Lisbon, we consider how pixação functions as an alternative form of urban palimpsest—layered, contested, and continuously reworked. Situating pixo within debates on the archaeology of the contemporary world, we examine how its materiality, transience, and social context contribute to a broader discussion of what constitutes an archaeological trace. By bringing pixo into the archaeological conversation, this paper challenges rigid boundaries between past and present, sanctioned and unsanctioned materialities. Through an interdisciplinary approach that integrates spatial analysis, visual semiotics, and ethnographic engagement, we argue that pixação is not merely an act of vandalism but an evolving cultural practice worthy of archaeological attention.

**1217. NOT ONLY OF MATERIAL CULTURE THE ARCHAEOLOGIST LIVES. AN INTERDISCIPLINARY STUDY THROUGHOUT CINEMA AND ARCHIVES**

**Contribution format:** Oral  
**Contribution authors:** Patrizia Marra (Sapienza Università di Roma | National Research Council of Italy, Institute of Heritage Science)

The alchemy between archaeology and cinema has been strong since the very first invention of the cinematographic medium. At date, we can mention a number of archaeological exhibitions which devote some part of their itinerary (usually the closing segment) to highlight some cinematic incursions into the archaeological framework object of the instalment. Though, what is missing within this frame is a systematic and structured scheme helping archaeologists and curators of archaeological exhibitions to make the most out of the fascinating binomial archaeology-cinema. This presentation discuss an ongoing research project focused on a systematic revision of filmic and archival documents from Italian silent cinema productions. The aim is on the one hand to allow structured search by keywords, on the other hand to highlight the value of archival information: mentioning the presence of a specific archaeological reference in a silent movie is not a merely anecdotal curiosity. Rather, the interdisciplinary approach can help us reconstruct the ‘chain of interest’ originating from the film-industry worker (i.e. director, scriptwriter, set designer) researching the archaeological past, its narrative suggestions and its evocative material culture and, through its filmic rendition, reach the spectator in a world – the early ‘900 – where moving images played a pivotal role in the shaping of popular imagery. Indeed, according to Turin’s Società Anonima Ambrosio’s films production brochure for 1913, cinema was intended to be a “popular tool for intellectual propaganda”.

**1846. THE REAL HOUSEWIVES OF ESTADO NOVO: EXCAVATING GENDER IDEOLOGY IN PORTUGUESE MAGAZINES**

**Contribution format:** Oral  
**Contribution authors:** Susana Pacheco (CFE-HTC, NOVA University of Lisbon)

The Estado Novo (1933-1974) established an authoritarian regime in Portugal, rooted in a conservative ideology that reinforced female subordination through repressive policies and rigid social norms. Women were institutionally reduced to the roles of housewives and mothers, seen as the pillars of family and national morality. Through legislation, official discourse, and organisations such as the Mocidade Portuguesa Feminina and the Obra das Mães pela Educação Nacional, the regime perpetuated a model of femininity based on obedience, modesty, and economic dependence on the husband. This presentation explores the repression of housewives from an archaeological perspective, focusing on magazines, mostly but not exclusively, aimed at a female audience as key material evidence of ideological control. These publications, widely circulated during the Estado

Novo, functioned as powerful tools of propaganda, shaping and reinforcing prescribed gender roles. By analysing their texts, images, advertisements, and recurring themes, we can uncover how the regime used mass media to regulate women’s identities, confining them to the domestic sphere and discouraging any form of autonomy. Even within this controlled media landscape, magazines also reveal subtle forms of resistance and negotiation. Some content exposed tensions and contradictions in Estado Novo’s idealised vision of domesticity, while certain readers or even editors found ways to challenge or reinterpret these narratives. By treating women’s magazines as archaeological artefacts, this study sheds light on the materiality of repression and how Portuguese women faced and sometimes defied totalitarian expectations. Through this case study, the communication contributes to broader discussions on the archaeology of gender, power, and propaganda in 20th-century authoritarian contexts.

69. GENDERED SPACES AT WAH-SUT: THE FICTIONAL TALE OF PRINCESS RENISENEB THROUGH AN ARCHAEOLOGICAL LENS

Contribution format: Oral  
Contribution authors: Courtney Crawford (Northwest Missouri State University)

Many scholars have studied gender and women in ancient Egypt; however, the concept of archaeological storytelling is new in Egyptology. One site in Egypt, Wah-Sut, contained many artefacts that pertain to women that can illuminate their roles and spaces in the Pharaonic Period. In particular, property seals with names of women were found in large quantities, most specifically for the woman Princess Reiseneb. The author created a fictional story about the Middle Kingdom Princess by using archaeological evidence that was found in Villa A, a palace at the site of Wah-Sut, to contextualise the artefacts and their significance for women. Additionally, most archaeology work is only analysed by an academic audience, which does not allow the general public to learn more about the past. The creation of a fictional story based on archaeological evidence can attract a larger audience to the study of women in ancient Egypt. This research illustrates the spaces women inhabited and how they can be interpreted in a fictional context.

1411. BORGES AS AN INFINITE ARCHEOLOGIST

Contribution format: Oral  
Contribution authors: Vukic Antovic (Faculty of Philosophy, University of Belgrade)

Archeology and literature have a very long common tradition. This paper deals with possible methodological contributions of postmodern literature to archeology. Archeological research will be placed within the framework of a literary text that talks about reading the archeological record, using the example of Borges’ “Fictiones”. The possibilities of this metatextual process will be explored through the principles of philosophical hermeneutics of Gadamer and Heidegger. In that literary construction, the archeologist will become a Socratic hero in his ever-questioning-ness, who witnesses the elucidation of the dialectical nature of meaning. The dialogicness of the relation between the important two: archeologist — archeological record, and reader — text will also be a metaphor for the relationship between the two great horizontal planes on which the archeologist moves: rational and existential. Moving from one plane to another, the archeologist will be able to redefine and enrich the horizon in which he or she thinks, understands and acts.

1808. IS ARCHAEOLOGY STILL A BIOLOGICAL SCIENCE OR ALREADY MORE HUMANISTIC? COGNITIVE ARCHAEOLOGY VS. PSYCHOLOGY BASED ON KARL GUSTAV JUNG

Contribution format: Oral  
Contribution authors: Patrycja Godlewska (University of Nicolaus Kopernik Toruń)

Archaeology bases its main assumptions on solid foundations - biology, science, and object descriptions. It analyses the creations of material culture. Its paradox is that it is a science on the borderline between the biological disciplines and the humanities. The biological factor seems to be more strongly emphasized. This may bring archaeology closer to psychology. According to Karl Gustav Jung, psychology is a mediated science. It is empirical in its research and humanistic in its methods of explanation and description. The psyche is biologically determined. Emotions manifest themselves through concrete actions visible in material culture, similarly in archaeology. The archaeologist, often unconsciously examining the matter (the physical products of culture), tries to get into the mind of the man of the past - especially the archaeologist-cognitive. Emotions are often hidden in the main element of research - matter. It is the object that becomes the ‘silent’ interlocutor. With it, the archaeologist engages in a dialogue. By analyzing objects, using the assumptions of mnemonics and archaeotatology, cognitive archaeology tries to decipher the emotions that drove people. In this respect, it is methodologically similar to psychology. On an empirical basis, both sciences seek answers to the question of human nature. Their combination can yield surprising results. Elements of material culture in the right context can tell a lot about the hidden emotions of the past. Early medieval Slavic cemeteries from Piast Poland will serve as a basis. By analysing selected objects, which will offer a new perspective on the objects found in early medieval graves. I will use

the concept of K. G. Jung and the psychopathology of A. Kempieński

1377. EXPANDING ARCHAEOLOGICAL INVESTIGATION THROUGH DIGITAL RECONSTRUCTION: THE CASE OF POSTA RIVOLTA

Contribution format: Oral  
Contribution authors: Roberto Malinconico (Università degli studi di Bari Aldo Moro | Università degli studi di Roma “La Sapienza”) – Annalisa Treglia (Castello Svevo di Bari - Direzione regionale Musei nazionali Puglia) – Enrico Lucci (Università degli studi di Bari Aldo Moro)

Introduction: Digital reconstruction offers an alternative approach through an additive process, enriching archaeological interpretation by creating and analyzing structures in their original context. This study explores how digital methodologies, particularly 3D reconstruction, open new perspectives for understanding prehistoric architecture. The research focuses on the domestic structures of Posta Rivolta, a settlement associated with the Palma Campania cultural horizon in Southern Italy (late 3rd – early 2nd millennium BCE). Through the use of digital tools, this study supports conventional archaeological paradigms, positioning digital reconstruction as an analytical tool rather than merely a multimedia resource. Methodology: The research implements an integrated digital approach using open-source software, comprising data acquisition through GIS-based spatial analyses and excavation data, 3D modeling with archaeological markers, material reconstruction using AI-generated textures, and analytical calculations of structural properties. Results: The digital reconstruction has produced key findings through volumetric analysis of construction materials, aerodynamic simulations for wind resistance and ventilation, and evaluation of structural feasibility including load-bearing capacity. Discussion: This research positions digital reconstruction as a crucial tool for archaeological interpretation, introducing an additive component to a discipline that traditionally relies on a subtractive approach—one that uncovers the past by removing soil and material layers through excavation. In contrast, digital reconstruction allows archaeologists to visually restore and integrate lost or fragmented elements, enhancing interpretation and analysis. Rather than merely representing past structures, digital methodologies provide dynamic tools for testing hypotheses on construction processes, resource allocation, and environmental adaptation. The integration of AI-generated textures and quantitative analysis enhances the scientific rigor of reconstructions. This virtual reconstruction method also extends to heritage valorization and public engagement through musealization and the creation of multimedia content. The case of Posta Rivolta demonstrates how these approaches can complement traditional excavation, broadening the scope of archaeological research while maintaining methodological accuracy.

2316. RIVER, FOREST, CITY: A DEEP MAPPING STUDY OF KAISERSLAUTERN, GERMANY

Contribution format: Oral  
Contribution authors: Kat Nickola (University of the Highlands and Islands)

In this deep mapping study, the city of Kaiserslautern is used as a focal point for an intensive look at the way experiences within the landscape can inform the cultural and historical heritage and landscape memory of a small area in Germany. Purposeful walks, influenced by psychogeography techniques, establish a baseline of encounters that help to evolve the focus and synthesis of historical records, archaeological sites and reports, folklore and mythology, historical maps and photography, art and media, and GIS usage. By setting aside conventional methodology and opting for the openness of deep mapping, the project organically conveys the connection between modern personal encounters and both perceived and historical past in the landscape. Delving into the source of cultural memories in this ‘everyman’ of a small German city also shows the value of studying such places. By deep mapping Kaiserslautern, we can begin to understand how less well-known, seemingly simple landscapes are powerful to those who occupy them.

2035. LASER-INDUCED BREAKDOWN SPECTROMETRY (LIBS) AS A POTENTIAL NEW METHOD FOR SORTING COMMINGLED SKELETAL REMAINS FROM AN ARCHAEOLOGICAL CONTEXT

Contribution format: Poster  
Contribution authors: Katie Zejdlik (Department of Anthropology, Ohio State University) – Kristen Livingston (National Center for Forensic Science and Department of Chemistry, University of Central Florida) – Jonathan Bethard (Department of Anthropology, University of South Florida) – Matthieu Baudalet (National Center for Forensic Science and Department of Chemistry, University of Central Florida)

Commingling of human skeletal remains in archaeological assemblages may be the result of many different mortuary behaviors and taphonomic processes. Reassociation of commingled remains requires time, space, and a practiced knowledge of skeletal articulation, taphonomic processes, and human variation. Laser-Induced Breakdown Spectroscopy (LIBS) is a tool being assessed for its utility in sorting commingled remains. LIBS is

an atomic spectroscopy that uses a high-focused laser to excite the atoms in a sample and breakdown materials to their most fundamental level, resulting in an elemental profile. It is portable, does not require sample preparation, relatively non-destructive (approximately 1/5 the thickness of human hair), and can detect low atomic weights such as carbon, nitrogen, and oxygen; thereby, making it a potentially useful tool for reassociating commingled remains beyond the capacity of other elemental methods such as the more popularly used portable X-ray fluorescence (XRF). This method and team have demonstrated success in sorting human remains from human decomposition facilities in the United States. Expanding on what we learned from that study, the team tested the LIBS technology on archaeologically recovered human remains (17 sets, 445 total human bones) from three archaeological sites in Transylvania, Romania dating between CE 1600 and 1800. Early results indicate that the method was successful at sorting the remains into individuals and that additional refined data related to age of interment may be possible.

### 3 ARCHAEOLOGY OF THE FORGOTTEN: RECOVERING ERASED PASTS

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Forgotten Archaeology, Theoretical Archaeology, Erased pasts, Ephemeral  
**Session organisers:** Joel Santos (University of Leicester) – Tania Casimiro (FCSH University Nova of Lisbon)

#### SESSION ABSTRACT

Mainstream archaeological research has traditionally focused on grand monuments, dominant cultures, and prominent material remains, shaping historical narratives that prioritise certain voices while silencing others. This session seeks to redress such imbalances by examining the “archaeology of the forgotten”—those individuals, communities, landscapes, and narratives that are frequently marginalised or omitted from the canon of archaeological inquiry. By foregrounding what has been deliberately excluded or inadvertently overlooked, this session invites a critical reassessment of the processes that produce absences in both archaeological research and collective memory. We welcome contributions that interrogate the structural forces—such as power dynamics, social hierarchies, and cultural biases—that shape the selective remembering and forgetting of particular histories and material cultures. How do these forces govern what is preserved, represented, and valorised within archaeological and public discourses? Moreover, what are the ethical implications and methodological challenges of recovering these marginalised pasts? We encourage discussions on the role of archaeology in addressing historical erasures and rebalancing narratives that have long been skewed by dominant ideologies. Submissions may explore diverse themes, including the archaeology of marginalised populations, ephemeral materialities, and silenced traditions; erased or contested landscapes; gendered and racialised exclusions; and the intersections of digital and public archaeology in recuperating forgotten pasts. By engaging with interdisciplinary approaches and fostering critical debates, this session aims to expand the epistemological boundaries of the discipline, challenging conventional narratives and illuminating the complexities of memory and omission in the construction of historical knowledge.

#### CONTRIBUTION ABSTRACTS

##### 986. (IN)VISIBLE CHILDREN AT THE BINIADRÍS CAVE (MENORCA, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Nina Horn-Wittkuhn (University of Tübingen) – Monice Timm – Döbereiner Chala-Aldana (University of Tübingen | SFB 1070 ResourceCultures, Germany) – Auxilio Moreno Onorato (University of Granada) – Marta Díaz-Zorita Bonilla (University of Tübingen | SFB 1070 ResourceCultures, Germany)

Children are an integral part of human communities, playing a vital role in daily life—a role that should not be underestimated. Yet, both in the present and past, their significance often remains marginalized, with children frequently assigned an ephemeral presence in archaeology and beyond. Until the late 1980s, children were largely overlooked in the archaeological record, and scholars’ lack of interest nearly rendered them invisible. Furthermore, their social role and influence in past societies were not recognized as they were rarely the subject of in-depth analysis. Archaeologists recognizing the importance of integrating childhood studies have formed a growing community exploring various aspects of childhood archaeology in recent years. Despite children’s undeniable presence and agency—often making up a significant portion of past populations—they continue to receive minimal attention, with their role in archaeological interpretations remaining sparse in broader discourse. This paper aims to present an example of archaeological research that prioritizes children, emphasizing a case of archaeological research where the focus lies on their significance in a commingled funerary context. The burial

cave of Biniadrís, Menorca (Spain), dating to Late Bronze/Iron Age, serves as an excellent case for studying interrelations of different age groups and their social structures and dynamics due to its remarkable preservation of various archaeological materials and its well-balanced paleodemographic profile. Children’s agency in the funerary context at Biniadrís is explored through multiple methods including GIS and theoretical perspectives. Additionally, associated find groups are considered, while the theoretical framework is informed by current approaches in Childhood Archaeology, Gender Archaeology and the Bioarchaeology of Care. The available data from Biniadrís will be further contextualised through a comparative analysis with other caves in Menorca, including Es Càrritx, Cova des Pas, and Cova des Mussol, to explore children’s presence and agency on an inter-regional scale within Island Studies.

##### 821. FORGOTTEN ITALIC PEOPLE: ARCHAEOLOGY OF OENOTRIANS AND BRETTIANS IN SOME MINOR DESTINATIONS OF CALABRIA

**Contribution format:** Oral  
**Contribution authors:** Luciano Altomare – Paolo Brocato (Università della Calabria, Dipartimento di Studi Umanistici) – Fabio Bruno (Università della Calabria, Dipartimento di Ingegneria Meccanica, Energetica e Gestionale) – Chiara Capparelli – Filomena Costanzo (Università della Calabria, Dipartimento di Studi Umanistici) – Emanuele Marino (Università della Calabria, Dipartimento di Ingegneria Meccanica, Energetica e Gestionale) – Antonio Agostino Zappani(Università della Calabria - Dipartimento di Ingegneria Civile)

Archaeological research in southern Italy has traditionally given priority to the study of Greek and Roman sites, defining a historical narrative that has often marginalised indigenous Italic cultures, relegating them to a secondary level. Significant delays in the reconstruction of indigenous landscapes have been caused by the prevalence of ethnocentric approaches. The lack of investment in the promotion of indigenous archaeological areas has left them on the margins of tourism and unknown even to local citizens. As part of the research project “Tech4You - Pilot Project 4.5.1: Enabling Accessibility in Minor Destinations” (University of Calabria, National Recovery and Resilience Plan) activities are underway to analyze some minor destinations in the Calabrian territory. The aim is to highlight less known areas through systematic scientific research, as a basis for the digital reconstruction of archaeological evidence. In particular, the cases of the Oenotrian site of Francavilla Marittima and the Brettian site of Tiriolo are examined. These are contexts that are located in decentralised areas of Calabria, where the historical and cultural identity could be represented just by the remains of Italic civilisations. The sites preserve fundamental evidence of pre-Roman context, but they have suffered from the lack of systematic researches and publications, with consequent gaps also in terms of structured promotion. For Francavilla Marittima and Tiriolo the finds are often fragmented and are not immediately comprehensible. Therefore, it’s essential to carry out digital reconstruction work in order to give content to the scientific data and increase its communication potential. The aim of this speech is to illustrate the research activities, combining systematic approaches to the study of archaeological evidence with digital and multimedia techniques (3D models and augmented/virtual reality tools), in order to promote the reconstruction, in terms of storytelling, of the archaeology of the “forgotten”.

##### 276. REDISCOVERING A FORGOTTEN BYZANTINE COSTAL SETTLEMENT AT DURRUELI: A COMPELLING CASE FROM THE SOUTHERN SHORE OF SICILY

**Contribution format:** Oral  
**Contribution authors:** Fabrizio Ducati (Aix Marseille University | The University of British Columbia) – Tomoo Mukai (Aix Marseille University) – Maria Serena Rizzo (Parco Valle dei Templi Agrigento)

In Sicily, the Late Antiquity and Early Middle Ages have long been overshadowed by an adverse historical bias that frames these periods as marked by decline and decadence. This perspective has, in some instances, led to the hasty removal of traces of occupation from these centuries in favour of uncovering the more opulent structures of the Hellenistic and Imperial periods beneath. Such practices have often resulted in the significant loss of information, erasing entire phases of a site’s history and producing oversimplified interpretations and gaps in our understanding until the present day. In this context, the site of Durruei provides a particularly compelling case study. Situated a few kilometres northwest of Agrigento, Durruei is renowned for its magnificent villa marittima, which was extensively excavated between 1979 and 1985 by a Japanese archaeological mission. However, apart from a few preliminary reports, much of the documentation remains unpublished. For a long time, it was assumed that the site was abandoned following the villa’s destruction in the 3rd century AD. Nevertheless, a recent re-analysis of the finds and documentation from the Japanese excavations, conducted as part of a Marie Skłodowska-Curie Global Fellowship, has uncovered compelling evidence of later phases of occupation. This paper presents the results of the 2024 study season, which identified a 6th- and 7th-century settlement amidst the villa’s ruins. This settlement emerges as a node within a broader network of landing places along Sicily’s southern coast, as mentioned in contemporary sources. The integrated approach combining archaeological and archaeometric analyses of artefacts—particularly pottery—offers invaluable insights into the daily lives of this community,

shedding light on their consumption practices, habits, and needs. Furthermore, the material evidence highlights connections linking such a settlement to various regions of the Mediterranean, spanning the Byzantine domains and extending to African territories already under Umayyad control.

2419. VIKING BLISS : THE GOLDEN AGE OF SQUARE KUFİ

**Contribution format:** Oral  
**Contribution authors:** Annika Larsson (TexArk - The Society of Textile Archaeology & Culture Studies | Uppsala University) – Mohamed Guennoun (TexArk - The Society of Textile Archaeology & Culture Studies)

Let us present our new book “Viking Bliss - The Golden Age of Square Kufi”, which will be released in September 2025. The starting point is the immense amount of Islamic faith expressions, found on textiles during c. 150 years of the pre-Christian era of the Viking Age in Scandinavia. The findings do not only consist of tiny remains in rich burial environments, such as the well-known necropolis of Birka in Eastern Central Sweden, but are also expressed in tapestries preserved above ground throughout the Nordic region for more than 1000 years. The Kufic patterns help us in several cases both to redefine burial environments that were previously classified as expressions of a particularly “ur-Nordic” Asa faith, but also help to re-date finds that were previously considered to be of older date than the patterns actually tell. Almost all textile art preserved in Scandinavia appears to have originated in Central Asia, and, like the large number of Islamic coins from the same period, provides a picture of how the Islamic Golden Age - via Russia - had a significant impact on the Nordic “Viking” society before Christianity gained its dominance in the area. Through solidly presented analyses in art, linguistics, religion and, not least, the historical perspective of ideas, we question many of the identity-creating so-called “truths” about the Scandinavian Viking Age. Our results indicate that today’s Islamophobic movements, which often use Viking Age textile patterns from Scandinavia as a model, actually manifest themselves through consistently Islamic expressions.

1736. EXPLORING THE EREMITICAL LANDSCAPES OF SERRA DA OSSA THROUGH ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Joel Santos (University of Leicester)

In medieval times, there was an eremitical community living in Serra da Ossa, and it was connected with the congregation of São Paulo. They sought refuge in the isolation of the mountain, searching for spiritual fulfilment. Yet, their retreat from society often led to unintended consequences—loneliness. Their volunteer isolation from the world was probably connected to some will to be forgotten. Historical narratives have been written about this community. However, there is still a lack of archaeological investigation. We believe it is possible to use material traces the hermits left behind to identify their daily struggles. This paper invites discussions on the methodological challenges of studying communities that left behind ephemeral material remains and fragmented records. By engaging with themes of memory, marginality, and the politics of remembrance, we seek to illuminate the lives of those who, despite their withdrawal, remain integral to our understanding of medieval religious landscapes. In bringing these forgotten hermits back into scholarly discourse, we challenge conventional narratives and reaffirm the importance of exploring history’s silenced voices.

352. RECOVERING ERASED HISTORIES: NOBLE CRYPTS AND THE FORGOTTEN PASTS OF POMERANIA.

**Contribution format:** Oral  
**Contribution authors:** Katarzyna Slusarska (University of Szczecin) – Joanna Rennwanz (Institute of Archaeology and Ethnology, Polish Academy of Sciences) – Marcin Majewski (University of Szczecin) – Monika Ogiewa-Sejnota (Archaeological and Historical Museum in Stargard)

The archaeology of forgotten pasts is crucial for reconstructing historical narratives that have been erased by social and political shifts. In Pomerania, the pre-World War II history of its German noble families was marginalized during the communist era in Poland. Our research aims to reintegrate these lost histories into contemporary awareness, linking the pre-war past with the current inhabitants. Since 2020, our interdisciplinary team has investigated so far four noble crypts from the 16th to 18th centuries: Białowas (Balfanz), Koszewo (Groß Küssow), Bród (Braunsforth), and Komorowo (Kummerow). These neglected burial sites provide vital insights into early modern funerary practices, social hierarchies, and transgenerational memory in Pomerania. Through historical inquiry, epigraphic and artistic analyses, osteological research, and material culture studies, we aim to reconstruct the narratives of these noble families. Our investigations involve collaboration between the research team and the local community, supported by municipal and church authorities. Each excavation concludes with an open lecture, sharing our findings and the histories of the noble families with the public. These events attract significant interest, illustrating how historical awareness can enhance local identity and foster a sense of responsibility for cultural heritage. Our work is more than historical restoration; it fosters modern awareness of Pomerania’s

complex heritage. By uncovering these crypts, we help contemporary communities reconnect with their region’s multi-ethnic and layered history, challenging dominant narratives, addressing historical erasures, and expanding the discourse on forgotten landscapes., allowing contemporary communities to reconnect with their region’s multi-ethnic and multi-layered history. In doing so, we challenge dominant narratives, address historical erasures, and expand the theoretical archaeology of forgotten landscapes.

547. UNEARTHING THE MARGINALISED COMMUNITY IN THE POST-MEDIEVAL CEMETERY OF SÃO JORGE CASTLE, LISBON

**Contribution format:** Oral  
**Contribution authors:** Susana Henriques (CIDEHUS - University of Évora)

An archaeological excavation in São Jorge Castle identified an unknown cemetery in Lisbon, associated with a Military Hospital, the administration of the hospital alternated between military officials and the Hospitaller Order of São João de Deus. The Hospital catered to the military community between the end of the 16th century and the earthquake of 1755. The construction of a new cemetery intended for the military population, a consecrated four-wall space, in the old medieval city centre, implied the physical separation of this community of the dead, from the community of the dead buried in the parish grounds. This intentional segregation carries significant social implications regarding the status of the deceased interred in this new cemetery. Analysis of the parish records presents a more complex portrait of those buried in the cemetery. In addition to the military personnel: prisoners, slaves, foreigners, unnamed individuals, the poor and mendicants were also buried there. We aim to explore this community of dead individuals who were ostracised from the parish grounds. Once buried, these individuals merge into an anonymous collective group, negating their individuality and personhood. This transformation into a communal setting enables archaeologists to conduct thorough studies of these burial populations. By examining the archaeological data and the parish obituary records we can gather important information about the cultural practices, social structures, and demographic characteristics of the communities from which these individuals originated, thereby contributing to a deeper understanding of historical societies. We intend to analyse this marginalised community, aiming to bring these social agents back to the historical discourse. A segregation act for a community outside the norms buried in a new community, devoid of familial or community ties, provides a valuable opportunity for reevaluating social frameworks. It also enhances the representation of diverse individual identities within post-medieval social structures.

525. JUXTAPOSED TECHNOLOGIES AND MATERIALIZATION OF THE ANDEAN INDIGENOUS AND MESTIZOS WORLDS IN THE ATACAMA DESERT, CHILE (16TH - 19TH CENTURIES)

**Contribution format:** Oral  
**Contribution authors:** Mauricio Uribe – Claudio Wande (University of Chile)

The study of European colonization in the Americas has primarily been approached from historical perspectives, undervaluing archaeological and material evidence in understanding these traumatic processes. This has led to partial perspectives and biased imaginaries due to the lack of material data in colonial narratives and documents, which were written from within the Spanish bureaucracy. In the Andes, this has generated notions such as the “Indios” being conceived as a “passive or residual recipient” or even as the “defeated” in history, erasing their agency in the reconfiguration of socio-economic systems in response to European civilization expansion. These conceptions are further reinforced in the margins of colonial regime in South-Central Andes, where marginality becomes doubly marginalized due to the absence of the extensive historical and documentary records available in Spanish centers. To address this, we propose a materializing archaeological approach to colonial encounters, where materiality serves to make visible the pasts and conditions that were hidden, erased, or even eradicated. Through an archaeological perspective on the technologies and materialities represented by Hispanic and Indigenous ceramics from northern Chile at the colonial contact, we systematically examine the materialization of these “colonial encounters” in key colonial locations of the Atacama Desert. By analyzing these technologies, we aim to contribute a substantive perspective on syncretisms, violences, and resistances to discuss how indigenous, mestizo, and Iberic worlds were configured in the Andes. This materializing archaeological approach is essential for disentangling the tensions imposed by colonial narratives in the world’s driest desert, moving beyond simplistic divisions between victors and the defeated. Instead, this technological evidence of these ceramics shows violent coexistences and even juxtapositions that emerged in the margins of these imperial systems.

646. WHY HAVE WE NOT SEEN THEM? AFRICAN POPULATIONS IN LA IGLESIA DE LA CONCEPCIÓN, SANTA CRUZ DE TENERIFE (CANARY ISLANDS)

**Contribution format:** Oral  
**Contribution authors:** Alejandra Ordóñez (Universidad de Las Palmas de Gran Canaria) – Javier Serrano – Clara Díaz-Pérez – Ana Pérez (Universidad de La Laguna) – Matilde Arnay De La Rosa – Rosa Fregel (Universidad de La Laguna)

The identity of present-day inhabitants of the Canary Islands has been constructed primarily by the cultural and genetic heritage of two main historical groups that have evolved into the current Canary Islands society. One is the Indigenous Berber people, which nationalist discourses have highlighted to emphasize the differences between the Archipelago and the rest of Spain. The second one would be the Europeans introduced after the conquest of the Islands at the end of the Middle Ages. Nevertheless, following the European conquest, the Canarian Archipelago became a strategic point of Modern trans-Atlantic commerce and, therefore, a participant in the trade of enslaved individuals. The presence of black enslaved African people can be traced in the Canary Islands in the first years after the completion of the conquest by the Crown of Castile in 1496. Despite their substantial contribution, their presence and influence have not been sufficiently acknowledged inside and outside academia. This work seeks to address this issue, partly correcting this mistake. We present preliminary genomic and historical results from the 18th-century burials from the Iglesia de la Concepción in Santa Cruz de Tenerife. Our findings reveal the presence of 18.2% of individuals of maternal sub-Saharan African origin, showing the significant role of African-descended populations within the Modern Period Canarian Society. The written documents, where we find specific references to the enslaved populations, illuminate their role in this community, often linked to domestic environments and as a symbol of social status for their owners. This interdisciplinary data will allow us to discuss not only their role and the reasons why they appear in this burial site but also why they have been practically erased from the construction of the Canarian identity and the implications it has for contemporary issues like the modern migration of African populations into de Archipelago.

2492. ANTI-COLONIAL SEDIMENTS: MIGRANT AND INDIGENOUS ARCHAEOLOGIES IN 19TH-CENTURY OTTOMAN WRITINGS FROM THE GULF OF ANTALYA

**Contribution format:** Oral  
**Contribution authors:** Leticia Rodriguez (University of Houston) – Jason R. Vivrette (University of California, Berkeley)

This paper bridges the disciplines of archaeology and literature, with a focus on intersections between two 19th-century Ottoman works set in the coastal environs of Antalya: Dimitri E. Danieloglou’s Greek-language archaeological travelogue, *Travels in Pamphylia* in 1850, and Nabizade Nazım’s novella of 1890, *Karabibik*, one of the first realist works in Ottoman Turkish to thematize Anatolian village life. *Karabibik* is also notable for its narrative engagement with the numerous ancient structures and archaeological layers (e.g., Lycian, Greek, Byzantine) that feature prominently in the local landscape. Previous studies (e.g., Özil, 2020, 2024; Gökalp Alpaslan, 2007) have begun to explore how Danieloglou and Nazım provide a glimpse into provincial (and multicultural) perspectives on life among the ruins. And yet in the research to date, there is still a tendency to give precedence to the Hellenophilic, colonial ideologies of previous European travelers to these terrains (e.g., Charles Fellows, Charles Texier) informing the writings of these Ottoman authors. Indeed, as members of elite communities with privileged mobilities (Danieloglou came from a wealthy Greek land-owning family in Antalya, while Nazım was a graduate of the Imperial School of Military Engineering in Istanbul who traveled to Antalya to document its topography), both writers at times reproduce a kind of colonialism-through-archaeology by delegitimizing non-elite knowledges and mobilities. Nevertheless, this paper contends that there are still significant “alternative archaeologies” (Greenberg and Hamilakis, 2022) to recover within these works. By removing the ‘colonial sediments’ often projected onto the provincial archaeoscape (an elite ‘backfill’ of sorts), counter-archaeologies (especially those of indigenous and migrant communities) alluded to within each text begin to come to the fore. In essence, by unsettling these layers, this paper provides access to highly local and often syncretic ways in which the 19th-century Gulf of Antalya archaeoscape was viewed and experienced by non-elite inhabitants.

2337. THE MEMORY OF A DISPERSED HERITAGE: MATERIAL REMAINS FROM ANTIOCH AND ITS VICINITY

**Contribution format:** Oral  
**Contribution authors:** Ezgi Erol (Transcultural Studies - University of Applied arts Vienna | Art Theory and Cultural Studies - Academy of Fine Arts Vienna)

How can we write the history of an excavation within its colonial context? What happens when an archaeological site is fragmented and scattered across continents—can these dispersed objects still tell a coherent story? What issues arise in contemporary historiography when objects are removed from their origin and housed in Western museums, far from their homeland? Finally, how can the memory of these forgotten narratives, shaped

by epistemic violence, be revived and mobilized? In this presentation, I focus on the French Mandate excavations at Antioch-on-the-Orientes. The Iskenderun region (now Hatay, Turkey, bordering northern Syria), formerly part of the Aleppo Vilayet in the Ottoman Empire, became a major center of archaeological activity under the French Mandate (1920–1939). During the 1930s, French and American archaeologists collaborated on excavations, with Princeton University leading archaeological research. Many mosaics were uncovered, cut into sections, and distributed to more than 30 museums across North America. In my presentation, I examine the process of cutting and distributing mosaics as an epistemological tool that reflects colonial practices—practices that continue to shape museological approaches today. Therefore, I focus on both the presentation and contextualization of these mosaics and their forgotten biographies. My research draws on archival materials and legacy data from various collections.

189. VINCA FASHION ANFD BALKAN TODAY - AFTER 7000 YEARS STILL HERE

**Contribution format:** Poster  
**Contribution authors:** Jadranka Ahlgren (Društvo antikvara Srbije / Serbian Antiquarian Society | Iženjerska komora Srbije, IKS / Serbian Chamber of Engineers,IKS)

Poster (pictures speak) about Starcevo and Vinca Neolithic fashion design. The poster treats similarities I found in costume design of Neolithic and traditional Balkan women’s folk dress today (ex YU territory), like in one-piece linen long dress (“Košulja”), winter jacket with oblique joints (“Kaftan”), low set soft belt (“Tkanica”), in gaiters, aprons, Red Fez cap, and, “Elibelinde”-“hand on the hips”, women’s posture typical for Balkan folk dance - goddess in the Anatolian carpet weaving tradition, and similar. Because of lot of the material, I have a big poster, too, look here: [https://www.academia.edu/130413029/Vinca\\_culture\\_and\\_Balkans\\_today\\_POSTER\\_II](https://www.academia.edu/130413029/Vinca_culture_and_Balkans_today_POSTER_II) Point is at Vinca woman functional reasoning! She was fishing and hunting, by throwing small, handy nets with shells-weights! She was hunting alone. That supports Hualapai tribe, Great Canyon, and many other USA Indian tribes’ women, wearing of a beaded; diamond net like, capes, which they feel as magical protection – must be hunting nets in the past (gave security – food)! Blombos Cave diamond fishing net schemas, engraved in the Ochre stone from 73000 BC, South Africa, and later similar finds from Middle Paleolithic caves support that too! Net were around bodies, do not disturb, hands were free! The figurines represent that are from Vitkovac Field, 5500-4500 BC, col. of National Museum Kruševac. One, high 5,3 cm, terracotta (T.I 1969-71, number 399), wear a small handy fishing net around the hips, tied in the front, and the other, high 6,5 cm, clay, painted red (T.I.2001, number 39) tied on the back. The both nets are with a lot of big shells. Tradition of wearing front and back aprons exist in Serbia today.

368. REVISITING KATSIMIDI: NEW PERSPECTIVES ON AN ATTIC FRONTIER SITE

**Contribution format:** Poster  
**Contribution authors:** Robert Wagman (University of Florida)

In this presentation we offer a new assessment of the Katsimidi site on the NE Attic frontier, focusing on some previously unnoticed features of the Late Classical complex and a nearby cluster of later structures, also unnoticed, which attest to the area’s continuous use into early modern times. Sitting at an elevation of 850 masl, on a rocky ridge overlooking the Oropian plain, the Katsimidi fort guarded the road that led from Oropos to Athens through the northern end of the Decelea Pass. Although very little survives today of this once strategically important thoroughfare (Thucydides 7.27), substantial remains of another road branching off from it in the fort’s direction can be clearly observed on the east slope of the cliff. Still mostly unpublished except for brief notices by Milchhöfer (1895) and Ober (1985), this road shows some interesting features that call for a more detailed study. In particular, our discovery of a rock-cut niche near one of the road’s switchbacks seems to indicate the existence of a hitherto unknown cult in this area. Cults associated with lookouts and hilltop military installations are not unknown in Attica. Here, however, the presence of springs along the ascent to the fort might also suggest the worship of a nature deity, such as a local nymph. This possibility is reinforced by a cluster of 3 Post-Classical rubble structures near the lower course of the road, which seem to include a springhouse, a water reservoir, and possibly a small chapel. In our presentation we give a preliminary discussion of this new evidence, arguing that the Katsimidi road—thus far interpreted, somewhat restrictively, as a service road to the fort by the same name—should be re-examined in light of its wider archaeological and topographical context.

1058. MEMORIES ENGRAVED IN BONES: DECODING THE PAST IN VILA FRANCA DO CAMPO, SÃO MIGUEL (AZORES, PORTUGAL)

**Contribution format:** Poster  
**Contribution authors:** Daniela Cabral (Vila Franca do Campo Municipality (São Miguel, Azores) | Laboratory of Forensic Anthropology, Centre for Functional Ecology, University of Coimbra)

This study presents an interdisciplinary investigation of the “Skeleton of the Externato,” a set of human remains whose history has been transmitted through oral tradition. According to the accounts, the remains belonged to

the former butler of Dr. Urbano Mendonça Dias, a man of African descent who, upon his early death, bequeathed his skeleton to the educational institution founded by his employer. However, the circumstances surrounding this donation, as well as the identity and life story of the individual, remain unknown. The research combines historical sources, bioarchaeological, and anthropological analysis to reconstruct the biography of this individual and understand the processes that led to his transformation into an object of study. The study draws on institutional documents, notarial records, and journalistic sources to verify the authenticity of the narrative and provide context for the donation. In parallel, an osteobiographical analysis will offer data on age, sex, stature, confirm population affinity, and reveal potential life and death markers. In addition to clarifying the history of this individual, the investigation aims to reflect on his significance and impact today. By restoring voice and identity to a previously anonymous figure, the study contributes to a broader understanding of the dynamics of memory and forgetting, as well as to a more critical approach to the preservation of human remains in historical and educational heritage.

**1572. THE (NOT SO) NEW NOMADIC AGE: THE MATERIAL EVIDENCE OF FORCED DISPLACEMENT OF 19TH CENTURY INDIGENOUS GROUPS OF SOUTHERN CHILE**

**Contribution format:** Poster  
**Contribution authors:** Oscar Toro (Universidad Alberto Hurtado)

The Pehuenche indigenous of the upper Biobío River were compelled to settle towards one of the two slopes of the southern Andes in the second half of the 19th century, when the geopolitical borders between Chile and Argentina were defined. However, Pehuenches usually moved through the western inter-Andean valleys and the eastern pampas. The surroundings of the Chilean forts of Liucura, Lonquimay, Nitrito and Lolco, were surveyed, all in the vicinity of the headwaters of the Biobío River, with their locations relatively well described through literature and archives, as well as some probable sites where battles between Chilean and Argentine troops occurred. The landscape and the places chosen for the establishment of national-state military detachments in these mountainous areas are keys to assessing ephemeral and hard-to-find archaeological evidence. This material presence from the Chilean state, not seen until that date, caused a series of accommodations of Pehuenche groups, from both sides of the Andes, as a bloodier military campaign was taking place at the same time in Argentina. How can archaeology contribute to making these forced migratory processes visible, and what alternative narrative can emerge from a bottom-up view of these socio-historical processes? I suggest that the consequences of the forced mobilities of indigenous populations in the past are reflected in the current life of the Pehuenche comunidades reflected in the material remains, the landscape, oral stories, and fluid memories. This long-term historical process frames in the times of expansionist capitalism, a prelude to the current global capitalism, thus the so-called “new nomadic era” has its roots long before the present times.

**5 OUT OF THEIR ELEMENT: NOVEL METHODS OF ISOTOPE ANALYSIS TO INVESTIGATE HEALTH AND DISEASE IN THE PAST**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Discussion session  
**Session keywords:** isotopes, paleopathology, bioarchaeology, trace elements, health, disease  
**Session organisers:** Noel Hinchá – Naomi Kilburn (Durham University) – Sangyu Shen (University of Toronto)

**SESSION ABSTRACT**

Isotope analyses of human hard tissues are well established within archaeology as a means of reconstructing and interpreting past dietary and mobility patterns, with recent research increasingly focused on investigating biocultural aspects of past lives—such as the growing body of work on breastfeeding and weaning practices. In these studies, isotopes serve as proxies for the external environment in which the human body developed, reflecting the metabolic and geological characteristics of consumed food and water. As isotopes enter the body, they fractionate and become part of newly synthesized tissues, thereby preserving information about the in vivo environment. This creates unique opportunities to make inferences about past diseases and health statuses. Nonetheless, the analysis of pathological conditions has traditionally been avoided due to a range of theoretical and methodological complexities and challenges. Recent developments in the field, however, illustrate the potential of considering pathophysiological factors when interpreting isotope values. Innovative analyses of conventionally used elements—like carbon and nitrogen—as well as emerging research on less commonly applied isotopes, like sulfur and heavy metal trace elements, are expanding the breadth and depth of isotope analysis as a robust tool in paleopathology. Groundbreaking methods utilizing multiple isotope systems demonstrate great capacity to reveal nuances in the interpretation of health and disease etiologies and evolutions. In this session we invite

contributions that employ novel isotope approaches to explore biocultural aspects of health and disease in the past. We are particularly interested in multidisciplinary studies incorporating recent advancements in biomolecular techniques with historical and material evidence. We hope papers will showcase how isotope analyses can provide significant insights into the impacts of diseases on both populations and individual life histories, while highlighting promising new avenues in isotope methods and frameworks. We encourage discussion on these understudied relationships between isotopes and human health.

**CONTRIBUTION ABSTRACTS**

**1574. OXYGEN STABLE ISOTOPE ANALYSIS OF BURROW HILL CEMETERY, SUFFOLK**

**Contribution format:** Oral  
**Contribution authors:** Yueying Li (—)

This study examined the oxygen isotope correlation of Burrow Hill Cemetery in East England by analyzing the characteristics of the cemetery and the oxygen isotope levels of 42 individuals buried there. This data was then compared with the findings of other cemeteries in East England during the Anglo-Saxon period. In addition, the  $\delta^{18}\text{O}_{\text{dw}}$  value obtained using the calibration equation was compared with local water isotope levels, which led to the inference that there was more migration at Burrow Hill. Seven of them are likely to have grown up not in the UK, but in warmer regions such as mainland Europe or North Africa, close to the Mediterranean. Other individuals may be from the West of the UK, Ireland or Northern/Eastern Europe. However, due to correction errors and other factors, it cannot be absolutely ruled out that these people are not local. In addition, the study conducted a systematic study of Burrow Hill Cemetery, which included a number of health indicators. The study found that the average height of Burrow Hill’s studied samples (male 186.2cm, female 173.4cm) was higher than that of Sutton Hoo, Staunton Meadow and Ipswich. This may indicate that the inhabitants of Burrow Hill were generally better nourished than the inhabitants of Anglo-Saxon settlements of the same period. However, 56 percent of the individuals in the sample had incomplete enamel, which is in conflict with the above view, and may be due to the small size of the individuals used in the study, which is not fully representative of the overall situation. This study can provide reference for extracting as much data as possible in the case of limited information. It was the first to examine Burrow Hill, providing material for future studies of the site.

**662. ASSESSING THE USE OF HUMAN AUDITORY OSSICLES AS A SOURCE OF IN UTERO STABLE ISOTOPE DATA**

**Contribution format:** Oral  
**Contribution authors:** Naomi Kilburn – Rebecca Gowland – Janet Montgomery – Darren Gröcke (Durham University) – Debbie Wilkinson (University of Aberdeen) – Julia Beaumont (University of Bradford)

The first 1000 days of life are a crucial period of developmental plasticity for humans. Stressors experienced during this phase, including in utero exposures, impact the health and well-being of individuals throughout their entire lifespan. A potential avenue for studying this period of life in individuals who survive beyond infancy is the isotopic analysis of human auditory ossicles. These tiny ear bones are considered fully ossified by 24-26 weeks in utero, prior to dental development, and do not remodel—though they do have large medullary cavities that become gradually filled in during early life. The exact time frame for the completion of this secondary mineralization phase is not known, nor is the impact it could have on stable isotope values. To determine if auditory ossicles can provide in utero isotopic data, the bone mineral density (BMD) of archaeological ossicles from non-adult individuals (in utero – 5 years of age) was derived from microCT scans. BMD data was then integrated with  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  stable isotope results from incremental dentine and auditory ossicle samples of the same individuals. Here we present the preliminary results of these analyses and offer some initial insights into the use of auditory ossicles as a source of in utero isotope values.

**2241. USING FUZZY CLUSTERING TO EXPLORE ISOTOPIC VARIATION AMONG ARCHAEOLOGICAL ATTRITIONAL AND CATASTROPHIC JUVENILE DEATH ASSEMBLAGES, KUÉLAP, PERU**

**Contribution format:** Oral  
**Contribution authors:** J. Marla Toyne – Christina Trent (University of Central Florida) – Donovan Adams (University of Central Florida)

There are two areas wherein stable isotope analysis of diet struggle to engage methodologically and interpretatively: juvenile remains and paleopathological variation. This presentation examines the variation between juvenile bone dietary stable isotopes considering the nature of two different mortuary contexts and innovates by applying a fuzzy clustering approach for analysis. With attritional burials, the expectation is that the individuals died of natural causes, which could affect nitrogen stable isotope values. With those juveniles killed in a massacre

event, we would expect that their dietary isotopic signatures would not be as impacted by pathological processes. At Kuelap, in highland Chachapoyas during the late prehispanic period (900-1535 A.D.), a juvenile sample of 83 individuals are divided into attritional (n=50) and massacre (n=33) groups. Traditional statistical analyses (Mann-Whitney U) indicate significant differences between each group suggesting that either juveniles had different diets in each group or that nitrogen variation could have been due to the influence of pathological conditions in the attritional group. Unsupervised possibilistic fuzzy c-means clustering is a soft clustering approach that allows individuals to be members of multiple clusters to differing degrees. This technique provides a more robust and nuanced approach to examining inter and intra-individual/group variation than traditional statistical analyses. Fuzzy clustering evaluation of the data support this group-based division but also allow us to explore additional factors such as age subcategories, burial context, and osteological features that contribute to the isotopic variation. Further, the membership and typicality degrees of this approach allow for the opportunity to critically examine the similarities and differences between individuals by removing a priori assumptions of group membership.

**1004. THE EFFECT OF EARLY-LIFE VITAMIN D DEFICIENCY ON SEQUENTIAL DENTINE  $\delta^{13}\text{C}$  AND  $\delta^{15}\text{N}$  VALUES IN HUMANS**

**Contribution format:** Oral  
**Contribution authors:** Jacob Griffith (Archaeology, Environmental Changes and Geo-Chemistry, Vrije Universiteit Brussel) – Olivia Cashmere – Jason Laffoon (Faculty of Archaeology, Leiden University) – Barbara Veselka (Archaeology, Environmental Changes and Geo-Chemistry, Vrije Universiteit Brussel)

Sequential dentine sampling is becoming an ever-increasing tool for reconstructing the early lives of past individuals. Serial  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values have been used to reconstruct weaning ages and strategies, dietary changes in childhood, nutritional stress periods, as well as age-related hormonal changes within humans. However, there is ongoing debate about whether vitamin D deficiency (VDD) also affects  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values. If an individual experiences VDD during tooth formation, the developing dentine can become defective and hypomineralised, forming interglobular dentine (IGD). While VDD is known to alter dentine’s mineral structure, its impact on the isotopic composition of collagen formed during the same period is currently unknown. To explore this potential relationship, we sequentially sampled the dentine of eight teeth from individuals dating to 17th–19th century Belgium and the Netherlands. These teeth had previously undergone microscopic analysis, which identified significant IGD associated with VDD. A control sample from the same population, free of IGD, was also included. Using both slicing and puncture methods, we analysed  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values to assess potential differences. The results revealed no notable differences in  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values between IGD-affected and unaffected samples, both between individuals and within the same tooth. Our preliminary findings suggest that when reconstructing life histories from serial  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$  values, considering the effect of VDD on given results is not necessary.

**6 ONTOLOGICAL AND EPISTEMOLOGICAL INTERPRETATIONS INTERTWINING ARCHAEOLOGY, LANDSCAPE AND THE SKY**

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Archaeoastronomy, Archaeology, Astronomy, Skyscape, Ontology, Ethnography  
**Session organisers:** Jose Balbi (Colchester Archaeological Group) – Javier Mejuto (Universidad Nacional Autónoma de Honduras) – A. Cesar Gonzalez García (Institute of Heritage Sciences (INCIPIT), Spanish National Research Council (CSIC)) – Hans Martz De La Vega (National School of Anthropology and History, Mexico) – Stanislaw Iwaniszewski (Escuela Nacional de Antropología e Historia - Instituto Nacional de Antropología e Historia)  
**Session discussant:** Eduardo Miguel Bufalino (ISFD Instituto Superior de Formación Docente)

**SESSION ABSTRACT**

As in the last six years, this session corresponds to the SEAC-EAA community. The convolution between data obtained in the field and novel approaches from complementary academic studies provide key information to approach past cultures. The landscape and the celestial realm play a fundamental role, intertwining in their ontological and epistemological interpretations to result in a holistic cultural interpretation. The main characteristic of these studies is their interdisciplinarity, through which we attempt to study and understand different cultures, to comprehend how they interpreted the skies and the landscape from their relationship with elements of ancient Architecture and Archaeology. Key questions should go beyond the mere identification of particular celestial events (such as solstices or heliacal rising), but try to answer social questions such as, what was the

way of life, practices and world views of the people in those past cultures through the use of new techniques and their connection with the landscape and the sky. Who were the people responsible within each community for sky watching? Was their knowledge sacred and restricted, or open to the whole community? In this session we encourage presentations that address how Archaeoastronomy and in particular the study of orientations, alignments and/or the location of monuments in the landscape and their possible relationship with the sky can provide clues to understand cases of change/resilience in different societies. Given these possibilities, the participation and contribution from different archaeological sciences is encouraged and we welcome these different visions that help answering the questions posed earlier and many others.

**CONTRIBUTION ABSTRACTS**

**146. ALL SAINT’S CHURCH, ESSEX, UNITED KINGDOM; THE SEARCH OF THIS NORMAN ORIGIN**

**Contribution format:** Oral  
**Contribution authors:** Jose Balbi (Colchester Archaeological Group)

The presentation deals with the History and archaeological discoveries related to the old Fordham Church, in Essex, United Kingdom. Oral tradition tells that in the old town, and after the arrival of the Normans to Great Britain (1066), a large amount of land was donated by William the Conqueror himself to different abbeys, mainly in the north of present-day France. Many of these stories were confirmed although in reality many of the original buildings were remodelled and even date back to the time of the Roman occupation (until 410 AD). We have carried out a research on the origins of All Saints’ Church, which is believed to have been founded in 1086. Our work includes consultations with the library of Bec Abbey (Normandy-France), the Domesday Book in the British National Archives (London-UK) and a series of bibliographies and correspondence confirming actions carried out in the 11th century, posterior correspondence and publications, in addition to theories about its Roman origins which are complemented by the excavations we are currently carrying out nearby and which undoubtedly include antecedents of the Roman Occupation of Britain. Our research reveals more about the heritage of our town and its cultural relationships.

**1176. LANDSCAPE AND SKYSCAPE OF IRON AGE GALICIA. THE CASE OF CASTRO OF ELVIÑA (A CORUÑA, SPAIN)**

**Contribution format:** Oral  
**Contribution authors:** Andrea Rodríguez-Antón – Samuel Nión Álvarez (Institute of Heritage Sciences (INCIPIT-CSIC)) – Alberto Fachado Baña (Independent)

Castro de Elviña (A Coruña, Spain) is an Iron Age oppidum located in a small hill close to sea and terrestrial communication routes. Elviña is defined by its monumentality, highlighted by massive defenses and accesses, as well by a close relationship with Mediterranean communities, especially with Gades. It is also noteworthy the presence of several religious and collective buildings, which are not particularly common in northwestern Iberian Iron Age. This work is an approach to the relationship between architecture and cultural expressions in northwestern Iberian Iron Age (Castro culture) with the surrounding landscape and skyscape. Castro de Elviña has been chosen as an excellent example to carry out an approach from cultural astronomy, due to the aforementioned unusual presence of buildings of a collective and/or cultic nature. Additionally, this settlement was strategically located, which favoured the control of the natural communication and maritime trade routes due to its proximity to the north-western coast of A Coruña. The case of Elviña can provide a better understanding of the cosmovisions of its inhabitants, as well as propose new perspectives on trade contacts beyond the Gulf of Santa Cruz and the interaction of cultural practices. Additionally, along with previous archaeoastronomical works, through this study we have explored the potential relationships between the sky and the societies that inhabited the land of modern Galicia during the 1st millennium BC in order to provide valuable information about whether astronomy influenced crucial aspects such as religion, politics or time-keeping, how and why. Finally, we have explored new perspectives on cultural interactions, power and social dynamics, according to the influence of the Punic communities of Cádiz on the cosmovision and local beliefs of the peoples of Elviña.

**671. TLALOC’S CALENDAR ON CERRO TLALOC, MEXICO**

**Contribution format:** Oral  
**Contribution authors:** Stanislaw Iwaniszewski (Escuela Nacional de Antropología e Historia, Mexico City)

Long before the Spaniards imposed the Julian and later the Gregorian calendars upon New Spain, Mesoamericans had developed their own and unique way of counting time and negotiating space through native calendar systems. Also, the Mexica (=Aztec) time-place reckoning was not just a part of their culture integrated but a specific perspective that integrated cosmological, divinatory-numerological, and astronomical-calendrical epistemologies. Their hilltop ceremonial sites were not just locations for religious-political ceremonies, but unique hubs that linked

agricultural fertility and the religious legitimation of rulers. One of the best-known examples is Cerro Tlaloc in the Valley of Mexico. The ritual precinct atop Cerro Tlaloc unveils various calendar patterns that have not been discussed before, seemingly related to the figure of Tlaloc. The paper again discusses the possible meaning of the site’s alignments. The paper explores Mexica time-place reckoning as a particular way in which Mexica priests have attempted to conceive their relationship with their surroundings through the aims of the calendar. In conclusion, the Mexica skyline is not just another set of alignments, but a significant map of meanings in the sky and prominent landforms. What seems to be specific for the Mesoamerican is that these meanings were also negotiated within their calendars or calendrical time reckoning epistemology adding a weight of importance to their unique perspective.

**693. NEW OPPORTUNITIES FOR ARCHAEOLOGY IN A SPECIFICALLY DESIGNED DEGREE PROGRAM IN CULTURAL ASTRONOMY**

**Contribution format:** Oral  
**Contribution authors:** Javier Mejuto – Eduardo Rodas-Quito (Universidad Nacional Autónoma de Honduras)

Since the beginning of studies linking astronomical knowledge and archaeological contexts in Europe, there has been a tense relationship between archaeologists and cultural astronomers due to the lack of epistemological and methodological convergence. In the European case, what has historically been called Green Archaeoastronomy involved cultural astronomers working in European contexts who favoured methodologies based on statistics and topography at the expense of the necessary cultural interpretations. This was one of the major criticisms to Cultural Astronomy by European archaeologists. The clearest historical example of this was the case of Sir Norman Lockyer and his analysis of the Amun-Re Temple at Karnak, Egypt. Therefore, specific training in Cultural Astronomy, in which the currently predominant approaches in the astronomical analysis of cultural contexts converge, taking into account the points of view provided by Archaeology and Astronomy with their respective epistemologies, is necessary for the development of Cultural Astronomy as a discipline and presents an opportunity for Archaeology to explore and analyze new material contexts from a new perspective. In this paper we present the main aspects of the Bachelor’s degree program in Cultural Astronomy that is beginning at the proposal of the Department of Archaeoastronomy and Cultural Astronomy of the Faculty of Space Sciences of the Autonomous University of Honduras and the possibilities that are opening up in the Central American region for the development of this disciplinary field in collaboration with professionals in Archaeology.

**998. THE ORIENTATION OF NABATAEAN TOMBS FROM HEGRA**

**Contribution format:** Oral  
**Contribution authors:** Antonio César González-García (Institute of Heritage Sciences (INCIPIT, CSIC)) – Juan Belmonte (Instituto de Astrofísica de Canarias) – Andrea Rodríguez-Antón (Institute of Heritage Sciences (INCIPIT, CSIC)) – Munirah Almushawh (The Royal Commission for AlUla) – Maitane Urrutia-Aparicio (Universidad Europea de Canarias)

In earlier works at Petra, and elsewhere in Nabataea, we could verify that the Nabataeans built their cultic spaces in such a way that they included orientations towards sunrise on relevant moments of their calendar. Significantly, several temples, tombs, cenotaphs and processional ways seemed singularly linked with the winter solstice and the equinoxes. Often considered the southern capital of the Nabataean Kingdom, Hegra is located at the brink of the AlUla Valley Oasis. There the Nabataeans carved nearly a hundred tombs in the sandstone cliffs that surround the city center. In a recent field campaign on site, we measured the orientation of Nabataean tombs and sanctuaries in the area. This talk presents the analysis and interpretation of the data on the orientation of 113 tombs, including all monumental ones, the largest coherent set of Nabataean tombs ever analyzed. The results show that the tombs were not randomly orientated but followed a series of patterns, most probably emphasizing key moments within the framework of the Nabataean lunisolar calendar religious festivals, and, on occasions, also the local landscape.

**703. ANALYSIS OF THE CIVIC-CEREMONIAL CENTRE OF TIKAL IN THE CLASSIC PERIOD AS A MODEL FOR THE K’ATUNSCAPES (TWIN PYRAMID GROUPS)**

**Contribution format:** Oral  
**Contribution authors:** Hans Martz De La Vega (Escuela Nacional de Antropología e Historia) – Miguel Pérez Negrete (Centro Regional INAH Guerrero)

The great Maya cities of the Preclassic and Classic periods, located in present-day Mexico, Guatemala, and Belize, featured civic-ceremonial centres that included architectural complexes such as triadic groups and acropolises, where rulers of the dynasties were buried. These urban environments are characterized by common architectural patterns, guiding axes, and complex urban designs, with both similarities and local particularities. Their study requires consideration of fundamental and symbolic classification systems, the physiognomic properties of the

landscape, and the cyclic and regular movements of celestial bodies, which form a common reference framework for other processes and events that provide coherence to the Maya universe. We will address the civic-ceremonial centre of Tikal, composed of a large plaza flanked to the north by an acropolis with triadic groups from different periods, and to the south by another acropolis featuring buildings with nine doorways. This centre is one of the most studied within Maya civilization, which has led to various interpretations. One of these suggests that it served as the model adopted by the rulers of the Late Classic period for the design of the well-known Groups of Twin Pyramids, which we have termed k’atunscape, found so far only in the cities of Tikal and Yaxhá. While the main characteristic of these k’atunscapes is the orientation of their structures and axes, both in the “east-west” and “north-south” directions, no precise data or thorough analysis has yet been presented on this subject. In this contribution, based on our fieldwork, we aim to provide such information and, based on that, discuss the proposed interpretation. As those familiar with cultural astronomy know, the orientations in question are better understood when considering, primarily, the dates related to the tropical year and the positions of the stars in the night sky, as will be demonstrated once again in this study.

**1116. USE OF THE TELESCOPE FOR ARCHAEOASTRONOMICAL RECORDS**

**Contribution format:** Oral  
**Contribution authors:** Barthélemy D’Ans Alleman (Instituto Peruano de Astronomía | Planetarium María Reiche)

In archaeoastronomy, it is necessary to know the landscape profile of an observation point in order to define where the Sun, the Moon, the planets, the stars or any celestial object of interest for cultural astronomy is located. To do this, an astronomical horizon is defined centred on the observed point, which is tangential to the Earth’s surface using the horizontal or local coordinate system (azimuth and altitude). To do this, a compass and a clinometer are used as a first approximation, with which the azimuth (compass) and altitude (clinometer) of the landscape profile are directly measured. The most accurate traditional method to obtain this profile is the use of the theodolite, with which measurements of the Sun are obtained at an exact moment from the observation point used (Aveni 2005), so we can astronomically adjust its location based on astronomical tables, in equatorial or absolute coordinates (right ascension and declination), with this measure we obtain the precise directions of the azimuths and heights of the measured landscape (Martz de la Vega et al. 2016). During the year 2024 and early 2025, recordings were made with telescopes, mainly to record on video the setting of the Moon during important lunar stops over notable elements of the landscape and/or archaeological structures. With the telescope well positioned to follow a star, the absolute coordinates are easily obtained at the measured times. In this work, the precision of this method of measurement with a telescope will be discussed, and the advantages and disadvantages of using the telescope as a measuring instrument will be presented.

**1521. STONEHENGE & TIMING TYPHON**

**Contribution format:** Oral  
**Contribution authors:** Vance Tiede (Astro-Archaeology Surveys | Yale University)

Two new empirical findings are presented to update Hawkins’(1964) proposal that Stonehenge (TPQ 3000 BCE) was designed as a “Neolithic Computer” to time eclipse danger periods based on both analogue horizon alignments to the solstices ( $\pm 24^{\circ}8'$ ) and lunar standstills ( $\pm 19^{\circ}8'$  &  $\pm 29^{\circ}8'$ ), as well as digital encoding of luni-solar cycles in its architecture, viz.: 19 Bluestone(s) Horseshoe representing the 19-year Metonic (Lunar Phase) Cycle; 56 Aubrey Hole(s) Circle for the 18.6-year Regression of the Lunar Nodes Cycle ( $56 = 18+19+19$ ); and Sarsen Circle’s 29. 5 uprights (Sarsen #11 is 50% in Length:Width:Height), 29 Z & 30 Y Holes,  $29+30 = 59$  Bluestone(s) Circle representing a double-month which averages the 29.5-day Lunar Synodic Period. The first new numerical artifact proposed is that the 5:12 Width:Length Ratio of the Station Stone Rectangle was chosen from an infinite number of possible rectangle ratios because each interior 5:12:13 Pythagorean triangle (Dibble 1976) uniquely delineates in space (Area = 30 Ratio Units<sup>2</sup>, Perimeter = 30 Ratio Units) the nearest integer (30) to the time of the moon’s 29.5-day Synodic Period. The second new numerical artifact emerged from testing the efficacy of Hawkins’ eclipse warning proposal by modeling midwinter full moonrises over the Heelstone in Starry Night Pro planetarium software for midwinter lunar eclipses visible at Stonehenge, 3000–1500 BCE (Espenak 2015). The 56-year Stonehenge Cycle and 19-year Meton (of Athens, c.432 BCE) Cycle working in tandem forecast up to a tetrad of midwinter total lunar eclipses observable at Stonehenge (e.g.: 31 Dec 1583 BCE; 10 Jan 1564 BCE; 11 Jan 1545 BCE; 10 Jan 1526 BCE). The numerical findings both support Hawkins’ eclipse warning interpretation, and elucidate Eudoxus’ (c.370 BCE) otherwise enigmatic report that a “56-sided polygon is said to belong to Typhon,” the Greek demon-god Τυφῶν whose blood-red shadow eclipses the moon (Plutarch c.120 CE).

**147. ALEXANDRIA IN EGYPT. ITS LIBRARY AND THE ANCIENT CITY**

**Contribution format:** Poster  
**Contribution authors:** Jose Balbi (Colchester Archaeological Group)

The fate of the city of Alexandria is linked to that of its Library, which served for centuries as the heart of the city. Created in the Hellenistic period it was the fundamental element with which the satrap Ptolemy I Soter continued the diffusion of Hellenism as it was conceived by Alexander. There are no great certainties as to the place of its foundation, but it is determined by various authors and chroniclers of the time that there was a main one and a smaller one next to the Serapeum. This indicates to us from the beginning not only the cultural but also the religious relationship of the Library. Some authors understand the issue in such a magnitude that they think that the Library had the objective of making Alexandria the successor of Athens. We will study the current city of Alexandria and the plan of what was presumably the ancient city. We have to highlight the most emblematic places and the possibility of locating them in the current city. We chose the following: • The Lighthouse (Reference 1) • The Greek Port (Reference 2) • The Main Library (Reference 3) • The Market (Reference 4) • The Palace (Reference 5) However, looking at the modern map, we can add the following places to complete what could have been the ancient city: • The Fort (built with remains from the collapse of the Lighthouse) • The Underwater Archaeological Zone • The Ancient Cemetery • Pompey’s Pillar • The Modern Library Our research takes us to places in the city that are mostly not advertised for tourists, where archaeological remains from different periods can be found today and which allow us to reconstruct the experiences of ancient culture as recounted by both Historians and Historical Figures who lived in this city.

7 SURVEYING THE PAST, PROSPECTING THE FUTURE OF BALKAN ARCHAEOLOGICAL HERITAGE

**Session theme:** 8. Along and across the Danube!  
**Session format:** Regular session  
**Session keywords:** Archaeological Survey, Methodology, Geophysics, Remote Sensing, Future directions  
**Session organisers:** Miroslav Maric (Balkanološki Institut. Srpska Akademija Nauka i Umetnosti) – Miroslav Kočić (Centar za Arheologiju “Dragoslav Srejović”. Univerzitet u Kragujevcu) – Žarko Tankosić (Department of Archaeology, History, Cultural Studies and Religion. University of Bergen)

SESSION ABSTRACT

Over the past two decades, a multitude of new archaeological surveys in the Balkans have expanded our knowledge of human activities in the past. The rapid development and wider availability of new data collection, manipulation and interpretation technologies have, alongside increasing personal computing capabilities, created new, immense quantities of spatial information containing data on archaeological traces. The systematic archaeological survey, although usually the first step needed for a better insight into the past human societies, is often overlooked or underused in later phases of archaeological research. Often underfunded and facing the reality of rapid depopulation and disuse of land which is reclaimed by nature, archaeological survey projects in the Balkans need to find new pathways for a more encompassing research that will ensure the timely identification, preservation and utilisation of rich archaeological evidence present in the region. The goal of the session is to bring together archaeological survey experts dealing with the Balkans and Southeast Europe region to share experiences, knowledge, methodologies and problems and potentially create groundwork for new scientific cooperation in the area. Our focus is the networking of archaeologists that can share experiences, create new ideas and developments to be applied in the advancement of the field. Ideas that can be equally implemented by teams already active in the fields, but also applicable for the teams yet to be created and invested into this subject in the years to come.

CONTRIBUTION ABSTRACTS

270. THE NORWEGIAN ARCHAEOLOGICAL SURVEY IN THE KARYSTIA (NASK): METHODOLOGICAL AND INTERPRETIVE INSIGHTS IN RETROSPECT

**Contribution format:** Oral  
**Contribution authors:** Paschalis Zafeiriadis (Norwegian Institute at Athens - University of Bergen) – Žarko Tankosić (Department of Archaeology, History, Cultural Studies and Religion. University of Bergen)

The Norwegian Archaeological Survey in the Karystia (NASK) involved the intensive and systematic survey of the Katsaronio Plain, the largest expanse of arable land in southern Euboea (i.e., the Karystia), a region of strategic significance between the Greek mainland and the Cyclades. NASK identified numerous previously unrecorded sites and findspots, spanning from the prehistoric to the Byzantine periods, significantly enriching our understanding of the region’s archaeological heritage, particularly given the limited number of prior systematic excavations. As the most recent in a series of field surveys in the Karystia, NASK builds on previous work characterized by

varying geographical scopes, methodologies, and intensities, collectively establishing the Karystia as one of the most thoroughly surveyed regions in Greece. This paper presents the results of NASK and examines diachronic settlement patterns and landscape use in this part of Euboea, incorporating data from earlier surveys in areas adjacent to the Katsaronio Plain where necessary for interpretive synthesis. Additionally, we discuss methodological aspects of the survey, and the implementation of digital data recording procedures and protocols designed to enhance the speed and efficiency of fieldwork.

796. WITHOUT GIS, THE MINES ARE DARK AND FULL OF ERRORS: TRACING THE LATE ROMAN MINING LANDSCAPE OF MOUNT RUDNIK

**Contribution format:** Oral  
**Contribution authors:** Marija Kalicanin-Krstic (Cultural Heritage Preservation Institute, Kragujevac) – Marija Marić (University of Novi Sad, Department of History, Faculty of Philosophy)

The Central Balkans’ geoarchaeological heritage has been shaped by centuries of mining and metallurgical activity, posing significant challenges for archaeological research. Continuous use has changed the historic landscape, removing old features and making it harder to reconstruct their timeline. Therefore, analysing recording and overseeing archaeological sites in mining areas have become essential in this scenario. GIS technology has emerged as a fundamental tool for analysing complex landscape transformations and understanding their broader socio-economic implications. Using Mount Rudnik as a case study, where evidence of mining and metallurgical activities spans from prehistory to the present, we demonstrate how spatial analyses facilitate the identification of the Roman imperial domain within Metalla Tricornensia amidst the landscape’s stratification. The application of predefined ArcGIS 10.5 spatial analysis modules has enabled a critical reassessment of previous interpretations regarding the boundaries of metalla and territoria metallorum. A clearer picture of the mining landscape’s organisation has emerged by mathematically simulating spatial relationships between mining structures and ancient sites in correlation with written sources and archaeological excavations. The results of these analyses raise new questions not only about the spatial distribution of mining zones but also about the dynamics of administrative changes in Late Antiquity. A clear pattern emerges in this period: villae rusticae and fortifications form stable spatial units alongside mining and metallurgical centres. The pattern indicates a methodical approach to exploiting and controlling resources, aiding in predictive modelling for finding undiscovered sites. The research highlights the indispensable nature of GIS in examining and conserving mining landscapes. By combining digital technologies with a conventional research approach, it secures future preservation and enhances comprehension of geoarchaeological heritage, reducing its deterioration and disappearance in modern circumstances.

1113. CONTRIBUTION TO ARCHAEOLOGICAL FIELD SURVEY IN SERBIA - EXAMPLES AND RECOMMENDED METHODS

**Contribution format:** Oral  
**Contribution authors:** Aleksandar Aleksic – Jasminka Bogic (Institute for Cultural Heritage Preservation Niš)

An archaeological field survey is usually the first step in the field-conducted archaeological research. It is commonly used for academic archaeological research projects and It was usually used for most of the huge infrastructure development projects (highways, pipelines, etc.). While academic field survey is oriented to a certain archaeological period or a site type, rescue archaeology has a goal to map every archeological site within the boundaries of the development project. The Southeastern part of Serbia is a bordering, mostly hilly and mountainous region, with roughly 21000 km2 and 1,2 million inhabitants. It is economically the least developed region and by far archaeologically unexplored and unresearched, but very rich in archaeology. At the same time, there is only one heritage protection institute with only 2 permanently employed archaeologists trained for archaeological heritage preservation (the lowest number of archaeologists in archaeological heritage protection in Europe)! In the paper, we will present some examples of archaeological field surveys and recommend methods usable for archaeological protection and future research. Data from previous archaeological research, and archaeological analysis of the topography, lidar, and satellite imagery is the first step in the field survey planning with points of interest extracted. The whole area is covered by field walking with a crew in a line formation with at least 8 persons at a mutual distance of 10 – 20 m. Points of interest defined during the prep are walked and checked too. During the process, places that have archaeological material on the surface or consist of other indicators are the subject of separate under-surface tests. Under-surface tests consist of shovel test pits, augering, and/or geomagnetic prospection. All these methods, when well organized and with enough manpower on the field, could be very fast-paced and cover huge areas.

1554. ŠUMADIJA REGIONAL SCALE SURVEYS - RESULTS, CHALLENGES AND FUTURE

**Contribution format:** Oral  
**Contribution authors:** Miroslav Kocic (Center for Archaeology “Dragoslav Srejski” University of Kragujevac) – Ana Koić (Nortwest University, Xian, PRC | Center for Archaeology “Dragoslav Srejski” University of Kragujevac) – Marija Kalićanin Krstić (Center for Archaeology “Dragoslav Srejski” University of Kragujevac)

This paper will present results of almost 9 years of continuous survey efforts located in Central Serbia, in the region of Šumadija. During this time, our team conducted several large scale regional surveys, targeted municipal level surveys and targeted surveys for protective archaeology. During these surveys, we used some of the cutting edge technologies, including combination of the statistically driven regional pedestrian survey designs, geophysical prospection that was incorporated from the start as one of the crucial methods, UAV prospection, LIDAR surveys and geochemical survey methods. While the focus of most of our work was Neolithic and Eneolithic archaeology, surveying will always produce diachronic results that are very much needed for all archaeologist and heritage experts. Combination of these methods showed excellent results, from which some are published and some in the preparation for publication, but also raised some issues. These are especially connected to the uniformity of the results that are required by the legislature, the amount and the type of the data that we are producing, and the question of the comparative nature of the data produced by surveys primarily in Serbia, but also in the neighboring countries. Aim of this paper is not just to present the data produced during the SRGAP (Šumadija Geoarchaeological Project) that is conducted with the University of Pittsburgh, or the protective research conducted for the need of large infrastructural projects, but to start and promote discussion about how do we unify and standardize methodologies and data for future research and comparative studies across the Balkans.

2009. INTEGRATION OF LIDAR, THERMAL, MULTISPECTRAL, AND GEOMAGNETIC DATA IN THE INVESTIGATION OF THE NEOLITHIC SITE CRKVINE

**Contribution format:** Oral  
**Contribution authors:** Nenad Joncic – Adam Crnobrnja (National Museum of Serbia)

Advancements in remote sensing technologies have enabled more precise detection of archaeological sites and structures. This study examines the integration of data collected by drones equipped with LiDAR sensors, thermal, and multispectral cameras with geomagnetic surveys conducted at the Neolithic site of Crkvine near Stublina, which has been excavated since 2006. Geomagnetic surveys conducted from 2007 til 2010 facilitated the initial planning of subsequent excavations, while modern remote sensing methods were used preventively to provide additional information and enhance the understanding of the site’s archaeological context. The primary goal of the research is to assess the potential of combining these technologies for detecting previously unknown structures of the Vinča culture and improving archaeological research methodologies. By comparing and analysing data obtained from various sensors, the study explores how combining these methods can contribute to a better understanding of the site’s spatial characteristics, the identification of hidden structures, and the development of new research strategies. The expected results will contribute to the development of a comprehensive methodological framework for multisensor archaeological research, with broader applications in archaeological practice.

2366. FROM PREHISTORY TO THE EARLY MEDIEVAL - RGK MAGNETOMETRY SURVEYS IN SERBIA

**Contribution format:** Oral  
**Contribution authors:** Christoph Rummel (Römisch-Germanische Kommission)

As parts of various research and infrastructure projects, the Römisch-Germanische Kommission of the German Archaeological Institute has carried out magnetometry surveys at several sites throughout the Western Balkans and across Serbia in particular since the early 2000s. The chronological range stretched from the neolithic to early medieval sites, with some target areas chosen jointly between Serbian and German partners, others suggested in line with Serbian research or heritage management interests or necessities. The success rate of projects were widely varied: some lead to major landscape archaeological research projects or joint excavations that are still ongoing, such as at Romuliana-Gamzigrad. Some successfully published surveys provided new insights into key archaeological sites of the Western Balkans such as at Drenovac. Inevitably, there are also unloved datasets that still await final processing, interpretation and publication. This paper presents an overview of some of the work done and seeks to investigate what factors led to the success of some projects and the relative failure of others. Building on this, it seeks to chart future courses for successful planning and execution of geophysical survey programmes, particularly international collaborative ones.

177. SURVEYING THE FLATLANDS - THE ARCHAEOLOGICAL MAP OF NORTHERN BAČKA PROJECT

**Contribution format:** Oral  
**Contribution authors:** Miroslav Maric (Institute for Balkan Studies, Serbian Academy of Sciences and Arts) – Neda Mirković Marić (Intermunicipal Institute for the heritage protection Subotica)

Geographically, northern Bačka region of Serbia encompasses the territory of six municipalities in the very north of Serbia; namely Subotica, Kanjiža, Bačka Topola, Mali Idoš, Senta and Ada. The area lies on the western bank of the River Tisa, which is a natural boundary, but also a very important communication route in the region, linking the Pannonian plains and the Central Balkans area. It is rich in archaeological sites and has a very long history of archaeological research. Over the past decades, territorially competent Institutions of heritage protection performed individual excavations, surveyed the field and haphazardly collected archaeological data. However, in the recent years, with increased commercial and construction activities in the area a need to incorporate, systematise and enlarge the core of knowledge on the archaeology of the area appeared in order to create a more complete archaeological map of the area which covers 2700 sq. km. The Archaeological map of Northern Bačka project started in 2017 with the financial support of the Serbian Ministry of Culture and the municipalities it covers. Combining old maps, new technologies, satellite imagery, GIS analyses and targeted field walking, over 700 previously unknown sites were detected by now in 5 of the 6 municipalities of Northern Bačka. Experiences gathered over the last 8 years have made it possible to continually improve our approach and better identify possible archaeological features and settlement patterns in the landscape as well as do the predictive modelling of the settlements of specific period. We present preliminary results of the project and identify key results and problems and provide conclusions and suggestions for future research.

1339. EXPERIENCES AND LESSONS FROM ARCHAEOLOGICAL SURFACE SURVEYS IN SOUTHERN BANATE (SERBIA)

**Contribution format:** Oral  
**Contribution authors:** Predrag Novakovic (University of Ljubljana) – Dragan Jovanović (City Museum Vršac)

In Serbian archaeology, the methods of archaeological systematic surface surveys, as they were developed in the 1980s and 1990s, especially in the Mediterranean regions, did not take deeper roots despite their great potential, for example, in large agricultural landscapes in the lowland Danubian area. The reasons are many: the dominant tradition of small-scale ‘research-oriented’ excavations by local institutions, persistence on traditional archaeological topography (judgmental surveying) in searching for new sites in a very simple and inexpensive way (lack of funding, personnel, and other resources), omitting systematic surveying in compulsory preventive archaeological research, and, last but not least, lack of teaching of systematic surveying methods in the university curricula. However, the project of the Department of Archaeology, University of Ljubljana and City Museum Vršac, with continuous, systematic surface surveying since 2010 (13 campaigns), presents the exception. This project is probably the largest systematic surface survey in Serbia. The focus of the project was on two major areas: the surroundings of the town of Vršac and the area between Vršac and Vatin. In our campaigns, which were also field schools for students, various methods and sampling techniques were used (systematic grids and transects with various intervals, systematic and statistically random sampling, grab sampling, and subsurface sampling). So far, the total surveyed area is nearly 2,5 square kilometres large and was checked with more than 6.500 different sampling units, from where nearly 20.000 finds were collected and studied. More detailed empirical results will be presented in the paper. However, it is also necessary to stress some other aspects, particularly the experiences obtained in working in the landscape, which was agriculturally heavily modified in the last two centuries. This can provide valuable ideas for researchers in this or neighbouring regions with similar landscapes.

2385. SYSTEMATIC SURFACE SURVEY OF MEGA-SITES: ADAPTATION AND METHODOLOGICAL INSIGHTS BASED ON THE SILT PROJECT, BANAT, SERBIA

**Contribution format:** Oral  
**Contribution authors:** Caroline Bruyere (University College Dublin)

Systematic surface survey has been used in field archaeology for nearly a century, but social landscapes continue to pose new challenges for methodology development. In the second half of the 2nd millennium BC, communities in the area of modern Vojvodina, Serbia built over 100 monumental settlements which have been grouped within the Tisza Site Group. From 2019-2023, a team from University College Dublin and The Fall of 1200 BC project in collaboration with the Museums of Pančevo, Kikinda, Zrenjanin and Vršac, created the Survey in the Lower Tisza (SILT) project to investigate this network and individual settlement organization. The unique ethos of this settlement network created challenges for archaeological investigation. First, the massive size of the settlements prohibited excavation of significant surface area. Second, the use of earthen architecture and absence of a post-abandonment burning traditions seen in many prehistoric communities of Eurasia meant geophysical data was limited to the identification of pits and ditches. Pedestrian surface survey thus became an essential method

for understanding internal settlement organization. This paper compares the efficacy of two systematic survey methods, adaptations of the grid and the point-transect methods respectively, for the investigation of five Tisza Site Group settlements of different sizes. In addition, the paper will discuss how survey data was integrated with remote sensing, geophysics, and excavation data to develop tailored methodological and analytical approaches for this particular social landscape.

2367. EXPLORING THE PAST: THE ROLE OF MAGNETOMETRY IN BALKAN ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Dávid Šálka – Peter Milo – Tomáš Tencer – Michal Vágner – Jan Havelka – Anna Rekemová (MUNI - Ústav archeologie a muzeologie)

In recent years, our Department of Archaeology and Museology, Archaeogeophysical unit has conducted numerous non-destructive geophysical surveys in several Balkan countries. Most of them were carried out in collaboration with Czech expeditions, local institutions, and driven by our scientific interest in the region. Magnetometry was the primary method used, and it has proven to be a fast, effective, and reliable method at sites from different periods, of different extents and in diverse pedological or geological conditions. Especially, motorised magnetometry systems deliver crucial data efficiently, saving time and resources compared to traditional archaeological research methods. Application of magnetometry at sites dating back to Neolithic (settlement in Durankulak and several enclosures in Croatia), roman towns (Plevlja, Kabile), and early medieval centres (Pliska, Preslav) significantly enhanced our knowledge about these sites and understanding of the past. This new data also helps maximise the efficiency of future archaeological research and following steps in cultural heritage protection.

600. REDISCOVERING THE FORGOTTEN: UAV AND GEOPHYSICAL INVESTIGATIONS OF BUCHAREST’S ENEOLITHIC TELLS

**Contribution format:** Poster  
**Contribution authors:** Vasile Opris (Research Institute of the University of Bucharest (ICUB), University of Bucharest | Bucharest Municipality Museum) – Cristina Covătaru – Adrian Șerbănescu – Bogdan Manea (Research Institute of the University of Bucharest (ICUB), University of Bucharest) – Theodor Ignat (Research Institute of the University of Bucharest (ICUB), University of Bucharest | Bucharest Municipality Museum) – Cornelis Stal (Department of Built Environment, HOGENT University of Applied Sciences and Arts)

This study explores the current state of the Eneolithic tell sites in the Bucharest area, integrating historical documentation with modern survey techniques. The five tells (Chitila-Fermă, Măgurele-Movila Filipescu, Măgura Jilavei, Vidra-Măgura Jidovilor and Glina-La Nuci) have been known in the archaeological literature for over a century, with early excavation providing essential insights into human communities from the fifth millennium BC. Four of them are classified as historical monuments of national and universal value, and thus protected by national and international legislation. Despite their recognized significance, recent field surveys reveal a troubling reality: these tells have become „ghost-like monuments”, nearly invisible within the modern landscape: Damaged by erosion, agricultural activities or urban expansion, these sites are raising concerns about their preservation and long-term protection. Our research combines archival analysis with UAV-based 3D mapping, and geophysical survey to evaluate the current condition of these sites. The integration of remote sensing, subsurface prospections, and historical excavation data allows for a comprehensive evaluation of site degradation and contributes to discussions on future research and conservation strategies. The findings highlight the challenges and opportunities for archaeological survey projects in the region, emphasizing the need for interdisciplinary approaches to site documentation and management in rapidly changing landscapes around big cities. Research funded by a grant of the CNCS – UEFISCDI, project number PN-IV-P2-2.1-TE-2023-0876.

889. GEOPHYSICAL PROSPECTION AND ARCHAEOLOGICAL EXCAVATION ON ENCLOSURE ‘A’ FROM ARCHAEOLOGICAL SITE KAZLACHA (BULGARIA)

**Contribution format:** Poster  
**Contribution authors:** Viktoria Petrova (National Archaeological Institute and Museum, Bulgarian Academy of Science) – Todor Valchev (Historical Museum Yambol)

The Kazlacha archaeological site is located in Southeastern Bulgaria, 13 km northwest of Yambol (Bulgaria). In 2011, large-scale geophysical prospection was carried out, which revealed a concentration of five circular ditched enclosures (A, B, C, D, E) covering an area of 6 hectares. On the geomagnetic map, it is clearly visible that the five enclosures have diameters of 60 to 170 meters. They are built one after the other, partially overlapping and consist of one, two or four ditches. They enclose many anomalies of various sizes, shapes, and intensities. Based on the geomagnetic plan, archaeological excavations were carried out in 2015 and 2020-2023. During this first stage of

the study, the main parameters and the chronology of the enclosures were established. Four of them date from the Early Neolithic. The aim of the poster is to present the results of the geophysical prospection and archaeological excavation of the largest and the latest enclosure ‘A’. It is around 170 m in diameter. The ditch is V-shaped with 9.8 m maximal width and 4.9 m depth. It dates to the end of the Middle or beginning of the Late Neolithic in the region, which is supported by two radiocarbon dates, placing the ditch around the middle of the 6th millennium BC. The excavation of the site opens a lot of new scientific topics like: ‘How up it was digged?’ and ‘What it was enclosed – a settlement or a pit-site?’.

990. OVERCOMING CHALLENGES OF DINARIC KARST: ARCHAEOLOGICAL SURVEY STRATEGIES IN BAŠKA, CROATIA

**Contribution format:** Poster  
**Contribution authors:** Filomena Sirovica (Archaeological Museum in Zagreb) – Martin Bažoka (Stratum Ltd.)

The Dinaric karst landscapes occupy about half of Croatia’s territory and present challenging conditions for implementing standard systematic field survey methods due to their geomorphological heterogeneity and intensive human impact. The latter is a result of the general scarcity of soil, which has subjected the terrain to significant modifications through practices such as terracing and clearing land for agriculture. Such intensive parcelling of arable land has resulted in the absence of larger continuous areas with suitable visibility, which are typically necessary for conducting effective field surveys with consistent results. For this reason, it has been noted that the conditions in the Dinaric karst landscape require an adaptation of survey methodology to enable the uniform recording of archaeological remains across the landscape. With this in mind, a systematic field survey of the Baška municipality on the island of Krk, Croatia, was designed. As the island is part of the karst region of the Adriatic archipelago, it has historically been subjected to only limited agricultural parcelling. The island is characterized by the distinct appearance of rocky pasture vegetation of a sub-Mediterranean character, which facilitated extensive livestock farming. Until recently, this represented a significant branch of the island’s economy. However, such economic activities have now almost completely disappeared, and most of the walled plots and terraces, which were once used to artificially level the terrain, are now neglected and overgrown with tall vegetation or covered by forest. Given that these features characterize the landscape in which the field survey was conducted, the authors will demonstrate how the survey methodology was adapted to these challenging conditions and how it ensured the systematic and consistent recording of the distribution and frequency of surface archaeological material, which allows different visualizations and various analyses of the obtained data in a GIS environment.

1279. THE LATE NEOLITHIC VINČA CULTURE FORTIFIED SITES NEAR ALEKSINAC (SOUTHEASTERN SERBIA): STATE OF THE RESEARCH, SURVEYS AND EXCAVATIONS

**Contribution format:** Poster  
**Contribution authors:** Dragan Milanovic (Institute of Archaeology) – Marinko Antonijević – Magdalena Selaković (Faculty of Philosophy, University of Belgrade)

During the implementation of the project of the Institute of Archaeology, the County Museum of Aleksinac and the National Museum Niš, called “Archaeological prospection of the Municipality of Aleksinac (2014–2016)” in the Aleksinac and Niš basins, nine Vinča sites were identified, with smaller excavations conducted at only three of them. Those investigations indicated that the Vinča sites are distributed at relatively regular distances from each other, with the exception of two sites. One is the site of Srednje polje in Bradarac, which is located about 5 km away from the neighboring sites of Crnokalačka bara in Rujište and Drugo Aleksinačko okno in Aleksinac. To understand the complex relationship between these three settlements, analysis of their geographical position, the pedestrian and geophysical surveys, and excavations were undertaken. Only the second mentioned site was excavated and published a long time ago. Geomorphological, topographical and pedological analyses allowed consideration of the importance of their geographical position and land use. The collected surface finds from these sites indicated the existence of sites dating to the late phase of the Vinča culture. The geomagnetic survey in the following years (2017–2020), indicated that encircled Late Vinča culture settlements existed on all three sites. Their sizes varied from 7 to more than 10 ha. The excavations and absolute dating at the site in Bradarac have confirmed the existence of a long-lasting site, encircled by multiple ditches and a wooden palisade surrounding the settlement area of 7 ha. Future research will be focused on excavating smaller trenches inside the settlement area and the fortified part of the settlement at another two sites, to learn more about their chronology, size, use of the space, mutual relationship and significance in the settlement system.

1552. SURVEY AND EXCAVATION CASE STUDY - THE LATE NEOLITHIC VILLAGE AT THE ADŽINE NJIVE-BRAJKOVO 2 SITE

**Contribution format:** Poster  
**Contribution authors:** Miroslav Kocic (University of Kragujevac) – Dragan Milanović (Institute of Archaeology) – Magdalena Selaković – Marinko Antonijević (Faculty of Philosophy, University of Belgrade) – Uroš Nikolić (Ruma County Museum)

The site of Adžine Njive-Brajkovo 2 is located in the Municipality of Ruma, approximately 2 km north of the center of the village of Klenak in northwestern Serbia. Before the extensive protective excavations in 2021-22, geophysical and pedestrian surveys were conducted by the Institute of Archaeology. Excavations took place along a 1.2 km long, 40 m wide section of the highway, divided into three sectors: northern (Sector 1), middle (Sector 2), and southern (Sector 3). In Sector 3, on a slightly elevated area, covering approximately 0.5 ha, the geomagnetic survey indicated the existence of ditches and burnt structures. Subsequent archaeological excavations revealed the remains of several dwelling features from the late stages of the Vinča culture (5000-4300 cal BC) enclosed by deep, wide ditches. In addition, the remains of settlements from the Early Neolithic, older phases of the Vinča culture, Late Eneolithic, La Tene, and Roman periods were discovered. It is estimated that the settlements from the Vinča C-D periods surrounded by ditches covered an area of about 2-2.5 ha. Beside from the finds of the architecture that was first recorded by geophysics and later confirmed by excavations, noteworthy is the discovery of four graves from the Vinča period. Many specialists are currently analyzing the data and the findings, including experts in ceramics, stone, flint, bone, and antler artifacts, anthropologists, archaeozoologists, and archaeobotanists. The results will be published in an upcoming book focused on the Late Vinča settlements in Sector 3. This poster will present some of these finds and the case study of the combination of the survey methodology with later excavation results.

8 GENDERING THE BALKANS-BALKANIZING GENDER: ARCHAEOLOGICAL PERSPECTIVES

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Balkans, gender, archaeology, prehistory, history  
**Session organisers:** Uros Matic (University of Graz) – Bissierka Gaydarska (Durham University) – Nona Palincas (Romanian Academy)

SESSION ABSTRACT

It is a well-known fact that, despite being over four decades old, gender archaeology remains unevenly distributed among European archaeologies. One can hardly think of any region other than the Balkans as often labelled in behind-the-scenes scholarly discussions as lacking gender perspectives on the past. This creates a false dichotomy between Balkan “ungendered” and Western European “gendered” archaeologies. This session will revisit these assumptions. It in fact starts from knowing that in reality Balkan archaeologies are no less gendered than others while also proposing an exploration of what might result from focusing on the Balkans as an area of study.”The Balkans” is a concept originating in geography – the Balkan Peninsula, delimited from continental Europe by the Danube and the Dinaric Mountains. This soon became a geo-political and cultural concept referring to a somewhat wider area – including Romania and Serbia entirely -, now termed Southeast Europe. Nowadays, there are three alphabets and at least ten languages in the region and the degree of integration of archaeological research is rather low. In terms of gender research, over the past two decades, several archaeologists in the Balkans have explicitly addressed gender questions in their studies, but, most likely due to language barriers, many of these works remained unknown outside the small circle of Balkan scholars. This session aims both to “gender” Balkan archaeologies, by providing the first overview of gender research in the region, and to “Balkanize” gender by reclaiming and reinterpreting the concept of “Balkanization” (originally, fragmentation into small contradicting units) as an epistemological process. We see this process as the one that emphasizes fragmented, diverse, and particular approaches to gender rather than a unified, “one-size-fits-all” framework. At the same time, the session will juxtapose these studies from the Balkans with those from other – primarily Western - archaeologies.

CONTRIBUTION ABSTRACTS

1858. IMAGES OF THE GENDERED PAST? CONTRIBUTION OF BULGARIAN PREHISTORIC FIGURINES

**Contribution format:** Oral  
**Contribution authors:** Bissierka Gaydarska (AGE)

Marija Gimbutienė’s legacy in Balkan archaeology is unwavering. In some archaeologists’ views, recent aDNA evidence for a Yamnaya invasion has even strengthened her idea of peaceful matriarchal societies being replaced by war-like patriarchal ones. The other area where her influence remains almost untouched is the persistent perception of prehistoric female figurines as (mother) goddesses, entirely ignoring the heated debates taking place in the Western archaeology since the 1990s. Such continuous interpretations are based on the tacit assumption that figurines with female sexual traits dominate the available corpus of prehistoric figurines overlooking any evidence for unsexed, androgynous, and less so, male images. The few Balkan archaeologists who have broken away from this dogmatic interpretation have relied primarily on single case-study assemblages. But what would a country-wide Neo-Chalcolithic assemblage show? In this paper, the preliminary results of a study of publicly available Neolithic and Chalcolithic figurines from Bulgaria will be presented. The obvious questions by which to interrogate the assemblage would be:– how many female, male and unsexed figurines there are, what does this pattern mean, and is the postulated majority of female figurines really correct?

1038. WOMEN AND GYNOMORPHIC REPRESENTATIONS IN THE LATER BALKAN PREHISTORY (CA. 1600-600 BC): BETWEEN CULTURE-HISTORICAL ARCHAEOLOGY AND AN ARCHAEOLOGY OF DISJUNCTION

**Contribution format:** Oral  
**Contribution authors:** Nona Palincas (Vasile Pârvan Institute of Archaeology, Romanian Academy)

In later Balkan prehistory – i.e., Late Bronze and Early Iron Age (ca. 1600-600 BC) -, the main sources of data for gender archaeological studies are graves and gender-related representations on various artefacts. Both are rather few and unevenly distributed in relation to the vastness of the region and the length of the period, but gender-related representations are more so than graves. This paper concerns gynomorphic representations (i.e., representations of women or of female body parts) and their potential for the analyses of women’s roles. It mainly argues that:

- The wide domination of the culture-historical paradigm in archaeology as well as its unwitting survival in the background of gender studies (see, e.g., the use of the concept of archaeological culture) led to the under-representation of gynomorphic motifs in publications (as these focus on the typical rather than on the rarer representations) and a certain masking of the circulation of gynomorphic motifs across the region of study
- A more useful alternative for gender archaeology would be an approach in terms of the archaeology of disjunction (see, e.g., Wesley D. Stoner and Christopher A. Pool, in Current Anthropology 2015, based on Arjun Appadurai’s anthropological work), primarily because such an approach considers the multiscalar interactions between groups and, implicitly, the interplay between continuities and discontinuities of cultural traits in space and time. As a consequence, this would shed a different light on how various parts of this rather vast region were both connected and divergent over the lengthy period of time considered here.

1530. SPEAKING ABOUT THE UNSPOKEN: GENDER AND SEX IN SLOVENIAN ROMAN ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Kaja Stemberger Flegar (PJP d.o.o.)

As I was researching topics that fall under the umbrella of identity studies in Slovenian archaeology of the Roman period, I soon came to realise that a great deal of the core terminology is rarely defined, and almost never discussed. The most commonly examined aspects are ethnic identity/cultural affiliation, social status, age, and sex/gender. This list already hints at problems with the terminology – Slovenian “spol” covers both sex and gender, for example. While there are more precise and more verbose options such as “biološki spol” and “družbeni spol”, they are for the most part not explicitly used in the context of (Roman) archaeology. With the great increase in osteological studies, we are now faced with two different tracks of information, especially from the funerary setting: biological data obtained from bones, and social data obtained from grave goods, which were traditionally used for the determination of the sex/gender of the deceased. While the two can coincide, this is not necessarily the case. Their distinction calls for different methodological approaches, but at the same time, it opens possibilities for comparing the two tracks from which the information was obtained. The paper thus aims to present the state of research and the existing terminology, with suggestions on how it could be improved in light of scientific advancements. Another aspect is methodological, dwelling on how to bring legacy data to the common denominator and how to use it in further studies. Last but not least, I will explore the meta-issue of who has been explicitly studying sex and gender.

982. EXPLORING THE ROLE OF WOMEN ON THE ROMAN LIMES IN SERBIA – INSIGHTS FROM SMALL FINDS

**Contribution format:** Oral  
**Contribution authors:** Milica Marjanovic (Institute of Archaeology Belgrade)

Roman limes is traditionally perceived as a battlefield, a predominantly male domain situated at the periphery

of the civilized world. In last few decades, numerous scholars made considerable efforts to underscore the fact that the communities of limes fortifications also encompassed civilians who interacted with the Roman army in various capacities. Among these civilians were undoubtedly many women, who had diverse tasks and occupations within forts. Nonetheless, presence and roles of women in these contexts have not been sufficiently explored or acknowledged across all regions of the Roman limes. This paper examines several auxiliary forts located along the Iron Gate Gorge in Serbia, focusing on the distribution patterns of small finds that may be linked to women. These fortifications yielded a significant number of potentially female finds, including parts of typically female adornments, but also small finds that were considered mundus muliebris, or were symbols of female virtue in Roman world. Distribution patterns of these finds reveal their concentration in various contexts – principia, horreum, military barracks, areas between buildings, etc. Obtained data suggest not only that women were allowed and present inside these forts, but they were also actively engaged in commercial and manufacturing activities, with close family or business connections with the army. The assemblage of finds, along with the diverse architectural layouts of the forts, indicates that not all of them had exclusively military purpose, thereby challenging the conventional interpretation of the Roman limes fortifications.

1789. GENDER, MAGIC, AND HEALTH: JET ARTEFACTS FROM VIMINACIUM

**Contribution format:** Oral  
**Contribution authors:** Ilija Dankovic (Institute of Archaeology, Belgrade)

Since the beginning of the 3rd century, a new phenomenon arose across the Roman Empire: the emerging industry of jet object manufacture. Studies on jet artefacts from the western Roman provinces have shown that these objects are almost exclusively associated with the “women’s domain” or found in graves of biologically female individuals. While occasional exceptions exist, scholars have struggled to explain the strong connection between jet and women. One possible explanation lies in ancient medicinal texts, where authors like Pliny the Elder describe jet’s therapeutic properties, particularly in treating uterine conditions. Although these texts do not mention wearing jet amulets or jewellery, the rarity and high value of jet suggest that crafting durable objects may have been a way to preserve its protective and healing properties over time. At the Roman city of Viminacium (Serbia), jet artefacts have been found in 52 inhumation burials. The majority of these objects are jewellery, primarily discovered in the graves of adolescent girls and adult women. However, the presence of jet amulets—including one in a child’s grave—suggests that jet may have had broader magical and apotropaic significance beyond its association with women’s reproductive health. Additionally, jet beads found alongside amber necklaces hint at a potential symbolic or functional connection between these materials, both of which were believed to possess electrostatic properties and were valued for their protective qualities. This paper builds upon previous research of 32 burials by expanding the study to include 20 newly discovered graves from Viminacium. By integrating archaeological, anthropological, and textual evidence, this research aims to further explore the gendered significance of jet in Roman funerary practices and its role in concepts of health, magic, and protection in this part of the Balkans, and the broader Roman world.

2425. GENDERING ARCHAEOLOGY IN MONTENEGRO AND ITS MUSEUMS

**Contribution format:** Oral  
**Contribution authors:** Dušan Medin (University of Donja Gorica, Faculty for Culture and Tourism, Podgorica, Montenegro)

The question of gender in archaeology in Montenegro is one of many topics within a broad spectrum of phenomena that the local archaeological community – particularly museum curators archaeologists – has largely not explored in detail. If it has been addressed, it has mostly been approached in a very traditional manner, aligned with unwritten and thus unofficial but still strongly prevailing patriarchal norms that many adhere to in this country, which inevitably extends to the archaeological profession as well. In this presentation the author aims to provide preliminary answers to how, when, and in what ways archaeologists in Montenegro have so far linked questions of archaeology and gender (almost always considered and biological category of sex). Also, it will be paid special attention to how different genders are represented – either deliberately or unconsciously – in archaeological exhibitions in contemporary Montenegrin museums, including the archaeological material in permanent displays, temporary exhibitions, accompanying catalogs, legends, museum guides, etc. At the same time, it is evident that historical, artistic, and especially ethnological exhibitions (typically featuring material from the early modern period and parts of the 20th century) place considerable emphasis on how “male” and “female” objects, spaces, places, and roles are presented. Therefore, in this presentation, likely for one of the first times in Montenegrin practice, it will be critically examined the representation of gender in the archaeological museum context and provide an initial insight into a topic that, according to our knowledge, has been significantly avoided by colleagues both in the past and today. Yet, it represents a potent framework for reflection and action toward building a more equitable society in the present and future of this small Balkan country.

9 IT IS WHAT YOU MAKE OF IT: IMPERIAL AND PRIVATE IMAGES AT THE BORDERS OF THE EMPIRE

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Imperial images, Zeitgesicht, Local identity, Agency, Roman provinces, Reception  
**Session organisers:** Francesca Bologna (University of Verona) – Francesca Lam-March (King’s College London) – Raffaella Bucolo (University of Verona) – Hristina Ivanova-Anaplioti (University of Verona | University of Sofia)

SESSION ABSTRACT

This panel proposes to explore the intersection between making, viewing, and message in provincial portraiture between the 1st and 3rd century CE. The idea arises from the ERC-funded project RESP – the Roman Emperor Seen from the Provinces, investigating the reception of imperial images in the provinces. We aim to bring together papers analysing the public image of the members of the imperial family – both males and females – as well as of the local elite as perceived and understood by provincial audiences. This approach will, in turn, highlight the reception and manipulation of properly ‘Roman’ models by different recipients: the local population observing these images in public spaces, the patrons commissioning them, and the makers involved in their creation. Ultimately, this investigation will bring to light both the local reception of imperial propaganda and how the civic elite shaped their public personas by declining the Roman message in light of local traditions. Among the themes to be investigated in this panel are: 1) Local identities within a world-empire; 2) Representations of the emperor and members of his family outside of Italy; 3) Imperial propaganda expressed in visual media in the provinces; 4) The role played by the artisans producing these representations (in terms of familiarity with local and/or Roman iconography); 5) Local variations in the self-representations of private individuals, especially members of the civic elite; 6) Zeitgesicht, potential and pitfalls. We invite expressions of interest from scholars specialising in different media or any form of visual culture (sculpture, numismatic materials, metalwork etc). We are particularly interested in papers dealing with local ethnic traditions and/or the representation and agency of female figures, both private individuals and members of the imperial family.

CONTRIBUTION ABSTRACTS

73. HOW CAN THE PRODUCTION PROCESS OF PORTRAITS OF AUGUSTUS IN HISPANIA CHANGE OUR PERCEPTIONS OF PROVINCIAL REACTIONS TO THE EMPEROR

**Contribution format:** Oral  
**Contribution authors:** Francesca Lam-March (King’s College London)

This paper seeks to reassess the sculpted portraits of Augustus in Hispania to decipher what they can tell us about provincial reactions to the newly instated emperor. By building on the excellent identification methodology used by Boschung in his 1993 work Die Bildnisse des Augustus, this paper will go beyond questions of identification and typology to look at the attributes of the commissioning and sculpting portraits. It has long been established that sculpted portraits of Augustus followed a prototype for placement of his hair locks. Yet, the study of portraiture remains confined to this typology, labelling portraits close to the prototype as ‘strong’, and the others as ‘weak’. These semantically charged characterizations result in positive and negative assumptions about the sculptors’ skills and knowledge of the emperor. Boschung labels almost every single portrait of Augustus in Hispania as ‘weak’. While his typology works for identification, this overlooks more interesting questions that can be answered by considering other factors in conjunction with this approach. These include thinking about the materials used, the level of finish, the skills demonstrated by the carvers, and the potential cost of the portrait. Even if a head did not look exactly like the Prima Porta Augustus, it might still have been an incredibly high-valued piece. By considering these factors, we can gain a deeper understanding of not only how the provinces were responding and honoring the emperor through portraiture, but also which aspects of the imperial portrait production process were prioritized by the ancient commissioner and sculptor. This in turn leads to a more nuanced interpretation than one resting solely on the strong/weak dichotomy. As modern scholarly interpretation of imperial portraits does not necessarily correspond to ancient viewers’ experiences.

2229. PHARAOH, AUTOKRATOR, PATER PATRIAE – THE ROMAN EMPEROR AND HIS FAMILY AS SHOWN IN THE PROVINCE AEGYPTUS

**Contribution format:** Oral  
**Contribution authors:** Julienne Schrauder (German Archaeological Institute, Romano-Germanic Commission | University of Heidelberg, Institute of Egyptology)

The inclusion of Egypt into the Roman Empire meant that the Roman Emperors had to show themselves as legitimate rulers of Egypt and their families as guarantors of continuity in a multicultural setting. The imagery of pharaonic times and Hellenistic traits adapted during the reign of the Ptolemies needed to be combined with the Roman self-image – and distributed to the right audiences. This was achieved by choosing the right (pictorial) formulas for each group and type of legitimacy strategy. Two media will be presented and compared here: The Emperor and his family as shown in monumental Egyptian architecture (focusing on temples) and as depicted on the coins from the Alexandrian mint. The latter is especially of interest since until Diocletian times, the coinage of Egypt was separate from the rest of the imperial coinage, meaning it was addressed exclusively to the populace – and to a lesser degree also visitors – of Egypt.

**404. LOCAL REFLECTIONS ON DEVOTION TO ROME: INSIGHTS OF SOME PRIVATE PORTRAITS FROM THE “EMPEROR-LOVING” CITY NYSA AD MAEANDRUM**

**Contribution format:** Oral  
**Contribution authors:** Hava Keskin (Akdeniz University)

After a turbulent first century BC in Anatolia, the Nysaeans eagerly welcomed the Pax Aeterna inaugurated by Augustus. The evidence of the first century AD in the city is limited, and the existence of monumental buildings is known by indirect sources, mainly from Strabo’s accounts, who was educated in Nysa in his youth. Early imperial honouring is attested by an inscribed statue base which belongs to a bronze statue, that is lost today. A private portrait influenced by the Julio-Claudian images, sheds light on Nysa’s history during that period, reflecting public honouring in the city. Besides, numismatic data indicates the Nysaeans’ gratitude for Tiberius and provides insight into the city’s social context during the Julio-Claudian period. In the following century the sculptural programme of one of the city’s prominent buildings, the so-called gerontikon/odeion is striking. The construction of the building was financed by Pythodoros, a wealthy Nysaeon following his mother’s will. Inside the building was created an honorific courtyard adorned with statues of the imperial family of the emperor Antoninus Pius and statues of Pythodoros’s family members, aiming to manifest how loyal this local family was to the imperial family more precisely to the Roman empire. Pythodoros is also notable as a descendant of Khairemon, who made a significant donation of wheat to the Romans during the Mithridatic Wars. The third century in Nysa is documented primarily through epigraphic evidence. Despite the challenges and upheavals faced by the empire, the city maintained its loyalty to the emperors, earning recognition from the Ephesians as an “emperor-loving city.” A group of private portraits indicates that Nysa closely followed imperial portraiture throughout this period, reflecting the Nysaeans’ enduring commitment to their place within the Roman sphere.

**26. THE STYLE OF MEMORY AND COMMUNITY IN THE FEMALE FUNERARY PORTRAITS OF PALMYRA**

**Contribution format:** Oral  
**Contribution authors:** Amy Rasmussen (Independent Scholar)

This paper explores the role of style in the collective memory and community identities of the ancient city of Palmyra, in present-day Tadmor, Syria. The city’s Roman Imperial period offers a rich body of evidence in the form of its funerary portraiture, from which I focus on the commemoration of Palmyrene women. In addition to being the largest corpus of portraiture from the imperial period outside the Italian peninsula, the Palmyrene corpus stands out stylistically, departing from the portraits of the capital. First, I review prior scholarship, which has greatly focused on the lack of realism in Palmyrene portraits or the inscriptions accompanying the portraits. I argue that archaeology needs to shift from a connoisseurship approach that prioritizes the name and biography of the woman depicted, to one that still utilizes the tools of connoisseurship but considers the fundamental role of practice in funerary representation. Drawing upon Bourdieu’s theory of practice, my approach demonstrates the central role of style as a memory-making strategy. Thus, memory-making has a material component in the portraits, which resides in the ongoing practices of style. Then, I introduce a case study, a female funerary portrait from Palmyra, so to explore the complex relationship between style and geography. Traditional connoisseurship often collapses style, workshop, and geography, but the tools of connoisseurship allow me to refute a singular and spatially bound understanding of the portrait and instead suggest a link between style and the collective memory of Palmyra. This approach enhances the role of shared memory—both conscious and unconscious—so to recraft understandings of womanhood and community identity in Palmyra, and its balance between a local and Roman cultural heritage.

**1298. WRITING AND READING PARAPHERNALIA IN ATHENIAN FUNERARY STELAE FROM THE IMPERIAL AGE: ICONOGRAPHIC MODELS AND PERSONAL AMBITIONS IN WOMEN SELF-PRESENTATION**

**Contribution format:** Oral  
**Contribution authors:** Ada Caruso (Sapienza Unversy of Rome)

My paper focuses on writing/reading women on funerary stelae from Athens during the Roman Empire. Testimonia

date back to the 1st and 2nd centuries AD, when Athens was at the core of a cultural Renaissance. Inscriptions and literary testimonia from this period attest high-born Athenian women as philosophers or literate. As for grave-stones, five marble stelae represent wealthy women with an object that evokes ability to write and read, whereas no similar documents have been found in the Attic countryside. This contribution proposes to examine each case based on the iconography of each figure, her attitude (some women are sitting on a seat, others are standing), and the typology of writing/reading tool (the prevailing type, the way it is held, etc.). The monument will be also considered, as well as the related inscriptions, when present, and prosopography. My aim is twofold: one strictly pertains to gender aspects: to contribute to the reconstruction of the intellectual dimension of ancient women from a peculiar archaeological perspective, never considered before; the other aim pertains instead to visual culture: to detect any possible iconographic models in the representations of women (taken from e.g. the imperial family, and/or literate women from the rest of the Empire), and their reception in Athens. Finally, I also aim at pointing out local identities in literate women self-presentation.

**1226. NEW DATA ON ROMAN FEMALE PORTRAITURE IN AQUILEIA**

**Contribution format:** Oral  
**Contribution authors:** Luca Scalco (University of Padua)

Roman portraiture in Venetia et Histria has been the subject of numerous studies in the past, with a focus on stylistic, typological, social and dating aspects. In recent years, however, there has been a decline in scholarly attention, yet new acquisitions and research topics have emerged. The communication aims to contribute to this trend by presenting an almost unknown portrait of a woman from Aquileia. The portrait belongs to a fragment of a stela with portraits, as its technical and iconographical features point out. Alongside this descriptive analysis, the sculpture will be compared to the dataset of already published private portraits from the ancient city, that have been extensively reconsidered and further analyzed for this study. The results of the analysis offer valuable insights that can be transformed into a useful tool for the study of portraiture in the north Adriatic city, particularly in relation to issues concerning artisans’ practices, dating, and typological (and potentially geographical) attribution.

**598. 3D ANALYSIS OF ROMAN IMPERIAL PORTRAITS. QUANTITATIVE COMPARISON OF PHYSIOGNOMIC TRAITS FOR TYPOLOGICAL IDENTIFICATION**

**Contribution format:** Oral  
**Contribution authors:** Daniele Bursich (Università degli Studi di Verona)

The physiognomic traits that determined the recognition of an individual in ancient times were linked to specific physical characteristics. As for the emperor, the distinctive features that identified him included facial and appearance traits, which made him recognizable and symbolic of his authority. The approach based on the analysis of recurring details has proven particularly useful for archaeological research. These traits were emphasized or adapted to the media used to spread the imperial effigy in the Empire, such as coins, bas-reliefs and sculptures. However, the standardization of the image of the emperor imposed by Rome imposed fixed points that never changed, and which constituted the essential features immediately recognizable by anyone. A distinctive aspect to identify an emperor is the hairstyle, which was reproduced with care, and which sometimes allows us to define types of portraits only based on the number and orientation of the locks of hair on the face. On the contrary, the identification of an emperor based exclusively on the recognition of physiognomic traits is much more complex because often the conformation of the facial features does not follow a recurring standard but undergoes alterations and modifications depending on the provincial culture to which it is addressed. This latter type of analysis usually occurs in an autoptic or biometric manner. One of the aims of the IRIMES and RESP projects is the analysis of facial features using 3D models obtained from 3D scans. Based on published data, a new and specific workflow was developed that allowed obtaining quantitative data and percentages of overlap, facilitating a precise comparison, never attempted before. The methodology used can help to highlight the differences between provincial portraiture influenced by local style, such as the Trajan portraits from Salona and Piraeus, and metropolitan ones.

**293. THE SPREAD OF IMPERIAL PORTRAIT MODELS AMONG THE CIVIC ELITE IN THE PROVINCES. NERVA’S ZEITGESICHT?**

**Contribution format:** Poster  
**Contribution authors:** Raffaella Bucolo (University of Verona)

Emperor Nerva’s reign constituted a critical historical and political transition period. After the violent end of the last of the Flavians, Domitian, Rome went from a dynastic and hereditary government to the adoptive system of the 2nd century AD. Although Nerva’s reign was brief, it was significant that his sudden ascension to the imperial throne created an urgent need for images, which were immediately disseminated through coins and portraits. Due to the memory sanctions against Domitian, the majority of Nerva’s portraits are re-carved, the most comprehensive

surviving examples of his image are found in numismatic portraits, which played a crucial role in shaping public perception during his reign. Despite the brevity of his time in power, the quantity of documented portraits and statue bases attributed to Nerva is substantial, highlighting the urgency of his image’s propagation. In this paper, I intend to present several portraits of private individuals that echo Nerva’s distinctive appearance, illustrating the rapid spread of the emperor’s model. Additionally, I will focus on a specific case study of a marble portrait from Provence (France), likely found in the villa of Baumelles – situated near the ancient centre of Tauroentum - and currently held in the Museum of Saint-Germain-en-Laye. this portrait recently underwent restoration and was briefly referenced as a representation of Nerva in an article from the 1980s. However, it has yet to be thoroughly examined, and its unique characteristics and the context of its discovery warrant further investigation. In my analysis, I aim to delve into the technical aspects as well as the portrait’s stylistic features to determine whether this head can genuinely be classified as a provincial example of Emperor Nerva’s Zeitgesicht, contributing to our understanding of his image and influence beyond Rome.

**450. THE LAST LEGACY OF SEPTIMIUS SEVERUS IN PORTRAITURE AND ITS RECEPTION IN PROVINCIAL COINAGE**

**Contribution format:** Poster  
**Contribution authors:** Hristina Ivanova-Anaplioti (University of Verona)

With the rise of Septimius Severus to the throne in 193 AD an era ended and the period of the affirmation of a new dynasty started. These policies were expressed in various actions to prove legitimacy and shape the image of the new ruling family. Beginning with the emperor himself one of the most intrusive measures taken is in the imagery – being in the portraiture of the royal members or connected to local mythologies. Iconographic and stylistic adjustments are consistently traceable in numismatic material. This gives us a good scale to compare with other media in stone or other materials. The imperial portraiture of Septimius Severus has been a long-debated subject among scholars. The typologies developed during the last two centuries differ in parameters, partition, allocation, and interpretation. Even so, the known material sufficed for thorough studies of sculpture and coinage. This allows further discussion of the correlation between the two media and discloses how prototypes were imposed on them in Rome and the provinces. There are discrepancies between the consistency, quantity, and distribution of the portraits - first between metropolitan and provincial media and second between sculpture and coinage. However, several mints show the development of the basic typology’s upgrading from the first to the last type. The latter was the ultimate intervention by the emperor to mold his iconographical legacy. The reason, why only some mints go through the entire process and if there is coherence between them is not clear. Following this trend from Marcianopolis until Petra, these issues will be analyzed in this poster.

**2458. TRAJAN WHO? REPRESENTING ROME IN THE TROPAEAUM TRAIANI AT ADAMKLISSI**

**Contribution format:** Poster  
**Contribution authors:** Elizabeth Wolfram Thill (IU-Indianapolis)

In 2009, the National Bank of Romania issued a silver 10 lei coin to commemorate the 1900th anniversary of the Trajanic Tropaeaum monument at Adamklissi. The coin obverse featured stunningly detailed illustrations of three ancient metopes, each depicting Roman soldiers battling Dacian enemies. The coin’s reverse showed the reconstructed monument, set behind a prominent bust of Trajan himself. This modern choice of imagery is interesting, given that little evidence of any imperial portraiture has been recovered from the ancient site. Of the 49 extant Tropaeum metopes (out of an original 54), only one has been identified as possibly depicting the emperor, and that in a stylized pose probably copied from a coin reverse. While this does not preclude the emperor’s appearance in other forms, this limited imperial representation can be set against the metopes’ presentation of dozens of Roman soldiers and barbarian opponents, including at least 3 women, 3 children, several wagons, and even 5 sheep. That sheep should be more numerous than imperial portraits is even more striking when compared to the Tropaeaum’s contemporary monument in Rome, the Column of Trajan. Both monuments were set up between 108-113 CE and used relief sculpture as a medium to illustrate (in highly ideological form) the same wars in Dacia between 101-107 CE. Yet the urban monument includes some 60 representations of the emperor, who is shown overseeing every aspect of the campaign. This paper will argue that this discrepancy is evidence of a disconnect, between the focus of Roman elites—and modern scholarship—on the personal role of the emperor, and the way that Roman intervention was experienced along the frontier. For the conquered Adamklissi residents, it mattered little who set the policy of territorial expansion in faraway Rome. What mattered was who wielded the swords threatening their children.

**12 PLANTS, HUMANS AND LAND USE IN PREHISTORY AND EARLY HISTORY OF SOUTHEASTERN EUROPE**

**Session theme:** 8. Along and across the Danube!  
**Session format:** Regular session  
**Session keywords:** southeastern Europe, prehistory-early history, human-plant interaction, environment, land use  
**Session organisers:** Dragana Filipovic (Max Planck Institute of Geoanthropology) – Djurdja Obradović (Institute of Archaeology, Belgrade) – Soultana Valamoti (Aristotle University of Thessaloniki)

**SESSION ABSTRACT**

Although research on the history and nature of human-plant interactions and land use in southeastern Europe has its roots in archaeological investigations of the late-19th century in the then parts of Austro-Hungarian Empire, much of the specialist knowledge was produced in the last several decades, with archaeo-science methods having been used only recently and on a small scale. Modern research in the region has benefitted from numerous methodologically rigorous systematic and development-led excavations, rediscoveries of samples and materials long stored in museum depots, accelerated tempo and increased precision of analyses, growing range of methods and techniques employed, timely exchange and dissemination of results and an overall increase of scholarly and public interest in, and relevance of, this aspect of the past. Major international projects have been instrumental in extracting key knowledge from archaeological layers. Although this knowledge is, geographically and chronologically, still rather uneven, it has become possible to consider and include this part of the continent in broader archaeological discourses and debates. Now is a good time to look at the progress of research and the type of knowledge generated for the region so far, and from this think forward and plan for a future. Southeastern Europe has always been a cultural and environmental crossroads between Europe and the rest of Eurasia. This session invites scholars to present and promote their findings and insights on the deep and long history of interactions and co-evolution of people and plants in this region. We also encourage reflections on constraints and issues faced in the research and invite proposals for solutions and future directions. We call for papers from scholars of archaeobotany, archaeological science (in its broadest sense), ethnoarchaeology, palaeoecology, experimental archaeology, palaeodemography, ancient environmental pollution, land-cover and land-use modelling.

**CONTRIBUTION ABSTRACTS**

**1248. EARLY FARMERS AT SCHELA CLADOVEI: AN ARCHAEOBOTANICAL PERSPECTIVE**

**Contribution format:** Oral  
**Contribution authors:** Djurdja Obradovic (Institute of Archaeology, Belgrade) – Adina Boroneant – Mihaela Golea (Institute of Archaeology “Vasile Parvan”) – Clive Bonsall (The University of Edinburgh)

Archaeobotanical sampling has been limited to just two sites that survived dam construction along the Iron Gates section of the Danube. Minimal plant data were collected during salvage excavations conducted during the construction period of the dams (e.g., pollen from archaeological layers and coprolites). To compensate for this ‘lost’ evidence, alternative methodologies have been implemented, including stable isotope studies of human remains and the analysis of starch and phytoliths from dental calculus and grinding stones. Schela Cladovei, located on the Romanian bank of the Danube, is one of only two sites that escaped the flooding caused by dam construction. Consequently, it offers a unique opportunity to study dietary changes during the important Mesolithic–Neolithic transition in the Iron Gates but also, given the uniqueness of the evidence, in the wider region. Systematic sampling and flotation of pit features from excavations conducted between 2008 and 2022 have yielded substantial evidence for cultivated plant use in the Early Neolithic settlement. This contrasts with Vlasac, where plant remains were primarily recovered from grave contexts, and mostly from the Late Mesolithic. The archaeobotanical archive from Schela Cladovei is not only crucial for understanding economic and dietary changes across the Mesolithic–Neolithic transition; it also provides a rare opportunity to compare the use of plants in a domestic, everyday context with that in a funerary, symbolic context within the as yet unmatched archaeological treasure trove that is the Iron Gates.

**1781. BRIDGING THE OLD WITH THE NEW: RECENT ARCHAEOBOTANICAL RESEARCH OF THE 5TH MILLENNIUM BC KGKVI CULTURE**

**Contribution format:** Oral  
**Contribution authors:** Mihaela Golea („Vasile Pârvan” Institute of Archaeology, Romanian Academy)

The 5th millennium BC in southeastern Romania is characterised by the Kodjadermen-Gumelnița-Karanovo VI

(KGKVI) and its predecessor, the Boian-Marița material cultures. The major features of this period are complex settlements systems, booming animal and plant husbandry and a large interconnectivity among the communities along the Danube Valley and beyond. Although the KGKVI, and the Cucuteni-Trypillia are the best represented cultures in what Romanian archaeobotanical studies are concerned, main attention was paid in the past only on structured agglomerations of grain and seed remains. In this study, we share new data contributing to a better understanding of a series of aspects such as culinary preferences and plant use as construction material. Most of this new data emerged from the re-examination of the finds from the old excavations and some recent unpublished information. This allowed for a re-appraisal of the evolution and development of crop preferences during the 5th millennium BC in the region of interest.

**1950. INTERDISCIPLINARY APPROACH TO THE STUDY OF SUBSISTENCE AND PLANT PROCESSING AT THE EARLY CHALCOLITHIC OPEN-AIR SITE NEAR CHIRPAN, SOUTHERN BULGARIA**

**Contribution format:** Oral  
**Contribution authors:** Hanna Aleksandrova – Nataliya Ivanova – Tzvetana Popova – Petar Leshtakov (National Archaeological Institute with Museum at the Bulgarian Academy of Sciences) – Yordanka Ilieva (Department of Archaeology, Sofia University “St. Kliment Ohridski”)

The Early Chalcolithic open-air site is located near the modern town of Chirpan, Southern Bulgaria. Rescue excavations, carried out from 2020 to 2022, revealed that the prehistoric settlement had a relatively short-term occupation (4800 – 4550 BC). It was built according to a predefined plan – with orthogonal street network that led to a central courtyard, surrounded by buildings orientated to the four cardinal points. The inner space was enclosed by ditches. This presentation focuses on five of the fourteen studied dwellings, highlighting their interior planning and food preparation areas, equipped with an oven and fixed grinding installations. By applying contextual and interdisciplinary (macro- and microbotanical) analyses of the grinding stones and food preparation areas, we were able to reconstruct different activities related to plant use, storage and cereal processing. The archaeobotanical analysis revealed a rich assemblage composed of different cereal crops and legumes, fruits, nuts, processed food, and wood charcoal. In addition, the recovered microremains (phytoliths and starch) from the active surfaces of six grinding stones serve as direct evidence for the use of the tools in plant processing, including wheat, panicoid grasses and, in one case, legumes. Furthermore, SEM/EDS analysis also provided intriguing insights into taphonomical processes and possible food preparation techniques. The obtained data will be presented and placed in a regional context.

**429. CHARRED ORGANIC LUMPS FROM SARMIZEGETUSA REGIA (ROMANIA). INSIGHTS INTO PLANT USE AND LAND MANAGEMENT IN DACIAN SOCIETY**

**Contribution format:** Oral  
**Contribution authors:** Ciuta Beatrice (1 Decembrie 1918 Univeristy from Alba Iulia)

This study examines charred organic lumps from the Dacian archaeological site of Sarmizegetusa Regia (100 BC – 100 AD) (Transylvania region, Romania) focusing on their composition, formation processes, and potential role in ancient food practices and land use. Using archaeobotanical and archaeometry techniques, including 3D digital microscopy (Keyence), Scanning Electron Microscopy (SEM-EDS), and X-ray Fluorescence Spectroscopy (XRF), we analysed microstructures, elemental composition, and preservation conditions, distinguishing food remains from other carbonized organic materials. These analyses provided detailed insights into the nature of the remains and their possible connections to food preparation, fuel residues, or ritual activities. A key aspect of this research is the investigation of the environmental and cultural contexts in which these remains were formed, exploring their implications for human-plant interactions, land management, and environmental adaptation in Iron Age south-eastern Europe. Our findings contribute to the archaeology of food and environmental archaeology, offering new insights into Dacian subsistence strategies, resource management, settlement activities, and land use practices. By integrating multiple scientific methods, we aim to provide a clearer understanding of daily life, food consumption, and the broader relationship between human societies and their natural surroundings.

**233. EATEN AT THE TREE. ARCHAEOBOTANICAL RECORDS OF APPLES AND PEARS FROM THE CENTRAL BALKANS IN A EURASIAN CONTEXT**

**Contribution format:** Oral  
**Contribution authors:** Dragana Filipovic – Kseniia Boxleitner (Max Planck Institute of Geoanthropology, Jena) – Djurdja Obradovic (Institute of Archaeology, Belgrade) – Robert Spengler (Max Planck Institute of Geoanthropology, Jena)

The list of fleshy fruit types recorded at archaeological sites in the central Balkans grows with every new archaeobotanical analysis; however, the quantities of the remains, chiefly preserved through charring, are in most cases very modest. This is because many of these fruits were likely eaten at the tree or the bush, but also because they

were less likely to end up in fire since they were not parched or ground for eating and some were consumed whole (flesh, seeds and all), either fresh, or dried and then boiled. Earliest available finds of fruits in the central Balkans include hard-seeded species, like Cornelian cherry and elderberry, dating from the regional Late Mesolithic (early 7th millennium BCE). Remains of apple and pear appear later in the archaeobotanical archives, from the later stage of the Early Neolithic (early-mid 6th millennium BCE) onwards, with the youngest finds so far noted in Roman and Early Byzantine layers. Such long histories of apples and pears indicate their persistent value to people, and the many uses known in ethnographic and modern contexts give an idea of their potential versatile roles in the past. This paper reviews the evidence of apple and pear in the central Balkans and places it in a broader temporal and geographical context using the data compiled within the ERC-project “Fruits of Eurasia: Domestication and Dispersal (FEDD)”. In this, it emphasises the problems in distinguishing between the finds of apple and pear on morphological grounds. Further, it discusses the apparent parallel use of ‘wild’ and ‘cultivated’ forms of pear in the Late Roman period and the difficulties in determining wild vs. managed status of archaeological pears. It presents some ideas as to how to address the identification issues.

**2313. GRAZING THROUGH TIME: HUMAN-HERBIVORE DYNAMICS IN WOODLAND ECOSYSTEMS DURING THE PREHISTORY**

**Contribution format:** Oral  
**Contribution authors:** Jan Kolar (Institute of Archaeology, Czech Academy of Sciences, Prague) – Jelena Bulatović – Natalia Riabogina (Gothenburg University)

Woodlands were an important part of European landscapes for the last 12,000 years. Woodlands provided and provide many ecosystem and cultural services, and historically were important resources at critical times. Palaeoecology, which most often studies woodland in the past, has made significant progress in the creation of vegetation models, but the investigation of the human role in past woodland ecosystems still fails to integrate archaeological data in their full complexity. This is exactly what this paper will address. In addition to demographic models, which are relatively often compared to vegetation models, this paper will focus on the innovative use of big data from archaeozoology and biomolecular data and will discuss their potential for transdisciplinary research. This paper will present first results and future perspectives of newly started project combining data on plants, large domestic and wild herbivores, and humans, in a unique multi-species perspective. The project will focus on the study of these multispecies relationships along the continental route of spread of farming and animal husbandry, analytically connecting therefore south-eastern and central Europe.

**240. OVERVIEW OF ARCHAEOLOGICAL FINDS OF WOOD CHARCOAL IN SERBIA: TIMBERS, FIRES AND PYRES**

**Contribution format:** Poster  
**Contribution authors:** Dragana Filipovic (Max Planck Institute of Geoanthropology, Jena)

Large parts of present-day Serbia are thought to have been covered in dense forests almost until modern times. Extensive areas under natural woods can be found nowadays in the hills and mountains in its central and southern parts. These forests developed during the early and middle Holocene; much of this period in the Balkans was characterised by major cultural, technological and demographic developments. From around 6000 BCE, late prehistory, the region witnessed the transition to, and full establishment of agricultural lifestyles, including the rise and fall of large, enclosed pre-urban settlements. This was followed by millennia of short-lived settlements and pastoralism-dominated lifeways, succeeded by a period of proliferation of elaborate fortified centres with centrally organised food provision and storage, alongside household-based production. The first half of the 1st millennium CE, the Roman Period in the region, was a time of growing demand for resources and local production needed to supply newly founded urban and military centres. All these developments involved cutting of forests for timber and fuel or burning of forests to clear land for food production. Little research has been done on the direct evidence of wood exploitation, i.e. wood remains, preserved by charring and frequently found in archaeological layers and anthracological archives in Serbia. As a consequence, information on the use of wood through time and across space in the past is rather limited here, as is the knowledge on the composition and extent of woodland vegetation. In hope for a better future of anthracological investigations in Serbia, this poster presents the currently available data and their sources, and summarises the observations that have or can be made so far on past woodland exploitation in this territory.

1335. LIVING BY THE RIVER: PLANT USE AND VEGETATION IN THE LATE NEOLITHIC ALONG THE SAVA RIVER IN SERBIA

**Contribution format:** Poster  
**Contribution authors:** Djurdja Obradovic (Institute of Archaeology, Belgrade) – Dragana Filipović (Max Planck Institute of Geoanthropology, Jena) – Dragan Milanović (Institute of Archaeology, Belgrade)

The sites of Gomolava and Klenak are situated on the left bank of the Sava River, in the southern Pannonian Plain, and were intensively occupied from the Neolithic through to Roman times. Recent rescue excavations at Klenak have uncovered remnants of a Late Neolithic settlement surrounded by multiple ditches, as well as the remains of Late Neolithic burials. Here, the ongoing archaeobotanical sampling and analysis provide a unique opportunity to study plant use and deposition in sacred and domestic contexts from the same period (5300-4500 BCE). At Gomolava, archaeobotanical investigations conducted in the 1970s provided a detailed view on plant production and surrounding vegetation in the different phases of occupation, including the Late Neolithic settlement. The two sites are located c. 10 km apart and in the same, predominantly flat landscape. Given their proximity and coeval Late Neolithic occupations, together they offer important insights into plant use, crop choices and cultivation practices within a specific environment – the Sava plain, renowned for its high agricultural potential but prone to flash floods. This poster presents first archaeobotanical results from the site of Klenak and compares them with the data from Gomolava.

2001. IMPACT OF FIRE AND THERMAL ALTERATION ON PHYTOLITH PRESERVATION AT THE PROTOPALATIAL SETTLEMENT OF AGRIANA, CRETE, GREECE: INSIGHTS FROM OLM

**Contribution format:** Poster  
**Contribution authors:** Nafsika Andriopoulou (Foundation for Research & Technology Hellas (FORTH)) – Emmanouela Apostolaki – Calliope Galanaki (Ephorate of Antiquities of Heraklion)

This pilot study investigates the preservation of microscopic SiO<sub>2</sub>-rich phytoliths in sediment samples from the Protopalatial settlement of Agriana in North-Central Crete, Greece, with a focus on the effects of fire and thermal alteration. The site of Agriana, used from the Late Prepalatial to the Neopalatial periods, was violently destroyed by fire in the Protopalatial MM IIA phase (c. 1800-1750 BC). Sediment samples were collected from destruction layers, pottery contexts, the interior of a small kiln, and the tumble and building material of a boundary wall surrounding the preserved core of the settlement. Optical Light Microscopy (OLM) analysis generally showed good preservation of phytoliths, though some exhibited signs of dissolution or breakage, particularly those with intricately decorated margins. The study found a predominance of morphotypes associated with grasses and other graminoids, while phytoliths from dicotyledonous plants were present in smaller amounts. The presence of diatoms, aquatic SiO<sub>2</sub>-rich microalgae, in some samples suggests a combination of terrestrial and aquatic influences. Notably, elevated levels of melted phytoliths in certain samples indicated exposure to intense heat. Thermal alterations varied across contexts, with significant impacts observed in samples from the kiln and destruction layers compared to those of the boundary wall and pottery contexts. These findings underscore the significant impact of fire on phytolith preservation and highlight the need for integrating phytolith analysis with other archaeobotanical and geochemical proxies to better understand site formation processes and (archaeo) environmental conditions. Future research incorporating mineralogical and pH analyses could further clarify the extent of thermal impacts.

14 PREHISTORIC EXPLOITATION OF WATERSCAPES AND AQUATIC RESOURCES

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** aquatic ecosystems, zooarchaeology, isotope analysis, human-environment interactions, hunter-gatherers, Prehistory  
**Session organisers:** Mariana Nabais (IPHES - Institut Català de Paleoecologia Humana i Evolució Social) – Anna Rufà (ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour) – Asier García-Escárzaga (Universitat Autònoma de Barcelona) – Asia Alsgaard (SapienCE - Centre for Early Sapiens Behaviour | SEAS- Shaping European Leaders for Marine Sustainability)

SESSION ABSTRACT

A growing body of evidence has been recovered from several prehistoric sites showing that hunter-gatherer interaction with aquatic environments played a significant role in subsistence strategies, cultural development and technological innovation. The use of waterscapes - including rivers, lakes, wetlands, coastal areas and their resources - has been considered as a critical aspect of human adaptation. This session aims to bring together multidisciplinary research on the exploitation of waterscapes and the use of aquatic resources during prehistoric times, offering insights into the complexities of early human lifeways. We invite contributions exploring diverse aspects of the use of aquatic resources by hunter-gatherer groups, such as subsistence practices, tool technologies and site selection influenced by proximity to water. Some questions we want to address are: How did hunter-gatherer populations exploit aquatic food sources such as fish, shellfish, waterfowl, aquatic mammals and aquatic plants? What role did waterborne materials, like reeds and shells, play in tool making, daily life activities and symbolic human behaviour? To what extent did waterways facilitate the movement, exchange and social interactions of different prehistoric groups? This session also seeks to discuss methodological approaches to identify aquatic resource use in archaeological records, including zooarchaeology, lithic analysis, paleoenvironmental reconstruction, stable isotope studies, experimental archaeology, ethnoarchaeology, among others. By examining these multifaceted perspectives, we aim to develop a better understanding of the role of waterscapes in prehistoric adaptation and cultural evolution. Ultimately, this session will contribute to broader debates about human-environment interactions, showcasing the importance of aquatic landscapes in the everyday routines of our ancestors. Through case studies spanning various regions and time periods, we hope to highlight the significance of water and its resources in shaping human history, offering new insights into the relationship between humans, their environment and technology.

CONTRIBUTION ABSTRACTS

303. LAST INTERGLACIAL MOLLUSC EXPLOITATION IN WESTERN IBERIA: EVIDENCE FROM GRUTA DA FIGUEIRA BRAVA

**Contribution format:** Oral  
**Contribution authors:** Mariana Nabais (IPHES - Institut Català de Paleoecologia Humana i Evolució Social | UNIARQ – Centre for Archaeology. School of Arts and Humanities. University of Lisbon.) – João Zilhão (UNIARQ – Centre for Archaeology. School of Arts and Humanities. University of Lisbon)

This study examines the exploitation of aquatic ecosystems by Neanderthals during the Last Interglacial period (Marine Isotope Stage 5, or MIS-5), with a focus on evidence from Gruta da Figueira Brava in western Iberia. Detailed analyses of faunal assemblages, predominantly molluscs, crustaceans and birds, reveal systematic and sustained engagement with marine resources over a 20,000-year period. Molluscs, including limpets, mussels and brown crabs, formed over 50% of the faunal assemblage, highlighting their dietary significance. The selective harvesting of larger specimens and evidence of resource processing, such as roasting and boiling, indicate a deliberate and methodical approach to exploiting marine environments. The ecological context of the site, situated amidst diverse coastal and terrestrial ecosystems, provided Neanderthals with a stable, year-round resource base. Seasonal and spatial variations in mollusc collection suggest a sophisticated understanding of intertidal dynamics and resource availability. Taphonomic analysis supports the anthropogenic origin of the faunal remains based on patterns of burning, fragmentation and stratigraphic association with Mousterian industry. These finds challenge assumptions of opportunistic resource use, instead portraying Neanderthals as capable of sustained coastal adaptation and refined ecological strategies. The study situates Gruta da Figueira Brava within a broader comparative framework, aligning its assemblages with Middle Stone Age coastal sites in Africa. This evidence challenges the notion that Neanderthals lacked the behavioural sophistication to exploit coastal resources systematically. Instead, it demonstrates their ability to adapt to and exploit ecotonal environments effectively. Our results contribute to a better understanding of Neanderthal subsistence strategies, emphasising their ecological versatility and evolutionary parallels with early modern humans.

845. SURVIVING THE LAST GLACIAL MAXIMUM: THE ROLE OF LITTORAL RESOURCE EXPLOITATION FOR SOLUTREAN HUMAN POPULATIONS IN NORTHERN IBERIA

**Contribution format:** Oral  
**Contribution authors:** Asier García-Escárzaga (Universitat Autònoma de Barcelona . Institute of Environmental Science and Technology) – Rosa Arniz-Mateos (Leibniz Zentrum für Archäologie) – Igor Gutiérrez-Zugasti (Instituto Internacional de Investigaciones Prehistóricas de Cantabria | Universidad de Cantabria) – Elsa Duarte (Universidad de Oviedo) – Ricard. Fernandes (Max Planck Institute of Geoanthropology) – Marco De La Rasilla (Universidad de Oviedo)

Variations in past climate conditions had profound implications for human behaviour and the subsistence strategies developed by ancient human groups. Previous studies have identified the northern Iberian Peninsula as a refugium during the Last Glacial Maximum (LGM), underscoring its significance as a key location for understanding how harsh environmental conditions influenced the lifeways of foraging communities. The colder climate during this period triggered shifts in hunting strategies and mobility patterns along the coastal region. While marine resources were consistently utilized by Upper Paleolithic groups, the extent to which these resources supported human subsistence during the LGM remains poorly understood. To clarify the role of coastal resources during this time, it is essential to determine whether marine molluscs were intensively exploited despite the challenging climatic conditions. To address this question, stable oxygen isotope analyses were conducted on shells recovered from an archaeological site in Northern Iberia, dating to the Solutrean period. Stable oxygen isotope ratios serve as reliable indicators of seasonal seawater temperature variations experienced by molluscs in the past, allowing researchers to pinpoint the time of year when these organisms were collected by humans. In this study, stable oxygen isotope analyses were performed on *Patella vulgata* Linnaeus, 1758 limpets from Llonín Cave (Asturias, Spain). The goal was to determine whether these limpets were collected year-round, which would indicate a systematic and potentially intensive exploitation of molluscs. Furthermore, the isotope data were used to reconstruct climatic conditions during the LGM, providing deeper insights into the environmental challenges faced by human populations in this region.

**2222. CHANGING COASTLINES, STRANDED WHALES AND THE FINAL PALAEOLITHIC HUMAN PRESENCE IN NORTHERN DENMARK**

**Contribution format:** Oral  
**Contribution authors:** Felix Riede – Helena Dalager – Frederik Mygdam – Johanne Mouritzen (Aarhus University)

Humans began to reoccupy southern Scandinavia during the closing millennia of the Pleistocene. The prevailing view of these Final Palaeolithic foragers is that they were, first and foremost, terrestrial large-game hunters. After an early and likely failed colonisation episode during Greenland Interstadial 1e, groups equipped with arch-backed and large tanged points as well as a variety of basic domestic lithic tools spread – thinly – to the entirety of present-day Denmark, including its northern extremity. The very top of the Jutland peninsula, today known as Vendsyssel, constitutes the northernmost extension of the human world at this time; barren, exposed to wind, weather and the ocean, and likely characterised by rapidly shifting coastlines due to a complex interplay between eustatic and isostatic changes. We have previously hypothesised that unusually frequent whale strandings made this otherwise inhospitable stretch of land and its changeable coastline temporarily attractive to these Final Palaeolithic foragers. Using (i) site catchment analysis, (ii) zooarchaeological, and (iii) protein residue analysis, we here extend and test this hypothesis. In so doing, we demonstrate that stranded and beached whales – as well as perhaps other coastal jetsam and flotsam – were major resources that facilitated and enabled the human presence in this coastal area during the relatively warm Greenland Interstadial 1a-c.

**714. EVIDENCE FOR FISHING INTENSIFICATION DURING THE LATER STONE AGE AT HOFFMAN’S/ROBBERG CAVE IN SOUTH AFRICA**

**Contribution format:** Oral  
**Contribution authors:** Asia Alsgaard (University of Bergen) – Judy Sealy (University of Cape Town, Cape Town, South Africa) – Carin Andersson (Norwegian Research Centre (NORCE)) – Mimi Lam – Karen Van Niekerk (University of Bergen)

During the Later Stone Age in South Africa, there is increasing evidence for less mobile coastal hunter-gatherers based on their subsistence practices. We add to this growing body of evidence by documenting the evidence for fishing intensification and resilience from archaeological sites on the Robberg Peninsula, a location that provided unique access to both local endemic species such as the white stumpnose (*Rhabdosargus globiceps*) as well as open ocean fish species such as the Cape yellowtail (*Seriola lalandi*). We present new data on Cape yellowtail body size reconstructed using 3D geometric morphometrics from fish remains excavated from Hoffman’s/Robberg Cave (4,570-3,210 cal BP). We compare these data with previous analyses of the fish remains from both Hoffman’s/Robberg Cave and nearby Nelson Bay Cave, located on the same peninsula. Following a decline in the size and relative abundance of the white stumpnose, we suggest the inhabitants may have shifted their dietary focus to include a high abundance of open ocean pelagic fish such as the Cape yellowtail. We conclude by suggesting the Robberg peninsula provided specific access to these fish species along with other coastal resources including the Cape fur seal which may have helped facilitate longer term residential stays at these sites.

**1153. MOLLUSK AND CRUSTACEAN PROCESSING IN THE MESOLITHIC: FEATURE C OF THE CABEÇO DA AMOREIRA SHELL MIDDEN (MUGE, PORTUGAL)**

**Contribution format:** Oral  
**Contribution authors:** Beatriz Pinto (University of Algarve- ICArEHB) – Maria João Valente (University of Algarve- CEAACP) – Célia Gonçalves (University of Algarve- ICArEHB)

The Mesolithic period in the Iberian Peninsula (c. 8.5–6 kyr BP) was characterized by significant environmental changes that influenced human subsistence strategies, particularly through the intensified exploitation of marine and riverine resources. The Muge shell middens, with their exceptionally well-preserved faunal assemblages, provide a unique context for examining these adaptive responses. This study focuses on the remains of mollusks and crustaceans recovered from Feature C at the Cabeço da Amoreira shell midden, a context interpreted as a possible combustion structure. By integrating taxonomic and taphonomic analyses, we aim to evaluate the contribution of mollusks and crustaceans to Mesolithic dietary practices and to explore their association with this anthropogenic feature. Additionally, our research investigates post-depositional processes and site formation dynamics, highlighting the roles of both natural and human agents in the accumulation and preservation of faunal remains. Our methodological approach combines traditional zooarchaeological techniques with cutting-edge quantitative methods, including biometric analysis and statistical modeling of species distribution. The research also incorporates geoarchaeological data to contextualize the depositional environment and assess preservation conditions. This multi-proxy approach allows for a more comprehensive understanding of resource exploitation patterns, seasonal gathering strategies, and the spatial organization of food processing activities within the site. The results of this study will contribute to ongoing debates about Mesolithic adaptations to environmental change and the role of aquatic resources in prehistoric subsistence economies of Atlantic Iberia.

**1415. FROM SHORE TO SEA: EXPLORING THE ROLE OF WATERSCAPES IN MESOLITHIC SOCIETIES OF SW IBERIA**

**Contribution format:** Oral  
**Contribution authors:** Ana Cristina Araújo (Archaeosciences Laboratory, PC, IP, Lisboa | CIBIO - Research Center In Biodiversity and Genetic Resources/University of Porto | Uniarq, University of Lisbon)

Mesolithic communities of the western Iberian Peninsula developed a strong reliance on marine resources, leading to the formation of several dozen shell middens. These sites are a defining feature of the archaeological record of this period, offering insight into the last hunter-gatherer societies and their way of life. During the earliest phase (c. 11,000 – 8400 cal BP), shell middens appear scattered along the Portuguese present-day coastline. Typically small in size, their malacofaunal content reflects the characteristics of the local substrate and surrounding geomorphological conditions. From around 8,500 BP onwards, during the Late Mesolithic, the archaeological record reveals a significant shift in settlement patterns, now concentrated in the innermost areas of estuaries shaped by the maximum extent of marine influence due to global warming. Many of these Mesolithic middens were not solely dedicated to the exploitation and immediate consumption of molluscs. Instead, they reflect a much broader range of activities, from hunting to artifact production. The diversity, abundance, and state of preservation of the remains found in many of these middens, along with their spatial organization within the habitat, provide opportunities for multidisciplinary research, offering a more comprehensive understanding of these past populations and their relationship with waterscapes

**1725. USING SPATIAL ANALYSIS TO INVESTIGATE MESOLITHIC HUNTER-FISHER-GATHERER (HFG) LANDSCAPE INTERACTION IN DIFFERENT COASTAL AREAS OF ATLANTIC EUROPE**

**Contribution format:** Oral  
**Contribution authors:** Kelly Gibbons (University of Oslo)

It has long been recognised that Mesolithic populations were living in coastal areas across Europe and exploiting resources distinct to these areas such as fish, shellfish and marine mammals. This appears to have culminated in the Late Mesolithic in formation of large and perhaps complex societies, based on specialist coastal adaptation. While evidence for these communities has increased considerably in recent years, the nature of archaeological investigation tends to be ‘site’ specific, meaning we lack understanding of how HFGs interacted with their wider landscape and environment. Investigation has also focused on the economic and subsistence benefits of coastal adaptation, ignoring less tangible motivations. The paper will present the approach taken by one of the projects incorporated in the HORIZON Marie Skłodowska-Curie Action (MSCA) Doctoral Network Archaeological Coastal Heritage: Past, present and future of a hidden prehistoric legacy (ArChE) project. The project is re-evaluating existing data to better understand social and communicative meaning and function and cosmological aspects of the populations under study, and how this influenced their use of the landscape. The project is approaching this issue using a number of methods, and this paper will focus on the application of GIS techniques, including

viewshed analysis and least cost analysis to existing data from three discrete areas of Europe, SE Norway, N Spain and W France. The three areas under study are very different in their current climate, topography, preservation and survival as well as material expression so it is hoped the project will allow us to bridge gaps between each location and give a fuller understanding of hunter-gatherer-fisher landscape interaction in Mesolithic Europe.

1605. APPLICATION OF SCLEROCHRONOLOGICAL METHODS TO MUSSEL SHELLS FROM A NEOLITHIC CAVE SITE – WHAT CAN WE LEARN FROM THESE ARCHIVES?

**Contribution format:** Oral  
**Contribution authors:** Mario Bodružić – Dario Vujević (University of Zadar, Department of Archaeology) – Melita Peharda (Institute of Oceanography and Fisheries, Croatia) – Meghan Buchnell (Memorial University, Canada) – Davi. Gillikin (Union College, USA) – Elizabeth Harper (University of Cambridge) – Bern. Schöne (Johannes Gutenberg Universität Mainz) – Hana Uvanović (Institute of Oceanography and Fisheries, Croatia) – Anouk Verheyden (Union College, USA) – Niels De Winter (Vrije Universiteit Amsterdam, the Netherlands)

During systematic archaeological excavations conducted in Ždrilo Cave (near Rovanjaska, eastern Adriatic coast), a high abundance of marine shells, partly fragmented, were discovered, including those of oysters (*Ostrea edulis*), mussels (*Mytilus galloprovincialis*) and gastropods. In the recorded stratigraphic sequence, shell deposits made a significant proportion of the layers that can otherwise be interpreted as fumier deposits and are associated with the seasonal use of the cave for the purpose of herding sheep and/or goats. The layers in the cave have been dated to Early and Middle Neolithic. Bivalve shells are considered important archives of past environmental variation as well as human behaviour and foraging. In the framework of the research project BivalveSPEECH, archaeological specimens of *M. galloprovincialis* were analysed using sclerochronological methods. Isotope geochemical analysis ( $\delta^{18}O$ ,  $\delta^{13}C$ ) was conducted on shell carbonate samples drilled from shell cross-sections. Results were compared to published results from modern *M. galloprovincialis* shells from the eastern Adriatic Sea and discussed in the context of marine environmental conditions during this period as well as human foraging behaviour. The study provides new insights into settlement patterns, mobility and subsistence strategies of Neolithic populations occupying Middle Dalmatian coastal zones.

1167. PERSONAL ORNAMENTS FROM THE MESOLITHIC SITE OF LA CHORA CAVE (CANTABRIA, NORTH-ERN IBERIA)

**Contribution format:** Poster  
**Contribution authors:** Oriol Montero-Buch (I.U. d’Investigació en Arqueologia i Patrimoni Històric (INAPH), Universitat d’Alacant) – David Cuenca-Solana (Ins. Internacional de Investigaciones Prehistóricas de Cantabria (IIIPC), Universidad de Cantabria | Centre de Recherche en Archéologie, Archéosciences, Histoire (CRéAAH), Université de Rennes) – Asier García-Escárzaga (Department of Prehistory, Universitat Autònoma de Barcelona | Institute of Environmental Science and Technology (ICTA), Universitat Autònoma de Barcelona) – Igor Gutiérrez-Zugasti (Ins. Internacional de Investigaciones Prehistóricas de Cantabria (IIIPC), Universidad de Cantabria)

Personal ornaments are considered indicators of behaviour complexity in Prehistory. Their use by forager groups is evidenced throughout the entire Upper Palaeolithic and in the European continent they represent one of the few symbolic expressions that persists during the Pleistocene-Holocene transition. In this poster we present the first results on the personal ornaments from the two most representative stratigraphic units at the Mesolithic shell midden site of La Chora cave (Cantabria, northern Iberia). Most of the personal ornaments were manufactured from aquatic shells (both marine and freshwater). The study was carried out from an interdisciplinary perspective, including taxonomic, taphonomic, biometric and use-wear analysis. Thus, we present the taxonomic diversity used by the different hunter-gatherer-fisher groups that inhabited the cave, as well as a proposal of the chaîne opératoire from the selection and collection of the shells through their manufacture, use and final abandonment. Furthermore, in comparison to ethnographic and archaeological evidence, we examine the possible roles that these elements may have played in the daily life of the foraging groups. Overall, more than 50 personal ornaments and 20 elements considered potential raw material accumulations have been studied. The two most used taxa are *Tritia reticulata* (Linnaeus, 1758) and *Trivia* sp. J. E. Gray, 1837, which together account for more than half of the assemblage and are characteristic of the Mesolithic of northern Iberia. Various manufacturing techniques are present, and use-wear analysis has documented different stages of use, ranging from the pierced ornaments with no signs of wear to those used for a prolonged period. These results allow us to interpret the site, particularly the two oldest Mesolithic layers, as a centre of ornament production and use of these symbolic elements.

1185. INDIGENOUS PEOPLE FROM THE CANARY ISLANDS WERE ALSO FISHERS: LAST ICTHYOARCHAEOLOGICAL RESEARCH OF THE ARCHIPELAGO

**Contribution format:** Poster  
**Contribution authors:** Simon-Pierre Gilson – Javier A. Cruz Viera – Aitor Brito-Mayor – Jonathan Santana (Universidad de Las Palmas de Gran Canaria)

In the Canary Islands, the faunal remains associated with marine resources have received limited attention, often being overlooked or considered secondary. Since 2022, the IsoCan (ERC) project has focused on ichthyological remains from several pre-colonial settlements in the Canary Islands, conducting zooarchaeological studies. These studies have begun to reshape our understanding of the significance of marine resources for the indigenous populations of the Canaries. For example, the research has identified specialized sites dedicated to processing fish before they were transported to other locations. The analysis also suggests a direct correlation between ecological richness and the frequency of archaeological species found. Additionally, it appears that direct fishing occurred along rocky shores. Based on the timeline of findings, fishing activities seem to have been a consistent practice throughout the indigenous occupation of the islands. Compared to previous research, this analysis confirms the importance of the parrotfish (*Sparisoma cretense*) for past populations while also highlighting the significance of other species, such as garfish (*Belone belone*). Furthermore, the study has uncovered the presence of unexpected species like tuna and sharks.

15 CONTEXTUALIZING CREMATIONS DURING THE EUROPEAN LATE PREHISTORY AND PROTOHISTORY

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Cremation, Bioarchaeology, Late Prehistory, Protohistory, Funerary ritual  
**Session organisers:** Paula Becerra Fuelleo (Department of Prehistory and Archaeology, University of Granada) – Vasso Papathanasiou (Department of History and Archaeology, Aristotle University of Thessaloniki) – Oriana Chiappa (Department of Archaeology, Ghent University | Department of Archaeology, Environmental changes and Geochemistry, Vrije Universiteit Brussel (VUB))

SESSION ABSTRACT

Cremation as a mortuary practice has a long history in human culture and has been employed across a range of geographic and chrono-cultural contexts. In Europe, the intentional use of fire for the disposal of the dead can be traced back to the Mesolithic, and it has manifested in various forms throughout prehistory and protohistory. Even though cremation was widely practiced in ancient societies, it was often overlooked in bioarchaeological research, largely due to the fragmented nature of burnt skeletal remains. However, recent advancements in methodology have underscored the importance of these remains for archaeological interpretation. Osteological analysis of cremated bones is crucial for understanding the cremation process, reconstructing the biological profiles of the deceased, and assessing the burning conditions and treatment of bodies. Bioarchaeological studies have demonstrated that cremation was far from a static and uniform tradition; rather, it exhibited considerable variation across different communities and frequently intersected with other funerary practices, such as inhumation. This session seeks to explore the diverse ways in which cremation was practiced within a broad chronological and geographical framework, aiming to a better understanding of this multifaceted funerary practice within different bioarchaeological and sociocultural contexts. Special attention will also be given to the complex and intertwined relationship of cremation with other mortuary practices. We welcome contributions from across Europe, spanning from the Mesolithic period to the Iron Age, including but not limited to:

- Bioarchaeological studies of burnt skeletal remains employing various methods (macroscopic, microscopic, biomolecular etc.) with an emphasis on contextual analysis.
- Case studies and theoretical approaches addressing the coexistence of cremation and other disposal methods within the same community, exploring their potential sociocultural implications.

CONTRIBUTION ABSTRACTS

752. SWOT-ANALYSING THE BIOARCHAEOLOGY OF CREMATION’S GOLDEN AGE

**Contribution format:** Oral  
**Contribution authors:** David Gonçalves (Património Cultural IP/Biopolis | Research Centre for Anthropology and Health | Center for Functional Ecology)

The recent impulse in archaeological cremation research has been fuelled by several theoretical and methodological advances since the late 20th century which have raised the bar toward new levels of excellence. Due to their usual poor preservation, cremated skeletal remains have usually been seriously neglected by bioarchaeologists even though cremation has been a very popular choic. since prehistory. However, the current and unprecedented surge in cremation related studies has been supported by an important increase in the number of experts on burnt skeletal remains and in the amount of papers published on the subject. It could be argued that the bioarchaeology of cremation presently experiences a golden age benefitting from expanded networks and interdisciplinary collaborations while piggybacking on the wave of the Third Science Revolution. The present talk will discuss the state of affairs of the bioarchaeology of cremation field by carrying out a SWOT analysis with the objective of identifying its strengths, weaknesses, opportunities and threats.

**732. THE COEXISTENCE OF CREMATION AND INHUMATION IN MEGALITHIC BURIALS OF SOUTHEASTERN IBERIA**

**Contribution format:** Oral  
**Contribution authors:** Paula Becerra Fuelleo – Gonzalo Aranda Jiménez (Department of Prehistory and Archaeology, University of Granada) – Marta Diaz-Zorita Bonilla (University of Tübingen) – Miriam Vílchez Suárez – Sonia Robles Carrasco – Margarita Sánchez Romero (University of Granada)

Burnt human bones have been discovered in megalithic contexts in Southeast Iberia since the 19th century. However, these remains were traditionally interpreted as the result of cleansing or purifying rituals performed on skeletonized individuals within megalithic chambers, rather than as evidence of a cremation rite. This interpretation was based on the prevailing assumption that cremation as a funerary practice only emerged in the southeastern Iberian Peninsula during the Late/Final Bronze Age (ca. 1250-800 BC). Our recent investigation at Los Milanes necropolis (Abla, Almería) has used a multiproxy analysis, combining a detailed anthropological study with analytical techniques (FTIR-ATR, Carbon, Oxygen and Strontium Analyses) to determine both the cremation event and the pre-burning condition of the bodies exposed to fire. This is the first application of such analyses in Iberian megalithic contexts and provides evidence for the cremation of corpses. The cremated deposit, composed of 28,000 human bone fragments, has yielded significantly older radiocarbon dates than those previously discussed for cremation in the region, concentrating in the first quarter of the III millennium, particularly in the 28th century cal BC. This chronology now situates the cremation rite as a one of the chalcolithic funerary rituals. These findings indicate that cremation rites coexisted alongside inhumation within megalithic cemeteries indicating the contemporaneity of multiple funerary practices in the Chalcolithic period. By reassessing burnt remains in megalithic contexts of Southeast Iberia, this study challenges the prevailing assumption that all cremated remains in these monuments resulted from Bronze Age reutilizations or purifying rituals on skeletal remains.

**774. THE USE OF FIRE IN THE MEGALITHIC NECROPOLIS OF LA LENTEJUELA (TEBA, SPAIN): BETWEEN THE COLLECTIVE AND THE INDIVIDUAL BURIALS**

**Contribution format:** Oral  
**Contribution authors:** Jesús Díaz (Universidad de Granada) – Paula Becerra Fuelleo (University of Granada) – Marta Díaz-Zorita Bonilla (University of Tübingen) – Serafín Becerra Martín (Museo Histórico de Teba) – Adolfo Moreno Márquez (University of Almería) – Juan Cantillo Duarte – Eduardo Vijande Vila (University of Cádiz)

The megalithic necropolis of La Lentejuela is located in the northwest of the province of Málaga (Spain) and comprises up to 13 megalithic structures. Since 2020 the University of Cádiz have been leading excavations where a total of 4 megalithic structures have been completely excavated until now. In this paper, we analyze the human bone assemblage from one of those structures (I), where we found some human remains affected by fire and the purpose of this paper is to decipher how it contributes to our understanding of funerary patterns observed during the transition from the 3rd to the 2nd millennium BC. We have identified a phase of individual Bronze Age burials, resulting from the reuse of the structure, a common phenomenon for the time period. In the lower levels, we found a level dated to the Chalcolithic of collective burials with the presence of thermally altered bones. The aim of this study is to understand the functional dynamics of the structure and the role of fire as a determining factor in its potential reuse or closure. In addition, we would like also to highlight with this work the diversity of funerary practices and the different uses of the space and the importance of recognizing the coeval practices during the Late Prehistory of Europe.

**176. IBERIAN CREMATIONS. THE CASE OF THE NECROPOLIS OF PIQUÍA (ARJONA, JAÉN, ANDALUCÍA)**

**Contribution format:** Oral  
**Contribution authors:** María Sedeño Ráez (University Institute for Research in Iberian Archaeology (University of Jaén))

The Iberian culture comprises a set of societies that inhabited the Iberian Peninsula during the protohistoric period, approximately between the 6th and 1st centuries BC. Although these communities share common cultural traits, they also present regional differences that configure a diverse and heterogeneous cultural landscape. One of the most relevant territories for the study of this culture is the Upper Guadalquivir, located in the area of the headwaters of the river that gives it its name. In the funerary field, the cremation rite is considered a dominant practice in the entire Iberian culture, although each community develops particular rituals that reflect its specific cultural identity. We present the preliminary results obtained from the research at the Iberian necropolis of Piquía (Arjona, Jaén, Andalucía). The osteological investigation has been carried out applying the classical macroscopic methodology, although we have also resorted to the punctual analysis of one of the structures through Infrared Spectroscopy (FTIR-ATR). The necropolis is part of a transition period between the Iberian world and the influence of the Roman exogenous world. The analysis of the cremations, both at the osteological level and in terms of the funerary ritual, offers the opportunity to approach this stage of the process of cultural hybridisation. It is important to highlight that only the elites of the oppida (fortified settlements) had privileged access to the funerary spaces. Although this implies that the information collected is limited to a part of the population, the archaeological record allows us to interpret how this social group represented and identified itself. The multiple funerary structures, the varied grave goods and cremation, as a unifying ritual element, are key components in understanding this complex cultural dynamic.

**1398. BETWEEN STONE AND ASH IN BRITTANY: CREMATION AND FUNERARY PRACTICES IN THE NEOLITHIC MULTI-CHAMBERED CAIRN OF GOASSEAC’H, CARHAIX-POUGUER, FRANCE**

**Contribution format:** Oral  
**Contribution authors:** Anastasija Brancic (Laboratory of Prehistoric Archaeology and Anthropology, Faculty of sciences, University of Geneva) – Florian Cousseau (Laboratory of Prehistoric Archaeology and Anthropology, Faculty of sciences, University of Geneva | Department of Archaeology, Durham University) – Astrid Suaud-Préault (UMR6566-CReAAH) – Valérie-Emma Leroux (Iggdrasil) – Marie Besse (Laboratory of Prehistoric Archaeology and Anthropology, Faculty of sciences, University of Geneva)

The Middle Neolithic (4700–3500 BC) in Western France is predominantly associated with megalithic funerary practices, characterized by primary deposits within chambered tombs. Furthermore, Brittany is often known for the absence of bones due to the acidity of its soil. The multi-chambered cairn of Goasseac’h, near Carhaix-Plouguer in Central Brittany, challenges these patterns. One of its nine passage tombs, named Dolmen A, presents an exceptional case: a cremation deposit within a structured arrangement of stones. Given the rarity of cremation during this period—especially in megalithic tombs—this discovery provides new insights into Neolithic mortuary customs and raises questions about burial traditions for passage tombs. This study investigates the funerary practices of Dolmen A using a multidisciplinary approach that integrates osteological analysis of cremated remains, spatial distribution studies, architectural assessment, and possible traces of inhumations. Previously examined funerary artifacts, such as ceramics and personal adornments, are incorporated to help reconstruct depositional practices and link them to the broader research. By situating Dolmen A within the regional context of Middle Neolithic Brittany and comparing it to wider European megalithic traditions of the 5th millennium BC, this research highlights both local burial variability and the broader significance of cremation in monumental funerary architecture. The findings offer new insights into the social, ritual, and symbolic significance of cremation, demonstrating the complexity and regional diversity of Neolithic burial customs.

**900. THE USE OF CREMATION IN MORTUARY PRACTICES IN SOUTHERN GAUL DURING THE SECOND IRON AGE**

**Contribution format:** Oral  
**Contribution authors:** Elodie Caserta – Gaelle Granier (UMR 7268 ades (CNRS, EFS, Aix-Marseille université)) – Lola Bonnabel (Inrap | UMR 8215 Trajectoires)

Thanks to the development of preventive archaeology in France and of archaeoethanatology research methods (such as the detailed study of cremations), recent years have seen a proliferation of data documenting the mortuary practices in Southern Gaul during the Second Iron Age (5th - 1st centuries BCE). In addition to this recent data, important researches carried out over the last thirty years has enabled us to develop a comprehensive overview of the funerary practices of Gaul populations during the Iron Age. Cremation, as a means of transforming the

dead body, gradually became the norm in southern Gaul, from the Late Bronze Age to the 1st century CE (Dedet, 2004). But it was not used in a linear, systematic way. For example, it was predominant among Gaul populations at the beginning of the Second Iron Age, and from the 3rd BCE onwards. Nevertheless, these general trends take on more varied local realities: in mountain areas (Southern French Alps: Hautes-Alpes, Alpes-Maritimes, Alpes-de-Haute-Provence), the so-called High Mountain populations adopted both cremation and inhumation to transform the body throughout the period under consideration. Beyond its evolution in time and space, the adoption of cremation took a variety of forms in protohistoric funerary contexts, such as graves made from pyres, secondary deposits in simple pits or under burial mounds, thus illustrating the diversity of funerary practices both in the mountains and on the plains of southern Gaul. Drawing on a corpus of varied funerary structures from throughout the Second Iron Age, put into perspective with data from archaeological documentation, this work will offer a viewpoint on funerary practices linked to cremation in the Gallic populations of southern Gaul.

515. TOWARDS RE-CONTEXTUALIZING THE EARLY CYCLADIC II HUMAN CREMATION AT DASKALIO, KEROS

**Contribution format:** Oral  
**Contribution authors:** Eleni Gourgouleti (Independent | National and Kapodistrian University of Athens)

Until recently, the practice of human cremation was missing from the archaeological record of the 3rd millennium BC Cyclades in the Aegean, where inhumation has been the typical funerary practice throughout the Early Bronze Age. As a result, the unique discovery of cremated human remains on the islet of Daskalio across Keros serves both as a methodological and an interpretive challenge. Traditionally, archaeological search has been focusing on the reasons behind the emergence of the practice of cremation, thus prioritizing an etic rather than an emic perspective. As such, the practice was diffused or imposed, adopted or adapted from elsewhere. Since however, there are no universals as to the reasons why some societies choose to burn their dead over burying them, and why some societies combine or interchange inhumation and cremation, those can vary and eventually mislead us. There lies the need for a more flexible and reflective framework that would allow us to move beyond the explanatory limitations of the traditional approaches. For this venture the concept of the community of practice is proposed. It refers to a group that is (re-)structured by the participation of its members in a particular activity with a shared goal. In this way, the human cremation at Daskalio can be re-introduced to its wider sociocultural context, arguably as a differentiated strategy for distinction at death through the manipulation of the simultaneously destructive and reconstructive aspect of fire to representations of the body and the self. The adequacy of the proposed concept relies on its multiscalar applicability which could enable us to associate and compare the practice of cremation with other contemporary practices of social distinction, individual or collective identity making and processes of becoming within the Early Cycladic II period.

1497. B'URN'ING THE DEAD IN THE LATE BRONZE AGE AEGEAN: OSTEOARCHAEOLOGICAL INSIGHTS FROM SECONDARY CREMATION BURIALS FROM ARGOS, GREECE

**Contribution format:** Oral  
**Contribution authors:** Niki Papakonstantinou (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece | The Marc and Ismene Fitch Laboratory for Archaeological Science, British School at Athens) – Evangelia Pappi (Ephorate of Antiquities of Argolid, Hellenic Ministry of Culture, Greece) – Vassiliki Papathanasiou (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece) – Elisavet Stamataki – Christophe Snoeck (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel) – Sevasti Triantaphyllou (Department of History and Archaeology, Aristotle University of Thessaloniki, Greece)

Cremation has been long considered as an exceptional practice throughout the entire Aegean Bronze Age. However, increasing evidence of Bronze Age cremations has been revealed in the last decades, while their number increases considerably towards the end of the Late Bronze Age (LH IIIC, 12th and early 11th centuries BCE). During this period cremation burials with or without urns are attested in a wide geographic area, appearing in various contexts, including rock-cut chamber tombs, stone tumuli and pits. Nevertheless, integrated osteological and archaeological investigations of cremation burials that would provide a more comprehensive evaluation and picture of the cremation practice are few. The aim of this paper is to present the results from the bioarchaeological study of cremated skeletal remains deriving from Argos in the Argolid (Greece). The 2003 rescue excavation carried out at the National Stadium of the city yielded 27 secondary cremation deposits dating to the LH IIIC period. The burnt human remains, and a variety of objects were deposited inside cinerary amphoras of various sizes, while in a few cases, ash layers along with burnt bones and grave goods were found below the urns. On the basis of osteobiographical profiles (minimum number of individuals, age at death, biological sex, pathologies) and preservation patterns (e.g. quantity of bones, skeletal representation), we will discuss manifold aspects of the funerary practices. The combustion process and the burning conditions of the bodies will be explored through

the thermal alterations of the bones and analytical methods (FTIR-ATR, carbon and oxygen isotopes), while the post-cremation treatment and the final deposition of the cremains will be examined through the lens of archaeological evidence.

2197. OSTEOARCHAEOLOGICAL ANALYSIS OF EARLY IRON AGE CREMATION BURIALS FROM CENTRAL MACEDONIA, GREECE

**Contribution format:** Oral  
**Contribution authors:** Vasso Papathanasiou (Aristotle University of Thessaloniki) – Elisavet Stamataki – Christophe Snoeck (Vrije Universiteit Brussel) – Asterios Lioutas (Ephorate of Antiquities of Thessaloniki City) – Vasiliki Missailidou Despotidou (Ephorate of Antiquities of Thessaloniki Region) – Sevasti Triantaphyllou (Aristotle University of Thessaloniki)

Cremation burials are commonly found in the archaeological record of prehistoric and protohistoric Aegean. In the region of Macedonia, the practice of cremation appeared as early as the Late Neolithic and continued to be applied during the Bronze Age. During the Early Iron Age, cremation became more widespread, with an increasing number of cemeteries with deposits of burnt human remains. However, osteological studies on these remains are still limited. This presentation aims to explore cremation practice in central Macedonia during the Early Iron Age (11-8th c. BCE), focusing on two cemeteries: Polichni and Nea Philadelphia, Thessaloniki. Both cemeteries have yielded numerous urned cremation deposits, accompanied by various artefacts. This presentation aims to explore cremation practice in these cemeteries through an interdisciplinary approach. The macroscopic analysis of the burnt skeletal remains will focus on reconstructing the biological profiles of the individuals and evaluating thermal alterations (e.g. warping, coloration). Additionally, infrared and isotopic data (FTIR-ATR, carbon and oxygen isotopes) will provide valuable insights into burning conditions, fire intensity, and body treatment. Finally, integrating archaeological and osteological evidence will shed light on the socio-cultural dimensions of this multi-layered practice.

2195. ANALYZING THE BIOLOGICAL PROFILE OF CREMATED INDIVIDUALS FROM HELLENISTIC AND ROMAN PERIOD THESSALONIKI

**Contribution format:** Oral  
**Contribution authors:** Christina Kakasa – Panagiota Bantavanou (Laboratory of Physical Anthropology, Democritus University of Thrace) – Frank Siegmund (Abt. Ur- und Frühgeschichtliche Archäologie, University of Münster) – Konstantinos Moraitis (Department of Forensic Medicine and Toxicology, National and Kapodistrian University of Athens) – Maria Eleni Manthou (Laboratory of Histology-Embryology, Aristotle University of Thessaloniki) – Christina Papageorgopoulou (Laboratory of Physical Anthropology, Democritus University of Thrace)

Cremation during Greek antiquity was a common burial practice, increasing in frequency during the Hellenistic (323-31 BCE) and the Roman (31 BCE – 324 CE) periods. During cremation, however, the human body and consequently the skeleton undergoes intense alteration and destruction, preventing standard anthropological methods to perform efficiently retaining the identity of the individual largely unknown. This project attempts to explore the practice of cremation by identifying the biological profile (age-at-death) and the taphonomical alterations of the bone microstructure emerging by high temperatures. For this, age-at-death was assessed through the application of a new histomorphometric method based on Haversian System Density (HD) regression equation (Bantavanou et al., 2025) modified for cremated femur bones. The modification of the method was conducted on experimentally cremated (400-900°C) modern individuals (n=19) with documented data. The Percentage of Difference (PoD) was calculated between the HD values before and after cremation for every 100°C. HD values were mathematically corrected according to the PoDs. The new method was applied on 30 cremated individuals dated to the Hellenistic (n=11) and Roman (n=15) period Thessaloniki in northern Greece. The modified method produced accurate age estimates with standard estimation error of ±5 years. The age-at-death of the ancient cremated individuals was estimated at 42 years for the Hellenistic and 43 years for the Roman period, respectively. While, histological analysis of the taphonomical alterations provided information (i.e degrees of cremation) regarding the practice of cremation. Overall, our methodology provided significant information for the biological profile of ancient cremated individuals rendering a significant part of the ancient world accessible for demographical analysis. Funding: ERC-Consolidator Grant CityLife (Project: 101126337).

816. BIOARCHEOLOGY OF CREMATION IN THE MIDDLE BRONZE AGE EAST OF THE CARPATHIANS

**Contribution format:** Oral  
**Contribution authors:** Mihai Constantinescu (Faculty of History, University of Bucharest)

In the hilly area east of the Carpathians, two archaeological cultures, Monteoru and Costișa, developed throughout the Middle Bronze Age (2200-1500 BC). Both cultures are extensively documented from an archaeological perspective, particularly regarding their funerary practices, several hundred inhumation burials being published and discussed in the literature. Inhumation in large cemeteries was the dominant funerary rite of these communities, with individuals exhibiting relatively standardized orientations, body placements and grave goods. The presence of cremation as a secondary funerary rite in these cultures has been only briefly addressed, no cremation grave being published in detail, but rather mentioned in general overviews. Based on recent discoveries from the cemetery at Cărlomănești-Arman, on the burials from Năeni-Colarea and the grave from the settlement at Poduri, we will present a bioarcheological perspective on cremation practices east of the Carpathians during the Middle Bronze Age. We will discuss the archaeological contexts in which cremated remains have been found, their chronology, an analysis of burning temperatures, the preserved skeletal segments and their weight. These aspects will be analyzed in comparison with similar practices within the neighboring archaeological cultures to explore the significance and origins of this funerary treatment in a region where inhumation was the prevailing rite.

**1691. THERMALLY ALTERED HUMAN REMAINS FROM PREHISTORIC AUSTRIA: A HISTOTAPHONOMIC ANALYSIS**

**Contribution format:** Oral  
**Contribution authors:** Estella Weiss-Krejci (University of Vienna) – Caroline Partiot (Austrian Archaeological Institute, Austrian Academy of Sciences)

Numerous ethnographic, historical, and archaeological studies have demonstrated that cremation is not a uniform practice. Indeed, there are many differences in the method of burning, the positioning of the body, and the temperature. This presentation explores the issue of variability in thermally modified bones from the perspective of histotaphonomy, an archaeological method for drawing conclusions about ancient burial practices and depositional environments. Histotaphonomy involves the analysis of the microscopic structure of bone to assess postmortem biogenic degradation and diagenetic processes. In recent years, the number of studies dealing with the histotaphonomy of thermally altered bone has significantly increased. This paper presents the results of histotaphonomic analyses of bone samples from Austria using transmitted light microscopy and SEM. The time periods range from the Urnfield Culture to Late Antiquity. The presentation explores the similarities and differences observed and discusses the implications for our understanding of the state of the body prior to cremation and broader funerary ritual practices.

**2479. THE AGE OF DEATH AND FIRE: DATING BURIAL CUSTOMS BY RADIOCARBON AND CORRESPONDENCE ANALYSIS AT LATE BRONZE AGE CEMETERY, INZERSDORF**

**Contribution format:** Oral  
**Contribution authors:** Michaela Fritzl (Austrian Archaeological Institute, Austrian Academy of Science)

The Late Bronze Age is marked by an increasing homogenization of material culture and burial customs. The cemetery of Inzersdorf, situated in the Lower Traisen Valley, Austria, serves as a case study to examine diachronic changes in burial practices. This paper interprets radiocarbon data from 49 calcined human bone samples and employs correspondence analysis of grave contexts. The carefully integrated dataset enables the precise delineation of the cemetery’s chronological structure in relation to the burial practices, which include body-sized graves, graves encircled by ditches, and urn graves. Insights into rituals or ancestral veneration emerge from temporal discrepancies in graves with multiple occupation. The analysis indicates the cemetery’s early origin at around 1400 BC, at the transition from the Middle to the Late Bronze Age, and identifies two peak phases of activity before burial practices decline around 950 BC. The integration of typo-chronological markers, 14C data, and comparisons with nearby contemporary cemeteries reveals a complex temporal framework, emphasizing the fluidity and regional variability of burial practices. This challenges assumptions of a linear development in mortuary rites and establishes an absolute as well as relative chronology of the Late Bronze Age for eastern Austria.

**1528. THE ROLE OF CREMATION CUSTOM IN THE EARLY METAL PERIOD OF THE SOUTHEASTERN BALTIC REGION**

**Contribution format:** Oral  
**Contribution authors:** Lijana Muradian (Lithuanian Institute of History)

This presentation analyzes cremation as a complex mortuary practice in the southeastern Baltic region during the Early Metal Period (2nd–1st millennium BC). During this time, cremation first appeared in the mentioned region. The emergence of cremation, alongside other burial practices such as inhumation and barrow burials, provides a unique opportunity to study the social and cultural aspects of funerary practices. Focusing on the Southeastern Baltic region, the presentation will examine the development of the cremation custom, including the factors influencing its spread and the ways it intersected with other funerary practices. It will also consider the

reasons why some individuals were buried in burial mounds, while others were buried outside of them. A key case study from the Mišeikiai mound cemetery in Lithuania, which features cremation burials outside barrows, will be highlighted to shed light on these practices. Investigations at this burial site were carried out in 2024 in order to test the area between the barrow mounds and to compare this material with a previously investigated barrow.

**411. FROM EARTH TO FIRE: FUNERARY RITUALS IN MEGALITHIC MONUMENTS IN CENTRAL ALENTEJO (PORTUGAL)**

**Contribution format:** Poster  
**Contribution authors:** Leonor Maria Pereira Rocha (CHAIA, Universidade de Évora) – Daniela Anselmo (CCDR Lisboa) – Paula Morgado (Câmara Municipal de Monforte, Portugal | CHAIA, Universidade de Évora)

All the details of prehistoric funerary rituals are important for understanding ancient societies - primary burial, secondary burial, with or without cremations. Understanding when cremation rituals began is essential, as it implies a new mentality towards death. In the case of Central Alentejo, where most of the megalithic graves were excavated in the first half of the 20th century, with stratigraphy recording methodologies that were not always (or almost never) very rigorous and often did not even collect osteological remains (human bones), this analysis is more difficult. Thus, the osteological analysis of bones, despite being crucial for understanding the evolutionary process of funerary contexts (with or without cremation), reconstructing biological profiles and assessing the conditions of cremation, may be completely lost for some regions. In this work, we intend to present the existing data for the Central Alentejo (Portugal) based on the research projects of the author, which focused on ancient works, but also to present data from more recent excavations, which have allowed us to clearly identify several monuments where cremations took place between the late Neolithic and the 1st Iron Age (5th century BC).

**16 ARCHAEOLOGY? GOOD GOD! WHAT IS IT GOOD FOR? (ABSOLUTELY NOTHING?)**

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Round table  
**Session keywords:** future, politics, application, public intellectual, significance of archaeology  
**Session organisers:** Thomas Meier (Heidelberg University) – Raimund Karl (University of Vienna) – Karin Reichenbach (Leibniz-Institut fuer Geschichte und Kultur des östlichen Europa)  
**Session speakers:** Alexander Gramsch (RGK - Romano-Germanic Commission DAI) – Owen Hurcum (University of York) – Ivana Mirković (IMT Scoula Alti Studi Lucca) – Hüseyin Burak Soy (Middle East Technical University) – Benjamin Vis (University of West Bohemia) – Ivana Živaljevic (University of Novi Sad)

**SESSION ABSTRACT**

As archaeologists – and as part of the humanities in general – we frequently claim the importance of our discipline for modern societies in terms of identity building, the exploration of alternatives to and the critical reflection of our present. As common as such claims are in discussions, publications and public talks, as abstract and vague our analyses, statements and recommendations remain. If the best we can do is to demonstrate that the bleedingly obvious did actually occur in the past, e.g. that societies either adapted to or collapsed due to climate change, are claims that we can contribute anything of significance to modern societies justified at all? In this round table, we want to ask: Is that all that archaeology has to offer to our societies? Don’t we have more and, above all, more precise and applied achievements of our discipline? What applied and applicable recommendations for action and understanding, what prognoses – if any – can we offer politicians, e.g. in areas of climate change and adaptation, migration, inequality, identity politics, defence of democracy, social cohesion, open societies, and many more? What do we really have to say in the face of grand societal challenges beyond the meta-level of abstract reflection? Do we have anything substantial to say and offer at all? And should we have something to offer – how should we do it? Address politicians directly? Reach out to think tanks? Become ‘public intellectuals’, commenting on current affairs in the media? Are the same approaches viable for all kinds of archaeology, academic, commercial, volunteer etc? And how to stay sober and credible while inevitably becoming part of one political camp or another? The organisers will strive for a diverse range of panelists in terms of gender and regionality. Interested to be a panelist? Contact us!

18 LEPENSKI VIR AND ITS WORLD: 60 YEARS ON

Session theme: 8. Along and across the Danube!  
Session format: Regular session  
Session keywords: Lepenski Vir, Mesolithic, Early Neolithic  
Session organisers: Dusan Boric (Sapienza University of Rome | New York University) – Clive Bonsall (University of Edinburgh)

SESSION ABSTRACT

The 1960s discovery of the site of Lepenski Vir and two dozen other broadly contemporaneous Epipalaeolithic, Mesolithic, and Neolithic sites in the Danube Gorges (Iron Gates) area between present-day Serbia and Romania opened up unprecedented insights about the diversity and richness of a pre-Neolithic world in southeastern Europe. Sixty years on, this area’s record of Early Holocene foragers and early farmers, as well as their interactions, still represents an exceptionally well preserved and documented case study. Moreover, the last three decades have seen applications of various methodologically advanced approaches in the study of the archaeological evidence from various sites in the region, including new fieldwork initiatives. The goal of this session is twofold. Firstly, we invite a dialogue about the current state of affairs from those researchers who have investigated first-hand various aspects of the evidence from this region, thus working towards a new synthesis of diverse strands of extant data. Secondly, we also welcome researchers working in other broadly contemporaneous and relevant case studies from the adjacent regions of southeastern Europe and beyond in an attempt to open up this case study to wider lateral and diachronic comparisons.

CONTRIBUTION ABSTRACTS

1221. THE MESOLITHIC AND EARLY NEOLITHIC OF THE DANUBE GORGES: A SYNTHESIS

Contribution format: Oral  
Contribution authors: Dusan Boric (Sapienza University of Rome | New York University)

The area of the Danube Gorges, with its wealth of archaeological evidence covering the transition from the last foragers to the first farmers, provides a rare opportunity to understand, at a high resolution of detail, processes involved in this major shift of lifeways. Sites found concentrated in this area offer evidence of a specific Early Holocene riparian adaptation. There are some notable traits: subsistence and ritual links between humans and different species of fish, a diversity and complexity of burial rites, a peculiar settlement organization, elaboration of unique architectural units linked to a specific landscape setting, distinctive body adornments, and extraordinary boulder artworks. The region also stands in stark contrast to the apparent lack of Mesolithic sites in the surrounding areas of the central Balkans. Recent applications of a suite of sophisticated bioarchaeological and other science-based approaches, which include multi-isotope studies in conjunction with radiocarbon dating, aDNA, analytical approaches to dental calculus and histology, lipid analyses on ceramics, geochemical provenancing of stone raw materials, and others, have significantly contributed to the creation of datasets that allow for increasingly nuanced interpretative accounts. This paper offers a review of the extant data in light of these recently obtained results. It also offers a perspective on the long-standing question of whether the Danube Gorges area represents an exceptional or paradigmatic case of adaptations and transformations of Mesolithic foragers in southeastern Europe.

497. HOW ISOTOPES HAVE TRANSFORMED OUR UNDERSTANDING OF IRON GATES PREHISTORY

Contribution format: Oral  
Contribution authors: Clive Bonsall (University of Edinburgh) – Adina Boroneant (Vasile Pârvan Institute of Archaeology, Bucharest) – Catriona Pickard (University of Edinburgh)

Isotopic analyses, which encompass stable isotopes and radiocarbon dating, have greatly enhanced our understanding of the Mesolithic and Neolithic periods in the Iron Gates. By integrating the results from stable isotope analyses and radiocarbon dating, researchers have gained valuable insights into the dietary habits of past populations, revealing nuances in food sources and consumption patterns that were previously obscure. These methods have also played a crucial role in refining and reshaping chronological frameworks, providing a more accurate timeline of historical events and developments. Moreover, when these isotopic findings are combined with ancient DNA evidence, they offer a more comprehensive picture of population dynamics, such as movements and interactions between different groups. This multidisciplinary approach has enriched our knowledge and challenged existing narratives about the Iron Gates region. The paper delves into these discoveries, highlighting the indispensable contributions of stable isotope research in advancing our understanding of the intricate prehistoric tapestry of the Iron Gates.

1352. REDRAWING THE PREHISTORIC CHRONOLOGY OF THE IRON GATES REGION

Contribution format: Oral  
Contribution authors: Adina Boroneant (Basile Pârva. Institute of Archaeology) – Corina Simion – Cristian Mănăilescu (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering) – Oana Calancea (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering | Vasile Pârvan Institute of Archaeology) – Maria Iliea – Alexandru Petre – Doru Păceșilă (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering) – Adrian Bălășescu (Vasile Pârvan Institute of Archaeology) – Clive Bonsall (University of Edinburgh)

Over the past thirty years, significant progress has been made toward developing absolute chronologies for a select number of prominent archaeological sites in the Iron Gates section of the Danube Valley. For many other sites, however, stratigraphy remains the foundation for internal chronology. In this review, we discuss the results of a programme of AMS 14C dating of animal bones recovered from original excavations on the Romanian bank of the Danube—specifically, at Alibeg, Cuina Turcului, Climente I, Climente II, Ostrovul Banului, Schela Cladovei, Ostrovul Corbului, and Ostrovul Mare. Over fifty new AMS 14C dates are reported, with implications for local and regional chronologies within the Iron Gates region. The integration of new archaeological findings with previous data reveals discrepancies in the traditional chronology, creating a revised timeline that more accurately reflects human occupation and cultural development. By reassessing artefact typologies and settlement patterns, this research contributes to a more nuanced narrative of prehistoric human activity in the Iron Gates region. A significant part of the radiocarbon dating was supported under Research Programme Partnership in Priority Areas PNII MEN-UEFISCDI, contract PN 23210102 and PN 23210201. Experiments were carried out at the 1 MV Tandetron™ accelerator from “Horia Hulubei” National Institute for Physics and Nuclear Engineering (IFIN-HH) and were supported by the Romanian Government Programme through the National Programme for Infrastructure of National Interest (IOSIN).

1183. ENERGY USE AND FIREWOOD-RELATED PRACTICES AMONG PALEOLITHIC HUNTER-GATHERERS

Contribution format: Oral  
Contribution authors: Ethel Allué (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV), Departament d’Història i Història de l’Art) – Andres Robledo (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV), Departament d’Història i Història de l’Art | IDACOR, Museo de Antropología, Facultad de Filosofía y Humanidades, Universidad Nacional de Córdoba) – Tomás Fernández-Iriarte – Maria Joana Gabucio (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV), Departament d’Història i Història de l’Art) – Noa Lachman (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV), Departament d’Història i Història de l’Art | Museum National d’Histoire Naturelle, Paris) – Bàrbara Mas (Université Côte d’Azur, CNRS-UMR 7264 CEPAM | Seminari d’Estudis i Recerques Prehistòriques (SERP) Universitat de Barcelona) – Alba Vidal (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV), Departament d’Història i Història de l’Art) – Llorenç Picornell-Gelabert (ArqueoUIB. Departament de Ciències Històriques i Teoria de les Arts, Universitat de les Illes Balear)

The objective of this communication is to present a new research project focused on studying past fuel use to better understand specific aspects of Paleolithic human behavioral patterns. This research integrates three key objectives: examining firewood selection patterns, investigating energy resources and mobility, and analyzing the living conditions of Paleolithic hunter-gatherer groups. The study covers archaeological sites spanning from Western Europe to Central Asia, incorporating diverse methodologies, including experimental archaeology and dendroanthracology. To achieve the objectives, we are analyzing high-resolution archaeological layers from two case studies in northeastern Iberia: Abric Romaní (Mousterian [Middle Paleolithic]), representing both short- and long-term occupations; Molí del Salt (Magdalenian [Late Upper Paleolithic]; and two sites in the Balkans (Vrbička Cave and Lepenski Vir), where Pinus sylvestris type constitutes 60% to 100% of the total charcoal assemblage. The application of dendroanthracology will help determine whether Pinus sylvestris type branches or trunks were indeed the primary wood-fuel source. It will also allow us to assess whether this practice was consistently maintained or if wood provisioning patterns changed over time and/or space due to social or environmental factors. Additionally, experimental research aims to recreate Paleolithic living conditions and analyze smoke and particle emissions within dwellings. The experimental protocols are designed to ensure replicability and consider

variables such as dwelling types, fuel selection (type, quantity, and quality), duration, and hearth types (braziers and flat hearths). Furthermore, different fuel types—including wood, bone, and grease—are being tested to evaluate their impact on living conditions and combustion structure functionality.

**2148. REVEALING LARGE-SCALE CULTURAL NETWORKS IN THE MESOLITHIC: STRONTIUM (87SR/86SR) ISOTOPE ANALYSIS OF RUTILUS FRISII PHARYNGEAL TEETH FROM SERBIA AND UKRAINE**

**Contribution format:** Oral  
**Contribution authors:** Ivana Živaljevic (Department of History, Faculty of Philosophy, University of Novi Sad) – Adam Boethius (Department of Archaeology and Ancient History, Lund University) – Dmytro Haskevych (Institute of Archaeology, National Academy of Science of Ukraine) – Lilia Popova (Schmalhausen Institute of Zoology, National Academy of Science of Ukraine) – Dušan Borić (Dipartimento di Biologia Ambientale, Sapienza Università di Roma | Department of Anthropology, New York University) – Dušan Mihailović (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

The Late Mesolithic (c. late 8th and the 7th millennium cal BC) saw remarkable expressions of large-scale cultural networks, as evidenced by similar body adornment traditions flourishing in the Danube Gorges region in Serbia and the Dnipro Rapids region in Ukraine. In particular, a multitude of ornaments made from pharyngeal teeth of migratory cyprinid *Rutilus frisii* (vyrezub or pearlfish) has been found in a number of burials in both regions. Sporadic finds of such ornaments have also been reported in the Upper Danube region in Germany, in the Southern Balkans (Montenegro and south-eastern Serbia), and in the Crimean Peninsula in Ukraine, offering further insights into Mesolithic connectivity via riparian and land routes. Whereas the migratory *R. frisii* would have been readily available in most of these areas, seasonally moving to the Danube, the Dnipro, and Crimean rivers from the Black Sea, the contemporaneity and similarity of these practices cannot be seen as unrelated phenomena. In this paper, we present the results of strontium (87Sr/86Sr) isotope analysis by sequential laser ablations undertaken on a large sample of *R. frisii* teeth ornaments and unmodified teeth from Mesolithic sites in Serbia and Ukraine, as well as on archaeological and modern water vole (*Arvicola amphibius*) teeth from various river systems which served as local aquatic baselines. By establishing the local baselines, we aim to shed more light on the provenance of the fish, and the provenance and the routes of the fish teeth ornaments. We will also engage in the questions of local/non-local ornament production and acquisition, and look into the interregional correlations in 87Sr/86Sr isotope ratios as possible indicators of long distance exchange and the movement of people and decorative objects in the Mesolithic.

**1118. EARLY NEOLITHIC POTTERY IN THE DANUBE GORGES (IRON GATES) – PAST AND PRESENT APPROACHES**

**Contribution format:** Oral  
**Contribution authors:** Anca Georgescu – Adina Boroneanț (“Vasile Pârvan” Institute of Archaeology, Romanian Academy)

The works on the Danube riverbanks in Romania and Serbia carried out between the early 1960s and the 1980s, triggered by the construction of the hydroelectric power stations Iron Gates I and II, gave the opportunity for extensive archeological research on both banks, with a particular focus on the site locations that were to be flooded once the constructions of the two dams were completed. These changes opened the chapter of so-far 60 years of research on the archaeological materials found (lithics, faunal and botanical remains, pottery, etc). Initially, the Early Neolithic pottery recovered has been classified by type, paste, color, and decoration (mid1960s – mid-1980s). The shift in pottery analysis started in the 1990s and brought new insights into the function and utility of the vessels. Recent approaches to pottery analysis combine interdisciplinary studies (e.g., modern chemical and physical analysis on paste/pigment composition together with fresh 14C dates) to refine and widen our perception of the origin and development of patterns in ceramic production during the Early Neolithic period.

**936. FLEXIBLE PERSONS AND IDENTITIES: HUMAN AND ANIMAL MANIPULATIONS AT LEPENSKI VIR**

**Contribution format:** Oral  
**Contribution authors:** Jason Rasmussen (SUNY University at Buffalo)

The site of Lepenski Vir has been a phenomenal site over the past 60 years to test and evaluate new archaeological theories, methods and techniques as they came available over the decades. Its unique position along the Danube and Iron Gates created a Refugium allowing archaeologist to study complex interactions between the population and environment in detail previously thought impossible. This presentation seeks to demonstrate such complex interactions between humans and animals as seen in the burial record during the Mesolithic. Manipulations of multiple species alongside human beings’ physical bodies suggest that personhood and identity was highly

malleable in Iron Gates communities during this period as it transitioned into the Neolithic. These manipulations mix and match marine and terrestrial species alongside multiple sets of human remains giving us a view into complex prehistoric ideology. This presentation is based off of the forthcoming Doctorial dissertation by the author at SUNY University at Buffalo.

**218. MESOLITHIC AND EARLY NEOLITHIC OSSEOUS INDUSTRIES FROM OSTROVUL MARE (THE LOWER IRON GATES, ROMANIA)**

**Contribution format:** Poster  
**Contribution authors:** Monica Margarit (“Valahia” University of Targoviste) – Adina Boroneant (“Vasile Parvan” Institute of Archaeology, Romanian Academy)

The Mesolithic and Early Neolithic sites in the Iron Gates have yielded rich assemblages of osseous artefacts. Here we focus on the assemblages from Ostrovul Mare (km 873 and km 875). Our study identified four categories of osseous raw materials: antler (red deer), bone (large mammals), tooth (*Sus* sp.) and shell (*Testudo* sp. carapace). All raw materials could have been obtained locally, suggesting direct acquisition and in situ processing. The typological ranges are limited but comprise well-defined tool series. The most representative are the antler beveled tools and bone pointed tools. While the projectile points are indicative of hunting, the other items suggest domestic activities (cutting and debarking wood, perforating and cleaning hides, etc.). Of technological significance is the raw material differentiation of the blanks: volume blanks in the case of antler, and flat blanks in the case of bone. The osseous assemblages from Ostrovul Mare suggest both economic and technologic specialization. These assemblages fit well in the general pattern of the Mesolithic and Early Neolithic assemblages in the Iron Gates.

**19 INVESTIGATING FOOD STORAGE IN ARCHAEOLOGY THROUGH APPLIED NATURAL SCIENCE METHODS: PROXIES, METHODS AND THEORIES**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** food storage, multi-proxy, multidisciplinary approaches, applied natural science,  
**Session organisers:** Valentina Tumolo (Università degli Studi della Tuscia, Viterbo) – Lisa Maher (University of California, Berkeley)  
**Session discussant:** Meriel McClatchie (University College Dublin)

**SESSION ABSTRACT**

Storing food has always been a basic need for sedentary and semi-nomadic people, and is a central topic in the current discourse around access to resources and food stability. Food stockpiling represents a risk management strategy aimed at reducing food loss due to unfavourable environmental and anthropic factors, but it is also a source of social power that is influenced by socio-economic conditions and, in turn, generates social changes, including the emergence and development of social inequality and hierarchy. Because of this, the decisions associated with food management are not just determined by maximisation of goals, but by a combination of ecological, technical, and social factors. The diverse material outcomes of the interaction of these multiple aspects on archaeological timescales can be investigated using a variety of approaches, and in the recent decades the central value of using applied natural science techniques, including micro-archaeological investigative methods, to define past storage practices has become evident. This session is aimed at researchers tackling the study of food storage evidence, targeting different proxies by using various approaches in applied natural sciences, including micro-archaeological techniques, and covering a range of temporal and spatial scales across different regions and time periods. The goal is to assess the state of the art in food storage study across research strands and to consider how the full range of natural science approaches has been integrated with traditional investigative methods to produce coherent interpretations with strong empirical support, and to reflect on future directions.

**CONTRIBUTION ABSTRACTS**

**601. PALYNOLOGY AS A WINDOW INTO FOOD STORAGE PRACTICES**

**Contribution format:** Oral  
**Contribution authors:** Renée Enevold (Moesgaard Museum)

Food has played a central role in the life of every person who has ever lived. However, because of its perishable nature, food remains can be hard to detect in the archaeological record. Palynology (pollen and non-pollen paly-nomorph (NPP) analysis) has the potential to reveal the contents of containers, storage facilities, pits, and more.

Microscopic fragments of animals or plants can be identified as palynomorphs, and their presence can be analysed and interpreted to aid the archaeological interpretation of a floor-layer, vessel or other storage contexts. This presentation will communicate unpublished case studies where palynology has substantially widened the framework for archaeological interpretation of past storage settings, alongside well-known published case studies. It highlights the utility of palynology for identifying past storage practices. The advantages of sampling the original, prehistoric dirt preserved both on and in artefacts, in cracks and crevasses of planks, ropes and textiles, as well as in graves and floor layers are highlighted. It is important to be creative, yet also very selective when sampling for palynological analysis, and a variety of closed contexts and artefacts with potential for application of the method is suggested.

**1910. HUNTER-GATHERER FOOD MANAGEMENT SYSTEMS IN PREHISTORIC SOUTHWEST ASIA: INSIGHTS FOR THE EMERGENCE OF FOOD PRODUCTION?**

**Contribution format:** Oral  
**Contribution authors:** Lisa Maher (University of California, Berkeley)

Microstratigraphic approaches to the prehistoric record allow us to better understand a ‘life history of place’ by providing insights into the nature of daily practices and activities often invisible at the macroscopic scale. Employing micro-stratigraphic, especially micromorphological, approaches alongside other traditional analyses of hut structures and associated food processing areas, pit features and hearths at a 20,000-year-old Epipalaeolithic site in Jordan provides a window into the life-history of the community by reconstructing the life-history of these features. Kharaneh IV’s large size and dense artefact deposits indicate that it was a hunter-gatherer aggregation locale during occupation and a focal point for regional interaction. Situated at the edge of an extinct wetland, we explore the life-history of the site’s features, especially those surrounding food management (including storage), to assess changes in the use of space over time and to provide a glimpse into the lives woven into and around these places as integral to the construction of hunter-gatherer communities.

**448. MICROSCOPIC INVESTIGATIONS OF AN EARLY THIRD MILLENNIUM BC STORAGE BUILDING AT THE KURDISH-IRAQI SITE OF BASSETKI**

**Contribution format:** Oral  
**Contribution authors:** Felicitas Ruschel (Durham University | Newcastle University | University of Tübingen) – Dan Lawrence (Durham University) – Lisa-Marie Shillito (Newcastle University) – Karen Milek – Graham Philip (Durham University) – Peter Pfälzner (University of Tübingen)

Ancient Mesopotamia is important for understanding the emergence of stratified societies, social inequality and, ultimately, large urban centres and states. Evidence from Northern Mesopotamian sites indicates an initial expansion of settlements and the development of centres in the late fourth millennium BC. This is followed by a period of stasis and in some areas decline, before a second urban florescence in the later third millennium BC. The socio-political organisation of settlements in this intermediate period is not well understood. Small villages along the plains and river valleys become common, with little attestation of social stratification. Many of these villages accommodate large scale storage facilities which have been interpreted as evidence for collective grain storage and processing. However, almost all of these facilities were completely emptied before abandonment, meaning no archaeobotanical or material culture remains are available to corroborate the theory. Nevertheless, the scale of these facilities suggests they were not only used to feed the local population but were either part of a political economy which involved transfers of food to regional centres or were used to bridge poor harvest years and compensate for crop failures. The opening up of fieldwork in Iraqi Kurdistan offers an opportunity to reinvestigate storage facilities in this period to investigate these two competing hypotheses. This paper analyses a recently excavated storage building dated to the early third millennium BC at the Kurdish-Iraqi site of Bassetki using a variety of different methods. It will focus on microscopic methods, especially thin-section micromorphology and phytolith analysis. The aim is to investigate the architecture, building techniques, maintenance and traces of in situ stored goods to evaluate the evidence for economic dependencies, specialisation and social differentiation. This contributes to a better understanding of society and economic strategies of settlements at that time and determine Bassetki’s role in this system.

**225. MICRO-ARCHAEOLOGICAL INVESTIGATIVE METHODS AND FOOD STORAGE SYSTEMS IN THE NORTHERN FERTILE CRESCENT DURING THE FIFTH, FOURTH, AND THIRD MILLENNIA BCE**

**Contribution format:** Oral  
**Contribution authors:** Valentina Tumolo (Università degli Studi della Tuscia)

During the fifth, fourth and third millennia BCE, complex societies emerged in the Northern Fertile Crescent (western inner Syria, southeastern Türkiye, and northern Iraq) including the world’s first cities and early states, and the storage of food staples was crucial to their development. Since food storage depended on the purposes

and social actors involved, and many other different natural and anthropic factors affected the tangible forms of stockpiling, the interpretation of the archaeological record is far from straightforward, and a direct and unequivocal association between the form of the facilities and their purpose cannot be made. This paper will present an international project focused on the investigation of food storage features from the aforementioned regions. This research includes the direct examination of stockpiling facilities from key archaeological sites in Türkiye and the Kurdistan Region of Iraq through a combination of macro-archaeological methods and micro-archaeological techniques, aimed at inferring the processes of building, use, maintenance, and possible secondary repurposing of structures, and the nature of the materials stored. Here we focus on the micromorphological and phytolith analyses, as well as the associated issues with using these methodologies.

**1775. STORAGE OF AGRICULTURAL RESOURCES DURING THE LATE MIDDLE BRONZE AGE AND EARLY LATE BRONZE AGE IN CENTRAL ANATOLIA, TÜRKİYE**

**Contribution format:** Oral  
**Contribution authors:** Doga Karakaya (University of Helsinki, Department of Cultures)

The Bronze Age political systems are believed to have evolved largely through an economic drive to control the production and redistribution of agricultural resources such as wine, olive oil, and staple crops. This control extended beyond household-level subsistence, as palatial authorities played an active role in agricultural production through a range of social and economic mechanisms, including rationing dependent farmers, mobilizing corvée labor, implementing storage systems, and managing irrigation to serve broader political and social objectives. Consequently, agriculture functioned not only as a means of sustenance but also of asserting and displaying political authority, reinforcing the integration of social relations within the Bronze Age societies. The Middle Bronze Age presents a particularly significant period for examining agricultural decision-making within ancient political systems, given the rise of internationalism in Southwest Asia. This era saw the consolidation of political power by Semitic Amorite kings and the expansion of long-distance trade networks linking Mesopotamia, Central Anatolia, the Levant, and Minoan Crete. This paper seeks to contextualize preliminary macrobotanical evidence for the storage of agricultural resources in three Central Anatolian settlements (Aşağıseyit Höyük, Tavşanlı Höyük and Konya-Karahöyük) that were contemporaneously occupied during the final phases of the Middle Bronze Age and the early Late Bronze Age. Each settlement, located across distinct climatic gradients, was buried following a single destruction event, preserving numerous intact storage vessels filled with staple crops in situ. The plant remains indicate a limited range of stored crops, primarily two-rowed barley and hulled wheats. By adopting a multi-settlement perspective, this study aims to identify key variables influencing the spatial organization of storage in Central Anatolian settlements. Additionally, it evaluates the role of local climate, crop production, and Middle Bronze Age political economies in shaping storage practices.

**1812. STORAGE PRACTICES IN THE LEVANT DURING THE BRONZE AND IRON AGES: AN ARCHAEOBOTANICAL PERSPECTIVE**

**Contribution format:** Oral  
**Contribution authors:** Eline Demeulenaere (University of Tübingen) – Simone Riehl (University of Tübingen | Senckenberg Centre for Human Evolution and Palaeoenvironment (SHEP)) – Jens Kamlah (University of Tübingen)

Agricultural endeavors have played a major role in the history of the Levant, with food storage being crucial for managing the risks of seasonal, environmental, and climatic challenges. The study of storage practices can shed light on the organization, surplus management, and socio-economic structures of ancient societies, playing a key role in urbanization and trade. While archaeological and archaeobotanical research has advanced our understanding of agricultural and storage practices in the Levant, a comprehensive synthesis of Bronze and Iron Age storage from an archaeobotanical perspective is still lacking. Archaeobotanical data, when remains are found in situ, can help determine whether a deposit represents intentional storage or other forms of accumulation, aiding in the identification of storage. This study examines Bronze and Iron Age storage in the Levant, synthesizing archaeobotanical data from 18 sites and integrating findings from 54 others to provide a comprehensive region-wide synthesis of storage practices. It explores differences between storage and non-storage contexts, regional and chronological variations in storage practices, socio-economic links, and environmental influences, with the goal of gaining a deeper understanding of storage practices in Bronze and Iron Age Levantine societies.

20 MATERIAL TRACES OF TOTALITARIAN AND DICTATORIAL REGIMES IN THE 20TH CENTURY HIDDEN PAST

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Regular session  
Session keywords: Contemporary archaeology, Forensic archaeology, Materiality, Contemporary history, Digital humanities  
Session organisers: Laura Muñoz-Encinar (University of Barcelona | Institute of Heritage Sciences. Spanish National Research Council) – Dawid Kobiałka (University of Lodz) – Alejandro González Trejo (Institute of Heritage Sciences. Spanish National Research Council) – Lee Douglas (Goldsmiths University of London)  
Session discussant: Rafael Millán Pascual (Institute of Heritage Sciences INCIPIT CSIC)

SESSION ABSTRACT

During the last decade, archaeology has played a key role in the investigation of the repressive strategies of the 20th-century totalitarian and dictatorial regimes (Sturdy Colls 2015, Starzmann 2015; Theune 2018). The systematic use of forensic science –defined as the forensic turn– has also been essential, opening a new window of opportunity for identifying victims’ DNA and reconstructing the hidden past. Mass graves, concentration camps, labour camps and prisons have been archaeologically investigated, producing new narratives surrounding contemporary history. Advanced methods based on the interaction of archaeological and forensic sciences have revealed invisible traces of exclusion and annihilation in Europe and elsewhere (Theune, 2010; Sturdy Colls, 2015; Kola, 2000; Gilead et al., 2010; González-Ruibal, 2020; Muñoz-Encinar, 2019; Kobiałka et al, 2021). The systematic analysis of the sites by combining micro- and macro-methods of archaeological excavation with non-invasive, forensic archaeological methods have been essential. The focus on materiality, known as the material turn, has also been crucial to unearthing marginal stories from the hegemonic narratives of the recent past. The input of material studies has greatly advanced contemporary history and the production of historical knowledge. The overall objective of this session is to reflect on the relevance of archaeology in the study of the repression and violence used against specific political, gender and ethnic groups of society during the contemporary era. The session is open to contributions regarding theoretical, methodological, archaeometry, forensic and digital humanities studies. As such we invite contributions within the broader theme of the contemporary hidden past an. . . totalitarian and dictatorial regimes related but not limited to. Contemporary archaeology Forensic Archaeology Gender archaeology Materialities of perpetrators Other areas of research that contribute to conflict archaeology and multi-disciplinary approaches to understanding contemporary debates about violent pasts.

CONTRIBUTION ABSTRACTS

28. AN ARCHAEOLOGY OF MASS CRIMES – THE CASE OF DEATH VALLEY IN CHOJNICE, POLAND

Contribution format: Oral  
Contribution authors: Dawid Kobiałka (Insitute of Archaeology, University of Lodz) – Laura Muñoz-Encinar (University of Barcelona; Incipit CSIC) – Alfredo González-Ruibal (Incipit CSIC) – Joanna Rogóż – Michał Czarnik (Institute of Archaeology, University of Rzeszow) – Jakub Stępnik (Faculty of Archaeology, University of Warsaw) – Karol Woliński (Institute of Archaeology, University of Gdansk) – Bartosz Żarkowski – Paulina Przepiórka (Faculty of Archaeology, Adam Mickiewicz University) – Szymon Ważyński (Independent)

Since 2020, archaeological research and prosecutor’s investigation have been carried out regarding mass crimes committed by the Germans during the Second World War near Chojnice in Gdańsk Pomerania, Poland. In the autumn of 1939, representatives of the local intelligentsia, farmers, the mentally ill and disabled people, and members of the local Jewish community were murdered near the town. At the end of January 1945, the Germans murdered several hundred Poles in the surrounding fields, whose bodies were then burned to cover up the traces of the crime. As a result of the archaeological research carried out, the remains of approximately 700 people were found, over 6,000 pieces of evidence were secured and various types of samples were taken for specialised analyses. The aim of our paper is to outline the history of the place and the key role of methods, tools and archaeological approach that led to the discovery of the remains of victims that were to be hidden forever and the memory of them erased. In our paper, we will also emphasised the ethical and personal dimension of this type of archaeological work.

52. CAVE UNDER MACESNOVA GORICA – THE LARGEST EXCAVATION OF A POST SECOND WORLD WAR MASS GRAVE IN SLOVENIA

Contribution format: Oral  
Contribution authors: Uroš Košir (Avgusta, d. o. o.) – Luka Rozman (Luxor, d. o. o.)

The paper examines the results of extensive archaeological research conducted at the post-Second World War mass grave site known as the Cave under Macesnova gorica, or ‘Jama pod Macesnovo gorico’ in Slovenian, located in the remote and densely forested area of Kočevski Rog. This region is notorious for containing numerous concealed gravesites created during the chaotic months immediately following the conclusion of the Second World War. It was during this turbulent period that the Yugoslav Army systematically executed large numbers of political and military opponents. Since 2004, the area surrounding the execution site and the mass grave itself has been the focus of ongoing historical and archaeological investigations. Among these, the exhumation of human remains conducted in 2022 is particularly significant due to its scale and the insights it provided. The research uncovered the remains of approximately 3,450 murdered individuals, making it the largest of such archaeological exhumations in Slovenia to date. Furthermore, the use of metal detector survey, excavations at the execution site, and of the mass grave have led to the recovery of thousands of artifacts. These artifacts, which include personal items, military equipment, and other remnants, offer a poignant glimpse into the lives of the victims and the grim realities of the massacre. The evidence collected sheds new light on the tragic events of the immediate post-war period, revealing the systematic nature of the mass executions carried out against opponents of the communist-orientated national liberation movement and the newly established Yugoslavian regime. This study presents the findings from the most extensive archaeological excavations of war victims’ remains within Slovenia, highlighting the vital role archaeology plays in uncovering and understanding the poorly documented and violent episodes of the 20th century.

630. RECONSTRUCTING DEATH CIRCUMSTANCES IN ATYPICAL CASES OF SOVIET CAPITAL PUNISHMENT (1944–1947) IN LITHUANIA

Contribution format: Oral  
Contribution authors: Jovita Kadikinaite (Faculty of History, Vilnius University)

Between 1944 and 1947, individuals sentenced to death by NKGB-MGB were secretly buried at Tuskulėnai Manor (Vilnius, Lithuania). The majority of these individuals were resistance fighters engaged in anti-Soviet activities. Despite the site’s discovery and exhumations beginning in 1994, only 66 of 724 remains have been positively identified, and the investigation is still ongoing. While identification remains a priority, this research adopts a broader approach, reconstructing antemortem, perimortem, and postmortem events to better understand the treatment of prisoners, execution circumstances, and body disposal methods. Addressing these questions is of crucial importance for the provision of closure to families who have yet to receive answers regarding the deaths of their relatives. A central focus of this paper is the analysis of perimortem injuries to reconstruct the circumstances of death. Using forensic anthropological methods, this research enhances our understanding of two key aspects: the individual circumstances of each victim and the methods of the Soviet regime. Preliminary findings indicate that executions were not limited to a gunshot to the head; a number of victims also suffered atypical methods of execution, including perimortem blunt force trauma (blows and crushing) and sharp force trauma (stabbing and slashing). These findings challenge conventional narratives of execution practices, revealing a more complex and violent reality. By comparing forensic evidence with historical sources, this research sheds light on the victims, their deaths, and the actions of the executioners, offering a deeper understanding of Soviet-era crimes against humanity. Moreover, it uncovers details absent from written records, contributing to a more complete historical narrative.

343. SLANA CONCENTRATION CAMP: ARCHAEOLOGY OF THE SECOND WORLD WAR IN CROATIA

Contribution format: Oral  
Contribution authors: Sara Simões (UNIARQ - Centre for Archaeology, University of Lisbon) – Rui Gomes Coelho (Department of Archaeology, Durham University | UNIARQ - Centre for Archaeology, University of Lisbon) – Valerija Gligora (Independent) – Marin Maderić (Independent resercher) – Sanja Horvatinčić (Institute of Art History, Zagreb) – Iva Stojević (Independent resercher) – Ivona Grgurinović (University of Zagreb) – Angelina Stefanović (University of Belgrade, Faculty of Philosophy – Department of Archaeology) – Laia Gallego-Vila (Universidad Autònoma de Barcelona) – Igor Drvendžija (Archive of Serbs in Croatia, Serb National Council)

The death camp of Slana was established on the island of Pag in the summer of 1941 as one of the first and most brutal concentration camps in the Ustaše-controlled Independent State of Croatia. Ran by this Croatian fascist

movement during the Second World War, Slana was part of the Gospić - Jadovno - Pag concentrationary system. In less than three months of operation, thousands of political opponents and civilians were tortured and killed at the barren rocky landscape of the Slana cove, mainly due to their ethnic identity (such as Serbs and Jews). After the closure of the camp by the Italian military authorities for sanitary reasons, the corpses of victims were systematically burned. Even though Slana has been suffering a process of historical erasure since the 1990s, the former camp’s landscape and materialities keep revealing the atrocities that happened there. In 2022 and 2023, as part of the project Tracing Oblivion: The Ustaše Concentration Camps on the Island of Pag, Croatia, an interdisciplinary group of archaeologists, art historians and social anthropologists carried out fieldwork on the island. As part o. this research program, the team conducted a systematic archaeological survey of the camp. Through this project we seek to bring visibly to the atrocities that took place at Slana, re-assembling memories of the recent past and contributing to an ongoing debate on problems that affect contemporary Europe, such as the rise of the far right, neofascism, xenophobia or racism. In this paper we will present the preliminary results of the project.

477. LAYERS OF CONFINEMENT: WAR, RESISTANCE, AND DISPLACEMENT AT CAMP 65

**Contribution format:** Oral  
**Contribution authors:** Giuliano De Felice (Università di Bari ‘Aldo Moro’) – Maria Turchiano (Università di Foggia) – Sergio Chiaffarata – Daniele Mittica (Università di Bari ‘Aldo Moro’)

Camps of confinement—whether for prisoners of war, political detainees, or displaced persons—are defining features of 20th-century conflict landscapes. Since their origins in the 18th century, such sites have played a crucial role in controlling people worldwide during periods of war, colonial expansion, and political repression. In Italy, large-scale detention structures emerged in the 20th century, first with internment sites during the colonial wars and World War I and then widely expanding under Fascism into a vast network of internment, concentration, and POW camps during World War II. Camp 65, the largest POW camp in Fascist Italy, was built in 1940 in Apulia, in the country’s south and, between 1942 and 1943, housed over 20,000 allied prisoners, mostly captured in Africa, with a peak of around 9,000 at a time. However, its history did not end in 1943. Following the Italian armistice, it was repurposed as a training ground for Tito’s partisans (1943-1945) and, after the war, became a recovery center for Italian refugees (1955-1963). Since 2021, archaeological surveys and stratigraphical excavations have been reconstructing this complex history, revealing traces of daily life and survival strategies across all phases of the camp’s existence. Moreover, spatial analysis and surveys are helping to place Camp 65 within a broader and largely overlooked conflict landscape spanning from World War I to the Cold War and the Balkan conflicts of the 1990s. Beyond deepening knowledge of the camp, archaeology brings a new perspective to the narration of war, displacement, and resilience, adding value to an already lively and engaged international heritage community committed to memory and preservation. From a material standpoint, Camp 65 becomes a powerful case study of how tangible remains can help convey a message of memory, peace, and tolerance.

1526. REMAINS OF NAZI TYRANNY AS A SUBJECT OF ARCHAEOLOGICAL MONUMENT PRESERVATION – RECENT EXAMPLES FROM LOWER SAXONY, GERMANY

**Contribution format:** Oral  
**Contribution authors:** Henning Haßmann – Sebastian Messal (Lower Saxony State Service for Cultural Heritage)

The Nazi era is well documented by historical sources and eyewitnesses. Nevertheless, many traces can only be located and explained with archaeological methods. Archaeology also contributes new knowledge to historical research. Due to the enormous quantity, these relics are examined on a case-by-case basis. Forced labor, prisoner of war and concentration camps were mostly demolished after the war. They can be localized using photographs and maps, aerial archaeology, airborne laser scanning, geophysics and field surveys. Abandoned Jewish cemeteries, war graves and camps are protected monuments. Archaeological investigations are carried out to answer specific research questions or as part of international educational work, often to make remains that have been deliberately concealed visible. Explained excavations provide reference points that visitors to the memorial sites can use to find their orientation on the camp area. Excavated finds help to make this elusive place more tangible. However, the excavation of camp-era buildings also poses a major conservation problem. For this reason, the preservation of archaeological monuments is cautious about the desire often expressed by victims’ associations and local initiatives for complete excavation, because the moment it is uncovered, the building substance, which was usually created using rapid lightweight construction methods, is left to decay. Here, protection concepts must be developed that vary on a case-by-case basis between refilling the excavations, structural protection, roofing and translocation. In addition to the sites of tyranny, the focus of monument preservation and commemoration work is increasingly shifting to sites of Nazi mass rallies, as this is where the concept of the “Volksgemeinschaft” as the basis of the inhuman Nazi ideology can be understood. The outstanding testimonial and visual significance of selected relics is undisputed today. However, the educational work is in the hands of the commemoration institutions; archaeological heritage preservation can make an important contribution to this.

905. ADVANCING FIELDWORK METHODOLOGY IN FORENSIC ARCHAEOLOGY: LESSONS FROM THE DEATH VALLEY IN CHOJNICE, POLAND

**Contribution format:** Oral  
**Contribution authors:** Jakub Stepnik (University of Warsaw) – Michał Czarnik (University of Rzeszów)

During the 2024 excavation season in Death Valley near Chojnice, Poland, a mass grave containing the remains of approximately 160 victims of World War II war crimes was uncovered. The deceased were patients of a mental hospital in Chojnice, executed by Germans in 1939 and buried in narrow military trenches, resulting in a multi-layered, intertwined burial. In the talk, we present the excavation methodology, highlighting its advantages and challenges, as an example of the integration of modern documentation techniques during forensic exhumations. The excavation followed a traditional stratigraphic approach, involving the gradual uncovering of the grave along its length and the sequential extraction of individual remains, beginning with the most recently deposited victims. Each set of remains was assigned a unique inventory number, documented photographically in situ, and subsequently analyzed by an anthropologist. To enhance efficiency without compromising data accuracy, georeferenced photogrammetry models formed the basis of the documentation process, completely switching from hand drawings. As a result, each identified object, based on the analysis derived from the 3D models and precise GPS RTK measurements, is unequivocally assigned to a specific individual. This method, while adhering to strict field quality standards, facilitated the development of a detailed 3D database comprising 34 photogrammetric levels, enabling comprehensive post-excavation analysis in a digital environment. The ongoing development of the 3D database aims to not only visualize the scale of the crime but also reconstruct the sequence of events through detailed analyses of trauma, artifact locations, and victim positioning. This digital reconstruction seeks to create a precise virtual model of the burial serving as a resource for forensic archaeological research and education while preserving an already excavated crime scene. The use of this method will allow the scale of the crime to be revealed much more emphatically.

1484. MATERIALITY OF MARTYRDOM: OBJECTS, IDENTITY, AND POLITICS IN THE EXHUMED MASS GRAVES OF POSTWAR SPAIN

**Contribution format:** Oral  
**Contribution authors:** Miriam Saqqa-Carazo (Institute of Heritage Sciences (INCIPIT-CSIC))

More than 80 years have passed since the end of the Spanish Civil War and 50 years since the death of dictator Francisco Franco. However, the mass graves resulting from the war and the regime’s violence remain a crucial subject of historical and archaeological study. This presentation focuses attention, specifically, on the mass graves exhumed by the dictatorship after the war. Between 1939 and 1951, the Franco regime conducted a judicial process to locate and exhume mass graves. However, this effort was exclusively focused on those the dictatorship referred to as “martyrs and those fallen for God and Spain,” deliberately excluding the victims of its violence. Within this necropolitical framework, this paper seeks to examine the context and specific characteristics of these graves and their exhumation processes, while at the same time I will expose and explore the different materialities associated with the bodies of those whom the Franco regime considered ‘martyrs and fallen’. Through the interdisciplinary dissection of the judicial and forensic and through specific exhumation cases, I will outline the excavation methodologies, the typology and quantity of objects recovered from the exhumed mass graves, and their role in the forensic identification of the corpses. At the same time, beyond the objects themselves, we recognize that they, whether in archaeological or forensic contexts, not only define their bearers as individuals but also as members of a social group, class, or ethnic community. With this in mind, I will examine how the objects and clothing recovered from mass graves exhumed in post-war Spain provide insight into the social and political context embodied by this ‘martyred’ materiality.

1979. RECONSTRUCTING THE TRACES OF 20TH CENTURY VIOLENCE IN CATALONIA (SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Queralt Solé Barjau (Universitat de Barcelona) – Laia Gallego-Vila (Universitat Autònoma de Barcelona)

Reconstructing the Traces of 20th Century Violence in Catalonia (Spain) Gallego-Vila, Laia Universitat Autònoma de Barcelona Solé, Queralt Univesritat de Barcelon. Violence during the Francoist Dictatorship took many forms, ranging from murder and confinement to the destruction of material living conditions. This violence permeated the construction of landscapes, architectures, spaces, and specific materials, which shaped the lives of people under this regime. This work proposes a synthesis and interpretation of various case studies in the Catalonia area from the perspective of the material traces of these violences. Different geographies across the territory will be addressed, which we understand represent examples of the different manifestations of violence in Catalonia. The journey will include the destruction of populations, abandonment and reconstruction (Corbera d’Ebre, Guardiola de Berguedà), the Francoist fortification of the Pyrenees Line (Alp), energy and industrial production under

Francoism and housing precariousness (Vallcebre, Barcelona, Flix), and the environment of guerrilla resistance (Guardiola de Berguedà).

2067. BEYOND THE FENCE: A COMPARATIVE ARCHAEOLOGY OF THE FRANCOIST CONCENTRATION CAMPS (DES-ALAMBRAR)

**Contribution format:** Oral  
**Contribution authors:** Laura Muñoz-Encinar – Alejandro González-Trejo (Institute of Heritage Sciences (INCIPIIT CSIC)) – David Alegre Lorenz (Autonomous University of Barcelona (UAB)) – Lee Douglas (Goldsmiths University of London) – Zahira Aragüete Toribio (Independent researcher) – Antonio Rodríguez-Hidalgo (Spanish National Research Council, Institute of Archaeology of Mérida (CSIC-Junta de Extremadura)) – Alvaro Falquina Aparicio – Alfredo González-Ruibal (Institute of Heritage Sciences (INCIPIIT CSIC))

In Spain, there were nearly two hundred concentration camps. The ‘rhetorical’ end of the civil war in April 1939 resulted in tens of thousands of prisoners being (re)integrated into the social fabric of the “New Spain”. From then on, thousands of inmates embarked on a journey which, in the best case, would take them to concentration camps, prisons, or forced labour camps. The diversity of spaces that the camps represent is substantially unknown, and its comparative study presents a potential source of historical knowledge. From April 1939, two different forms of violence were deployed against the subjugated enemy. On the one hand, the violence was channelled through institutional instruments. On the other, the mechanisms implemented against counterinsurgency movements were based on a wide range of brutal practices and massacres against civilians and combatants. The violence continued to spread also to civilians and daily life during the dictatorship until the transition to democracy (1975-1978). This paper outlines the results of the project DES-ALAMBRAR, which addresses the analysis of Francoist concentration camps from the study of the material culture left behind by the violence exerted on them. The results have provided new data about the complexity of Franco’s repressive apparatus and its organisation. The outcomes of the project reveal new aspects of the role played by violence as a form of social control as well as the extreme living conditions to which the inmates were subjected. Many of them were executed or died as a result of diseases derived from the hard living conditions inside the camps. Furthermore, it allows us to shed light on the specific violence applied to women, descendants of prisoners and other minority groups in society. Our results have allowed us to get closer to the traces of the past that remain in the present of Spanish society.

530. FINDING THE DEAD – SEARCH FOR THE VICTIMS OF 20TH CENTURY CONFLICTS IN SLOVENIA

**Contribution format:** Poster  
**Contribution authors:** Uroš Košir (Avgusta, d. o. o.)

Slovenia was the scene of different wars in the 20th century. The First and Second World Wars left numerous cemeteries and war graves scattered throughout the country. Many soldiers still lie unburied on former battlefields or are buried in unmarked graves. A particularly traumatic chapter in Slovenian history are the more than 700 so-called concealed graves from the Second World War and its aftermath. After the war, around 15,000 Slovenes and tens of thousands of members of the occupying forces, collaborators, and political opponents of the new communist regime were executed by the Yugoslav authorities. Slovenian archaeologists have been involved in the excavation of concealed gravesites since 2006. To date, more than 230 grave sites have been confirmed by trial excavations and over 7400 victims of war and post-war executions have been exhumed since 2006. In recent years, greater attention has been paid not only to the anthropological analysis of human remains, but also to archaeological data, such as the stratigraphy of burial sites, artefact spatial distributions and the analysis of artefacts found. These artefacts often reveal whether the victims were soldiers or civilians and to which military formations they belonged. In some cases, the discovered objects can even lead to the identification of the victims. Unfortunately, personal identification is rare in Slovenia, and only in isolated cases has identification been established by DNA analysis. Archaeological research on the victims of the First World War is much rarer, although such research has increased in recent years. In the largest study to date, 32 Italian soldiers who fell towards the end of the fighting on the Isonzo/Soča front were exhumed in 2022. Some earlier studies also focused on cemeteries and war graves in the hinterland of the front lines.

565. CONFLICT ARCHAEOLOGY AND MATERIAL MEMORY: INVESTIGATIONS ON TWO WWII SITES IN APULIA

**Contribution format:** Poster  
**Contribution authors:** Giuliano De Felice – Sergio Chiaffarata – Maria Nunzia Labarbuta – Daniele Mittica (Università di Bari ‘Aldo Moro’)

Modern Conflict Archaeology includes among its most important topics the study of twentieth-century

conflict-related contexts. In Italy, Apulia stands out in this field, with key sites like the American Pantanella Airfield in Canosa di Puglia and Campo PG 65 in Altamura. The Pantanella Airfield, built by the U.S. Army Corps of Engineers in 1944 near Canosa di Puglia, was part of the Foggia airfield complex, a network of over 30 Allied airfields established after the September 1943 landings in southern Italy. Spanning more than 20 square kilometers, some structures still preserve traces of decorations and features linked to the presence of American airmen. Aerial photographs, and documents from the Air Force Historical Research Agency, along with archaeological surveys and digital documentation of surviving remains buildings—have helped reconstruct its layout and identify the function of several buildings, including mass hall, theatre and chapel, and some decorations. The 2021 archaeological investigations at POW camp PG65 near Altamura (Bari, Italy) revealed its complex history beyond WWII. Built in 1940, it later served as a Yugoslav partisan training camp (1943) and a refugee center (1950s) before being mostly demolished in the late 20th century. The study of its remains traces these transformations and raises questions about its future conservation. An active local community, committed to preserving its memory, exemplifies the heritage communities envisioned by the Faro Convention, offering a model for integrating PG65 into a broader narrative of 20th-century history in the surrounding landscape. The archaeology of conflict goes beyond uncovering the material traces of war; it fosters dialogue, reflection, and reconciliation. By preserving and interpreting sites like Pantanella Airfield and PG65, we transform war-torn landscapes into spaces of peace, memory, and shared heritage.

21 THE SOCIAL LIFE OF CRAFTS(PEOPLE): EXPLORING THE INTERPLAY BETWEEN CRAFTS AND SOCIAL STRUCTURES AND NORMS IN 1ST MILLENNIUM BCE EUROPE

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** craftspeople, 1st millennium BCE, Europe, social context, norms and regulations  
**Session organisers:** Karina Groemer (Natural History Museum Vienna | HEAS Human Evolution and Archaeological Science, Vienna) – Matija Črešnar (University of Ljubljana) – Manuel Fernández-Götz (University of Oxford) – Francisco Gomes (UNIRQ - Centre for Archaeology of the University of Lisbon; School of Arts and Humanities)

SESSION ABSTRACT

Studies dealing with craft goods and activities have historically taken different approaches to the topic. Material-centred approaches have had particular currency in archaeological research, and they have been fostered by a growing focus on archaeometry. However, it has long been recognized that we also need other approaches that focus on the social and political contexts in which craft activities were embedded. Studies focusing on cross-craft interaction (CCI) (McGovern 1989; Brysbaert 2007; 2008) have proven particularly fruitful in exploring the social setting of craft activities, especially when combined with the more widespread approach to the chaîne opératoire. CCI approaches look at how different crafts interact in the physical and social space, allowing for a better understanding of the position of craft activities and craftspeople in social networks and, conversely, of the impact of social structures, rules, norms, and regulations in the organization of craft activities. This session explores the social framework of craft activities and their protagonists from a comparative, cross-craft perspective by looking at a range of crafts, including (but not limited to) textiles, pottery, metal, glass, and wood. We invite contributions that explore the social setting in which they took place and how they were organized in a spatial and social sense (Costin 1991), but especially the people behind the craft – the producers and also the consumers –, their identity, status, and role in society (Costin 1998). By bringing together perspectives from the study of multiple craft activities, we aim to foster the development of theoretical and methodological tools to better understand crafts and technology as socially embedded practices, as well as the social role and significance of crafts and craftspeople in 1st millennium BCE societies across Europe. The session thus hopes to ultimately highlight and explore the social mechanisms behind processes of technological innovation, development, and transmission.

CONTRIBUTION ABSTRACTS

2311. CRAFT CONNECTIONS IN ANCIENT CORINTH: EXPLORING CERAMIC-TEXTILE INTERACTIONS THROUGH LOOM WEIGHTS

**Contribution format:** Oral  
**Contribution authors:** Bela Dimova (University of Padua) – Carlotta Gardner – Noémi Müller – Vangelio Kiriatzis (Fitch Laboratory, British School at Athens)

Corinth was one of the great cities of the ancient Mediterranean, with a powerful economy and a vast trade

network. Corinthian pottery was exported widely, but Corinth also made less durable goods, such as textiles. Excavations at the city, led by the American School of Classical Studies at Athens, have uncovered over 1500 loom weights as well as other textile tools, which provide direct evidence for textile production from the 9th to the 1st century BC. An interdisciplinary project examined how the textile and ceramic industries and Corinth were organised and how they interacted through the case study of ceramic loom weights. In addition to studying the function, chronology, contexts, and technology of Corinthian textile tools, we examined how the marks on the loom weights (some of which are considered makers’ marks) relate to their ceramic fabrics through petrography and chemical analysis (WD-XRF). This work was part of a wider study of the textile economy of ancient Corinth and a re-examination of ceramic technology and clay resources in the north Peloponnese. The results show that Corinthian potters used different techniques to make loom weights over the course of the first millennium BC, with workshops going in and out of operation. Petrographic and chemical analysis found (surprisingly) no correspondence between clay paste recipes and makers’ marks, which opens up several possible scenarios for the chaîne opératoire and the potters’ choices.

**1354. ORIENTALISING POTTERY IN ETRURIA: ARCHAEOMETRIC INSIGHTS INTO GREEK INFLUENCE, TECHNOLOGICAL INNOVATION, AND CRAFT SPECIALISATION**

**Contribution format:** Oral  
**Contribution authors:** Maria Diakatou – Efraim Andreadakis (Archaeometry Research Group, Eberhard Karls University of Tübingen) – Lara Maritan (Department of Geosciences, University of Padova) – Lionello Morandi (Department of Civilisations and Forms of Knowledge, University of Pisa | Archaeometry Research Group, Eberhard Karls University of Tübingen) – Maria Taloni (Istituto di Scienze del Patrimonio Culturale - CNR) – Silvia Amicone (Archaeometry Research Group, Eberhard Karls University of Tübingen | Institute of Archaeology, University College London)

The early Orientalising period (late 8th to mid-7th century BCE) was a dynamic phase of sociocultural transformation across the Mediterranean, during which Etruria (central Italy) underwent significant internal changes and saw the emergence of city-states. Relationships with the Eastern Mediterranean escalated, leading to an influx of materials—both tangible and intangible—and to technological innovations, such as wheel-throwing, that facilitated new artistic developments. In particular, the Greek influence in the Etruscan pottery has been stressed the most, with the adaptation of Greek geometric motifs, vessel shapes, and the presence of Greek potters in Etruria. Despite considerable research into this topic, studies have predominantly focused on the typological aspects. However, direct scientific investigations into the underlying material culture—specifically local Etruscan ceramic technology, production organisation, and broader social implications—remain relatively limited. This study examines pottery production in Southern Etruria through archaeometric methods, providing insights into the structure and technology of local crafts associated with Orientalising pottery. By analysing pottery recipes, technological choices, pigment and material characteristics, this research aims to infer the technological niveau, assess the degree of the external stimuli, and explore the social dynamics. Comparative data across important Southern Etruscan sites, including Veio, Cerveteri, Tarquinia, and Vulci, were obtained through ceramic petrography and X-ray fluorescence analyses on 84 pottery samples, representative of Orientalising ceramics. Additional pigment analysis was performed on selected samples using micro-X-ray diffraction and Raman spectroscopy. Results indicate an unprecedented level of standardisation across the region, with evidence of inter-site circulation. The locally produced pottery attests to the technological advancements of Etruscan potters—wheel-throwing, more elaborate manufacturing and firing—their possible response to the Greek influence or other external stimuli. This new level of specialisation and organisational sophistication may partly result from knowledge transmission by Greek potters.

**1737. (A)CROSS THE ALPS: CROSS-CRAFT INTERACTION AND HYBRID CUSTOMS**

**Contribution format:** Oral  
**Contribution authors:** Claudio Negrini (Universität Wien – Institut für Alte Geschichte | Austrian Archaeological Institute of the Austrian Academy of Sciences) – Petra Amann (Universität Wien – Institut für Alte Geschichte)

This contribution presents a case study of cross-craft interaction (CCI) between Italy and Central Europe during the Iron Age. It focuses on bronze configured bow fibulae, sometimes with additional bone and amber inlays. These fibulae were particularly common among the Etruscans of the Po Valley and the ancient Veneti, but have also been found at sites north of the Alps. As part of the costume, the fibula can be considered a distinctive element. The adoption of a specific foreign fashion may therefore indicate the existence of a high-ranking clientele north of the Alps who wanted to adapt their costume to new models of exotic origin. The demand for these novel items was not entirely satisfied by the direct import of exotic goods, but saw the emergence of a local production, possibly facilitated by the transfer of specific craft skills. The bone and amber inlays found on bow fibulae

from sites north of the Alps are consistent with those found in Italy, but they are mounted on fibulae with shapes found in the central-eastern Alpine area, thus showing a hybrid character that is foreign to Italian specimens. This study suggests that these fibulae were made by craftsmen who combined imported decorative elements with objects of local provenance, thus creating a new type of fibula. This implies a remarkable organisation of craft activities, which relied on the import of raw materials and semi-finished products needed to produce locally the products demanded by part of the local community. This case study provides new evidence to further explore the close link between high-rank clients and the production process.

**1648. EVERY STEP OF THE WAY: AMBER WORKSHOPS ALONG THE AMBER ROADS**

**Contribution format:** Oral  
**Contribution authors:** Katja Hagemann (Friedrich-Alexander-University, Institute for Prehistory and Protohistory) – Miloslav Chytráček (Institute of Archaeology of the CAS, Prague) – Lukáš Kučera (Palacký University in Olomouc, Faculty of Science, Department of Analytical Chemistry) – Martin Golec (Palacký University in Olomouc, Faculty of Arts, Department of History, Section of Archaeology) – Zuzana Golec Mírová (Charles University in Prague, Faculty of Arts, Institute of Archaeology | Institute of Archaeology of the CAS, Prague) – Doris Mischka (Friedrich-Alexander-University, Institute for Prehistory and Protohistory) – Vojtěch Zemek (Palacký University in Olomouc, Faculty of Science, Department of Analytical Chemistry) – Jan Martínek (Palacký University in Olomouc, Faculty of Arts, Department of History, Section of Archaeology)

Since the beginning of amber research, the distribution of the raw material along the so-called amber roads has played a pivotal role to this field. Historically, the focus has been placed on specific scientific methods, such as infrared spectroscopy, which allow for the determination of ambers’ origin. Our project, “Amber Roads in the Early Iron Age in Central Europe,” funded by GAČR and DFG from 2023 to 2026, takes a multi-methodical and interdisciplinary approach to achieve a more comprehensive understanding of this fossil resin. We incorporate various methods, including infrared spectroscopy, Raman spectroscopy, and gas chromatography, which complement one another in their output and enable a more precise determination of ambers’ origin. In addition, archaeological and traceological investigations of amber findings have been conducted. The overarching goal of the project is to gain a better understanding of the provenance, distribution, and processing of amber during the Early Iron Age (Ha C – LT A). A significant gap in amber research has been the investigation of amber processing sites (workshops) in Central Europe. By examining the chaîne opératoire of amber and identifying the different phases of amber production, we aim to draw conclusions about these workshops in our project. These locations provide very important information concerning the distribution of raw material and finished products across Europe. Step by step, we seek to clarify the function of workshops along the trade routes and enhance our understanding of the dynamics of amber trade and production.

**1606. UNCOVERING THE “MISSING LINKS” IN IA GLASS BEAD NETWORKS: POSSIBILITIES AND LIMITATIONS**

**Contribution format:** Oral  
**Contribution authors:** Valentina Loncaric (HERCULES Laboratory, University of Évora | IN2PAST Associate Laboratory for Research and Innovation in Heritage | Dept. Earth and Environmental Sciences, KU Leuven) – Mafalda Costa (HERCULES Laboratory, University of Évora | IN2PAST Associate Laboratory for Research and Innovation in Heritage) – Patrick Degryse (Dept. Earth and Environmental Sciences, KU Leuven)

An overwhelming number of Iron Age glass artefacts found in Europe are beads from funerary contexts – deeply personal objects used to adorn bodies both in life and death. While intuitively recognized as luxury imports from the Eastern Mediterranean, the consumer-centered nature of their find contexts (when reliably known), reveals little about glass producers, beadmakers and traders. The issue is further complicated by the lack of direct evidence for primary glassmaking centers or bead workshops during the 1st millennium BCE. Archaeometric studies of glass composition, including trace elements and isotope ratios enable the mapping of glassmaking regions and basic understanding of raw material selection and glassmaking technology, but nuances like the number or size of workshops, their organization or the identities of glassmakers remain unknown. Even less evidence remains of beadmakers and traders. We only know they existed because their existence is integral to the existence of glass beads themselves. How can we approach cross-craft interactions embodied in glass beads when traditionally, research is focused either on the initial glass production or the final consumption practices? Can we attempt to identify beadmakers without direct evidence of a workshop? This paper explores how shifting to a transdisciplinary approach focused on cross-craft interactions can be leveraged to address the invisible craftspeople linked across the Mediterranean by glass beads in the 1st millennium BCE. While this opens new opportunities for

research, caution is necessary due to many methodological limitations.

2318. THE POWER OF TOOLS. IDENTITY AND PRAGMATISM OF THE CELTS ON THE DÜRRNBERG

Contribution format: Oral  
Contribution authors: Ronja Lau (Ruhr-University Bochum)

The settlement, the burial grounds and the Dürrnberg salt mine provide a unique insight into local textile production of Celtic people, from sheep to clothing. Mainly spindle whorls and loom weights from graves and the settlement provide evidence of a link between everyday life and status symbols. The cultural change from the Hallstatt period to the Latène period provides an opportunity to take a closer look at the changes in the working methods of the people on the Dürrnberg from 600-100 BC. Not only did local production techniques change, as can be seen from the spindle whorls, but trade routes and resources also influenced the craftsmen on the Dürrnberg in the Latène period. How is the change of a new culture reflected in craftsmanship, what is typical of the Hallstatt period and what is typical of the Latène period in a place where both can be found? In this paper, I will discuss how we can grasp a change in society on the basis of tools, resources, knowledge transfer and textiles using the extensive site of Dürrnberg near Hallein.

1368. SPECIALIZED CRAFTSMANSHIP IN THE SHADOW OF THE PRINCELY SEAT ON THE IPF? THE OHRENBURG SETTLEMENT IN THE SOUTHWESTERN NÖRDLINGER RIES

Contribution format: Oral  
Contribution authors: Jonathan Schmidt (Goethe-University Frankfurt)

The unfortified settlement at the Ohrenberg, located in southwestern Germany at the border of Baden-Württemberg and Bavaria in the Nördlinger Ries, has yielded a rich spectrum of finds from the late Hallstatt to the early and middle Latène periods. Intensive surveys and two excavation campaigns on its eastern slope have provided evidence for diverse craft activities, including bronze working (casting residues, semi-finished products and crucibles), iron working (slags), textile production (spindle whorls, loom weights), antler processing (semi-finished products) and, with some reservations, even glass processing (production waste). Imported artifacts – such as northern Italian pottery, a southeastern Alpine fibula, and numerous glass objects – suggest an elevated social status for the settlement. Through typochronological, technological, and geochemical analyses, this study examines the development of craft production at Ohrenberg and explores the factors behind the presence of objects traditionally associated with elites in an unfortified settlement. A key focus is the transition from Hallstatt to Latène bronze-working traditions, investigating how local production practices adapted to external stylistic and technological innovations. The presence of imported artifacts at the Ohrenberg settlement suggests a connection to the princely seat on the Ipf, located just 5 km southeast. With the fortified hillfort on the Goldberg (2 km south) and multiple ‘Rechteckhöfe’ and ‘Viereckschanzen’, several central sites from the late Hallstatt and Latène periods are situated in the immediate vicinity. By contextualizing the settlement and its craft production within this subregional framework, this study aims to explore the relationship between craftsmen and elites, the social status of artisans and the distribution networks of their products.

2310. FROM CRUCIBLES TO ARCHAEOLOGICAL LANDSCAPES: THE IMPORTANCE OF EARLY LA TÈNE METALWORKING FOR THE REGION OF SOUTH HESSE, GERMANY

Contribution format: Oral  
Contribution authors: Anna-Lena Jerg (University of Tübingen) – Roland Schwab (Leibniz-Zentrum für Archäologie)

This paper examines the archaeological site of “Groß-Rohrheim” (South Hesse, Germany), which, among other archaeological remains of different periods and about 180 slags, contains almost one hundred mostly well-preserved early La Tène crucibles. Herefore, it is the largest assemblage of early La Tène crucibles known for this period, which is particularly interesting, as the complex comes from a region, in which the Iron Age was usually perceived to be of lesser intensity than in neighbouring areas. However, recent research implies that the region must have been characterised by some sort of centralised settlement to which a workshop may have belonged. This impression is reinforced by the circumstance, that many crucibles seem to be of similar types. Furthermore, radiological examinations indicate, that several adhering metal residues are still preserved, which enables us to explore the questions of standardization, distribution, composition and quantity of the materials used, by applying radiography and computer tomography, light and scanning electron microscopy and energy dispersive X-Ray fluorescence (EDXRF). By reflecting on the current state of research for the wider geographical region and on early La Tène metalworking, we seek to adress not just the distribution and technological properties of the crucibles, but also hope to gain further insight into the underlying social structures and the wider archaeological landscape in which the complex is embedded and to understand the importance of metalworking for early La Tène societies of South Hesse.

2269. THE RISE OF THE LA TÈNE MIDDLE CLASS: HOW TRADE AND TECHNOLOGY FUELED LUXURY CONSUMPTION

Contribution format: Oral  
Contribution authors: Daniel Bursak – Alžběta Danielisová (Institute of Archaeology of the CAS, Prague) – Joëlle Rolland (CNRS, UMR 8215 Trajectoires)

One of the most visible archaeological transitions between early (5th–4th century BC) and middle–late (3rd–1st century BC) La Tène society is the changing nature of the production and distribution of personal objects. In early La Tène, costume parts shared stylistic elements interchangeable across vast regions, forming a kind of broad “La Tène identity”. Provenance of these otherwise homogeneous objects could only be distinguished through archaeometric analysis. By the 3rd century BC, however, elite demand grew for luxury objects made from rare materials or showcasing exceptional craftsmanship. These prestige items, limited in number, did not always align with local technological innovations, such as the emerging use of leaded bronze. However, these innovations fuelled large-scale production to meet the growing local demand for such prestige objects. Local craftsmen rapidly developed efficient production techniques, leading to standardised designs and structured raw material supply networks, often spanning long distances. As a consequence, this period saw the emergence of a new, self-confident La Tène society, where costume styles blended domestic and Mediterranean influences, forming a kind of new “popular culture”. The influx of raw materials created opportunities for individuals with access to long-distance trade, fostering a new elite whose status was based not only on traditional warrior aristocracy but also on commercial and political influence. These suppliers and producers laid the groundwork for later mass-scale production in the 2nd–1st century BC, making metal and glass jewellery even more accessible to wider group of consumers. Our paper explores how trade and technological advancements reshaped social identities and class dynamics. We examine the expansion of production, evolving distribution networks, and how once-exclusive elite goods became widely available, fostering new social distinctions in La Tène Europe.

617. CASTING LIGHT ON CAST METAL: PRODUCTION OF LOCAL AND NON-LOCAL TYPES OF COPPER-ALLOY ITEMS IN THE PRE-ROMAN IRON AGE SILESIA

Contribution format: Oral  
Contribution authors: Joanna Markiewicz (Univerzita Karlova) – Dawid Sych (University of Leicester)

While the middle and late La Tène period in central Europe was definitely the heyday of iron, mass-scale production of copper-alloy items also flourished. The study discusses a few selected artefacts recorded at the La Tène culture central site of Nowa Cerekwia. Those include fibulae, belt hooks, bracelets, production waste, and parts of the Kronenhalsring necklaces connected to the Jastorf tradition from the North European Plain. Many artefacts display traces of being cast in two-part moulds, most likely ceramic. Traces of metal grinding, hammering, drilling, drawing and bending are also visible. The presence of a series of non-La Tène copper-alloy artefacts, such as the Kronenhalsring hinge pins, raises questions about the transfer of skills, ideas, and movement of people among the artisans of the time. It is all the more intriguing, given that some of these items seem unfinished and bear production traces, such as casting seams, indicating they were made on the spot. In this way, the study also discusses social and cultural reproduction in ancient societies, highlighting the complex dynamics of cultural exchange and mobility during the Iron Age.

1370. FROM PRESS TO TABLE: SOCIOECONOMICAL VIEW OF THE IRON AGE WINEMAKING AND OIL-MAKING IN THE NORTHEAST OF THE IBERIAN PENINSULA

Contribution format: Oral  
Contribution authors: Antoni Corrales Soberino (Institut Català d’Arqueologia Clàssica (ICAC-CERCA))

The production of oil and wine during the Antiquity has been extensively studied by the archaeology and the historiography. In fact, in the northeast of the Iberian Peninsula (approximately the current limits of Catalonia), the investigation of these artisanal activities has been focused on the roman period. This is due to the importance of this region as a winemaking producer during the High Empire. The great spread of productive centres along the territory and their conservation allowed, consequently, their study. Despite that, the investigation of these activities during the Iron age is furtherly different. Until less than two decades, apart from few findings of elements in secondary position, the productive spaces were still unknown. Currently, with the recent discovery of many pressing installations and warehouses, not only the knowledge of these vegetal transformation activities has increased, but also the elaboration of new studies. At this point, we present the following contribution: a synthesis of all the Iron age winemaking and oil-making evidence in the northeast of the Iberian Peninsula (between Vth – IIInd centuries BC). The analysis of these activities will be ascendent: starting with the elements and the structures (presses, tanks and warehouses) and finishing with the comparation between Iberian territories. We will also treat factors as the pressing space, its place in the house and in the urban scheme, or the

type of settlement where these activities can be found. Through the comparison and discuss of the mentioned elements, it will be possible to obtain a socio-economical view. Specifically, not only it can be suggested many productive approaches, but also who could control these facilities and to whom were assigned the finished products. Therefore, it will be able to have a more complete understanding of the Iron age winemaking and oil-making in the northeast of the Iberian Peninsula.

496. CLAY FIGURINES, CRAFTS AND COMMUNITIES ON EASTERN IBERIA DURING THE IRON AGE

**Contribution format:** Oral  
**Contribution authors:** Mireia López-Bertran (Universitat de València) – Jaime Vives-Ferrándiz Sánchez (Museu de Prehistòria de València)

This paper examines how the craft practices involved in modeling terracotta figurines offer insights into historical dynamics related to various social issues, including technological processes, group and gender identity, and conceptions of the body. Specifically, we focus on human and animal terracotta figurines from eastern Iberia (modern-day País Valencià), dating from the 3rd to the 1st centuries BCE. In this context, we explore the manufacturing techniques of these clay figurines and how they construct communities with social bonds formed through the practice of modeling. Additionally, we discuss how structural variations in production processes are linked to the technological traditions of these groups, particularly in terms of modeling techniques, gestures, and symbolic elements. Iberian clay figurines are a valuable source of information for understanding the social contexts in which craft activities were practiced. The data presented here is part of the ongoing research project entitled TERRACOT: Clay Figurines and Communities in Eastern Iberia during the Iron Age (PID2023-150349NB-I00), funded by the Spanish Ministry of Science, Innovation, and Universities.

801. THE CRAFTY DEAD: WORKING TOOLS AND POSSIBLE ARTISANS IN GRAVES FROM THE IBERIAN SOUTHEAST (MURCIA, SPAIN), 4TH-2ND CENTURIES BCE

**Contribution format:** Oral  
**Contribution authors:** Pablo Harding – José Fenoll-Cascales (Universidad Autónoma de Madrid)

This paper explores the perception and role of artisanal work in Iberian society by focusing on a selection of graves containing tools used for working wood, stone, leather and pottery. These graves are found in the southeast of Spain, and date from the 4th to the 2nd centuries BCE. The symbolic and ritual nature of funerary contexts, in which every action and grave good is a result of a careful and pre-meditated decision, makes them ideal contexts for approaching identity at both a collective and individual scale, albeit with considerable caution. In this sense, the publication of the rich “Jeweller’s Grave” from the Cabezo Lucero necropolis (Uroz 2006) brought to bear the topic of the role and status of artisans in Iberian society. Opinions differ on whether working tools found in funerary contexts were used during the lives of the deceased or whether they were deposited as an indicator of a source of wealth. Nevertheless, the small number of such graves has brought the discussion to a standstill. The topic has continued to be overshadowed by studies focusing on other more frequent materials interpreted as identity markers, often gender-related, such as weaponry and textile implements. Recent research has provided more examples of this interesting minority than previously considered. Close analysis of the working implements themselves, associations between different tools, and their specialised uses in the chaîne opératoire, leads us to conclude that most of these tools would have been used for specialised tasks related to the final elaboration of the goods, and less so the extraction and initial preparation of raw materials. This evidence, in ritual spaces with a limited aristocratic access as were Iberian necropoleis, points to a high appreciation of the act of crafting by the Iberian elites, whether or not the deceased was an artisan.

472. WHO PULLED THE STRINGS? IRON AGE TEXTILE ACTIVITIES IN SOUTHERN PORTUGAL IN THEIR SOCIAL AND ECONOMIC CONTEXT

**Contribution format:** Oral  
**Contribution authors:** Francisco Gomes (UNIAHQ - Centre for Archaeology of the University of Lisbon | School of Arts and Humanities of the University of Lisbon)

In recent years, our understanding of textile production during the Southern Portuguese Iron Age (8th/ 7th – 2nd centuries BCE) has advanced considerably, despite a persistent dearth of good quality data. Insights can now be garnered on the technological features of this production, and even on its scale and general context. However, many questions remain regarding the organization of production and, most critically, the identity of the craftspeople themselves. The information regarding possible textile production spaces remains scarce, but evidence seems to suggest a pre-eminence of household production, which is difficult to characterise in detail due to the scarcity of good analyses of domestic spaces. A growing body of data suggests that a parallel production on a larger scale in sanctuaries also took place, but information on its organization remains limited. The fragmentary evidence from the funerary record offers insights into the agents of this production, pointing (albeit in a tentative

way) to an association between textile production and women, and potentially women of a certain status within their communities. A key question that remains to be answered is how this textile production fits into the overall productive fabric of regional Iron Age societies. This presentation will explore this topic, comparing what we know about the context and scale of textile production with the available panorama for pottery and metallurgical production. It will be argued that, in the wake of the transformation of economic systems fostered by the Phoenician presence, there are key differences regarding the organization of these activities, which may map onto gendered roles within the community and an integration between household and workshop production as part of complex economic systems. The implications of this situation for the social status and standing of textile crafts and their practitioners will be discussed as a corollary to this analysis.

1617. TRACING THE SOCIAL LIVES OF IRON AGE CRAFTSPEOPLE BY ADDRESSING THE STUDY OF PLANT-BASED CRAFTS: CASE STUDIES FROM NORTHERN IBERIA

**Contribution format:** Oral  
**Contribution authors:** Maria Martin Seijo (Institute of Heritage Sciences (INCIPIT-CSIC), Santiago de Compostela)

During the Iron Age, plants constituted the primary source of raw materials for crafting, with a wide range of objects being made (e.g. cords, nets, baskets, wooden containers, handles and even statues), structures being built (e.g. buildings, thatching roofs, wattle fencing, trackway structures) and even means of transport being constructed (e.g. log boats, carts). The importance of wood crafting and other plant-based artefacts in relation to metalworking should be given due consideration and discussion in the context of archaeological research. The reason for this is that plant materials and metals are closely intertwined. A wide array of tool types and forms – adzes, saws, chisels and gouges, and various types of specialised axes – were developed for wood crafting, and two of the main technological innovations of woodworking – turning and cooperage – were developed in late European prehistory, probably somewhere around the latter half of the 2nd millennium BCE. Both tools and techniques reflect an increasing complexity in working with plant materials, suggesting the acquisition of exceptional biomechanical skills and the development of bodily relationships with tools through cross-generational craft memory and experience passed down from master to apprentice. This also indicates the existence of specialised workshops and the potential for the emergence of specialised craftspeople. Even those craftworks often considered as related to the domestic sphere require specific and long processes of learning to acquire a deep knowledge of plants and their lifecycle, as well as specialised skills for tending and managing trees, shrubs and herbs to obtain adequate raw materials. The social lives of Iron Age craftspeople involved in the crafting of plant materials will be addressed by several case studies from Northern Iberia. These will be based on direct archaeological evidence, as well as other forms of evidence of cross-craft interaction.

1163. FIRST APPROACH TO THE DEPOSITS OF MUREX (STRAMONITA HAEMASTOMA) FOUND IN THE RAMPART AREA OF CAMPA TORRES HILLFORT (GIJÓN, ASTURIAS)

**Contribution format:** Oral  
**Contribution authors:** Fernando Rodríguez Del Cueto (University of Oviedo) – Almudena Orejas Saco Del Valle (CSIC) – Rubén Montes López – Paloma García Díaz (Archaeological Museums of Gijón) – Elena Lastra Alonso (University of Oviedo)

The Campa Torres hillfort was dug between 1978 and 2000, as part of the research in Iron Age societies of the prehistorian Jose Luis Maya. Two main areas involved this research: first, the hilltop. Probably the oldest area where the only preserved ditch, next to a complex network of modular walls cut the connection of the Cape Torres with the mainland. The old excavations indicate an important occupation since (at least) the VI century BC and till the Roman times. Second, the plain area where Roman buidings live together with other structures. Although the main occupation lead us to different Roman phases, the first uses of the plain started around the Second Iron Age (IV century BC). Several small papers and a book were the only archaeological information available due to the tragic loss of Maya. Now, a new phase of the project just started divided in 5 steps: since 2021 we carried out a database of the archaeological materials with around 20.000 registers (phase I). The conservation of the plain remains (phase II), affected by continuous floodings till 2023. Phase III implies the research and conservation of the rampart area. Here, in various zones near the deffensive walls, at least 127 kilogrammes of murex (stramonita haemastoma) corresponding to a mininum of 10.460 elements were recovered in the old excavations. New radio-carbon data indicates that we are moving in a time lapse between the II century BC and the end of first century BC. The acquirement and processing of enormous ammounts of murex was surely an important effort for the protohistoric communities of Campa Torres. Our contribution will summarize the main features of these activities as well as some considerations about the social repercussions in the inhabitants of the hillfort, based on the data gathered in the new research.

1456. MULTIFUNCTIONAL AND COOPERATIVE WORKING-SPACES IN EARLY IRON AGE ARTISANAL SITE OF “QUESTURA” (PADUA, ITALY). DATA FROM MICROSTRATIGRAPHIC EXCAVATION

Contribution format: Poster  
Contribution authors: Vanessa Baratella (University of Padua | University of Ljubljana)

The center of Padua (Veneto region, Italy) was born and developed during the 8th century BC, in the context of the proto-urbanization phenomenon that involved the entire Veneto territory between Early Iron Age 1 and Early Iron Age 2. In the heart of the modern center of Padua, at the Police Headquarters (i.e., “Questura”), a significant part of a site with both productive and residential functions was investigated between 2000 and 2001. In this context, several production workshops were identified: a ceramic workshop, an area for the production of building materials, and a foundry for producing bronze artifacts; all these production areas operated in synergy. Twenty years later, thanks to a microstratigraphic excavation conducted in 2022 by the University of Padua on a portion of stratigraphy that had been removed from the foundry in 2000 and had not yet been excavated until now, it was possible to recognize how different productive activities (bronze working, deer antler processing, and woodworking) coexisted in this specific space, and consequently, different artisans and technological know-how live together. The entire complex was then subjected to a detailed analysis that provided new data on the management and organization of artisanal spaces in Early Iron Age Padua. Moreover, thanks to an interdisciplinary approach that combined archaeological data with archaeozoological and archaeobotanical data, it was also possible to analyze in detail the interaction between artisans and their workspace.

22 SHAPED MARGINS: MORPHOLOGICAL AND ENVIRONMENTAL EVOLUTION OF COASTAL AREAS IN LONG-INHABITED URBAN SPACES

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Regular session  
Session keywords: Geoarchaeology, Paleoenvironments, Environmental proxies, Coastline, Anthropogenic influence  
Session organisers: Ana Maria Costa (Laboratório de Arqueociências (LARC) | Património Cultural, IP) – Matthieu Giaime (Archéologie des Sociétés Méditerranéennes UMR5140, Université Montpellier 3, CNRS)  
Session discussant: Maria Conceição Freitas (University of Lisbon, IDL - Instituto Dom Luiz)

SESSION ABSTRACT

Due to the general attraction of people to the sea, coastal areas were occupied since prehistory, progressively becoming important urban centers hosting large number of inhabitants. Concentration of populations along the coastal margins led to an artificialization of the milieu through time mostly due to i) dump deposits on the marginal environments (beach and marshes); ii) the edification of structures such as front walls, defensive walls, docks and port structures on the coast; iii) the construction of anthropic landfills on the coastal environments, among other anthropogenic actions. These human impacts modified the natural environmental conditions on the coastal area. They could lead to the advance of the coastline (beach, dune, marshes, low subtidal environments) or to the regression or disappearance of coastal environments. In this sense, this session aims to present and discuss research concerning morphological and environmental changes of coastal areas through time, with a focus on areas located near long-inhabited cities that are prone to anthropogenic actions over a long period of time.

CONTRIBUTION ABSTRACTS

359. PALEOENVIRONMENTAL STUDY OF THE TAGUS ESTUARINE MARGIN (LISBON, PORTUGAL) - PRELIMINARY RESULTS OBTAINED FROM A SEDIMENT CORE COLLECTED IN SANTOS

Contribution format: Oral  
Contribution authors: Margarida Silva (Laboratório de Arqueociências PC, IP | Departamento de Geologia, Faculdade de Ciências, Universidade de Lisboa | Instituto Estudos Medievais NOVA) – Ana Costa (Laboratório de Arqueociências PC, IP | BIOPOLIS | InBIO | CIBIO | IDL - Instituto Dom Luiz; Universidade de Lisboa) – André Albuquerque (Império Arqueologia Lda) – Nuno Neto (Neópica, Lda – Arqueologia e Património) – Nuno Pires (Empatia – Arqueologia, Conservação e Restauro, Lda) – Maria Freitas (Departamento de Geologia, Faculdade de Ciências, Universidade de Lisboa | IDL - Instituto Dom Luiz; Universidade de Lisboa)

This paper discusses the preliminary results from the multiproxy analyses (sediment texture, organic chemistry, organic matter and calcium carbonate content) of a sediment core (Metro Santos) collected during a salvage archaeological intervention in the former Boavista Bay, where a subway station is under construction. The Boavista Bay, located between Cais do Sodré and Santos (Lisbon), lies on the estuarine margin of the Tagus, and once comprised ancient beaches, intertidal and subtidal environments. The core was collected c.175 m south of Rua da Boavista, considered as the pre-occupation coastline (assuming the high tide line). The area has been documented as a major site of human activity, especially for port and commercial purposes, throughout the Roman, Modern and Contemporary periods, until the construction of the Boavista landfill in the 19th century, that covered these marginal environments. Multiproxy data from previous sediment cores (EDP1 and Essentia, both located c. 200 m south of the Rua da Boavista and c. 200 m east of Metro Santos) obtained in other interventions in the same area, indicate sedimentation occurring in subtidal to intertidal conditions in a low-energy environment and the transition to sediments rich in anthropic debris topwards, covering the last 3000 years as suggested by the preliminary 14C dating results. Our objective is to compare and correlate these results with the information obtained from the Metro Santos core i) searching for a better understanding of geomorphological evolution of the bay; ii) aiming to reconstruct the paleoenvironmental conditions of this estuarine margin over time, and iii) disentangling the anthropic influence from the natural processes responsible for the identified changes. This work is supported by the Portuguese Fundação para a Ciência e Tecnologia, FCT, I.P./MCTES through the PhD grant PRT/BD/155050/2023 and national funds (PIDDAC): UID/50019/2025 and LA/P/0068/2020 (<https://doi.org/10.54499/LA/P/0068/2020>).

1959. ENVIRONMENTAL FACTOR IN THE DECLINE OF LATE ANTIQUE URBANISM: A COMPARATIVE STUDY ON HISTRIA AND EPHEBUS

Contribution format: Oral  
Contribution authors: Sercan Batum (Humboldt-Universität zu Berlin | Middle East Technical University)

This paper aims to analyze the environmental impact on Histria and Ephesus in Late Antiquity. Though both of the coastal cities, Histria and Ephesus, are in different geographies (Scythia Minor/Western Black Sea and Western Anatolia, respectively), changes in their coastal environment led to their decline at the end of Late Antiquity ca. 6-7th centuries AD. Thus, this similarity deserves a comparative study and scrutiny. Both Histria and Ephesus were subjected to environmental and political challenges during Late Antiquity. This paper emphasizes the environmental aspect of the decline: In light of recent data, this work hypothesizes that both cities lost their maritime vocation, becoming landlocked cities due to geomorphological transformation of their coastal environment e.g. sedimentation and coastal progradation. Cross comparison of both sedimentary records is to highlight the response and resilience of the two cities. Though urban life in Ephesus could survive through urban reconfigurations in the Medieval Period, it ceased to exist in Histria. In addition to a comparison between the two cities, the paper aims to highlight how the environment affected their urban nature, including urban topography, social-cultural settings, and economic structure. This is done with an interdisciplinary approach that combines different disciplines such as archaeology, history, and geology.

1164. LINKING ALEXANDRIA TO THE NILE: GEOARCHAEOLOGICAL INVESTIGATIONS TO LOCATE THE ANCIENT BURIED CANAL(S)

Contribution format: Oral  
Contribution authors: Matthieu Giaime (Université Montpellier Paul-Valéry, UMR 5140 Archéologie des Sociétés Méditerranéennes) – Isabelle Hairy (UMR 8167 Orient & Méditerranée | UAR 3134 CeAlex, Egypt) – Mena El-Assal (King Khalid University, Saudia Arabia) – Hany Salah – Mohamed Al Deep – Mahfooz Hafez – Wael Ragab – Mamdouh Soliman (National Research Institute of Astronomy and Geophysics, Egypt)

Alexandria, second largest city of Egypt, was founded by Alexander the Great in the winter of 332-331 BCE on the western coast of the Nile delta. The coastline on which Alexandria was built was bordered by the island of Pharos, defining a long bay between the capes of Agami to the west and Silsileh to the east. Between the two ends of the island and the capes, the eastern and western approaches were protected by reefs. The Alexandrian sandstone has deep fissures where water flows freely and at high speed, making it similar to a karst aquifer. This reservoir could possibly contain ca. 200 liters per cubic meter of sandstone. The first wells, drawing water from the aquifer, were sufficiently important to provide water for the earlier inhabitants of Alexandria. However, few decades after the foundation of the city, Ptolemy 1st orders the digging of a canal to connect Alexandria to the Nile. The construction of the canal(s) responded to a political and religious objective. From a religious perspective, linking the city to the Nile made it fully Egyptian. It has also a practical and economical aspect, the water supply of Alexandria and the navigation between Alexandria and the Nile. Here we present preliminary results of Electrical Resistivity Tomography and geomorphological coring aiming at locating the canal and its outlet into the Mediterranean, the Kibotos basin, that were mentioned by Strabo during its visit of the city at the turn

of the Christian era.

1863. FLOODING THE CITY: A MULTIDISCIPLINARY APPROACH TO ANTHROPOGENIC ACTIONS RELATED TO FLOODS IN MEDIEVAL ISLAMIC LISBON (TAGUS ESTUARY, PORTUGAL)

**Contribution format:** Oral  
**Contribution authors:** Victor Filipe (UNIARQ- Centre for Archaeology, University of Lisbon | Torres Novas City Council) – Manuel Fialho (GEO - CML: Gabinete de Estudos Olisiponenses, Lisbon City Council | CH-ULisboa: Centre for History, University of Lisbon | UNIARQ- Centre for Archaeology, School of Arts and Humanities, University of Lisbon) – Luís Almeida (DGEG- Directorate General for Energy and Geology | UNIARQ- Centre for Archaeology, School of Arts and Humanities, University of Lisbon | HERCULES Laboratory - University of Évora)

Archaeological excavations in Hotel de Santa Justa, in Lisbon’s downtown, uncovered an 11th-century Islamic neighbourhood alongside Esteiro da Baixa, a subsidiary creek of the Tagus Estuary. This area is set in a flattened valley embedded in Miocene formation and infilled after sea-level rise deceleration around 7000 cal. years BP. The estuarine margins were then reworked in sediment-accumulating estuarine areas like Esteiro da Baixa. Since the Iron Age, human activity influenced sedimentary dynamics, erosion, and infilling processes, reflecting the long diachrony of occupation of the city. Although we don’t know much about Islamic Lisbon’s history, Archaeology has been revealing a vibrant and active urban centre. The city, located in the riverside of the Tagus Estuary mouth, was structured in different areas, with a western suburb very much prone to floods coming both from the Tagus and from its subsidiary creeks that crossed the downtown. The urban growth that took place in the 10th and 11th centuries faced an important challenge to domesticate the creek to allow the building of houses in previous peri-urban rural areas. Floods were common in the period, and there are historical accounts of riverside floods elsewhere in Al-Andalus that caused forceful actions by the Islamic authorities, which allow us to draw parallels based on the archaeological and geoarchaeological evidence presented in the site of Hotel de Santa Justa. The archaeological excavation, made in 2011, revealed some structures that may be connected to anthropogenic actions related to the water presence very close to these houses of Lisbon’s western suburb. Our revisit to this archaeological site follows an approach which combines Archaeology, Geoarchaeology and History to allow us to understand the anthropogenic actions made by Lisbon’s inhabitants in a specific place of Islamic Lisbon’s western suburb trying to control the course of nature in a very exposed coastal area.

2138. EVIDENCE OF ANTHROPIC MODIFICATIONS ALONG THE LISBON ESTUARINE MARGIN IN THE DOCUMENTARY RECORD, INCLUDING PHOTOGRAPHS, MAPS, AND WRITTEN DOCUMENTS

**Contribution format:** Oral  
**Contribution authors:** Ana Maria Costa (Laboratório de Arqueociências (LARC) | Património Cultural, IP | Associação BIOPOLIS-InBIO | IDL - Instituto Dom Luiz, Universidade de Lisboa | UNIARQ - Centro de Arqueologia da Universidade de Lisboa) – Margarida Silva (Laboratório de Arqueociências (LARC) | Património Cultural, IP | IDL - Instituto Dom Luiz, Universidade de Lisboa) – Maria Da Conceição Freitas (IDL - Instituto Dom Luiz, Universidade de Lisboa)

Estuaries are transitional zones between fluvial and marine environments that often provide space, shelter, and abundant natural resources for human populations. Lisbon, the capital and largest city of Portugal, is located on the right bank of the Tagus estuary, one of the larger estuaries in the Iberian Peninsula. The city has a long history of human occupation. The city center was established during the Iron Age, the earliest anthropic structures dating from the 5th to 3rd centuries BCE. Since then, there has been anthropic manipulation of the estuarine margins, both for the Tagus and its tributaries, although human influence along the margins intensified mainly during the Middle Ages. In addition to data derived from sedimentary and archaeological records, historical cartography (since the 16th century), old photographs (from the 19th century onwards), and written documents also provide key evidence of anthropic changes. These sources contribute to reconstructing the morphologies and environments of the Tagus estuarine margin in different periods. In this study, we present the results of an interdisciplinary investigation aimed to reconstruct the evolution and morphology of the northern Tagus estuarine coastline in Lisbon, mainly based on historical images and written documents. Old cartographic maps helped to estimate the extent of the coastline, which has been buried beneath deliberate landfills built at least from the 16th century onward. Historical photographs reveal Lisbon as a city of beaches rather than buildings. Written documents provide evidence of salt marshes at the mouths of some Tagus tributaries that once crossed the city. These are just some examples, and the findings, along with additional examples, offer valuable insights into the transformation of the Lisbon estuarine margin over time.

23 TAMING THE BALKANS: RIVER VALLEYS AS COMMUNICATION SYSTEM FOR THE EARLY FARMERS SETTLING THE BALKAN HINTERLANDS

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Balkan hinterlands, river system, spread of farming, settlement strategies, economic strategies  
**Session organisers:** Darko Stojanovski (Austrian Archaeological Institute, Austrian Academy of Sciences | Goce Delchev University) – Slaviša Perić (Institute of Archaeology, Belgrade) – Krum Bacvarov (National Institute of Archaeology & Museum, Bulgarian Academy of Sciences) – Barbara Horejs (Austrian Archaeological Institute, Austrian Academy of Sciences | HEAS and UHA, University of Vienna)

SESSION ABSTRACT

The Balkan hinterlands played a crucial role during the transition of the Neolithic communities from the warm Mediterranean towards temperate Central Europe. It was an arena where people had to adapt their practices to the changing environments and adopt new ones. Exploring the landscape was an initial step in that direction. In the rugged Balkan terrains, the rivers facilitated movement, navigation, and further expansion into the new lands. The role of rivers in the dispersal of the early farming communities has been explored in the past, in the general context of the Neolithization process between the Near East and Europe. The Vardar/Morava and the Struma valleys have been recognized as the two most important corridors connecting the Aegean Sea and the Danube, and Maritsa River has increasingly been emphasized by recent research. To better understand the process, a (micro-) regional approach is necessary. With the latest international multidisciplinary collaborations and intensification of fieldwork in the Balkans, a higher resolution assessment is possible, and we believe it is the right time to revisit the topic. The session is open for different methodologies and approaches, focusing on the settlement and adaptation strategies of the early farmers in the micro regions along the riverine valleys of the diverse Balkan landscape between the Aegean and the Danube. Topics may include, but are not limited to, settlement strategies and spatial organization, raw material procurement, exchange networks and social interaction. We invite papers presenting new data, comparative studies or overviews, and we hope the session will serve as a platform where the state-of-the-art in the field is represented.

CONTRIBUTION ABSTRACTS

1249. NEOLITHIC VARDAR-MORAVA CONNECTIVITY. A SITE-BASED, INTERDISCIPLINARY AND COMPARATIVE APPROACH

**Contribution format:** Oral  
**Contribution authors:** Barbara Horejs – Darko Stojanovski (Austrian Archaeological Institute, Austrian Academy of Sciences)

The new site-based, interdisciplinary and comparative study on the ‘Neolithic Vardar-Morava Connectivity’ has been initiated by the authors in 2024. This multi-level research aims new primary data in the framework of a conceptual re-evaluation on the Neolithization of the central Balkans, which we understand as a key region for the European Neolithic, where the communities went through essential transformations by bridging the gap between the warm Mediterranean and the colder and humid continental parts of the continent. Our approach is focusing on comparing the two Neolithic sites Amzabegovo at the Vardar River and Svinjarička Čuka at the southern Morava River and their distinct micro-regions to identify the discrete mechanisms and the dynamics of the Neolithic spread between the Aegean and the Danube. The Vardar and Morava River valleys constitute one of the main corridors, facilitating the movement of people, goods, skills and ideas, and is well represented by both case studies we are currently excavating with state-of-the-art methods. This paper presents an overview of the ‘Neolithic Vardar-Morava Connectivity’ studies based on new contextualized materials.

721. THE VALLEYS OF THE STRUMA AND VARDAR RIVERS, TWO OR ONE WAY OF THE NEOLITHIZATION PROCESS?

**Contribution format:** Oral  
**Contribution authors:** Malgorzata Grębska-Kulow – Galia Vandeva (Regional Museum of History, Blagoevgrad)

The intensive studies of the Early Neolithic in the valleys of Struma (Strymon) and Vardar (Axios) have yielded novel data on the introduction and development of agriculture in this region, thereby revising extant theories and offering new insights into the emergence and development of the first settled communities. Importantly, these studies have provided realistic and plausible answers to significant questions related to the mechanism and causes

of Neolithization, especially in specific cases such as Kovachevo, Ilindenci and Brezhani. Concurrently, novel hypotheses have emerged, including the potential existence of an indigenous population during the Mesolithic period, the reasons for cultural divergences between the northern and southern regions, and the nature of interactions between settlements along the longitudinal axis. A significant yet often overlooked aspect pertains to the role of the third, Mesta (Nestos) river valley in the Early Neolithic settlement network. This paper will offer a comprehensive exploration of this issue from the perspective of studies conducted in the valleys of the Struma and Mesta in southwestern Bulgaria, but also in northern Greece, and the Republic of North Macedonia.

**1741. THE ESTABLISHMENT OF NEOLITHIC COMMUNITIES IN THE VARDAR BASIN: THE REVISED STRATIGRAPHY AND CHRONOLOGY OF AMZABEGOVO, AND EN BUILDING DYNAMICS**

**Contribution format:** Oral  
**Contribution authors:** Darko Stojanovski (Austrian Archaeological Institute | Goce Delčev University) – Lyndelle Webster (Austrian Archaeological Institute)

Balkan prehistory is experiencing a new initiative of modern scientific approaches and cutting-edge methodologies. Research groups in several regions are developing international long-term interdisciplinary projects, aimed at understanding the neolithization process on the Peninsula. Part of this is the renewed field project at Amzabegovo – a long term pillar of Neolithic studies in Southeast Europe and a key site on the Vardar-Morava corridor connecting the Aegean with the Middle Danube. Here we present the first overview of the revised stratigraphic sequence and phasing. The settlement has seen a long history of development and decline, lasting for over a millennium. Within that sequence, diachronic changes are obvious, reflecting and defining the Neolithic period of the region. Recently obtained absolute dates and micromorphology data, focusing on the EN sequence, have provided a robust timeline and insights regarding the modus of settlement establishment, lifeways and the intensity of (re-)building during the first centuries. Combining our data, and comparing our results with similar sites along the Balkan river routes, we are looking to interpret the dynamics, the mechanisms and the intensity of the first farmer-settlers of the Balkan hinterland.

**1873. EARLY FARMERS IN THE HIGHLAND DESSARETIAN LAKES REGION, SOUTHEAST ALBANIA: PRELIMINARY RESULTS FROM THE KORÇA REGIONAL NEOLITHIC PROJECT**

**Contribution format:** Oral  
**Contribution authors:** Patrick Willett (Vrije Universiteit Brussel | University at Buffalo SUNY) – Edlira Andoni (Albanian Institute of Archaeology) – Jana Anvari (University of Cologne | Flinders University of South Australia)

In this paper, we present results from the ongoing Korça Regional Neolithic Project, which is focused on a microregion in southeast Albania that is characterized by mountains, lakes, rivers and intramontane basins. Our project combines surface collection and geomagnetic survey with limited excavation on several sites to research the development of the Neolithic cultural landscape of this micoregion. The Korça plain contains the oldest farming sites investigated to date in Albania (from ca. 6450 BCE) and presents the opportunity to investigate the emergence and evolution of farming societies over a few millennia in a mountainous region at the intersection of the littoral and inner Balkans. Our interdisciplinary approach focuses on understanding the social and environmental context of the emergence of the Neolithic in our study region, and the structure and social organization of settlements, potential interactions between settlements, and human-environment interactions throughout this period. Here we will present the preliminary results from the first three field campaigns.

**1519. STREAMS OF TRANSFORMATION: EARLY NEOLITHIC SETTLEMENT PATTERNS AND HUMAN-ENVIRONMENT INTERACTIONS IN THE MIDDLE MORAVA VALLEY, CENTRAL SERBIA**

**Contribution format:** Oral  
**Contribution authors:** Olga Bajcev – Slaviša Perić – Đurđa Obradović – Ivana Dimitrijević – Ružica Savić (Institute of Archaeology, Belgrade)

The Middle Morava Valley in central Serbia lies along the Morava-Vardar Corridor, a major communication route connecting the Aegean and Anatolian regions to Central Europe. This strategic position made it a crucial pathway for the movement of people, goods, and ideas during the Early Neolithic period. Having in mind the role of rivers in the dispersal of the early farming communities, this paper explores the settlement patterns of Early Neolithic communities in the Middle Morava Valley, focusing on their interactions with riverine landscapes. The region is characterized by the expansive alluvial plain of the Velika Morava River, rich in fertile soils. Its tributaries on the east and west banks exhibit distinct hydrographic features due to the differing petrographic composition of the basin’s edges. The eastern tributaries, fed by numerous springs, are short, sediment-rich streams that form alluvial fans upon entering the basin. In contrast, the western tributaries are larger, with elongated and narrow alluvial plains. With 67 recorded Early Neolithic settlements, the Middle Morava Valley was among the

most densely populated areas of the Central Balkans during this period. This paper investigates how rivers influenced the spatial organization and community dynamics of these early farming societies. Did they favor the flat, fertile alluvial plains of the Velika Morava, or were the diverse terrains of its tributaries more appealing? How did proximity to waterways benefit these communities, and what role did aquatic resources play in their subsistence strategies? By addressing these questions, the study aims to illuminate the critical relationship between geography, natural resources, and human activity in shaping the development of Early Neolithic communities in the Middle Morava Valley.

**342. TAMING A RIPARIAN WORLD: THE SITE OF NOVA NADEZHDA AND THE EARLY NEOLITHIC IN THE MIDDLE MARITSA VALEY**

**Contribution format:** Oral  
**Contribution authors:** Krum Bacvarov – Nikolina Nikolova – Atanas Tsurev – Georgi Katsarov (Bulgarian Academy of Sciences)

Extensive investigations over the last two and a half decades have produced abundant evidence on the early farming communities that settled in the Middle Maritsa Valey in Upper Thrace at the turn of the seventh millennium BC. It’s now obvious that they soon developed different adaptations to the new environment and were involved in large-scale exchange networks. This presentation will focus on the Early Neolithic occupation at the site of Nova Nadezhda in southeast Bulgaria and will discuss the dynamics of human-environment interactions throughout the site’s life using relevant excavation results as well as evidence produced by scientific techniques such as fluxgate gradiometry, electrical resistivity profiling, radiocarbon dating, and various sedimentological, mineralogical, isotopic, osteoarchaeological, archaeobotanical, and palynological analyses. Moreover, the talk will also use examples from other larger or smaller-scale digs and surveys to argue that the Early Neolithic in the Middle Maritsa Valley witnessed the appearance of complex social networks in the course of the adaptations to the challenges of the riparian environment and the exploitation of local resources giving further insights into the use of the valley as a dynamic thoroughfare of interaction and exchange during the Neolithic expansion in Upper Thrace.

**1040. THE ABSOLUTE CHRONOLOGY AND STRATIGRAPHY OF NOVA NADEZHDA AND THE NEOLITHIZATION OF THE MIDDLE MARITSA VALLEY**

**Contribution format:** Oral  
**Contribution authors:** Nikolina Nikolova – Atanas Tsurev – Georgi Katsarov – Krum Bacvarov (Bulgarian Academy of Sciences)

The early neolithization of Upper Thrace is a key focus of research, with current evidence suggesting this process already in progress around the turn of the seventh millennium BC. Despite the Maritsa River’s prominence as the region’s largest waterway and communication corridor, its role in the Early Neolithic occupation has been underexplored. However, recent research in the eastern part of the Middle Maritsa Valley seems to indicate that the Neolithic way of life was introduced into the area before the end of the seventh millennium BC, which is evidenced by the early radiocarbon dates, relatively long stratigraphic sequences, and a developed settlement pattern. The prehistoric site of Nova Nadezhda, which sits almost directly on the bank of the Maritsa, offers valuable insights into the early farming settlement patterns, as well as into the routes of Neolithic expansion in Thrace. Ongoing excavations revealed a well-developed settlement layout consisting of a residential area with a dozen houses uncovered so far, pits, and five successive enclosure ditches. The stratigraphic and chronological evidence is supported by a series of over 80 radiocarbon dates – the longest sequence of absolute dates recorded for the Early Neolithic in Thrace as well as the Balkans. The Early Neolithic occupation of the site appears to have lasted for approximately 450 years – from the very beginning of the sixth millennium BC or shortly before it to around its midpoint. This presentation will discuss the distinct phases of Early Neolithic occupation at Nova Nadezhda based on the substantial number of radiocarbon dates and the stratigraphic sequence. The foundation and the long life cycle of the site will be examined in relation to the available data on the neolithization of Thrace and the timeframe of the Early Neolithic in the area.

**539. THE EARLY NEOLITHIC CERAMIC ASSEMBLAGE OF NOVA NADEZHDA AND ITS POSITION WITHIN THE RIVERINE COMMUNICATION NETWORKS IN THRACE**

**Contribution format:** Oral  
**Contribution authors:** Atanas Tsurev – Nikolina Nikolova – Georgi Katsarov – Krum Bacvarov (Bulgarian Academy of Sciences)

The prehistoric site of Nova Nadezhda in the Middle Maritsa Valley provides an insightful case study into the Early Neolithic settlement patterns in Thrace and particularly into the role of river valleys as conduits for population movements and exchange of ideas and know-how. Viewed in the context of a broader communication network, the site’s pottery assemblage serves as a key dataset for tracing these interactions, offering insights into how early

farming communities adopted, adapted, and innovated ceramic production techniques while developing a distinct style throughout the Early Neolithic of Thrace. This study is based on a comprehensive analysis of the complete Early Neolithic ceramic assemblage from Nova Nadezhda consisting of over 32,000 sherds, mostly from the enclosure ditches and related contexts, supplemented by ceramic finds from the ongoing research at a residential area of the site. The results from the pottery analysis are supported by stratigraphic evidence and radiocarbon dating allowing the identification of several chronologically distinct occupational phases at the site. While some features show chronological complexity due to redeposited material, the earliest and latest phases provide a relatively ‘clean’ dataset for comparison. By examining ceramic typology, technological choices, and stylistic development, this presentation explores the position of Nova Nadezhda within the Early Neolithic settlement networks. The findings contribute to broader discussions on how early farmers used river valleys as pathways for expansion, resource distribution, and cultural interaction in the Eastern Balkans.

869. SETTLING THE HEIGHTS: THE NEOLITHIC OCCUPATION OF A PLATEAU IN THE LOWER DANUBE

**Contribution format:** Oral  
**Contribution authors:** Georgi Katsarov – Nikolina Nikolova – Krum Bacvarov (Bulgarian Academy of Sciences)

This presentation will discuss the evidence on the early farming occupation in the microregion of the Popovo Heights in the Lower Danube, between the valleys of the Cherni Lom and Baniski Lom Rivers and their tributaries. The earliest farming communities seem to have settled along the river that rises near the highest point of the plateau. Three Neolithic sites have been identified on its ridge, including a fortified settlement site, all dating to the first half of the sixth millennium BC based on surface scatters collected during non-intrusive field surveys. The southwestern part of the plateau was occupied in the second half of the sixth millennium BC corresponding to the Late Neolithic in the Eastern Balkan chronology. This area was investigated with magnetic gradiometry followed by large-scale excavations. Approximately 120 pits were uncovered at the site that yielded deposits of burnt structural debris, various artifacts, and faunal remains. Some of the pits were sealed by heaps of burnt house ruins. The excavation results provide indirect but significant insights into the later Neolithic occupation of the plateau emphasizing its role in the early settlement dynamics, the exploration of marginal landscapes, and the use of river valleys as corridors for the movement of both people and ideas, thus contributing to a broader understanding of the Neolithic settlement patterns in the northern parts of the Eastern Balkans.

1357. THE ROLE OF RIVER SYSTEMS IN THE SPREAD OF THE NEOLITHIC IN THE BALKAN-CARPATHIAN REGION

**Contribution format:** Oral  
**Contribution authors:** Dan Ciobotaru (National Museum of Banat in Timisoara) – Raiko Krauss (Tübingen University)

Rivers played a special role in the continental spread of the Neolithic from western Anatolia and the Aegean to Central Europe. This is not surprising when one considers the spread of Neolithic groups around the Mediterranean, which suggests a dense maritime network. Goods, but also seeds and demonstrably even live animals were transported over sea. It is therefore only logical that the northward spread to the European continent initially took place via the river valleys. It was not until the Linear Pottery Culture (LBK) that a different pattern of dispersal became apparent, as the Neolithic groups no longer orientated themselves primarily along the rivers, but instead specifically sought out loess soils. This applies to the western part of the Carpathian Basin (Transdanubia) and beyond that to large parts of Central Europe, from the Paris Basin in the west to the Ukrainian steppes in the east and in the north to just before the shoreline of the Baltic Sea. However, the situation in the east of the Carpathian Basin (Banat and Alföld) is different. The Neolithic groups here continued to move predominantly along the river systems. The different resource utilisation resulting from this is interesting. Various example regions will be compared in this paper.

1654. OPOVO UGAR-BAJBUK REVISITED: NEW RESULTS FROM GERMAN-SERBIAN RESEARCH ON SOCIAL STRUCTURE, DEMOGRAPHY, AND ECONOMY ON A LATE NEOLITHIC SITE

**Contribution format:** Oral  
**Contribution authors:** Fynn Wilkes (Kiel University) – Miroslav Birclin (National Museum Pančevo) – Martin Furrholt (Kiel University) – Tijana Stanković Pešterac – Aleksandar Medović (Museum of Vojvodina) – Kata Furrholt (Kiel University) – Ildiko Medović (Museum of Vojvodina) – Robert Hofmann (Kiel University)

The Late Neolithic site of Opovo Ugar-Bajbuk (Serbia), situated in the Tamiš River floodplain and in the Southern Banat, has been known since the 1960s and was extensively investigated during an international research project in the 1980s (Tringham et al. 1992). Earlier studies classified Opovo as a small to medium-sized settlement with an economy adapted to its environment. However, recent research conducted by our German-Serbian

team—including geophysical surveys, targeted drillings, and surface investigations—indicates that the site is much larger and exhibits a more complex spatial organization than previously believed. These findings allow for a deeper insight into the settlement’s social structure, demographic composition, and economic specialization. Additionally, a broader survey of the Serbian section of the Tamiš River has identified multiple related sites, allowing for a preliminary reconstruction of the regional settlement network. This contextualization provides a new perspective on Opovo’s role within the regional Late Neolithic settlement system. By integrating recent findings with data from previous excavations, this talk offers a more comprehensive and updated understanding of Opovo’s function, its social structure, economy, and a glimpse on its relationship with neighboring sites. Our research contributes to ongoing discussions on Neolithic settlement patterns, social organization, and economic adaptation in floodplain environments.

2294. EXPLORING HOUSE SIZE VARIABILITY IN THE LATE NEOLITHIC OF THE CENTRAL POMORAVLJE, SERBIA

**Contribution format:** Poster  
**Contribution authors:** Ružica Savic (Institute of Archaeology, Belgrade)

This paper examines the sizes of houses from the Late Neolithic period (5300–4500 BC) at three archaeological sites: Drenovac, Supska, and Kraljevo Polje. These sites are located in Central Pomoravlje, a region of strategic importance throughout history due to the Great Morava River, a key communication and economic corridor. The riverbanks provided favorable conditions for settlement, as evidenced by numerous multi-layered archaeological sites found along its valley and tributaries. The study aims to determine whether contemporary, geographically close settlements exhibit similarities in average house sizes and to explore potential relationships between house size, orientation, and relative chronology. These insights can help reconstruct settlement expansion and development over time. A one-way analysis of variance (ANOVA) was conducted to identify statistically significant differences in average house sizes, while variability within each settlement was assessed using range, standard deviation, and extreme values. The results reveal significant differences between locations and varying degrees of size variability among residential buildings within each settlement. This analysis provides a foundation for understanding settlement development and for investigating potential economic or cultural influences that shaped daily life in these communities.

24 ACTOR, ACTION, AND PLACE: THE PROPAGATION AND MODIFICATION OF CULT PRACTICE IN THE ROMAN WORLD

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Roman archaeology, ritual, identity, cultural transmission, Roman provinces  
**Session organisers:** Kaja Stemberger Flegar (PJP d.o.o.) – Jason Lundock (Full Sail University) – Aaron Irvin (Murray State University)

SESSION ABSTRACT

Ancient cults found their expression not in a set of orthodox statements of faith, but rather in orthopraxic ritual activities. Ritual practice functions as a foundational element for both communal and personal identity, binding allies as well as manifesting animosities. Yet as cults spread throughout the Roman Empire, their fundamental ritual elements also shifted to a new location, a new set of actors, and a new set of ritual actions. This, in turn, created entirely new cults and new communities. This panel shall explore the spread of ritual practices in the Roman World, as traceable through material remains, in order to examine this interaction of new and old ritual dissemination, the formation of new communities from old, and the development of the Roman Empire’s multi-cultural environment as seen through its diverse cult communities. Thus, our discussion will contribute to further understanding of culture change and adaptation across the Roman world as well as the role that shared ritual practice plays in the formation of communities and identity.

CONTRIBUTION ABSTRACTS

473. PROSELYTISM AND PROPAGATION OF POLYTHEISTIC CULTS

**Contribution format:** Oral  
**Contribution authors:** Aaron Irvin (Murray State Univeristy)

The study of the movement, proselytism, and conversion among and between religions has almost exclusively been the purview of modern orthodox religious studies. There is seemingly an obvious reason for this, as these

religions seemingly present an “all-or-nothing” concept of conversion, are generally brought in from outside, and are thus distinguishable from existing religious traditions. In short, they create what are easily quantifiable data sets. With polytheism existing as a seemingly endless, open-ended, and unrestricted array of potential deities to worship and interact with however one sees fit, trying to quantify and therefore discuss concepts of proselytism, conversion, and movement seems a daunting task indeed. Even when broken down to the level of individual cults, the potential concept of polytheistic conversion or polytheistic missionaries have instead been used to discuss trade networks, social interactions, and expressions of authority, rather than the nature of religion and religious pluralism or exclusivity within a polytheistic context. It has been noted that polytheistic cults apparently proselytize and move, but as of yet no one has attempted to confront how or why polytheistic cults proselytize and move. Such is the goal of this paper.

374. RITUALS ASSOCIATED WITH THE LAPIS NIGER IN THE ROMAN FORUM

**Contribution format:** Oral  
**Contribution authors:** Fangfang Tian (Sapienza University of Rome)

After the discovery of the Lapis Niger by Giacomo Boni in the Roman Forum, the archaeologists identified its connection to ritual activities associated with early Roman religion. The area of the Lapis Niger includes a U-shaped altar covered with black marble paving and a cippus with Greek inscriptions and a tapered base. Through the analysis of votive deposits and the content of the inscriptions, it becomes evident that ritual practices were deeply embedded in early Roman law. From an archaeological perspective, the use of specific objects may have played a juridical or administrative role in the ritual applications of the Lapis Niger. These objects include various types of pottery, bronze and terracotta figurines, ivory and bone artifacts, and animal remains. Votive deposits were closely linked to ritual functions—for example, knuckle bones used for divination and other animal bones interpreted as sacrificial remains. Notably, some of these bone remains belong to a vulture, a bird strongly associated with the foundation myth of Rome. Miniature vases, similar to other archaic votive offerings in Latium, were likely used in rituals. The most famous statue from the site, known as the “Augur of the Lapis Niger,” represents an augur in the formal act of interpreting divine will. Although the inscription found at the site is fragmentary, it clearly reflects elements of religious law. It contains references to specific ritual actions and terms, such as sakros esed (“he must be cursed”), a phrase also found in the Law of the Twelve Tables. These elements demonstrate the continuity and evolution of Roman sacred law, which remained deeply intertwined with religious practice over time.

292. EVIDENCE OF THE EARLY PRESENCE OF WORSHIPPERS OF THE CULT OF JUPITER DOLICHENUS IN THE ROMAN FORT OF APSAROS (GEORGIA)

**Contribution format:** Oral  
**Contribution authors:** Maciej Marciniak (Polish Centre of Mediterranean Archaeology, University of Warsaw | University of Warsaw | National Museum in Warsaw)

The Roman fort in Apsaros is located in the village of Gonio, in the Adjara region of present-day Georgia, about 8 km south of Batumi, by the Black Sea. It was one of the principal forts along the so- called Pontus-Caucasian frontier, or Pontus Limes, between the 1st and 3rd centuries AD. Apsaros was first mentioned by Pliny the Elder in his Natural History (NH 6.12). By AD 132, when Arrian visited the site, it housed five cohorts (Arr. Peripl. 6,1–2). The Tabula Peutingeriana (X,5) depicts Apsaros with a schematic illustration of the fort, without highlighting other coastal fortifications in the region. Years of excavations conducted by the Gonio–Apsaros Polish–Georgian Expedition have led to the discovery of a range of notable finds that can be directly or indirectly linked to the cult of Jupiter Dolichenus. This mystery cult, classified as an ‘Oriental deity,’ gained popularity in the first half of the second century AD, reached its peak during the reign of the Severan dynasty in the early third century AD, before rapidly declining. Among the finds are well-preserved bronze figurines, a knife handle, and a gold plaque with a dedication. Some of these objects can be dated quite precisely to the beginning of the second century AD. Therefore, it is plausible to assume that the cult of the god from Doliche arrived at the fort in Apsaros relatively early. The collection and its dating may contribute to discussions on the role of the Apsaros fort and its inhabitants in the transfer of the cult of Jupiter Dolichenus to Europe.

1237. DECODING THE MITHRAS CULT IN COLONIA IULIA FELIX SINOPE: ARCHAEOLOGICAL INSIGHTS

**Contribution format:** Oral  
**Contribution authors:** Eleni Mentesidou (International Hellenic Unverisity)

Rooted in ancient Persian mythology, Mithras was one of the principal deities venerated during the Achaemenid Empire. Following Alexander the Great’s conquests, the worship of Mithras persisted in regions of Anatolia and Armenia, where the cult had already established roots. During the Roman period, the cult of Mithras evolved into a distinct mystery religion, Mithraism, which flourished between the 1st and 4th centuries AD. This syncretic religion, centered around the Romanized figure of Mithras, developed its own unique mythology and ritual

practices, spreading widely across the Roman Empire. This presentation focuses on the archaeological evidence from Sinope, one of the most significant Greek cities on the southern coast of the Black Sea, to explore the cult of Mithras. Key questions guide this investigation: Who were the worshippers of Mithras in Sinope? Was the spread of the cult in Sinope influenced by its historical connections to the Achaemenid Empire, or was it driven by other factors related to the cultural context of the Roman period? By analyzing archaeological finds, we aim to reconstruct the ritual practices and community dynamics associated with the cult in Sinope. The study of Mithraism in Sinope offers a compelling case for examining how ancient cults adapted to new cultural and geographical contexts, shedding light on the spread of ritual practices in the Roman world and their role in shaping multicul- tural communities. Through the study of Mithraic material remains in Sinope, we aim to reconstruct the local ritual practices and their significance within the broader framework of Mithraic worship.

2084. MUSIC OR MAGIC? SET OF COPPER ALLOY BELLS FROM CERKNICA (SLOVENIA)

**Contribution format:** Oral  
**Contribution authors:** Mija Toplicanec (ZVKDS OE Ljubljana) – Ana Kovačč (Independent researcher) – Kaja Stemberger Flegar (PJP d.o.o.)

In the spring of 2016, a spectacular set of Late Antique copper alloy bells was discovered on a slope near Lake Cerknica (Slovenia). The six bells, all different in size, were deposited in a rock crevice and covered with a large stone slab, indicating that the deposition was done intentionally. Considering also the proximity of the water body, the find may be ritualistic in nature, since there are clear prehistoric and Roman traditions of depositing items in or near the water. In our case, Lake Cerknica was not only significant enough to have been mentioned by Strabo as “helos Lougeon kaloumenon”, it is also the largest intermittent lake in Europe. Bells themselves are in the Roman period frequently associated with magic, rites of passage, as well as closing and opening in both the pragmatic and the symbolic sense, and they were furthermore considered apotropaic items. Since copper alloy bells were previously not studied systematically in Slovenian archaeology, we aim to contextualise our find, and present other potential examples of bells used in rituals.

25 THE SPREAD OF MEDIEVAL GLAZE TECHNOLOGIES: CROSS-CRAFT AND CROSS-CULTURAL PERSPECTIVES

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** glaze technology, glazed ceramic, global Middle Ages, cross-craft interaction  
**Session organisers:** Elena Salinas (School of Arabic Studies, Spanish National Research Council (EEA, CSIC)) – Carmen Ting (University of Leicester)

SESSION ABSTRACT

Glaze technology during the 7th to 15th centuries CE, loosely equivalent to medieval period, is a subject that has attracted particular interest in the scientific community in recent years, resulting in a growing number of publi- cations that focused on exploring region-specific technological developments and testing new methods. Despite these advances, we are still missing a framework that will allow us to compare not only the development of glaze technologies across different parts of the world in a systematic way, but also to explore the agents, mechanisms and driving forces underlying these developments. This session seeks to fill in these important methodological and theoretical gaps of the existing research framework by (1) establishing the best practices in the scientific study of archaeological and historical glazed materials; (2) developing new ways and/or models in disentangling the occurrence of cross-craft and cross-cultural interactions behind the adoption of glaze production; and (3) promoting a comparative approach to studying glaze technologies in the global medieval context. We, therefore, welcome papers that feature a strong multidisciplinary element (e.g. a combination of archaeology, history, art history, anthropology, ethnography, natural science and/or experimental) in the study of glaze technologies that are characteristic of but not limited to the medieval period. We are also interested in papers that focus on testing new scientific methods but with a clear motivation to solve historical problems. We further encourage insights from studies that centre on glazed objects other than pottery such as architectural materials and figurines, which are currently underrepresented in the discussion of the spread of medieval glaze technologies.

906. TECHNOLOGICAL TRANSFERS OF GLAZED CERAMICS IN MEDIEVAL MEDITERRANEAN

**Contribution format:** Oral  
**Contribution authors:** Elena Salinas (Escuela de Estudios Árabes, CSIC)

The technology of making glazes was not mastered by all the medieval Mediterranean regions at the same time. Nor did they all use the same techniques to cover the ceramics: transparent, tin-opaque, quartz-opacification, high-lead, alkali lead, single firing, double firing, glass, etc. The study and identification of the techniques used in each region help us to understand their technological evolution, the movement of specialised potters from one region to another, the contact or lack of it with other medieval states, and how fashion and influences travelled and were adopted by medieval societies. We will also discuss how glazing technology was used as a way of legitimising power, creating a distinct identity and technological superiority to differentiate themselves from other medieval powers. Some case studies concerning the Maghreb, Ifriqiya, Egypt or al-Andalus will be discussed to trace these technological transfers across the Mediterranean Sea, especially between the 9th and 13th centuries.

1480. RETHINKING THE ROLE OF THE LEVANT IN THE SPREAD OF GLAZE PRODUCTION IN ISLAMIC WORLD

**Contribution format:** Oral  
**Contribution authors:** Carmen Ting (University of Leicester)

Glazed tableware is one of the hallmarks of the material culture across Islamic lands. These vessels are not only known for their decoration and designs, but their sheer presence in the archaeological record also marks a major episode of material revolution, as the production and consumption of glazed tableware did not start in many regions until they were under the Muslim control. In this talk, I will explore the origins and development of the technologies used to produce the glazed tableware recovered from the southern Levantine coast during the early Islamic to the beginning of the Crusader period (9th to 13th centuries CE). I will focus specifically on the glazed tableware types that do not feature the use of an opaque white tin glaze, evidence as such is underrepresented in the extant research framework. Drawing from a combination of archaeological, technological and isotopic evidence, our results showed that the beginning of glazed tableware production did not happen in vacuum, but it was rooted in the pre-existing local ceramic traditions and craft structures, supported by an interaction with other crafts. Participation in regional and supra-regional exchange networks facilitated the movement of raw materials, knowledge and ideas, providing further impetus for technological and social innovations.

569. TECHNOLOGICAL INNOVATION IN EARLY ANDALUSI CERAMICS: THE CASE OF THE KŪRA OF ILBĪRA (9TH-11TH CENTURY)

**Contribution format:** Oral  
**Contribution authors:** Cristina Martínez-Álvarez (Archeologii i Etnologii Polskiej Akademii Nauk)

In recent decades, various methodologies have been developed to determine whether ceramics found in settlements across al-Andalus are of local or imported origin. These studies have demonstrated that a comprehensive, multidisciplinary approach to ceramic analysis provides essential insights into exchange networks and manufacturing traditions. This contribution presents the results of recent archaeometric analyses conducted on six ceramic assemblages from both rural and urban sites in the Kūra of Ilbīra, located in the southeastern Iberian Peninsula. The chemical composition of ceramic pastes and glazes was analyzed using scanning electron microscopy with energy-dispersive spectroscopy (SEM-EDS). The study investigates the technological characteristics of these ceramics, focusing on production traditions and the emergence of new cultural practices during this period. By integrating advanced chemical analyses, this research enhances our understanding of ceramic technologies in the Kūra of Ilbīra between the 9th and 11th centuries. Additionally, it seeks to identify potential production centers, their distribution networks, and the role of rural and urban settlements within broader commercial circuits across al-Andalus. Aligned with the session’s theme, this proposal adopts a comparative, interdisciplinary approach that draws on archaeology, materials science, and historical studies of glazed ceramic technology. It highlights the transmission of technological knowledge among potters and examines the influence of both local and long-distance trade on ceramic traditions, particularly the diffusion of glazing practices.

1504. CONSUMPTION OF GLAZED POTTERY IN A 12TH CENTURY ANDALUSI QUARTER IN ALMERIA (SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Miguel Ángel Quero Domínguez (University of Almería)

The study of glazed ceramics offers fundamental keys to understanding the consumption habits, aesthetic preferences and technological innovations in Andalusí society. This oral communication will present the results of the analysis of a ceramic assemblage from a 12th-century residential quarter located in the madina of al-Mariyya (Almería), a strategic enclave of the Mediterranean and Atlantic during the Almoravid period (1090 - 1147). The wide variety of typologies and decorative techniques documented will be discussed, including monochrome and polychrome glazes, underglaze and overglaze decoration, as well as tin and quartz opacification treatments, reflecting both local production and Mediterranean influences. Particular attention will be paid to tableware and kitchenware, exploring their role in everyday life and their relationship with the local workshops and their commercial networks. This communication aims to contribute to the debate on the circulation of ceramic goods for consumption in the Islamic Mediterranean through an archaeological and archaeometric approach.

807. GC-CIGA. GLAZE CERAMIC INTRODUCTION AND CONSUMPTION IN THE GARB AL-ANDALUS

**Contribution format:** Oral  
**Contribution authors:** Massimo Beltrame – José Mirão (Hercules Laboratory - University of Évora) – Susana Gomez Martinez (University of Évora - CEAACP - CAM) – Elena Salinas (School of Arab Studies - CSIC)

GC-CIGA is new research project recently granted by the Portuguese Science and Technology Foundation to the University of Évora (Portugal) in collaboration with the School of Arabic Studies (CSIC-Spain). The main goal of the project is to explore the diffusion of glaze technology in the western al-Andalus, the Garb al-Andalus, and to understand how Islamic social-cultural expansion, Islamic culture assimilation, people mobility, social inequalities, exchange of know-how, political propaganda, trades expansion, and raw material access and exploitation might have influenced this process. In this framework, the application of a multidisciplinary approach to the study of Islamic glazed ceramics combining different disciplines (i.e. archaeology, history, archaeometry and ore geology) will permit the acquisition of a complete dataset to decipher different historical dynamics. To this extent, starting from the production and diffusion of first glazed ceramic exemplars, it will be important to understand and evaluate the dissemination patterns between the heartland and the periphery, the social reasons behind the adoption of glaze ceramics, the diffusion of know-how in the following centuries, the multiplication of ceramic workshops, and the possible differentiation in raw materials procurement for glaze production in the periphery of the al-Andalus if compared to the heartland of Islamic Iberia (i.e. Southern al-Andalus – Cordoba). These data will be used to evaluate the diffusion of Islamic glazed ceramics in the Garb al-Andalus with a chronological, geographical, technological, and socio-cultural perspective. The project hope to offer a new perspective of Medieval Iberi. between the 9th to 13th century AD, tightly connected to the production, consumption, and promotion of glazed ceramics.

1562. (RE-)LIGHT MY FIRE – INNOVATIVE GLAZE TECHNOLOGY ON A STOVE TILE FROM FREIBURG IM BREISGAU, SW-GERMANY

**Contribution format:** Oral  
**Contribution authors:** Sophie Hueglin (University of Tuebingen)

Among the first glazed ceramic objects of the medieval period are stove tiles. Initially, tiled stoves were valued as remote heating devices for early castles, palaces, and monasteries, and soon also for their figurative programs. Much like glass vessels or tapestries, they illustrated the belief systems and legendary tales that the commissioners wished to associate with and impress their guests in ceremonial rooms. In this regard, the coloured glaze played a significant role, as it made the texture of the tiles more visible, especially at night, enhanced the decoration, and could virtually illuminate the scenes. For the 14th and 15th centuries in Southern Germany and Northern Switzerland, the diverse finds from the latrine of the Augustinians in Freiburg im Breisgau play a central role (Untermann 1995). The amount and the quality of the ceramics allow us to study the beginning of the use of glaze on ceramics in general. Fragments of several niche tiles show the rather rarely depicted 13th-century troubadour’s tale of Vergil’s revenge, which was part of the literary and artistic topos of the ‘power of women’. In this part of the story, fire, flames, and torches play a central role; here, coloured glazes are masterly used to create contrasts and illuminate the scene. Comparing the fragments with other stove tiles found in Freiburg im Breisgau, it becomes clear that the monastery must have had a pottery workshop of its own. There, contributors with literary, artisan and alchemist backgrounds must have worked together to know the tale, conceptualise the scene and develop new glaze recipes (Stelzle-Hüglin 1998; Hüglin forthcoming). Also, the use of glaze on the stove tile will be compared with a 15th-century multi-coloured glass chalice from Venice, now held at the Cloisters, New York, depicting the same scene.

468. CERAMIC GLAZES AND DECORATIONS: TECHNOLOGY AND HISTORY

Contribution format: Oral  
Contribution authors: Trinitat Pradell (UPC)

Glazes add value to ceramic, improve its appearance (colour and shine) and make it waterproof. Through the choice of colours and designs, glazes made ceramics fashionable, even luxurious, and therefore, an object of trade. Each region and ruling dynasty developed its own style or trademark which makes them particularly suitable for dating purposes. Therefore, the study and analysis of glazes offers direct information about the acquisition of technical skills (technology), trade of specific materials (interregional links), migrations and the introduction/adoption of new trends. A ceramic glaze is a thin glassy layer fused to the surface of a ceramic body through firing. The interaction between the glaze and the ceramic body results in the interdiffusion of elements between both. A glaze consists mainly of an amorphous phase, but also includes bubbles, cracks and crystalline phases (undissolved compounds and crystals formed during the firing). Finally, the glazes were also decorated, and a large variety of materials and methods of applying the decorations were used. In this contribution, we will present a summary of the technical characteristics of glazes (composition, microstructures and technical requirements), their discovery and use throughout history and decorative techniques. The methodology and analytical techniques to obtain the information will also be discussed.

1488. DETERMINING OVERGLAZE AND UNDERGLAZE APPLICATIONS IN ANCIENT CERAMICS USING SEM AND MICRO-XRD ANALYSIS

Contribution format: Oral  
Contribution authors: Judit Marimon (Universitat de Vic - Universitat Central de Catalunya) – Trinitat Pradell (Universitat Politècnica de Catalunya) – Elena Salinas (CSIC- Escuela de Estudios Arabes)

The determination of whether ancient ceramic decorations are applied as overglaze or underglaze is crucial for understanding historical ceramic production techniques. Underglaze consists of painting the unfired ceramic pot with pigments before the first firing (biscuit). After firing, the decoration is fixed onto the ceramic body and cannot be removed by washing. A glaze is then applied over the decorated biscuit, and the ceramic is fired again. This technique produces sharply defined designs. Transparent glazes are commonly applied over underglaze decorations, but opaque tin glazes can be used for pigments with high diffusivity. Overglaze involves applying a glassy colored layer over a raw glaze, which is then fired again to fuse the decoration to the surface. Determining this can indicate whether a transmission technique or copies that achieve similar decoration in a different way were used. This study employs optical microscopy (OM), scanning electron microscopy (SEM), and micro-X-ray diffraction (micro-XRD) to analyze the glaze layers of ancient ceramics. Petrography is particularly useful for examining the color and its distribution across the ceramic material. SEM is a fundamental tool for determining the chemical profile of the chromophore elements in the cross sections of glazes. The identification of crystallites related to the chromophore elements can be challenging due to their small size (less than one micrometer) and/or low element contrast. Micro-XRD can identify phases with similar contrast in SEM, even for very small crystals or different polymorphs. Moreover, we present laboratory-made replicas that allow for the identification of specific insights, serving as fingerprints to determine whether the decoration was applied as underglaze or overglaze.

1712. GLAZED POTTERY WORKSHOPS IN BYZANTINE AND OTTOMAN THESSALONICA: CONTINUITIES AND CHANGES OF THE GLAZE PRODUCTION TECHNOLOGY (11TH-16TH CENTURIES)

Contribution format: Poster  
Contribution authors: Konstantinos Raptis – Periklis Slambeas (Ephorate of Antiquities of Thessaloniki)

Rescue excavations, which have been conducted in Thessalonica during the last 50 years have revealed archaeological data regarding the architectural remains as well as material waste from glazed pottery workshops that were operating from the 11th until the 16th century in Byzantine and consequently, after the year 1430, Ottoman Thessalonica; a diachronic urban center that has been established as a significant production center of glazed wares from the late Middle Byzantine period (late 11-12th centuries) and throughout the Late Byzantine period (13th – early 15th centuries) until the first period after the Ottoman occupation (1430 – 16th century). Based on the aforementioned ascertainments, this poster examines the continuities and the changes of the glaze technology applied in the Thessalonian glazed pottery workshops, presenting briefly the fabric and the shape of the wares and discussing mainly the type and the composition of the pigments and the, lead based, glaze applied in both the Byzantine and the Ottoman production, as well as the second firing of the production.

26 EMPOWERING HEIGHTS: THE IMPACT OF HUMAN AGENCY ON ANCIENT UPLAND SANCTUARIES BETWEEN NATURE AND RITUAL

Session theme: 1. On artefacts and beyond  
Session format: Session with keynote presentation  
Session keywords: Peak Sanctuaries, Greek Religion, Pre-Roman Religion, Landscape Archaeology, Archaeology of Uplands  
Session organisers: Aura Piccioni (Universität Trier) – Marianna E. S. Negro (University of Cambridge) – Laura Sarli (Universität Trier)

SESSION ABSTRACT

This session aims to examine the significance and functions of upland sanctuaries in ancient civilizations, with a particular focus on – but not limited to – Etruscan-Italic, Greek, and Roman examples. The discussion will address the ways in which they were integrated into the broader socio-political and economic structures of their respective cultures, as places where collective memory was both created and sustained. These sites, frequently situated on mountain peaks, but not limited to them, played a pivotal role in a multitude of contexts extending beyond the purely religious. Consequently, they have been inadequately addressed in a multitude of scenarios (cf. the interesting questions posed by Sporn 2013, 465-475). The exception to this seems constituted by the case of Minoan peak sanctuaries (Peatfield 2009, 251-259). The analysis of the spatial distribution and ritual practices associated with these sanctuaries, in addition to an exhaustive examination of the archaeological evidence, including artifacts and structural remains, are among the anticipated outcomes. Both the artifacts and the landscapes surrounding these sanctuaries retain their significance over time becoming an integral part of our heritage. The principal objective is to identify the defining characteristics of an upland sanctuary. In what circumstances might it be appropriate to adopt an emic or an ethic perspective? Can common patterns of development be recognized in these sanctuaries, despite the unique characteristics of each culture? What characteristics do these sanctuaries possess? What can be said about the rituals performed at these locations? Can specific societal layers be identified? What were the functions of upland sanctuaries within the social and political structures of ancient communities? How were natural landscapes integrated into the religious and mnemonic discourse of these sanctuaries?

CONTRIBUTION ABSTRACTS

1080. ANTHROPOMORPHIC MEGALITHISM IN NORTHERN PUGLIA. RECONSTRUCTIVE HYPOTHESES OF A PROTOHISTORIC PLACE OF WORSHIP

Contribution format: Oral  
Contribution authors: Maria Luisa Nava (Università Suor Orsola Benincasa Napoli)

Since the end of the third millennium BC the indigenous populations of Daunia are characterized by the production of stone sculptures. This phenomenon is part of the anthropomorphic megalithism in the Mediterranean area. Their function, exclusively cultic and religious, was an expression of collective belief. Later the stelaes become expression of an individual celebration, an original manifestation of the Daunian culture until the disappearance of the indigenous culture following the Roman conquest. This paper aims to examine the most ancient evidences of anthropomorphic megalithism in ancient Puglia, proposing an analysis of the function and meaning of the monuments, outlining also possible inferences with religious and ceremonial practices. The stelae from the late Eneolithic and Early Bronze Age express the divine and transcendent essence inherent in the spirit of men and women and show close formal and content-related affinities with the stelae-statues found in central Italy, in an area extending from Lunigiana to upper Tuscany. The stele statues of Bovino/Castelluccio dei Sauri were found on the slopes of the Daunio Sub-Apennines, in the basin of the Cervaro river, which established the connection between inland Campania and the Adriatic coast. The area of origin of the monuments (about 60 steles), is a rather restricted territory. Therefore we may suppose that they were originally placed in an open-air sanctuary, where they would have fulfilled a religious and cultural function. This interpretation would also be confirmed by the presence – in the surrounding areas – of a contemporary frequentation by Eneolithic peoples, with tangible evidence of their stable presence both with settlements and with cremation burial places. These evidences support the hypothesis that these monuments were a fundamental part for the devotio and religiosity of ancient Daunia.

1166. HIDDEN IN THE HEIGHTS: EXPLORING THE RITUAL ROLE OF PREHISTORIC HILLTOP SITES IN PRIGORJE, CROATIA

Contribution format: Oral  
Contribution authors: Franka Ovcarić – Luka Drahotusky-Bruketa – Laura Šejić – Janja Mavrović Mokos (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

Recent research in Prigorje, Croatia, identified two prehistoric sites with indications of cult practice: Sv. Križ and the newly discovered site Oštrc. Both sites occupy elevated positions, emphasizing the strategic importance of hilltop locations in controlling river valleys and regional corridors. The Prigorje area, situated along the Sava, Sutla, and Krapina rivers, with Medvednica mountain and its foothills, served as a vital resource zone and an ideal setting for prehistoric settlement. The Late Hallstatt site Sv. Križ is positioned at 310 meters above sea level, overlooking the Sava Valley and Brežice Gate. Excavations at the settlement have revealed a rectangular ritual structure, distinct from other structures on the site. Inside, exceptional finds were uncovered, including carefully selected animal bones and one human bone. The deposition of artifacts, based on the fibula dating, occurred over a span of two centuries. In contrast, Oštrc is located at an elevation of 737 meters on the eastern slopes of Medvednica mountain. On a small terrace, a circular dry-stone structure surrounded by a substantial quantity of intentionally broken decorated pottery, dating from the Late Bronze Age to the La Tène period, was excavated. Due to its elevated nature and lack of evidence for habitation, the structure has been interpreted as a ritual site used across generations. The study of these sites contributes to broader discussions on the role of upland cult sites in prehistoric societies. While Sv. Križ represents a ritual space integrated within a settlement, Oštrc exemplifies the use of a remote, elevated location for ritual practices. Both sites were in use for several centuries, reinforcing collective memory and the sacralization of the landscape. These sites raise critical questions regarding the relationship between natural landscapes and ritual behavior and how they were maintained over time.

**331. BETWEEN DEVOTION AND RITUAL: DOG SACRIFICE IN ANCIENT ITALIC AND MESOAMERICAN UPLAND-SANCTUARIES**

**Contribution format:** Oral  
**Contribution authors:** Laura Sarli (Universität Trier)

Dog sacrifice has been interpreted in various ways, including its association with chthonic deities linked to procreation and growth or as a symbol of protection over something valuable (De Grossi Mazzorin 2008). The myth of the underworld-related dog appears across various Indo-European traditions. Literary and archaeological evidence confirms that dogs were sacrificed to various deities, particularly female deities of fertility and rebirth, such as Genita Mana or Hecate. Literary sources referencing dog sacrifices include Plutarch’s Quaestiones Romanae, the Tabulae Iguvinae and Pliny’s Naturalis Historia. Evidence of such sacrifices has been found in Athens, Sardis (Asia Minor), Locri (Magna Graecia), Pyrgi (Etruria), Monte Ingino e Monte Ansciano (Gubbio, Umbria), as well as material artifacts like the acroterial group from the acropolis of Veio (VI century BC), which depicts a dog and its master, likely tied to domestic cult practices (Bartoloni 2011; Piccioni 2020). Iconographic and archaeological evidence highlights the dog’s symbolic role in Mesoamerican everyday life and religion, where it was linked to death, destruction, earth, and fire. Dogs served as messengers to the life after death, a food source, in rituals, in hunting and companionship. Archaeological records show fluctuations in dog remains connected to Mayan pyramid-shaped temples symbolising mountains, with high numbers in the Preclassic period (2000 BCE–250 CE), a decline in the Classic period (250–900 CE), and a resurgence in the Postclassic period (900–1539 CE) at sites like Mayapan (Yucatan) (Nunez-Cortes 2022). This study examines literary sources and archaeological evidence for dog sacrifice at upland sanctuaries in the Italic world, exploring its significance in both public and domestic contexts. It also considers the role of dog sacrifice in the Mayan world, particularly in relation to religious practices and pyramid temples.

**1156. ON THE VERY HIGHEST POINT – SANCTUARIES ON MOUNTAINTOPS IN CENTRAL ITALY**

**Contribution format:** Oral  
**Contribution authors:** Marion Bolder-Boos (Department of Ancient Studies, University of Mainz)

Upland sanctuaries are a well-known phenomenon in ancient Central Italy. The sanctuary of Jupiter Latiaris situated on the summit of Monte Cavo is a particularly famous one. Initially a cult place of the Latin League which the Romans eventually took over, it was the centre of the so-called Feriae Latinae, the festival in honour of Latin Jupiter, which took place in spring and autumn each year. Other mountaintops, such as the Monte Sant’Angelo at Terracina or the Monte Tifata near Capua, were also the home of important cult places. The sites often commanded a broad view of the surrounding territory and could in turn be seen from afar. At the same time, getting to these cult sites, either individually or in the context of festivities, could prove difficult, as their elevated position made the walk there strenuous, especially during the summer months. Also, while some of them seem to have been closely connected with a nearby town, others were situated a long way from any settlement, raising the question what community took care of the place and how and by whom rituals were carried out. The aim of the proposed paper is to take a closer look at the cult sites set in these exceptional surroundings, their architectural remains, and the artefacts recovered from them to filter out how these sanctuaries may have been organised, who frequented them, and how they were incorporated in the wider religious and social context of central Italian communities.

**1049. SACRED HEIGHTS AND TIMELESS WORSHIP: RITUAL PRACTICES AND RELIGIOUS CONTINUITY IN GREEK MOUNTAIN SANCTUARIES**

**Contribution format:** Oral  
**Contribution authors:** Cynthia Marti (University of Marburg)

From prehistoric times onward, especially during the Bronze Age, people have been seeking high-altitude locations for ritual purposes, showing that religious activities were not limited to sanctuaries in the lowlands and urban centers but also took place in the remote heights of mountain peaks. Since large parts of Greece consist of mountainous regions, mountains were not only of economic and social significance but also served as sites for sanctuaries, transforming them into sacred landscapes and places of communication with deities. Moreover, mountains played a crucial role in ancient myths and were often depicted as imagined landscapes inhabited by deities and mythical creatures. This paper aims to explore ritual behavior and cult practices from the Bronze Age to antiquity at Mt. Arachnaion and Mt. Lykaion on the Peloponnese. The perception of mountains as sacred spaces raises questions about the interaction between humans and their environment in these remote areas on the periphery of the polis. Within these sanctuaries, both natural elements—such as altitude, visibility, and vegetation—and man-made structures—including temples, altars, and temenos —contribute to the sacred atmosphere. To provide insight into how ancient communities utilized elevated landscapes for ritual practices, a multi-methodological approach is applied, analyzing both archaeological and literary evidence while also considering the surrounding landscape to integrate the sanctuary into a broader network. Mt. Arachnaion and Mt. Lykaion are two of many peak sanctuaries where Zeus was worshipped, but they are among the few that have been used as sanctuaries since the Mycenaean period. Evidence of religious activity persists to this day, visible in the chapels and shrines dedicated to the prophet Elijah (Profitis Ilias), the patron saint of mountains. These two case studies examine the religious continuity and significance of mountain summits as sacred places, illustrating a timeless phenomenon that endures even through religious transformations.

**122. DIVINE NATURE: THE UPLAND SANCTUARIES OF ATTICA AND ARCADIA**

**Contribution format:** Oral  
**Contribution authors:** Aura Piccioni (Universität Trier)

Upland sanctuaries of Attica and Arcadia played a pivotal role in ancient religious beliefs. The cults associated with these locations, especially those in Arcadia, are closely linked to natural phenomena and the involvement of diverse social groups. This played a pivotal role in shaping the religious significance of a sanctuary and a divine figure. My habilitation project aims to examine upland sanctuaries of Attica and the surrounding regions to identify a pattern of development embedded within a broader urbanization process. A micro- and macroscopic method, as well as an emic perspective, is employed in the collection of upland sanctuaries. Distinctive elements of various kinds of landscapes, such sanctuaries constitute the focal point of worship in this context, prompting human minds to seek divine inspiration. This phenomenon can frequently be attributed to mythological explanations or, on occasion, to the intrinsic shape of the mounds themselves, which may evoke associations with fertility (Stevens 2023, 37-38). However, they are essentially considered sacred due to their elevated position, their distinct separation from the surrounding landscape, and their perceived function as a vertical entity (cf. Stevens 2023, 46-47, with relevant literature; see also the concept of verticality in other cultural contexts: Dal Zovo 2023, 55-56). Additionally, deities such as Apollo can be associated with the stewardship of nature, albeit always subordinate to the needs of humans; for instance, in Attica, he was venerated as Proopsios, which Smith and Lowry (1954, 10) interpreted as a protector of herds.

**880. SUPPORT YOUR LOCAL STORM-GOD: HYMETTOS, PARNES, AND THE DYNAMICS OF RITUAL ON ATTIC MOUNTAINTOPS**

**Contribution format:** Oral  
**Contribution authors:** Alexis Belis (Metropolitan Museum of Art)

The mountaintops of Attica have been well traversed in both antiquity and modern times, revealing scattered remains of ritual activity on numerous heights across the region. The highest peaks, Hymettos and Parnes, had sanctuaries on their summits as early as the tenth century BCE that shared several common features. Both were dedicated to Zeus specifically in his capacity as a storm-god, worshipped under the exclusively Attic epithets Semios and Semaleos (“god of weather-signs”), and seem to have served the agricultural populations of the region. The archaeological remains indicate that activities at the sites centered on burnt animal sacrifice and ritual drinking and dining. Finally, both peaks marked the borders of the Athenian plain—Hymettos dividing it from the Mesogeia plain to the east, Parnes separating Attica from Boeotia to the north. Despite their lofty siting, shared deity, comparable religious rituals, and close proximity, however, the character of the sites and the dedications offered were markedly different. Excavations on Hymettos uncovered a votive deposit containing hundreds of locally made ceramic vessels and fragments associated with a modest stone altar. The dedications on Parnes, site

of a monumental ash altar, included a wide variety of objects in different materials, including terracotta, bronze, and iron, some produced in regions outside Attica. This paper examines the relationship between the upland sanctuaries on Hymettos and Parnes and the surrounding communities, the motivations behind the dedication of different votives and altar types, and the ways in which the two sites fit within the broader context of mountaintop sanctuaries in Attica, and in Greece more broadly. It may be that both originated in response to local circumstances in Attica, but that the sanctuary on Parnes, despite being relatively inaccessible from the north, eventually took on the character of an interregional sanctuary that served multiple communities and functions.

**1042. MOUNTAINS AND TERRACED SANCTUARIES IN THE HELLENISTIC WEST: A CASE STUDY OF THE SANCTUARY OF FORTUNA PRIMIGENIA IN PRAENESTE**

**Contribution format:** Oral  
**Contribution authors:** Luzie Jofer (German Archaeological Institute | University of Munich)

Terraced sanctuaries from the Hellenistic period are commonly located on mountains. While this has traditionally been attributed to the desire for panoramic views, this explanation does not fully account for sanctuaries in less prominent locations of the mountain. Their placement may thus be rather influenced by cultic, ritual, and socio-political considerations. In my dissertation, I explore the relationship between mountains and terraced sanctuaries in the Western Mediterranean, focusing on the following questions: - Can earlier cult sites on the mountain be identified, and how are they integrated into the sanctuary architecture? - How are the town and the sanctuary connected, and what did the processional routes look like? - What cultic, ritual, and socio-political functions do terraced sanctuaries serve, and can these be identified in specific examples? In line with the objectives of Session #26 – “Empowering Heights,” which closely align with my research, I aim to examine the example of the Sanctuary of Fortuna Primigenia in Praeneste. This sanctuary not only highlights the presence and architectural emphasis on the mountain’s natural features, previously regarded as “sacred” places, but also demonstrates their integration into a monumental complex designed in accordance with Hellenistic architectural principles. Directly connected to the city, the sanctuary featured processional routes leading to the “sacred” places, while establishing a connection with the landscape through visual axes that aligned the structure with its surroundings. Furthermore, the monumental scale and strategic location emphasize its role as a symbol of financial power. In conclusion, the Sanctuary of Fortuna Primigenia in Praeneste offers a case study that enhances our understanding of the multifaceted relationship between cultic practices, architectural design, and socio-political power in the context of terraced sanctuaries on mountains, shedding new light on the cultural and ritual dynamics of the Western Mediterranean during the Hellenistic period.

**2012. CHARACTERISTICS AND FUNCTIONS OF THE UPLAND SANCTUARIES OF UMBRIA, C. 525-290 BCE: A REGIONAL SURVEY**

**Contribution format:** Oral  
**Contribution authors:** Mirjam Von Bechtolsheim (The Open University)

This paper discusses the characteristics and functions of Archaic and Classical (‘pre-Roman’) upland sanctuaries in the region of Umbria (Italy). This region boasts a high concentration of such sanctuaries, that is of archaeological sites in elevated locations characterised by accumulations of pre-Roman votive objects (mainly small anthropomorphic and zoomorphic bronze figurines). These sites and the associated materials form a conspicuous proportion of the overall archaeological record of the religious activities (other than funerary) in this region and period, indicating their significance to the people who established and frequented them. While many of the Umbrian upland sanctuaries feature prominently in recent scholarship on this region and period (e.g. in Zapelloni Pavia 2024; Manconi 2018; Amann 2015; Gherardi 2014; Amann 2011; Bonomi Ponzi 2010), the large number of sites and their complex and frequently problematic excavation and publication histories have precluded detailed analyses of their regional functions and significance. This paper presents the results of a systematic investigation of the region’s documented upland sanctuaries, carried out as part of a recently submitted doctoral research project. It lays out their spatial distribution — both in relation to the region’s natural landscape features and coeval settlements —, built structures, and finds assemblages. This information will be used to reconstruct as far as possible the form and potential function of the activities (religious or otherwise) that took place at these sites. This, then, may form the basis on which to discuss these sanctuaries’ religious, as well as potential social, economic, and/or political functions.

**302. RITUALS ON THE PEAKS: THE ENDURING UMBRIAN RELIGIOUS IDENTITY IN GUBBIO AMID ROMAN EXPANSION**

**Contribution format:** Oral  
**Contribution authors:** Marianna Negro (University of Cambridge)

The ritual landscape of Gubbio showcases the continuity of Umbrian sacral practices from the Bronze Age through

the Roman period. The intervisibility of mountain peaks indicates a deliberate ritualisation of the territory, deeply embedded in Umbrian cultural identity. This practice is exemplified by the deposition of schematic bronze votive figurines at high-altitude sites, including Monte d’Ansciano Monte Ingino and Monte Loreto, a tradition typical of the Iron Age. Despite Roman political and cultural dominance, ritual activities at these sites continued in a hybridised form rather than being replaced by Roman religious structures. Excavations at Monte d’Ansciano revealed both Umbrian votive figurines and Roman coins, indicating the adaptation, rather than abandonment, of local rituals. The lack of monumental Roman sanctuaries at these sites further emphasizes the persistence of distinctively Umbrian religious practices. The Gubbio Survey (1983–1987) and GIS analyses of pottery and artifact distributions further illuminate the adaptation of Umbrian rituals into the Roman period. Roman terracotta figurines found in rural landscapes, particularly at the lower slopes of Monte d’Ansciano, suggest that ritual practices continued outside official Roman religious frameworks. This continuity is not merely a vestige of the past but reflects a form of cultural resilience, possibly as passive resistance to Roman religious imposition. The case of Monte Loreto, where both Umbrian bronze and Roman terracotta votive figurines were found, exemplifies the gradual transformation into a hybridised sacred space. Additionally, the Iguvine Tables, with their inscribed rituals in both Umbrian/Etruscan and Latin, provide further textual evidence of this fusion. Ultimately, Gubbio’s ritual landscape highlights the resilience of Umbrian religious practices, which endured and adapted within the broader Roman framework, demonstrating cultural continuity amid Roman expansion.

**413. HILLTOP SANCTUARIES AS NAVIGATIONAL MARKERS ON THE COASTS OF HISPANIA CITERIOR**

**Contribution format:** Oral  
**Contribution authors:** Marcos Esteban Barbieri (University of Alicante)

Along the coast of Hispania Citerior are located several hilltop sanctuaries which played a key role as visual landmarks in the landscape and especially from the sea. Beyond their religious function, their strategic location made them essential for maritime navigation and territorial organization. Their role varied depending on their setting, allowing a distinction between those located in isolated coastal areas and those situated in urban ports. In the case of rural sanctuaries, their visibility from the sea made them crucial navigational markers in a coastline often lacking clear references. Additionally, these sites not only structured the inland territory but may have also played an economic role related to the management of marine resources. On the other hand, sanctuaries located in urban ports dominated the harbor scene, visually presiding over the city skyline. These spaces served as symbolic reference points, marking the arrival and departure of sailors and reinforcing the city’s role in maritime trade. At the same time, they legitimized local power and projected the protection of deities over port activities. This communication explores the dual perspective of these sanctuaries, emphasizing their role in navigation and in the structuring of the coastal territory during the Roman period.

**2452. ARTEMIS’ SANCTUARY AT BRAURON: THE SACRED PLACE OF MARBLE CHILDREN**

**Contribution format:** Poster  
**Contribution authors:** Justyna Dworniak (Piotrków Academy | University of Łódź)

The Sanctuary of Artemis at Brauron, located on the eastern coast of Attica in Greece, has a unique status among Greek sacred sites. The temple dedicated to Artemis, the goddess of hunting, wilderness, and motherhood, functioned as a central site for religious worship and pilgrimage from at least the 6th century BCE. The Sanctuary of Artemis at Brauron is a significant place in ancient Greek religious and cultural history, renowned for its distinctive relationship with marble sculptures of children, mostly depicting teenage ladies. For centuries, scholars have pondered the significance of these marble young children within the religious context of the sanctuary. A prevailing explanation is that these things served as votive offerings, tangible expressions of prayer and reverence for Artemis, the revered goddess of hunting and protector of young ladies. These marble sculptures embody the aspirations and desires of worshipers seeking the goddess’s benevolent favor for the welfare and future of their offspring, signifying innocence and purity. Nevertheless, the allure of the marble newborns extends beyond mere religious meaning. Some academics propose that they participated in the ceremonial ceremonies of the sanctuary, namely in the transition of young girls into women. These sculptures likely represented the ideals of maidenhood under Artemis’s patronage, serving as visual embodiments of the virtues and qualities expected of young maidens in ancient Greek society. In my presentation, I will examine the importance and role of the marble children in the Brauron sanctuary. I will examine various interpretations of these enigmatic artworks using archaeological data, historical accounts, and similarities to other sacred locations.

28 MATERIALITY OF STUDYING AND PRESENTING ANCIENT RELIGION IN MUSEUMS AND OTHER SECONDARY SETTINGS

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: materiality of religion, archaeological artefacts in secondary settings, research strategies & processes, perceptions of archaeological objects, museum outreach, museum collection curation & history  
Session organisers: Tomasz Dziurdzik (National Museum in Warsaw) – Ljubica Perinić (Croatian Academy of Sciences and Arts) – Ivan Radman-Livaja (Archaeological Museum in Zagreb) – Adrianna Gizińska (University of Warsaw)

SESSION ABSTRACT

The turn towards materiality has been a defining feature in some models/directions of the study of ancient religions in recent years. We want to adopt a wider perspective – one that includes the perspectives of researchers, whether they come from traditionalist or theoretical models, and of the public, looking at how the materiality of ancient religious objects preserved and presented in secondary settings (museums, galleries, archaeological parks etc.) influences the modern understanding of ancient religious realities. Artefacts in those spaces are detached from their archaeological context, which may or may not be partly preserved in documentation, depending on their history. In many cases this increases the role that their materiality holds in reconstructing their original roles. In turn, those objects acquire secondary contexts, which influence the way in which they can be accessed, studied, and perceived. This happens e.g. through curation according to principles very different from ancient religious realities – such as storage and display according to the material (e.g. lapidaria) or divisions between various departments. The choice of items on display is often based on the perception of their artistic quality and beauty, rather than the sacral value attributed to them by their original users. Conservation also may add new layers (or sometimes remove old ones) of complexity to the materiality of such objects. All of this also shapes stories and narratives presented in public institutions, stimulating the public understanding of the issues they illustrate. We welcome contributions on topics including, but not limited, to: · research into the materiality of religious objects in museum collections, including those that lack archaeological context, · the relations between study of artefacts and study of religion, · issues of presentation of ancient religions to the public through material remains, · how materiality of religious objects shapes our understanding of past realities.

CONTRIBUTION ABSTRACTS

1423. WHEN MAN BECOMES MATERIAL: BELIEFS AND PRACTICES IN THE IRON AGE NORTH SEA ZONE

Contribution format: Oral  
Contribution authors: Leila Joensson (The University of Vienna)

This paper is based on the cross-disciplinary PhD-project encompassing archaeology, history of religions and philosophy. The project revolves around ritual practices 400 BC- AD 100 concerning violence before deposition in the North Sea Zone. The study aims to clarify if archaeological data and myths from ‘Celtic’ and ‘Germanic’ Iron Age societies in the North Sea Zone show similarities in beliefs expressed in ritual practices. Archaeological data presents bodies and objects that were destroyed before deposition. Perhaps the Iron Age societies did not distinguish between man and material and vice versa? The idea of no distinction between animate and inanimate brings forward a new perspective on violence, sacrifice and value potentially linked to belief. The study will focus on the underlying belief system by means of a comparative study of (later attested) mythologies from the North Sea Zone, theories on Embodied Knowledge and the ontological aspects of ritual practice transcending dualistic thinking. The theoretical framework is supported by the archaeological data presenting four comparative case studies of the North Sea Zone with a focus on strangulation before deposition in bogs. Two of these bog bodies are exhibited in museums and acts as storytellers of the past but can we trust the existing interpretation of their fate/faith?

120. STRANGER IN A STRANGE LAND: MATERIALITY AND UNDERSTANDING ANCIENT RELIGIOUS ARTEFACTS IN THE NATIONAL MUSEUM IN WARSAW

Contribution format: Oral  
Contribution authors: Tomasz Dziurdzik (National Museum in Warsaw)

Polish culture has an interesting relation with Graeco-Roman past, in that it is characterised by a surprisingly strong sense of belonging and continuity. But the extent of actual contact with ancient objects – and their understanding – was more akin to distant familiarity, especially as access to material remains of Antiquity was always

limited due to lack of any geographic overlap with those cultures. This is especially true in relation to ancient religious artefacts that made their way to Poland in 18th-20th century: they were vestiges of different realities, often already far removed from their background when they arrived to become parts of collections. Combined with the difficult modern history of the country, which meant the loss of much of the documentation, this often wholly obscured their original context. In their new, secondary contexts, they were (and still are) viewed in ways that were mostly dependant on their materiality. This combines with the fact that the focus of past and present curation of museum collections and displays was often mostly on the visual aspects of said objects as “works of art” rather than on their religious meanings. This paper will present several case studies of such artefacts in the Collection of Ancient Art in the National Museum in Warsaw, focusing on their materiality and how it influenced the objects’ biographies, study and presentation. It will be analysed how materiality determined which objects were acquired, their curation and study, as well as how it shaped public understandings of ancient religions. It will be argued that for many of those artefacts that are “strangers in a strange land”, the analyses of their materiality continue to be the most valuable way to make sure they are not lost and far from home but rather preserved in time for all to see.

1292. “OVERWHELMING AND RATHER PECULIAR”: CONTEMPORARY SPIRITUAL VISITOR EXPERIENCES OF MUSEUM DISPLAYS OF ROMANO-BRITISH RELIGION

Contribution format: Oral  
Contribution authors: Antony Lee (National Museums Scotland)

Museums are increasingly recognised as places which are as emotive and experiential as they are educational, with some museums deliberately creating galleries and displays to elicit such responses from their visitors. Yet the Roman world, and specifically its religious landscape, have not yet been a focus of these approaches. Recent scholarship into Roman religion has increasingly repositioned it as a situationally-dynamic, experiential and embodied phenomenon, with material culture constitutive of, rather than merely demonstrative of, internalised beliefs. However, traditional perceptions of it as a rather dry and emotionless civic duty persist, and ancient religion is similarly often assumed to be viewed by museum visitors through a dispassionate archaeological or art-historical lens. Despite presumptions that the deities of Roman Britain are ‘dead’, ancient religion still forms part of the spiritual landscape of many people. This paper explores how some museum visitors, especially contemporary Neo-Pagans and Wiccans, not only draw inspiration from prehistoric and Roman religious practices, motifs and deities, but encounter them in unique ways in museum galleries. Studies of ‘material religion’ have observed religious acts conducted in exhibitions devoted to more mainstream contemporary faiths, yet emotive, numinous and deeply personal experiences with ancient religious objects generally pass unnoticed by museums. This paper explores testimonial evidence for these often hidden and intensely personal gallery experiences in British museums, and considers how the materiality of objects is both central to the experiences evoked yet also restricted by glass-case displays and typologically-driven interpretative schemata. It argues that opportunities exist for museums to explore new methodologies for displaying and interpreting Roman religious objects; challenging all visitors to move beyond the passive art-historical gaze to consider these collections from differing ontological perspectives in which they retain traces of their numinous power.

1022. CONSOLIDATING DESIRES AND REALITY – ORGANIZING MILITARY VOTIVES’ EXHIBITION

Contribution format: Oral  
Contribution authors: Ljubica Perinic (Croatian Academy of Sciences and Arts) – Ivan Radman-Livaja (Archaeological Museum in Zagreb)

Votive inscriptions were a common practice in the Roman world, serving as a means for individuals to express gratitude for services rendered, devotion, or requests to deities. In the context of the Roman military, these inscriptions often reflected the religious and spiritual dimensions of soldiers’ lives, as well as their personal and collective identities. Roman soldiers, officers, and veterans frequently dedicated votive offerings to gods and goddesses for protection in battle, successful campaigns, safe returns, or recovery from illness. These dedications on stone altars, plaques, or statues, and placed in temples, shrines, inside and outside military camps. While organizing an exhibition on Roman military votive inscriptions, as we did in 2017, presents numerous challenges, careful planning, collaboration, and creativity can overcome some of these obstacles. By addressing these issues proactively, the exhibition can become a compelling and memorable experience that brings the ancient Roman world to life for modern audiences. Not only that, it also brings new scholarly challenges to organizers or professional visitors.

65. THE ALTARS FROM ISIS’ SANCTUARY IN CASKA AT THE ISLAND OF PAG

Contribution format: Oral  
Contribution authors: Inga Vilogorac Brcic (Faculty of Humanities and Social Sciences, University of Zagreb)

Caska bay at the island of Pag (Croatia) boasts the earliest known evidence of the cult of Isis in the Eastern Adriatic.

Four altars with inscriptions dedicated to this originally Egyptian goddess were erected in the first quarter of the 1st century AD by Calpurnia, a member of the aristocratic family of Calpurnii Pisones. Her father owned a maritime villa – a coastal estate – in present-day Caska, consisting not only of the luxurious residential buildings (yet to be discovered), but also of its own food production facilities. Having inherited this landed property from her father, Calpurnia worshipped there the goddess Isis and other deities of her circle. In this paper I will follow the trail of Calpurnia’s altars: the circumstances of their discovery, their current state and a new way of presenting them in the Novalja City Museum, but also in the area of the private sanctuary at the Calpurnia’s estate, to which they belonged.

**488. LOST CONTEXTS, PRESERVED MONUMENTS: THE ALTARS ERECTED BY THE MAGISTRI VICI FROM LOWER MOESIA**

**Contribution format:** Oral  
**Contribution authors:** Adrianna Gizinska (University of Warsaw)

Several altars erected by *magistri vici* have been discovered in Lower Moesia, with the earliest known monuments dating back to the reign of Antoninus Pius. The abundance of epigraphic and archaeological evidence related to *vici* in the region of Dobrudja highlights the unique character of Lower Moesia in terms of settlement organization. The diversity of rural administrative structures in this area reflects the complex ethnic composition of the province. Most of these monuments have been discovered incidentally, often as reused material in late antique constructions. Consequently, the precise locations of the original rural sites remain largely hypothetical. Nevertheless, the inscriptions retain significant documentary value, serving as a crucial source for research on the administrative organization of rural settlements, population structure, religious practices, and broader socio-cultural phenomena. A key aspect of this study is the emergence of a new religious practice in Lower Moesia, which involved the annual dedication of altars primarily to Jupiter *pro salute* of the emperors. Particular attention is paid to inscriptions dated to the Severan dynasty, analysing their significance in the context of the practices of the imperial cult and local religious traditions. This presentation focuses on the materiality of these altars and the implications of their detachment from their original functional context. The analysis of inscriptions and the monuments themselves allows for an attempt to reconstruct their original role in local cultic practices. In this context, a crucial question arises: how do the materiality of these objects and their secondary placement shape our understanding of the religious life of provincial communities?

**2146. ANTLER COMBS FROM SERBIAN MUSEUM COLLECTIONS AS THE MATERIAL REMAINS OF GERMANIC BELIEFS**

**Contribution format:** Oral  
**Contribution authors:** Eleonora Pawlikowska (Independent Researcher)

The arrival of Germanic peoples in Upper Moesia brought about a significant transformation in the assemblage of grave offerings accompanying the deceased. Prior to those population changes, funerary goods included a diverse range of cosmetic items, however, in a relatively short time it was largely replaced by a single, highly distinctive category: antler combs. While these artifacts, emblematic of Germanic society, became a ubiquitous feature in burial contexts, the choice of the raw material and the frequent appearance of specific decorative motifs— associated with solar symbolism—indicate that their function extended far beyond the purely utilitarian. The presence of combs in graves also suggests their use when preparing the deceased for the last journey, as they are associated with purification and bringing order. Solar motifs, widely linked to notions of life and rebirth, may have imbued these objects with additional protective and symbolic power to guard against malevolent forces. Moreover, the antlers shed and grown every year embodied not only the vitality and strength of the animal, transferred to the user of the comb made from it, but—which is particularly vivid in the sepulchral context—it represented the natural cycles of dying and renewal. Since the exact position of the examined artifacts in relation to the body and other inventory items is often unknown, their materiality serves as the primary source of insight into the role of combs. The adoption of Germanic burial practices and symbolic motifs in the Middle Danube region provides a glimpse into the cultural interactions between incoming barbarian groups and the local population.

**1823. BUILDING INCLUSIVE NARRATIVES: DISPLAYING GANDHARA ART IN MODERN MUSEUMS**

**Contribution format:** Oral  
**Contribution authors:** Bartłomiej Zurawski (University of Warsaw | National Museum in Warsaw)

This paper examines the challenges and opportunities of presenting Gandharan art in modern museums that embrace innovative narrative trends, questioning traditional geographical divisions in art history. Gandharan Buddhist art, characterized by its Greco-Roman stylistic influence, embodies a rich cross-cultural heritage that defies simple categorization. Employing a postcolonial perspective, the study reveals that conventional East–West dichotomies, which stem from 19th-century Orientalism, fall short of capturing the complex dynamics of

artistic production in Gandhara. Central to the argument is the recognition of Gandharan art as an integral part of the heritage of Late Antiquity. The paper advocates for a reimagining of museum displays that transcends rigid classifications, urging the integration of Gandharan art into a broader, more inclusive dialogue. Notably, while research into the Greco-Roman influences on Gandharan art yields valuable insights, it must not obscure the essential task of articulating its Buddhist heritage. This paper explores how museum exhibitions can effectively showcase both the distinctive stylistic features and the profound religious context of Gandharan art, advocating for innovative exhibition strategies that build inclusive narratives. By emphasizing both Buddhist themes and Greco-Roman stylistic influences, these strategies provide a more comprehensive framework for exhibiting Gandharan art, transcending artificial regional divisions and ensuring that the Buddhist elements remain central to its interpretation. At the same time, it ensures that the Buddhist elements remain central to the interpretation of this unique cultural legacy.

**809. BYZANTINE MONUMENTS IN MUSEUMS: TRANSFER AND LOSS OF SACRED CONTEXT**

**Contribution format:** Oral  
**Contribution authors:** Hanna Treda (University of Warsaw) – Evelina Kachynska (Institute of Archaeology and Ethnology, Polish Academy of Sciences)

As testimonies to the long-standing tradition and culture of Eastern Christianity, Byzantine monuments are incredibly valuable resources in museum collections worldwide. Often relocated from their original, natural contexts—such as churches, monasteries, or other places of worship—into museums, they change function, symbolism, and reception. Their presence in museum spaces allows for preservation and broader accessibility, but it also involves the loss of the original liturgical and sacred context that was key to their meaning. This relocation is influenced by a range of factors, including the specifics of conservation work, as well as the principles governing heritage protection. Byzantine churches were unique and complex sacred spaces created from various elements, such as mosaic and painted decorations, liturgical textiles, and even more specific features like the interplay of light, scents, and sounds. The materials used to shape these spaces were also significant, including the different types of marble, each with distinct color variations, contributing to the overall sacred atmosphere. The aim of our presentation is to analyze the process of transferring Byzantine monuments from their natural storage locations to museums and the consequences of this relocation. The transfer from their original, natural contexts—such as churches, monasteries, or other places of worship—alters their functions, symbolism, and modes of reception. While their presence in museums ensures protection and wider accessibility, it also leads to the loss of the liturgical and sacred context that was essential for their significance. We would like to explore how this change in context affects the interpretation of these works and discuss the broader implications of displaying sacred Byzantine objects outside their original settings. Specific examples of Byzantine artifacts that have gained new meanings and symbolism in museums, as well as those that have retained a close connection to their original context despite relocation, also will be highlighted.

**1463. REACTIVATING ANCIENT SACRED SPACES AND CONTEMPORARY RELIGIOUS USE OF ARCHAEOLOGICAL SITES**

**Contribution format:** Oral  
**Contribution authors:** Anja Mlakar (University of Maribor, Faculty of Tourism | Institute IRRIS)

This contribution will examine the return of religious practices to some Late Antique and Early Medieval Christian archaeological sites in Slovenia, taking into account how their physical remains contribute to their renewed function as sacred spaces. Once abandoned for centuries, some of these sites are now being re-used for religious practice. Their revival as spaces of worship presents an interesting case for researching the relationship between archaeological heritage and contemporary religious life. This contribution will therefore consider how material remains mediate between the archaeological past and contemporary ritual use. It will explore how materiality shapes interpretations of authenticity, continuity, and sacredness in heritage discourse and religious practice. The contribution will also highlight how religious, and heritage discourses interact, and how the use of these spaces today reflects broader cultural and historical processes. The study will also consider how different stakeholders, including religious communities and heritage professionals engage with these spaces and shaping their contemporary significance.

30 THE FOUNDATION OF KYIV AND THE TERRITORIES OF THE SOUTHERN RUS. CURRENT ARCHAEOLOGICAL AND HISTORICAL RESEARCH AND ITS RECEPTION

Session theme: 6. Intertwining archaeology, heritage, and museums  
Session format: Regular session  
Session keywords: Ukraine, Kyiv, Medieval, Archaeology, History, Cultural Heritage  
Session organisers: David Hill (Norwegian Institute of Cultural Heritage Research) – Sergiy Taranenko (National Reserve “Kyiv-Pechersk Lavra”)

SESSION ABSTRACT

From its foundation and development in the ninth century and through its evolution as the centre of a network of principalities the success of the Kyivan Rus state can in part be attributed to a multi-cultural and inclusive atmosphere that created a wealthy and powerful city that at its greatest extent controlled an area stretching from the White to the Black Seas. The Viking and Baltic connection, strong contacts with Constantinople and neighbouring Steppe cultures, all gave a mufti-cultural dimension to Kyiv’s development. St Sofia Cathedral from the first half of the eleventh century was the largest Byzantine church outside of Constantinople, the Christianization process and the introduction of literacy, large-scale international trade, rapid urban growth and artistic evolution have all left a rich archaeological and historical record. Ultimately the diverse cultural impulses that made up Kiyvan society fused together to create a powerful East Slavic state at the periphery of Europe. For geo-political reasons Kyiv’s medieval heritage was downplayed and side-lined in the nineteenth and twentieth centuries. The ongoing war in Ukraine sees Kyivan heritage at the forefront of a renaissance where the themes of the past again resonate within a reenergized Ukrainian national identity. This session will look at the archaeology and history of the Kyivan state within a frame of globalization, mobility, assimilation, and state formation. Additionally, the session will look at how these themes have come to the fore in post-Maidan Ukraine and during the ongoing war. What role does the heritage of the Medieval Kyiv state play in Ukraine today? How has research been influenced by the current conflict. How is the reception of the cultural legacy activated? What role can it play in the healing of conflict trauma and in building a cohesive national identity for all?

CONTRIBUTION ABSTRACTS

624. RUS, SLAVS AND VARANGIANS - MOBILITY, ASSIMILATION, AND STATE FORMATION

Contribution format: Oral  
Contribution authors: David Hill (Norwegian Institute of Cultural Heritage Research)

The Rus as an identifiable group are visible within documentary sources and within the archaeological record of the Dnieper basin from the ninth and tenth centuries, and represent the eastern dimension of the so-called ‘Viking expansion’. It is normal to identify a site as being Rus through the presence of objects of a Scandinavian type, site typology and topographic context. There is a general correlation between the sum total of the documentary and archaeological sources, though considerable discussion remains on details. Scandinavian participation in the foundation and development of the Kyivan Rus state has led to a controversy from ‘anti-Normanist’ nationalist models that sought to question the scale of the role of Scandinavians in state formation. The processes of assimilation of Scandinavians within Slavic society tempers the nationalist discussion somewhat. Mobility, expansion and economic opportunity in the ninth century formed the Rus. Scholars recognize today that Baltic, Slavic and other ethnic elements also made up a part of the mix. How do archaeological and historical data support each other? How have 19th and 20th political discussions influenced scholarship? Are we done with the anti-Normanist discussion or not? After the formation and development of Kyivan Rus a second wave of Scandinavian participation in the region occurred formed out of the lucrative military service at Constantinople from the eleventh century and use of Dnieper route from the Black Sea to the Baltic. The Rus and Varangians were mobile, fluid groups pursuing individual and collective interests which evolved to shifting situations. This presentation will frame the themes to be explored during this session and introduce the topography, terminology and chronology that will be discussed, and consider contemporary reception and issues of heritage management.

34. WHAT EARLY MEDIEVAL HILLFORTS ALONG THE DNIPRO AND DESNA RIVERS TELL US ABOUT THE SCALE OF THE SCANDINAVIAN PRESENCE?

Contribution format: Oral  
Contribution authors: Alla Kurzenkova (British Academy Researcher-at-Risk Postdoctoral Fellow, University of Glasgow)

The network of Rus’ trading posts facilitated travel along the eastern trade routes, linking different regions. For Scandinavian groups, these river-linked hillforts functioned as key entry points into wider trade and migration

networks. They played a vital role in supporting the eastward movement of Viking expansion and influence, underlining their strategic importance in this wider context of the Viking movement. But how do we define the Scandinavian presence in these hillforts? The central focus of this investigation is the presence of artefacts of Scandinavian origin, or their local copies, which serve as physical evidence of the far-reaching impact of Scandinavian activity. The analysis is based on the archaeological evidence, which highlights the uneven distribution of Scandinavian artefacts in different hillforts, ranging from high-status artistic objects to utilitarian artefacts associated with trade and warfare cultures. A key question is the nature and extent of this influence: what can these artefacts tell us about these societies? Were all these artefacts ‘equally Scandinavian’, or do they represent different scales of influence and integration? Do these artefacts reflect a direct Scandinavian presence, indirect cultural exchange, or a blend of both. This study reassesses the Scandinavian presence along the Dnipro and Desna rivers by focusing on hillforts from the 9th to 12th centuries AD. By looking at the artefacts, the trade networks they imply, and the artistic influences they carry, the research aims to reveal the level of interaction and adaptation that defines this process. At the same time, the role and function of hillforts as both physical and social-economical sites within these trade river routes will be considered. Through this dual focus research seeks to provide a comprehensive picture of Scandinavian influence, which flows from the evidence of artefacts and outwards to the wider historical landscape.

310. TRADE, SETTLEMENT, AND INFLUENCE: RUS IN TENTH CENTURY CHERNIHIV REGION OF UKRAINE

Contribution format: Oral  
Contribution authors: Stepan Stepanenko (Leibniz-Zentrum für Archäologie - Zentrum für Baltische und Skandinavische Archäologie | CNRS UMR 8167 (Monde byzantin))

Shortly after arriving in Kyiv, the Rus began looking beyond the town and established new sites along contemporary trade routes. With navigation through the Dnieper rapids proving difficult in the early tenth century, the routes via the Desna and Siverskyi Donets rivers provided direct access to the markets of the Khazars, the Caliphate, and Byzantium, furnishing a desirable corridor for expansion. These pathways ran through what is now the Chernihiv region of Ukraine, where the Rus moved eastwards along the Desna, founding a series of settlements whose chronology, character, and inhabitants remain subjects of ongoing scholarly discussion. Earlier interpretations dated the beginnings of Rus influence to the ninth century, yet fresh examinations point to sustained, large-scale occupation materialising only in the tenth century, likely from its middle decades. Shestovytsya, the first and most prominent early site on the Desna route, epitomises this episodic pattern of settlement in the early tenth century. Furthermore, recently reassessed Islamic silver hoards, and nearby sites demonstrate a heightened influx of coinage in the latter half of the tenth century, underscoring the growing significance of Chernihiv rather than merely signalling conquest. Excavations at hillforts along the waterway reveal the Rus eventually expanded beyond the immediate Desna corridor, progressing from short-lived outposts to more stable strongholds. Intriguingly, early Rus contexts show limited evidence of Slavic involvement, implying that control was consolidated gradually through interconnected trade networks rather than by outright subjugation. Thus, the Rus penetration into these Slavic territories did not represent a sudden transformation but rather a protracted process of settlement, commerce, and interaction. Current evidence strongly suggests that a distinctly recognisable Rus polity in the Chernihiv area only emerged during the latter half of the tenth century.

770. POROSSYA – A KEY REGION FOR STUDYING CULTURAL TRANSITION AND ETHNIC INTERACTION DURING THE RUS’ PERIOD

Contribution format: Oral  
Contribution authors: Artem Borysov (Institute of Archaeology of the National Academy of Sciences of Ukraine)

Located south of Kyiv, Porossia is a significant area mentioned in historical chronicles. The formation and development of settlements in this part of the Principality of Kiyv occurred between two major settlement crises. The first crisis arose with the arrival of the Pechenegs, which led to the decline of Slavic settlements in the late 9th and 10th centuries. The region’s development during the Rus’ period ended with a catastrophic settlement crisis in the 1240s, tied to the Mongol invasion. Porossia serves as an important test region for examining various scientific questions in the fields of archaeology and ancient history, particularly regarding the development of human society as a whole. Here are some key issues to explore: 1. “The Functioning of Princely Power: This includes the construction of the outer echelon of fortifications for the defense system of princely Kyiv with the special linear fortification complex called “Zmiievi Valy” (Dragon Ramparts) at the end of the 10th century. 2. “Interaction Between Centers and Outskirts”: Examining how princely Kyiv interacted with the surrounding inhabited areas. 3. “Ethnic and Economic Interactions”: The region was settled by diverse population groups of different ethnic origins and economic practices that integrated into communities known as the “Porshany” and “Black Klobuks.” 4. “Settlement Patterns”: Investigating how the settlement patterns and economic activity evolved alongside its defensive functions. In less than a century, Porossia transformed into an important economic region within Rus. Overall, the Porossia of Rus’ times serves as a vast testing ground for studying a

wide range of issues related to the adaptations, interactions, and impacts of human communities within the context of both the natural environment and social ecotones.

**781. THE NEED TO LOOK CLOSER. ARCHAEOLOGICAL EXHIBITION “KYJIVAN RUS’. ORIGINS” AT THE NATIONAL MUSEUM OF LITHUANIA.**

**Contribution format:** Oral  
**Contribution authors:** Egle Zaveckiene – Rūta Kačkutė (National Museum of Lithuania)

For many years, the origins of Kyivan Rus’ were largely shaped by the Russian narrative, which emphasized the continuity of the Russian state with the Slavs at its core. However, this theory is no longer accepted by scholars. In collaboration with 17 institutions across Europe, we have created the archaeological exhibition Kyivan Rus’. Origins. This exhibition, grounded in archaeological research and authentic artifacts, reveals the establishment of new long-distance trade routes that led to the emergence of Kyivan Rus’. These processes involved both Slavic and non-Slavic groups, including Scandinavians, Balts, Finnic peoples, Greeks, and Turkic-speaking nomads. The exhibition highlights the gradual development of Kyivan Rus’ into a distinctive and unique culture. It also examines how this rich cultural legacy was reflected in Lithuania. Recent archaeological discoveries and our particular focus on the role of Baltic tribes, provide new insights into their participation in these transformative events. Traditionally, the Baltic tribes have been perceived as isolated, with little involvement in any processes in the region. However, the discovery of an 11th-century Baltic burial ground in Ostriv (Kiev region) near the river Ros in 2017 would suggest that existing archaeological material deserves closer examination. The presence of a burial site with the Baltic material found in the south of Kyivan Rus’ indicates that Baltic tribes were capable of long-distance travel. It is possible that Baltic warriors served as mercenaries in the armies of Kyivan Rus’ princes. This hypothesis could also explain the nomadic influences seen in Baltic horse-riding equipment from the 10th to 12th centuries, such as metal stirrups and bits. Written sources on the relations between Baltic tribes and Kyivan Rus’ are very scarce. As a result, archaeological finds remain the primary and most reliable source for the study of relations between Kyivan Rus’ and the Baltic tribes.

**1078. INSULAR CONNECTIVITY WITH KYIV AND BYZANTIUM IN THE LATE VIKING PERIOD BYZANTINE COINAGE ON GOTLAND, THE BALTIC SEA AND BEYOND**

**Contribution format:** Oral  
**Contribution authors:** Christoph Kilger (Dept. Archaeology, Ancient History and Conservation, Uppsala University, Campus Gotland)

Despite its location in the middle of the Baltic Sea and its physical separation from surrounding communities, the island of Gotland was highly interactive throughout its early history, sustaining a complex connectivity and a multiplicity of reference points. Interactions and personal eastern encounters with Kyiv and Byzantium and their elites are mentioned in runic inscriptions and written sources and are also tangible in material culture, particularly coinage. Notably, Byzantine silver coins and miliaresia are not evenly distributed across Scandinavia and the Baltic Sea but are clustered on the island of Gotland (523 out of 739 recorded specimens). In my presentation, I will argue that the evidence of Byzantine coinage can provide new insights into how contacts with the Kyivan Rus developed during the second half of the 10th and early 11th centuries. This distinctive distribution pattern indicates that Gotlandic networks had access to and controlled the circulation of Byzantine silver. From a theoretical and methodological perspective, Byzantine coinage offers a compelling case to explore aspects of insular and maritime connectivity, including considerations of time, distance, and space.

**1842. VESTFOLD, NORWAY - CONTACTS WITH THE RUS: A SNAPSHOT OF ISLAMIC COINAGE RECOVERED FROM VIKING CONTEXTS**

**Contribution format:** Oral  
**Contribution authors:** Vibeke Lia (Vestfold fylkeskommune)

In the county of Vestfold on the west side of the Oslofjord metal detectorists regularly find Islamic silver coinage from ploughed contexts. After a rough start some ten years ago, the metal detectorists now are more aware of the importance of delivering their finds according to Norwegian law. Through better cooperation and new national guidelines for best practices these finds are handed in to the county archaeologist and the Museum of Cultural History. Archaeologists needed to step up to meet a hoard of individuals who wanted to contribute, and work with a material that is a result of non-academic filtration. The new finds in many respects deviated from the earlier known material gathered from excavations. These new finds represent widespread contact between Vestfold and the Eastern world of the Rus through the late ninth and tenth century. Vestfold had a strong role in the Viking world, with the Oseberg, Borre and Gokstad ship burials and the Viking trading site of Kaupang. Besides these well-known sites stray finds of Islamic coinage from across the county show that there are many other sites demonstrating strong contact between Norway and the Rus territories. Among other archaeological

finds tied to the eastern trade routes are korneol-, rock crystal- and glass beads, animalistic jewellery and a sword chape with the falcon motif. This presentation will focus on management practices from Norway when dealing with metal detector clubs, their obligations their motivation and look at what the finds themselves tell us about society and mobility in Vestfold.

**1247. MONUMENTAL ARCHITECTURE OF KIEVAN RUS: THE FORMATION STAGE**

**Contribution format:** Oral  
**Contribution authors:** Olena Chernenko (University of Warsaw)

Until recently, the development of monumental architecture in Kievan Rus was viewed as a linear progression. Scholars traditionally traced its origins to the arrival of master builders from Constantinople in Kyiv in 989, who were invited to shape the city in the image of a Byzantine imperial capital. However, recent archaeological and architectural research has refined this understanding. It appears that the adoption of Byzantine construction traditions in Kievan Rus was initially influenced not by the imperial style but by provincial Byzantine architecture—specifically, the Balkan tradition (as seen in the construction of the Church of the Theotokos and palace complexes in Kyiv) and the Anatolian-Caucasian tradition (exemplified by the churches of Tmutarakan and Chernihiv). The foreign craftsmen invited to Rus had to adapt their familiar building techniques to local conditions and materials. This adaptation led to a series of innovations that played a decisive role in shaping monumental architecture. The further development of Kievan Rus architecture is closely linked to the ambitious building program of Yaroslav the Wise, which included the construction of Saint Sophia Cathedral, the Churches of Saint Irene and Saint George in Kyiv, and the Saint Sophia Cathedrals in Polotsk and Novgorod. Architects from the Constantinopolitan school participated in this program, resulting in a fusion of different traditions. During this period, structures were built in Rus that retained Byzantine architectural features but had no direct counterparts in Byzantine architecture. It is likely that all monuments of the “era of Yaroslav” can be considered both part of the broader Byzantine tradition and as uniquely belonging to the architectural heritage of Kievan Rus.

**410. KYIV PERCHERSK LAVRA - ‘CAVE MONASTERY’ COMPLEX. THE ORIGINS AND ROLE IN THE DEVELOPMENT OF MONASTIC SITES IN KYIVAN RUS**

**Contribution format:** Oral  
**Contribution authors:** Dmytro Pefits – Sergiy Taranenko (National Reserve “Kyiv-Pechersk Lavra”)

The Pechersk Monastery is one of the oldest monasteries on the territory of modern Ukraine — the first mention of it in a chronicle dates back to 1051. An extensive network of caves run underneath the monastery and churches, when the earliest ‘Varangian caves’ were dug is still an open question. Its emergence as a cave monastery did not depend on the will of the Kyiv princes, unlike five other suburban monasteries in Kyiv. It quickly became the largest and most famous religious centre and was transformed into a sacred one already in the princely era. After the capture of Kyiv by Batu Khan’s troops in 1240, the monastery continued to function and only confirmed its importance. It became a place of refuge for many Kyivans and inhabitants of the surrounding villages. This process eventually led to the formation of estates and sloboda, from which the town of Pechersk developed, a new urban formation centred on the monastery. The status of a privileged private town was repeatedly confirmed by royal charters in the 16th century. Contacts between Kyiv, the Byzantine world, and the numerous other monastic sites across the Rus were aided by religious networks where ideas and impulses were spread over long distances. This presentation will consider the role that Pechersk Lavra has in forging Rus society and spreading its reach across its large sphere of influence. The monastery’s early structures and their evolution will be considered with the frame of mobility and assimilation.

**678. RECENT ARCHAEOLOGICAL OBSERVATIONS FROM THE CATHEDRAL OF SAINT SOPHIA OF KYIV**

**Contribution format:** Oral  
**Contribution authors:** Tymur Bobrovskyy (The National Conservation Area “St. Sophia of Kyiv”)

The Saint Sophia Cathedral is a unique monument which represents the integration of Byzantine art and architecture during the early Christian period at Kyiv. Archaeological excavations of the cathedral have been carried out intermittently for over a century, but the picture of its construction is still incomplete. Excavations during 2018–2024 have brought to light new information on how the building was constructed.

- The cathedral was built above a late 10th century barrow cemetery. Besides, under the northwestern part of the cathedral the traces of unknown monumental structure of early 11th century was found that had been destroyed by fire.
- The outer walls of the cathedral are erected on stone strip foundations with strong mortar, whilst the inner walls are erected on strip foundations from large stone blocks without mortar. It is thought that this was done to mitigate earthquake damage.
- The subsidence of the cathedral’s structures during its construction indicates that the builders adhered

to certain technological standards, which, however, were insufficient for local soils, as subsidence continued later.

- Besides the central core with its five altar apses, the cathedral had an additional large altar apse in the northern outer gallery. Around the middle of the 11th century this apse was equipped with a brick two-step synthronon and was temporarily used as a main altar of the cathedral.

Finally, we note that the author’s method of the analysis of graffiti allows us to reconstruct the original floor levels from different periods as well as track changes in the functions of the individual spaces of the cathedral during the 11th - 17th centuries.

**383. PLINTHOI (BRICKS) AND THEIR STAMPS AND MARKINGS FROM THE MONUMENTS OF THE PECHERSK MONASTERY OF THE 11TH—13TH CENTURIES**

**Contribution format:** Oral  
**Contribution authors:** Olena Makhota (National Preserve “Kyiv-Pechersk lavra”)

The Rus officially adopted Christianity at the end of the 10th century. This led to the spread of new building traditions and the construction of monumental stone buildings; primarily churches and palaces. According to written and archaeological sources, about fifty monumental buildings of the 10th—13th centuries are known in Kyiv. Some of the monasteries with brick churches are located outside the city. Among them, the largest complex of the so-called Princely Age was the Pechersk Monastery. Its main buildings are made using bricks — an expensive and, at the time, a relatively new building material for Rus, but known from, Rome and Byzantium. A plinthois is a wide and flat fired slab like brick. It was used in the architecture of the ancient Rus in the late 10th — early 13th centuries. An interesting phenomenon was recorded on the plinths of the princely period — the marking of its surface with various marks. According to the established terminology, all marks are divided into signs (convex marks on the side surface), markers (made with a finger or a tool on the upper bed of the plinth) and stamps. Determining the functional purpose of markings is an interesting but still insufficiently researched and debated issue. The most common hypotheses about the need to mark the plinth are production-accounting, votive-personifying, and magical decoration. Using the example of marked plinths from the monuments of the Pechersk Monastery of the 11th—13th centuries, Olena Makhota’s recently published monograph contains an analysis of all aspects of the production of these early ceramic building materials, as well as a typology of markings and their variations. How rapidly did the use of plinthoi develop? and how was their production and use integrated into monumental architecture in Kyiv? These and other questions will be discussed.

**168. KYIVAN BONE-CARVING WORKSHOPS OF EARLY RUS PERIOD IN THE CONTEXT OF EUROPEAN BONE CARVING**

**Contribution format:** Oral  
**Contribution authors:** Maryna Serhieieva (Institute of Archaeology NAS of Ukraine)

The genesis of bone-carving craft in Early Rus’ was connected with external cultural interrelations. For Kyiv, the Northern European tradition of bone processing is of the main importance. Certain impulses from steppe cultures can also be traced. Bone items of high quality dated back to the 10th century could be import, its copies or the products of itinerant craftsmen. They are mostly associated with the warriors’ graves. Bone-carving workshops of the 10th - early 11th centuries in the Middle Dnieper Region including Kyiv have not been identified. Kyivan bone-carving craft itself developed during the 11th–12th centuries. Its development reached its peak at the late 12th – early 13th centuries. Kyivan bone-carving craft of this period is represented by the largest number of bone-carving workshops. In total, it is currently possible to take into account at least 7 stationary and possibly stationary workshops, 9 small temporary workshops and 8 workshops with unknown character of production. Kyivan craft is characterized by the largest volume of production among the towns of Eastern Europe and variety of product range. Market character of production and area of finds of some items presumably originating from Kyiv workshops allows us to consider Kyiv as a production center not only of local significance but also of regional one.

**931. KUFIC DIRHAMS WITH GRAFFITI IN THE FORM OF A BIDENT**

**Contribution format:** Oral  
**Contribution authors:** Andriy Boiko-Haharin (The National bank of Ukraine) – Oleksii Artiukhin (National Academy of Culture and Arts Management)

The earliest appearance of a bident on a coin refers to images on Kufic coins of the Arab Caliphate, applied with sharp objects in the form of graffiti. That is, graffiti on Kufic coins became the earliest practices of using the signs of the Rurikids even before the beginning of the own Rus’ coinage. Kufic coins with sharp objects applied to their symbols - signs of the Rurikids princes, symbols of Scandinavian paganism, military attributes of the Vikings, Scandinavian runes are extremely important in the study of trade operations of Rus’ at the beginning of the 9th century. Arab dirhams engraved with graffiti in the form of a bident, dating mainly to the end of the 9th

- beginning of the 10th century, that is, long after the death of Svyatoslav - indicate the use of the bident not as a specific personal family princely sign, but as a sign of the entire Rurik’s dynasty or as a sign of princely power in general. Graffiti in the form of a bident is one of the most interesting artifacts of the early period of the reign of the ancient rulers of Kiev - it bears on its field the tribal sign of the Rurikids of pre-Christian times, creating in fact the first reliable case of its use on coins.

**1268. TRAUMAS AND THEIR TREATMENT IN ANCIENT KYIV**

**Contribution format:** Oral  
**Contribution authors:** Arina Potapova (National University of Kyiv-Mohyla Academy) – Aleksandra Kozak (Institute of Archaeology of the National Academy of Science of Ukraine)

Traumatic injuries can reflect historical events and everyday life of the population. Kyiv of the 10th-13th centuries was the intersection of major trade routes. Representatives of numerous peoples and various professions inhabited different districts of Kyiv. The history of the City in different periods is full of social and natural disasters. One of the directions of studying the social status, life, and level of medical knowledge in ancient Kyiv is the study of the distribution of domestic, professional, or military injuries and traces of their treatment. The study involves about 300 individuals discovered in the Upper City, Podil, and Kopyriv Kinets burials. Morphological method was used, in some cases with the involvement of X-ray diagnostics. Healed and unhealed injuries to the skull and postcranial bones were studied. The most common in Kyiv in the 10th-13th centuries were domestic and occupation injuries. The number of military injuries increased during the period of Kyiv’s establishment as the centre of the state and in the middle of the 13th century. Skull injuries are more common in men. Healed trauma is found more often in mature individuals, unhealed injuries occur mainly in young adults. Frequency of postcranial trauma appeared to be similar in male and female, but its localisation on the skeleton differs in these two groups. The most typical for Kyiv residents were fractures of the tibia and ankle joints, as well as the radius. This may indicate the occupation of individuals or be associated with the landscape of the city, located on the hills. The overwhelming number of healed injuries indicates a high level of development of medicine in ancient Kyiv. The results obtained confirm the evidence in written sources about the methods of treating injuries and skills of Kyivan monastic and secular physicians.

**730. ARTISTIC INFLUENCES ON NORWAY FROM KIEVAN RUS IN THE ELEVENTH AND TWELFTH CENTURIES**

**Contribution format:** Oral  
**Contribution authors:** Kjartan Hauglid (Norwegian Institute for Cultural Heritage Research)

The paper will investigate to what extent Byzantine artistic influences are a consequence of the close connections between Kyiv and Norway in the eleventh century, especially the marriage between the Norwegian Haraldr Sigurðarson Hadrada (1015–1066) and Princess Elisiv (1025–c.1067), daughter of Yaroslav the Wise. The introduction of masonry architecture in Norway in the eleventh century brought non-figurative friezes and geometric patterns, marking a break with Viking art and Germanic animal ornamentation. These cultural connections are an under-researched topic in Scandinavian art and cultural history. From the end of the tenth century until the beginning of the twelfth century, the Scandinavian high aristocracy was closely linked to Kyivan Rus. Four Norwegian kings are known to have stayed for a more extended period in Kyiv (Kænugarðr): Óláfr Tryggvason (960–999), Óláfr Haraldsson (993–1030), Magnús góði Ólafsson (c.1024–1047), who spent his childhood in Kyiv, and Haraldr Sigurðarson, who fled to Kyiv at the age of thirteen and served the Emperor of Byzantium for several years before he married Princess Elisiv who became queen of Norway. In the twelfth century, Princess Malmfred (1095/1102–after1137), daughter of Mstislav the Great, became queen of Norway when she married Sigurðr Jórsalafari “the Crusader” (1090–1130).

**2473. BYZANTINE AND EARLY RUS’ CRAFT INTERACTION THROUGH THE MEDIEVAL GLASSMAKING WORKSHOP OF KYIV-PECHERSK LAVRA: THE CASE OF GLAZED POTTERY**

**Contribution format:** Oral  
**Contribution authors:** Sergiy Taranenko (National Preserve “Kyiv-Pechersk lavra”) – Mariia Tymoshenko (Museum of Kyiv History)

Conversion to Christianity was a powerful political, economic, and cultural factor affecting the development of Early Rus A notable contribution in this regard was the tradition of brick church construction introduced by the so-called ‘masters from Greece’. The Kyiv-Pechersk Patericon gives the legendary description of the construction of the Assumption Cathedral of the Kyiv monastery of the Caves. Nevertheless, the unearthing of production sites related to the manufacture of building materials and interior decor in the middle of the 20-th century (V.A. Bogusevich) and their subsequent research (2021-2024, S. Taranenko) has provided many insights into the practices of craftsmen and their interaction with the local community in a craft, social, and cultural context. In the

course of recent archaeological excavations of the glassmaking workshop intended for the production of smalt and glaze for the monumental decor of the temple, the remains of furnaces, production equipment (crucibles for glass and glaze), and production waste (slag) were identified. Exceptional finds include open-shaped bowls on ring bases, which imitate byzantine models. A visual observation of the composition of the ceramic composition and the quality characteristics of the glaze, including X-ray fluorescence (XRF) analysis, along with the processing techniques and the obvious manufacturing ‘defects’, allow us to argue that the workshop produced these items as an extra to the main product. Alternatively, according to the second version, this is evidence of the second phase of the workshop’s functioning after the byzantine masters have left, which probably did not continue for long under certain circumstances. The contribution opens the question of the prospects for further analysis methods of this group of materials and their correlation with findings from the archaeological assemblages of the princely city, the production sites of glass and glaze on wider areas of the Byzantine cultural circle.

**1904. DIGITIZING ARCHAEOLOGICAL HERITAGE OF KYIV AND SOUTHERN RUS’: PRESERVATION, RESEARCH, AND KNOWLEDGE DISSEMINATION**

**Contribution format:** Oral  
**Contribution authors:** Kateryna Ilchyshyna (Institute of Archaeology, National Academy of Science of Ukraine) – Oleksandra Ivanova (National University of Kyiv-Mohyla Academy) – Ivan Zotsenko (Institute of Archaeology, National Academy of Science of Ukraine)

Since the full-scale war began, Ukrainian archaeologists have intensified efforts to digitally preserve endangered heritage. The Scientific and Research Lab “Archaic,” in collaboration with the Institute of Archaeology of the National Academy of Sciences of Ukraine, has digitized key archaeological materials from Kyiv and Southern Rus’. Nearly 100 high-resolution 3D models have been created, covering both artefact digitalization and in-situ site documentation, which is especially crucial during wartime. Beyond preservation, this initiative expands research opportunities. High-resolution 3D models enable precise morphometric analysis, technological studies, and cross-cultural comparisons without risking fragile objects. With heritage under continuous threat, digital tools are essential for protection and knowledge dissemination, ensuring Rus’ legacy remains accessible for future generations. Among the digitized sites is the Kytayiv Archaeological Complex (10th–13th century), an urban center. Unlike standard digitization efforts, this project aimed not only to document but also to protect the site from urban development. Public engagement played a key role: publishing 3D models on a dedicated website significantly raised awareness. Another important case is the Church of Saints Borys and Hlib in Vyshhorod, one of Rus’ largest known churches. While only the foundations and one preserved wall remain, its 3D recording initiated a broader effort to digitize Kyiv’s archaeological sites. A major component is the Ukrainian Heritage Digitization and Dissemination Initiative (UHDDI), through which over 50 artefacts from Kyiv and the Baltic burial site “Ostriv” on Rus’ southern border were digitized. Objects such as fibulae and neck rings offer valuable insights into 10th–11th-century cultural interactions. This project not only preserves Kyiv and Southern Rus’ heritage but also enhances research and public access. It underscores the role of digital tools in safeguarding cultural heritage during war and highlights the need for continued collaboration.

**1404. THE CONSEQUENCES OF THE RUSSIAN MILITARY INVASION OF 2022 FOR THE ARCHAEOLOGICAL HERITAGE IN THE VICINITY OF KYIV**

**Contribution format:** Oral  
**Contribution authors:** Volodymyr Hnera – Artem Borysov – Ivan Zotsenko (Institute of Archaeology of the National Academy of Sciences of Ukraine)

The Russian invasion in late winter 2022 took place on the archaeological heritage-rich outskirts of Kyiv. The consequences of the intense military confrontation also affected the state of the archaeological sites. In 2022–2023, the German Archaeological Institute supported work to monitor the state of the archaeological heritage of the Kyiv region. The field part of A. Buiskykh research grant was coordinated by V. Ivakin. As a result of the work of several field groups, several hundred archaeological sites were examined. The surveyed sites can be divided into several groups: 1. Sites damaged by shelling with various types of ammunition. Various traces of ammunition hits are recorded on these sites. Often the cultural layer is destroyed at the point of impact with the formation of a funnel-shaped depression. The upper layers of cultural archaeological sites are saturated with metal fragments, significantly changing the cultural layer’s structure as a whole. 2. Archaeological sites have been damaged by fortification activities. Such archaeological sites are damaged by various trenches, dugouts, and other buried elements of military infrastructure. Such activity completely destroys the cultural layer of the archaeological site at the site of the construction of such elements of permanent fortifications. 3. Objects whose condition cannot be physically determined by ground monitoring during martial law. The condition of such archaeological sites can be indirectly assessed from satellite images (if available), or rather conditionally from indirect data. Some of the sites, although inaccessible due to mined entrances, are still visually recorded. The collected data continues the tradition of surveying archaeological sites in the region, which has been carried out by the authors since 2017.

Currently, the work has been suspended due to lack of funding.

**660. STRATEGIES FOR PROTECTION OF CULTURAL HERITAGE ARTEFACTS LOOTED DURING WAR AND CONFLICT – AN INTERNATIONAL PERSPECTIVE**

**Contribution format:** Oral  
**Contribution authors:** Håkon Roland (Museum of Cultural History, University of Oslo)

Cultural Heritage research has been strongly influenced by the current conflict in Ukraine. The paper will present recent research that exemplifies strategies to protect looted and trafficked cultural heritage artefacts during war and conflict with special attention to Ukraine. The increasing commodification of cultural heritage, driven by demand in the global antiquities market, has intensified looting and smuggling, particularly in war-torn regions. As a result, countless artefacts, termed “fragments of war,” are illegally circulated worldwide, exacerbating cultural destruction and undermining national identities. Cultural heritage crime is linked to broader criminal networks, including terrorism and drug trafficking. For example, Interpol’s seizure of 567,000 artefacts in 2020 alone underscores the magnitude of the problem. Strengthening crime prevention strategies is essential to curbing illegal trade. The 1954 Hague Convention and its Second Protocol emphasize the urgent need for preventive measures to safeguard cultural heritage in conflict zones. These measures include comprehensive inventories, emergency planning, and strategies for protecting or relocating artefacts. However, despite the international legal frameworks, enforcement remains inconsistent across nations. One major challenge is the ineffective coordination between national and international bodies. While Article 21 of the Hague Convention’s Second Protocol mandates the prevention of illicit export and movement of cultural objects, gaps in national regulations and enforcement mechanisms persist. Norway’s case illustrates this issue, where legal instruments exist but implementation falls short. Restitution of looted artefacts remains a crucial but under-addressed aspect of cultural heritage protection. The international community must reinforce its commitment to returning stolen artefacts to their countries of origin. National and international efforts must align to ensure that cultural heritage protection is not just a legal obligation but an active priority. Compliance with the Hague Convention’s Second Protocol, coupled with stronger enforcement, is vital for preserving humanity’s shared cultural legacy.

**397. GLAZED TABLEWARE FROM MEDIEVAL KYIV. THE ISSUES OF STYLE, DISTRIBUTION AND DATING**

**Contribution format:** Poster  
**Contribution authors:** Mariia Tymoshenko (Head of the Departmen. ‘Kyiv Ancient and Medieval’. Museum of Kyiv History)

Glazed tableware is a quite rare category of pottery in Early (Kyivan) Rus’. Its appearance and spread are directly related to the glass and glaze production for monumental decoration of the brick-built churches, as some of the finds have been noted among the deposits of the 11-th century production sites, including St Sophia of Kyiv and the Assumption Cathedral of the Kyiv Cave Monastery. At the same time, the sporadic findings from the residential areas and the other workshops of princely Kyiv remain outside of the academic discourse. The poster gives an overview of the specific group of open-shaped vessels with ring bases of local production, which originate from Byzantine glazed pottery in terms of technology and style. It is characterized by the white ware shard with a plain glaze of green and yellow colors, sometimes with simple engraved underglaze decoration or stripes of dense glaze contrasting with the main background. The research aims to present the current scope of finds, their distribution and dating in the archaeological deposits of Kyiv and besides that consider the specific features of their occurrence in the social and cultural context of the princely city.

**1901. ON DETERMINING THE PROBABLE CENTRES OF PRODUCTION OF CERAMIC GLAZED PAINTED EGGS FROM PRINCELY KYIV**

**Contribution format:** Poster  
**Contribution authors:** Alina Sushko (Deputy director general for research work Kyiv History Museum)

The issue of identifying the probable centres of production of ceramic polychrome eggs is important in the context of studying the material culture of Kyiv Rus. Polychrome glazed eggs are not only a vivid manifestation of pottery art, but also status items that were prestigious to own outside of Rus. This is confirmed by their distribution area among the materials of the Scandinavian countries, Poland, the Czech Republic, Bulgaria, Latvia, and Eastern Europe. Until recently, the localisation of probable centres of production of glazed painted eggs was determined by the quantitative indicator of finds in the designated area. These indicators are important, but not decisive. It is more important to refer to laboratory tests that can determine the chemical composition of clays and glazed. Thus, to clarify the probable location of the clay deposits whose raw materials were used to make the products and to establish an approximate recipe for the glazes used to decorate the eggs. This research was carried out at the Swedish Museum of Natural History in Stockholm (Rune Edberg) in collaboration with the Kyiv History Museum and the Institute of Archaeology and Ethnology of the Polish Academy of Sciences (Sylwia Siemianowska). The clay

dough was examined by ICP, and the composition of the glaze was analysed by SEM-EDS. The analytical results were processed by Torbjörn Björsson and Kristina Larsson. According to the results of the work carried out, it was confirmed that Kyiv was a leading center for the production of painted eggs, but not the only one, as it was believed until now. The analysis of the results shows the presence of another center on the territory of modern Ukraine. The work carried out did not provide an exhaustive answer, but laid the foundation for further research with the expanded use of the material base.

31 FROM TRADITION TO CRIME SCENE: BUILDING BEST PRACTICES IN FORENSIC ARCHAEOLOGY

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** forensic archaeology, CSI, BPM, archaeological methods, archaeological methods, legal admissibility  
**Session organisers:** Pier Matteo Barone (American University of Rome | Forensic Geoscience Italy) – Cal Davenport (Blake Archaeology and Anthropology Services) – Mike Groen (Netherlands Forensic Institute)

SESSION ABSTRACT

This session explores the evolution of best practices in forensic archaeology, highlighting how established methodologies from traditional archaeology serve as a foundation for developing protocols in forensic and humanitarian contexts. The journey begins by examining traditional archaeological approaches, including field methods, remote sensing, geophysical techniques, stratigraphic digging, and bio-anthropological analyses. By showcasing these time-tested practices, we can set the stage for a comparative analysis of how they adapt and evolve to meet the needs of forensic and humanitarian investigations. The session aims to promote dialogue around the establishment of a Best Practice Model specific to forensic archaeology within the Scene of Crime ENFSI Working Group (SoC EWG). Presenters will discuss topics that address the practical challenges of applying archaeological methods in legal and forensic and humanitarian settings, from the search and recovery of human remains to (crime) scene management. These discussions will focus on ensuring that techniques are scientifically sound, legally admissible, and ethically responsible. The session will incorporate presentations to provide an interactive platform for attendees to share their perspectives, propose new ideas, and contribute to shaping best practices in forensic archaeology. By intertwining tradition and innovation, this session will not only educate participants on the nuances of forensic and humanitarian work but also raise awareness about the critical role archaeology plays in modern forensic and humanitarian investigations. Through this collaborative and multi-disciplinary approach, the session aims to inspire a broader understanding of forensic archaeology and its potential to establish standardized, effective practices that benefit both the field of archaeology and the justice system.

CONTRIBUTION ABSTRACTS

15. ADVANCING FORENSIC ARCHAEOLOGY: EUROPEAN STANDARDS AND INNOVATIONS IN CRIME SCENE INVESTIGATIONS

**Contribution format:** Oral  
**Contribution authors:** Pier Matteo Barone (The American University of Rome | Forensic Geoscience Italy)

Forensic archaeology has become a cornerstone of crime scene investigations and disaster victim recovery, offering a multidisciplinary approach to uncovering vital evidence and ensuring justice for victims. This presentation highlights the progress of the European Network of Forensic Science Institutes (ENFSI) Working Group on Scene of Crime - Forensic Archaeology (FA), specifically focusing on updates to the forthcoming Best Practice Manual. This manual aims to standardize methodologies across Europe, enhancing the consistency and reliability of forensic archaeological investigations. The presentation also addresses recent developments in European forensic archaeology, emphasizing collaborative efforts that integrate traditional archaeological techniques with advanced forensic technologies. Key examples of good practices include successful applications of 3D documentation during excavations, innovative remote sensing/geophysical surveys to locate clandestine graves or missing persons, and case studies from archaeological recovery operations. These examples underline the importance of cross-disciplinary collaboration between forensic archaeologists, anthropologists, and law enforcement agencies in achieving effective and respectful recovery operations. By exploring these advancements and good practices, the presentation underscores the critical role of forensic archaeology, the need of harmonized protocols, and the tangible impact of these practices in real-world investigations.

1396. NEW APPROACHES TO OLD IDEAS: HOW TO DETECT CLANDESTINE BURIALS COMBINING DIFFERENT TECHNIQUES

**Contribution format:** Oral  
**Contribution authors:** Almir Olovicic (Amsterdam Centre for Ancient Studies and Archaeology, University of Amsterdam) – Hayley Mickleburgh (Amsterdam Centre for Ancient Studies and Archaeology, University of Amsterdam | Forensic Anthropology Center, Texas State University) – Maurice Aalders (Dept of Biomedical Engineering and Physics, Amsterdam University Medical Centers)

The increasing number of global conflicts and mass violence requires robust remote techniques for locating burial sites, both for immediate criminal investigations and the recovery and identification of deceased persons, as well as for in-situ monitoring until excavation becomes possible. Although traditional survey and excavation methods (including test trenches and pits) remain preferred methods in many parts of the world, new technologies provide alternatives for non-destructive and remote location of potential graves, helping to reduce time, money and labour. This paper presents an interdisciplinary project aimed at developing reliable, safe, and efficient remote detection methods for clandestine (mass) burials. A key objective is to distinguish the presence of decomposing or skeletal human remains beneath the soil from other subsurface anomalies by analysing variations in spectral and thermal signatures. RGB, grayscale, multispectral, and thermal UAV imagery of experimental graves at a human decomposition facility in Texas are combined with environmental data and documented stages of body decomposition. In addition, open-source satellite images are evaluated for their potential in ongoing remote monitoring. Findings are cross verified against global datasets and tested in ongoing mass grave investigations in collaboration with the International Commission on Missing Persons. Promising remote methods include Infrared imaging (IR), which exposes thermal patterns in the soil, which can be indicative of subsurface anomalies. Multispectral imaging delineates the impact of buried remains on vegetation and soil disturbances, while remote Near Infrared and grayscale imaging capture human-induced alterations in the landscape. Physically locating historical graves resulting from mass violence is a crucial step in processes of (material) memorialization and transitional justice. Establishing validated spectral and thermal indices for remote detection and monitoring is necessary to facilitate the often difficult and dangerous task of locating graves, by reducing time, logistical and financial burdens associated with large-scale investigations.

1588. A HOLISTIC ASSESSMENT OF THE DOCUMENTATION OF LOCATIONS OF INTEREST AND DECEASED UNIDENTIFIED PERSONS FOR (MISSING) PERSON INVESTIGATIONS

**Contribution format:** Oral  
**Contribution authors:** Kristy Winter (Griffith University | International Committee of the Red Cross) – Pierre Guyomarc’H (International Committee of the Red Cross) – Rikke Rietveld (Cranfield University) – Andrea Zurek-Ost (University of North Carolina at Chapel Hill) – Peter Ellis (Griffith University | Forensic Medicine and Pathology Consultancy) – Almi Cabanzo Rubiano (The University of Texas Rio Grande Valley) – Stephan Naji (Commonwealth War Graves Commission) – Christopher Mcdermott (M-Emory) – Carney Matheson (Griffith University)

The documentation of deceased unidentified persons and locations of interests in a missing person investigation, particularly in the aspect of identifying the remains, is a complex challenge. The multifaceted variables interconnected within the identification process are conditional, but each one is independent and must be considered with scrutiny. Improvement to the overall identification process cannot exist without dissection of each variable and the applied improvements. Tracing the movement of persons (missing or otherwise) across different locations until they are found (alive or dead) is incredibly important to the continuity of their identity. Documenting locations and unidentified deceased persons is essential to determining a missing person’s fate, identifying them, and reuniting them to their loved ones. A thorough assessment of documentation, what and how it is recorded, helps identify weaknesses and limitations in the identification process in support of the investigation. Data were generated from holistic assessments of recording forms for locations of interest and deceased unidentified persons from medico-legal systems and structures globally. The forms were assessed for their language, diversity, and applicability for resolving missing persons investigations, as well as for thei. identification capacity. The analysis, divided by category of case (locations and unidentified persons) highlighted significant gaps and trends within the recording of information for missing persons investigations. The recording of information, lack of recording, or lack of accurate recording, of these different categories fails to capture comparable information between missing and unidentified persons to identify them. Without comparable information, the unidentified cannot be returned to their loved ones, leaving missing persons investigations ongoing. This presentation will emphasise the need to assess recording forms used by Forensic Archaeologists, and present suggested modifications to language, recording forms, documentation and medico-legal structures to prevent long-term unidentified persons.

2328. UNDER PRESSURE – POSSIBILITIES AND LIMITATIONS OF UNDERWATER RECOVERY MISSIONS

Contribution format: Oral  
Contribution authors: Svenja Weise (University of Southern Denmark)

Underwater excavations present unique challenges in maintaining the high standards of forensic archaeology. These operations are conducted not only under atmospheric, but also time and financial pressures, requiring seamless cooperation between scientific and commercial dive teams. For over 30 years, Project Recover, a citizen-led non-profit, has been dedicated to locating and recovering American service members missing in action. Partnering with the Defense POW/MIA Accounting Agency (DPAA) and Legion Underseas Services, a Veteran-owned commercial dive company, their missions span both underwater and land environments. In 2021 and 2023, Project Recover undertook two underwater recovery missions at a TBM-1C Avenger crash site in the Republic of Palau. These efforts led to the successful identification of all three missing servicemen by the DPAA. Over three weeks, a team of archaeologist(s), commercial divers, and volunteers of diverse backgrounds worked under water and on board. The average depth of 32 meters limited the time divers could spend excavating on site, and the extent and mangled state of the wreck required larger excavation units than usual. All work was performed in accordance with the standards specified by the Palau Historical and Cultural Preservation Act and the U.S. Secretary of Interior’s Guidelines for Archeology and Historic Preservation. These excavations prove that by adapting standard archaeological methods to underwater conditions, it is possible to meet forensic investigation needs, ensuring scientifically sound, legally admissible, and ethically responsible results.

1025. BEST PRACTICE MANUAL IN THE SEARCH OF SECOND WORLD WAR VICTIMS: RUSSIAN EXPERIENCE

Contribution format: Oral  
Contribution authors: Tatiana Shvedchikova (Institute of Archaeology RAS) – Aleksei Abramov (International Committee of the Red Cross icrc.org)

In 1992 Russia joined Valletta convention an. developed the legislatio. for the heritage preservation according to European tradition. The flexible border of 100 years since nowadays marked the starting point of archaeology. According to this rule the First Word War remains have to be investigated by archaeological methodology (which is highly developed) and strict policies. But the events of the Second World War are not yet covered by the federal law (#73-FZ) that regulates archaeological investigations. The potential of the archaeological approach to the evidence of recent past is undeniable. Researches who follow it gain significant advantage in the quantity and quality of the data obtained. In post-Soviet countries, the activities of non-governmental volunteer search teams are developed. They ar. focusing their efforts on the period of World War II and searching for the remains of fallen soldiers and civilian victims, and often don’t have any professional archaeologist in staff. Although, the understanding. that the archaeological methods combining forensic anthropology approach allow perform more professional fieldwork and help to identify nameless victims, does exist. It led to the necessity of standards and Best Practice Manual elaboration for this time period. The specific of developed Best Practice model and Standard Operation Procedure is the combination of anthropological, Forensic medical, criminalistic and classical archaeological approaches to the search an excavation of human remains. As an addition, the list of standard procedure operations as well as standard graphic forms are proposed for the description of excavatio. site and human remains.

32 ENTANGLING THE SOCIAL VALUE OF THE ARCHAEOLOGICAL RECORD: UNRULY PRACTICES IN ARCHAEOLOGICAL HERITAGE MANAGEMENT, CONSERVATION, AND DISSEMINATION

Session theme: 6. Intertwining archaeology, heritage, and museums  
Session format: Regular session  
Session keywords: public archaeology, archaeological record, archaeological collections, heritage values, community archaeology, conservation  
Session organisers: Michal Pawleta (Faculty of Archaeology, Adam Mickiewicz University in Poznań) – Ana Pastor Pérez (The J. Paul Getty Trust · Getty Conservation Institute) – David Barreiro Martínez (Spanish National Research Council, INCIPIT - CSIC)

SESSION ABSTRACT

Where are future dialogues surrounding archaeological collections and records headed? Most current practices in archaeological collections management continue to be guided primarily by technical and methodological criteria, often dismissing the creation of multivocal discourses. However, we also find examples where community

production, management, and conservation of collections have embraced new methods and ontological values, thereby incorporating peripheral voices. This social shift has long been perceptible on a global scale, particularly with the adoption of more critical and reflective approaches within the framework of public archaeology, heritage policies, and the significance of heritage values. These changes suggest an effort to develop new policies that emphasize foresight in the understanding and preservation of these records while placing communities at the center through more participatory methodologies. Therefore, the aim of this session is to discuss and explore how the social turn in heritage affects archaeological heritage management and its stakeholders, emphasizing the role of social perspectives. This session will specifically focus on papers that examine and/or contrast diverse methods and practices shaped by the recent social turn in archaeology and its social value, including archaeological interventions that do not necessarily involve excavation. This exploration may include:

- Diverse practices and experiences related to formal and informal collections, museums, archives, and sites.
- Community-driven and co-research projects aimed at creating new value discourses, strategies for preserving collections, reconstructions, re-enactments, or re-significations.

These initiatives and proposals can involve various social stakeholders and interdisciplinary perspectives, attempting to answer the following questions: What kinds of affections, intentions, and actions shape the community’s interests in creating and preserving a collection or site? Which methods support these interests? Who empowers whom? How do dissonances and conflicts manifest within these practices?

CONTRIBUTION ABSTRACTS

1430. SPYNIE PALACE: VALUE, KNOWLEDGE, AND POWER IN SCOTTISH METAL DETECTING

Contribution format: Oral  
Contribution authors: George Prew – Antony Lee (Treasure Trove Unit Scotland)

Spynie Palace, episcopal residence of the bishops of Moray in northeastern Scotland from the twelfth to seventeenth centuries CE, has seen seven years of formal excavation and over a decade of diligent informal metal detecting. This detecting has produced a body of material culture comprising hundreds of objects which, both individually and in aggregate, have added significantly to our understandings of the area throughout the Medieval period. By presenting the research history of Spynie Palace through the eyes of each of its stakeholders, this paper explores questions of informal knowledge versus formalised power, de facto and de iure ownership of a community’s heritage, and paths to co-operation within and alongside existing power structures. Metal detecting in Scotland exists within a system which is equal parts permissive and restrictive, wherein detectorists officially only require permission from landowners, but where anything they find must legally be reported to a treasure system which has only recently become fit for purpose. This has created an ecosystem of heritage communities, including:

- hobbyist detectorists with a strong sense of ownership and level of knowledge over particular areas of land even without any legal ownership of what they find;
- communities of landowners with varying levels of interaction with the objects found on their land and the people finding them;
- an official level of the Treasure Trove Unit, other local and national heritage organisations, increasingly cash-strapped museums, and a national legal apparatus which together act as guardians of local and national heritage.

Perhaps surprisingly, however, co-operation results from this situation far more often than chaos: This paper present the case study of Spynie Palace as one of the startling successes which the system has produced in recent years.

438. ASSESSING THE SOCIAL, ECONOMIC, AND SCIENTIFIC VALUES OF ARCHAEOLOGICAL HERITAGE: A POLISH CASE STUDY

Contribution format: Oral  
Contribution authors: Michal Pawleta – Aleksandra Chabiera (Faculty of Archaeology, Adam Mickiewicz University in Poznań)

Archaeological heritage is not only a priceless resource that we must protect; it is also a crucial element of development, both today and in the future. Although often undervalued and difficult to interpret, it holds immense potential to enrich our lives on many levels. It carries not only scientific value but also significant social and economic importance, stemming from its presence in our daily lives. Despite this imperative, shared by the professional archaeological community in Poland, assessment of archaeological heritage values in the country is not sufficiently understood or appreciated. Social research on this topic is scarce, making it difficult to develop effective strategies for the protection, promotion and making use of archaeological heritage based on empirical data and an evaluation of the effectiveness of current solutions. This presentation discusses the general aims and assumptions, as well as the preliminary research results, of the project titled ‘Values of Archaeological Heritage

from the Perspective of Local Communities: A Comparative Analysis’ - an extensive interdisciplinary initiative that, for the first time in Polish archaeology, addresses the topic of archaeological heritage values in a coherent and comprehensive manner. Using an innovative methodology based on both qualitative and quantitative social research methods, the project aims to analyze selected, representative examples to uncover the values embedded in archaeological heritage and related initiatives, and how these values can influence the lives of local communities and various stakeholder groups in Poland. It also strives to develop a dedicated research methodology that will enable systematic and comprehensive future studies of the values of archaeological heritage.

1505. WORLD HERITAGE NOMINATIONS FOSTERING DIVERSITY, EQUALITY AND SOCIAL INCLUSION

**Contribution format:** Oral  
**Contribution authors:** Monique Van Den Dries (Faculty of Archaeology, Leiden University)

Promoting the welfare of the world’s population is central to the United Nations Educational, Scientific and Cultural Organization (UNESCO). It aims to contribute to achieving a society based on fundamental values like social inclusion and equity and one that is grounded on tolerance and diversity principles. Through contemporary policies and programs, including those on safeguarding heritage for humanity, UNESCO encourages inclusive practices for the sake of all. It considers the symbolic value of inscription on the World Heritage list - particularly of sites or practices representing historically marginalized groups - to contribute to social inclusion and cohesion. The question is what this implies in practice; can we indeed observe a social turn? In this paper, the author looks at the degree to which the aim of achieving diversity, equality and inclusion plays a role in the context of World Heritage nominations and inscriptions. The nomination dossiers of fifty cultural heritage sites that were accepted for inscription in recent years were evaluated through a summative content analysis. The objective was to gain insight into the degree to which intentions of social inclusion and ambitions towards a people-centred approach in heritage management are expressed in these documents.

1331. CURRENT CHALLENGES IN ARCHAEOLOGICAL COLLECTIONS: PRESERVING MATERIALITY

**Contribution format:** Oral  
**Contribution authors:** Ana Pastor Pérez – Stavroula Golfomitsou (Getty Conservation Institute)

Recent advancements in our comprehension of the archaeological record facilitate the preservation of artefacts that embody multiple lives and significance. Archaeological artefacts are essential for understanding the multivocality of history and facilitating multiple connections between the past and present. For this to happen, we must design strategies that help us preserve traces linked to the histories of objects that transcend their physical nature in order to preserve values and memories. These strategies must include inclusive practices in conservation that are not limited to the northwestern perspective. However, how is the field of conservation and collection care evolving in response to these challenges? Do our interventions contribute to the understanding of the multiple narratives, multi-temporalities, and disputes that operate on objects? Could our approaches facilitate democratic access to the collections for researchers and the general public? Are we adapting our practices to the current trends inspired by social, community, or decolonial archaeology? This paper analyses the recent theoretical and methodological advancements in the conservation of archaeological collections. We will examine the evolution of our profession and role as archaeological conservators: its theoretical turns, practices, and the commitment to preserve materiality in a sustainable manner in both the short and long term. We will discuss the findings of the analysis of interviews conducted with professionals from diverse backgrounds, countries, and institutions. Finally, we will reflect on our vision for the future: promoting interdisciplinarity and establishing networks of actors hitherto excluded from the methodological and practical discussions of conservation and restoration.

1326. ARCHEOLOGY AND THE RECONSTRUCTION OF LOCAL MEMORY OF A PLACE ON THE EXAMPLE OF ARCHAEOLOGICAL RESEARCH IN THE WARSAW GHETTO

**Contribution format:** Oral  
**Contribution authors:** Jacek Konik (Museum of Independence in Warsaw) – Michał Grabowski (Cultural Heritage Research Foundation)

After WW II, Warsaw was approximately 90% destroyed. After the end of the war, there were too few inhabitants of the city to rebuild it on their own. Therefore, it was necessary to bring young people from other parts of the country so that Warsaw could rise again from the ruins Buildings and housing estates were often built on layers of rubble that could not be removed. In this way, the “Muranów” district was created on the site of the former ghetto, which was also supposed to be a monument to the murdered residents. However, the new, impressive buildings were very often inhabited by newcomers who had no roots in the city, and this group had no social memory of the war history of the places where they lived, and most often they were not interested in it. This changed after 1989. In Poland, there has been a clear shift towards local history. In Warsaw, the descendants of those who rebuilt the city began to look for material traces of local history. It was particularly difficult in the ghetto. Commemoration

sites are most often a story about death, not life. Archeology came to the rescue and found traces of a given life. There was some discussion and controversy. The presentation will discuss the residents’ reactions to the archaeological research from 2021-2023 (exploration in the Krasińscy Garden, at the intersection of Miła and St. Dubois streets, at Gęsia street) and their results. Not only will the varied reactions to the excavations be presented, but also the emerging questions of what to do with the discoveries (leave them uncovered and preserve them? Remove them?) and what to do with the memory of the place and how to include it in the process of rebuilding local social memory and awareness of local history.

1208. ARCHAEOLOGY IS DONE IN THE LIBRARY: MAPPING FORGOTTEN DIGS THROUGH TEXT MINING

**Contribution format:** Oral  
**Contribution authors:** Liam Downs-Tepper (University of Vienna)

Time buries all. This applies as much to archaeological records as to sites themselves; the challenge for both lies in the digging. Yet that physical toil becomes pointless if the record of it vanishes into obscurity. Instead of focusing on establishing guidelines and policies for long term sustainability of archaeological records going forward, this paper considers hindsight. The goal is simple: to create a usable map and index of archaeological records from historical journals. Beyond the inherent benefits of offering greater visibility to records, this project allows for an efficient, consolidated, and comprehensive access point for earlier archaeological work. This type of resource would be of particular value to community heritage organizations, illuminating long-forgotten work in the area. It also allows for some fascinating meta-analysis of archaeological patterns and areas of focus for different journals and eras. This expands upon work text-mining historical records (Minimo 2012, Richards 2015, and Plet 2021, among others) by both centering the geospatial and targeting accessibility. While the ultimate goal of this work is a full survey of (out of copyright) journals, the initial corpus is The American Journal of Archaeology, in which early volumes had dedicated chapters for overviews of finds - discussing work at dozens of locations in the first edition alone. It is only recently that tools have advanced enough to facilitate this type of work. This project offers various options, focusing on free and open source tools where possible, such as geocoding via OSM and building interactive websites using QGIS and Github. It also offers a framework for others to do similar work; with and without incorporating AI tools. This project allows for far greater access and dissemination of long dismissed records, bridging the gap documenting archaeology as it was and archaeology as it will be. A demo is here: <https://iamliamdt.github.io/EAA2025/>

465. SAVING FILES, REKINDLING STRUGGLES, ASSEMBLING MEMORIES

**Contribution format:** Oral  
**Contribution authors:** David Barreiro (Institute of Heritage Sciences, Spanish National Research Council)

Santiago de Compostela (Spain) is renowned for its historical and architectural heritage, which is closely associated with the Church and the city’s university. It is not an industrial city, nor does it have a large working-class population. However, certain areas on the outskirts of the city arose as a result of the social housing policy of the final years of the Franco regime. These residential areas were characterised by the low quality of the building materials employed, their lack of basic urban infrastructure and overcrowding. During the 1960s and 1970s, these neighbourhoods became home to underprivileged people who mainly moved in from rural areas. Policies which marginalised these residents led to problems of integration and crime, particularly in the 1980s. One such residential area (Vite), located in the north of the city, has undergone a process of great change from the time of its foundation to the present day, now being considered one of the most desirable areas to live in the city. The fighting spirit of the neighbourhood’s residents and their achievements have played a fundamental role in this process of change. Their struggle has left a material culture consisting of objects and documents of historical and sentimental value for the residents of the neighbourhood. For this reason, the Vite Arquiva initiative was created some years ago to create, organise and maintain a community archive and to promote different activities relating to the historical memory of the area. This initiative arose from the interconnecting memories of the community’s members, even reaching back to times before the construction of the residential area, to the rural life which thrived in the same physical space.

1759. SOMEWHERE IN BETWEEN CREATING A SPACE FOR DIALOG BETWEEN THE COMMUNITIES AND EXPERTS WESTERN SERBIA

**Contribution format:** Oral  
**Contribution authors:** Marija Aleksic Cevrljakovic (Institute for the Protection of Cultural Monuments Kraljevo)

If we acknowledge the need to put people and human values at the center of an enlarged and cross-disciplinary concept of cultural heritage, should we allow communities to value and interpret, use, or shape heritage independently and equally with experts? Although the duality of archaeological sites is recognized in their basic definition, for they are seen as instruments for historical and scientific study and as heritage, these features are

often used as synonyms. Because of the assimilation, the experts have a main role in interpreting and intervening with sites. As a rule, the knowledge of the community is ignored or isn’t equal in the processes of presentation or naming the place. However, if the goal is to achieve full potential of the archaeological remains, introduced by documents, should we allow two separate processes, which may or may not have the same starting point and outcome? One is led by experts to acquire knowledge about the past, and the other by communities in creating a place based on traditional knowledge or contemporary needs. Although in the processes of defining Us and Others, i.e. our and other peoples’ past some traces remain outside the focus of the group, there are examples in which the group interprets and appropriates remains from the ancient past, translating them into heritage. In these processes, expert knowledge often doesn’t play a significant role. This lecture will present examples from Western Serbia in which communities interpret, use, or ignore material traces from the past in the process of building a place and its identity. The goal is to point out, through examples, the existence of parallel realities and to show their consequences to archaeological sites. All this may problematize the statement that every material trace of the past is a heritage.

**1245. AT THE CROSSROADS OF COMMUNITY FORESTS AND PUBLIC ARCHAEOLOGY: A NEW APPROACH TO MANAGING CULTURAL HERITAGE IN GREATER POLAND’S FORESTS**

**Contribution format:** Oral  
**Contribution authors:** Paulina Przepiórka (Faculty of Archaeology, Adam Mickiewicz University)

Community forests, introduced into the Polish legal system and created from 2024, represent an innovative model of participatory forest management that actively involves local communities in decision-making processes. These forests create a unique platform for the co-management of natural and cultural heritage, fostering a sense of shared responsibility and engagement among community members. By integrating local knowledge, traditions, and values, community forests strengthen the role of communities in preserving both the ecological and historical landscape. One of the key potentials of community forests lies in their capacity to serve as a framework for the protection and interpretation of archaeological heritage located within forested areas. Public archaeology, built upon direct collaboration with local communities, can enhance the sustainable management of archaeological sites by incorporating participatory documentation and preservation methods. Community members, acting as stewards of their own historical landscape, can contribute to the mapping, monitoring, and interpretation of archaeological resources, ensuring their protection for future generations.. The aim of the paper is to explore the opportunities that community forests offer for the development of public archaeology, with a particular focus on the Greater Poland region. It will analyze the ways in which local communities can be actively involved in the documentation and preservation of archaeological sites through citizen science initiatives and other participatory methodologies. Special attention will be given to collaborative strategies that empower communities to take an active role in managing their cultural and natural heritage, reinforcing the idea that sustainable conservation efforts must be deeply rooted in local engagement and responsibility.

**280. ARCHAEOLOGICAL HERITAGE, SCIENTIFIC RECORDING, REMAINS AND DESTRUCTION: A LOOK AT A COMPLEX RELATIONSHIP**

**Contribution format:** Poster  
**Contribution authors:** Gertrudes Branco – Nelson Almeida – Inês Ribeiro (CHAIA/Universidade de Évora)

Over the last two decades, Portuguese archaeology has experienced a significant increase in the volume of work, mainly related to the practice of so-called Preventive Archaeology and Impact Minimisation, developed contractually in the context of projects that could destroy archaeological assets. This increase in work has corresponded to an exponential increase in the volume of archaeological remains deposited at sites proposed or approved by the authorities, understood by its legal definition as the set of movable archaeological goods, such as artefacts, ecofacts and samples, together with the corresponding inventory and other documentation produced during field and office work, which is indispensable for the handling and understanding of the context to be preserved for future memory. Our experience as researchers studying and working with collections of archaeological remains leads us to question how we consider archaeological assets to be ‘national heritage’ under the law, and what their validity actually is as a ‘scientific record’ that can replace and justify the destruction of an archaeological asset.

**1236. THE NEVER-ENDING STORY: ANTA DO ZAMBUJAL AS A CASE OF POST-DESTRUCTION GAINING OF SOCIAL VALUE?**

**Contribution format:** Poster  
**Contribution authors:** Nelson Almeida (Universidade de Évora, CHAIA – IN2PAST | UNIARQ, Universidade de Lisboa | O Legado da Terra, CRL) – Miguel Serra (Serpa Municipality | CEAACP-Uc) – Luís Costa – João. Reis (O Legado da Terra, CRL) – João Barreira (Museu Rainha Dona

Leonor | Institute of Contemporary History, University of Évora / IN2PAST | O Legado da Terra, CRL)

Recent years have seen an increase in the amount of agricultural land reconversion in Southern Portugal, resulting in the affectation and destruction of several archaeological sites with mass media coverage. Among these, the destruction of prehistoric contexts as also been recognized, including megalithic monuments. One of these cases and among the few that were excavated is the Anta do Zambujal, a previously known Late Prehistory tomb located in the Vidigueira Municipality (inland Alentejo, Southern Portugal), a low-density rural area. This site was recognized and subjected to a small archaeological intervention of which no information was published beyond a technical report. In 2017 the site was destroyed following agricultural works with repercussions on regional and national mass media. A small intervention aiming to assess the preservation of contexts was made, followed by a larger intervention by the heritage cooperative O Legado da Terra, with both scientific and social aims considered since the beginning. Following guardianship regulations, after the excavation, the remaining unaffected contexts were covered and the site “disappeared” with only its scar being seen in the landscape. Besides divulging of works through social media and press, a small exhibit with information on the site accompanied by a presentation to the local community was done. The 3d record of the site prior to the covering was also made freely available online. Recently, an artistic photographic exhibit on archaeological sites and materials was prepared, with a selection of materials from the site being exhibited as an example of destroyed heritage. This never-ending story leads us to discuss how heritage destruction paradoxically might result in a post-destruction acquisition of social value even if not long lasting, and if this can lead to help in the preservation of other heritage assets.

**34 PAST MOVES, PRESENT FINDS: THE ARCHAEOLOGY OF GAMES IN THEIR SOCIAL CONTEXT**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Board games, Leisure, Culture, Entertainment, AI  
**Session organisers:** Tim Penn (University of Reading) – Barbara Carè (University of Fribourg) – Walter Crist (Leiden University) – Branislav Kovár (Slovak Academy of Sciences) – Dorina Moullou (Hellenic Ministry of Culture)

**SESSION ABSTRACT**

The archaeology of board games in their social context has recently gained significant scholarly attention. Once dismissed as an antiquarian pursuit, attitudes have shifted thanks to two European Research Council-funded projects and the ongoing COST Action “Computational Techniques for Tabletop Games Heritage (GameTable),” with which this session is associated. This shift reflects growing recognition that studying traditional games in (pre-) historical societies offers insights into past and present human behaviour, cognitive processes, and social structures. Research has demonstrated play’s ubiquity in human societies worldwide, highlighting its connections with societal aspects such as leisure, social interactions, literacy, numeracy, trade, and cross-cultural communication. Games were not just forms of entertainment but served as tools for teaching skills, fostering social cohesion, and transmitting cultural values. They were embedded within religious, political, and economic systems, playing significant roles in identity formation and social integration across cultural settings. Despite the growing recognition of play’s importance in the past, many questions remain about games’ role in human societies. This session will uncover how ancient games were integrated into daily life, demonstrating game studies’ potential to enhance our understanding of human behaviour, social interaction, and the movement of ideas. We invite contributions which take archaeological, ethnographic, and historical approaches to board games. Papers will examine the material culture of gaming—boards, dice, tokens—while considering play’s broader social contexts. We welcome particularly contributions focusing on under-represented regions and periods, alongside those employing innovative scientific methodologies such as computational modelling, AI-driven reconstructions, and experimental archaeology. Papers dealing with reconstructed and preserved games to teach cultural, historical, and technological concepts in formal and informal educational settings are also welcome, as are papers addressing the preservation of heritage games. The session aims to underscore the relevance of game studies for understanding broader cultural phenomena and to foster cross-disciplinary dialogue.

2260. BOARD GAMES IN TRYPILLIA: WHERE ARE WE NOW?

**Contribution format:** Oral  
**Contribution authors:** Liudmyla Shatilo (Institute of Pre- and Protohistoric Archaeology, Kiel University | Institute of Archaeology of the National Academy of Science of Ukraine)

This contribution examines the social and historical context of prehistoric ‘board games’. This label is used conventionally, as it does not fully reflect the full range of the possible use of the discussed objects. Many ancient and ethnographic examples of such ‘games’ show that they are often associated with predictive and divinatory practices. The inventory of the Trypillia complex (4700-3000 BC), which can, as one of the hypotheses, be interpreted in the context of board games, is represented mainly by three categories of material. These are numerous finds of tokens, astragals and a few boards ‘for games’. After identifying the last objects as game boards (Shatilo 2015), new similar objects have been found (Chapman et al., 2020; Chernovol 2023), the research has been conducted on tokens (Juncker 2023), and understanding of the entire Trypillian phenomenon has changed significantly, in particular thanks to several recent research projects (e.g. Müller et al. 2016; Gaydarska 2020, Hofmann et al. 2019). This study is aimed at revision of ‘board game’ inventory through contextualising it within the framework of new interpretations of the Trypillia complex and adding recently found objects. A few observed patterns should be highlighted: association of some of the ‘game’ boards with communal buildings (mega-structures) and the reduction in the number of tokens used in the post-mega-site period. All this points to the potential interconnection of the use of these objects with historical and social realities.

335. A PREHISTORIC BOARD GAME FROM NW IBERIA: THE CASE OF CASTRO CURBÍN (ARZÚA, GALICIA, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Samuel Nión-Álvarez (Institute of Heritage Sciences (INCIPIT-CSIC))

This paper presents an approach to one of the few Iron Age board games with well-defined stratigraphic and chronological contexts. It was found in a small hillfort (Castro Curbin, Arzúa, Galicia, Spain), and it has been dated between the 4th and the 3rd centuries BC, without any kind of relation with Roman contacts. The work proposes an in-depth analysis of the archaeological evidence, focusing on describing the archaeological site and the context of the material evidence, the process of fabrication of the pieces and some of their most relevant features. This approach has revealed specialised production techniques for game objects, diverse typologies of game pieces, and their deliberate fragmentation within a votive context. The game board from Castro Curbín stands out as a remarkable example of a European Iron Age board game, offering reliable contexts, absolute dates, and strong connections with cultic activities, providing a significant context for understanding Iron Age games.

1727. FINDS OF BOARD GAMES IN THE NORTH OF THE CARPATHIAN BASIN

**Contribution format:** Oral  
**Contribution authors:** Branislav Kovár (Institute of Archaeology, Slovak Academy of Sciences)

The north of the Carpathian Basin is still an unexplored area in the research on board game finds. Despite the fact that the history of board games is ideal for research into several types of human interaction, the region of central Europe remains a proverbial terra incognita in this respect. This paper aims to map the finds of board games and their components from the Iron Age to the Middle Ages. The aim of the presentation is to report and analysis on lesser-known finds. The main group of finds consists of game stones, figurines and tokens, which may have been made in the form of polished pebbles or ceramic and bronze discs. During the La Tène period, in the context of the probable Celtic migration, several processes took place in Central Europe that changed the environment of the Carpathian Basin. We have only indications of board game finds, for example, the dice game (clay and bone dices) is much more frequently documented. In the Roman period, the territory of the northern Carpathian Basin came into direct interaction with the expanding Roman Empire. It is in this period that we have documented finds of playing stones, tokens and tokens. In addition, we have confirmed isolated finds of game boards. Finds have not only been found in the environment of Roman camps, but also among the “barbarian” Germanic tribes. A typical and best example is the well-known discovery of a game board from the grave of a Germanic nobility man in Poprad. The largest number of finds of board games and their components were found in the study area in the Middle Ages. Again, these are mainly finds of playing stones, but we have also documented several board games (e. g. mills/marelles and chess).

2389. GAMING AND PLAY IN ROMAN PANNONIA

**Contribution format:** Oral  
**Contribution authors:** Linda Dobosi (Eotvos Lorand University | HUN-REN-ELTE Research Group for Interdisciplinary Archaeology)

Archaeological finds connected to gaming and play are numerous in Roman Pannonia but are mostly unpublished. The area of the province, which was inhabited by indigenous Celtic tribes, was merged into the Roman Empire during the first half of the 1st century AD. The province had an extremely long section of the Danube limes, a contact zone for the different cultures living in the region. For this reason, not only classic Roman game pieces were used in Pannonia, but also Iron age Celtic and Roman age Germanic pieces as well, for example long dice. Game pieces have been found in funerary contexts as well as during settlement excavations. A ludus duodecim scriptorum game board made of limestone was set up on the forum of Scarbantia (Sopron, Hungary). Other game boards were scratched on the surface of bricks and tiles before firing, these mostly had a checkerboard pattern. Dice and counters were generally made of bone, but along the Amber Road pieces made of red and yellow amber have also been found in graves in Savaria (Szombathely, Hungary) and Scarbantia. In the case of counters, the reuse of the bottom part of pottery or glass vessels is a frequent occurrence. Furthermore, a half-finished bar of bone from Campona (Budapest, Hungary) provides an insight into the manufacturing process of six-sided dice. The paper will give an overview of the game pieces used in Roman Pannonia based on the finds that are in the collection of Hungarian museums and will discuss the multidirectional cultural transmission along the border of the Empire.

2173. NEW DIRECTIONS IN TABLETOP STUDIES: THE STUDY OF PAVEMENT DESIGNS AND BOARD GAMES FROM ATTICA

**Contribution format:** Oral  
**Contribution authors:** Barbara Care (University of Lausanne / FNS)

The paper presents ongoing research on designs carved into pavement slabs and steps at various archaeological sites in Attica, Greece. As recent studies on graffiti (“inscribed or surface applied media”) have shown, this evidence cannot be universally defined or interpreted outside the specific context in which it was produced. This context is not simply a matter of archaeological provenance, but of temporal and spatial context at immediate and wider scales, as well as cultural context within a broader understanding of both the practice and materiality of these graphic signs. Long neglected, these engraved media are now seen as significant evidence of human agency, preserving important and otherwise unknown information about lived experience and human creativity within ancient cities. They have been recorded from across the ancient Mediterranean, and their study is now an important strand of archaeological research. Games are also recognised as a rich source of knowledge about our shared cultural past, providing privileged access to the social, cultural and economic fabric of past societies. While it is generally accepted that graffiti board games have much to contribute to this debate, a global approach is still lacking. The contribution introduces a new research project that aims to deepen our understanding of games as cultural artefacts in ancient Greece and to develop new methods and techniques for their identification. By integrating the traditional study of rules with the implementation of new methods of investigating the materiality and experience of games (using digital documentation, AI and machine learning techniques), it combines the content and physical appearance of design in open spaces with the study of ancient urban landscapes and offers insight into the social context of games.

167. WHOSE GAME IS IT ANYWAY? ANALYSING ANCIENT AND POST ANTIQUE BOARDGAMES AT APHRODISIAS, TÜRKIYE

**Contribution format:** Oral  
**Contribution authors:** Tim Penn (University of Reading)

Board games carved into floors, seats, and steps are common in Roman, late antique, and Byzantine urban sites. Despite the significant potential of these carvings to inform us about everyday life in the past, they have received little systematic study. Until recently, board game studies were largely confined to antiquarian approaches that sought to reconstruct game rules. The past decade, however, has seen an explosion of research into the significance of games in past societies, exploring who played games, where and when they played them, what they played with, and what this reveals about social practices. Major opportunities in ancient board game studies nevertheless remain, as progress is hindered by the lack of systematic collection and collation of archaeological evidence for carved gameboards in the ancient and post-antique world. Moreover, no rigorous or systematic attempt has been made to date these gameboards; games are often discussed in synchronic terms, implying that all games were played in the same way, within the same types of social settings, across the entire ancient and post-antique world. This assumption deserves re-evaluation. This paper addresses these issues by presenting an initial analysis of my site-wide survey of gameboards from Aphrodisias, Türkiye. Critically, 60 years of detailed study at

Aphrodisias enable us to closely date the construction of many building surfaces into which gameboards were carved, providing for the first time a reliable terminus post quem for these boards. Since existing research does not closely consider the chronological dimension, this study is particularly important in helping us understand when these games were played—predominantly in the late antique period—shedding new light on their social significance in the urban environment of Aphrodisias.

1286. CHANGING THE GAME: MEASURING MESOPOTAMIAN GAMES WITH AI-SIMULATED PLAY

**Contribution format:** Oral  
**Contribution authors:** Walter Crist (Leiden University) – Éric Piette (UCLouvain)

The Royal Game of Ur is one of the oldest board games known to have existed, having been played in Sumer since at least the middle of the third millennium BCE the game was also played in Iran, Central Asia, and in the Indus Valley. Toward the beginning of the second millennium BCE, the geometry of the board changed, creating a new configuration of playing squares known in the archaeological literature as the game of twenty squares.. Around the same time, the geographic distribution of the game shifted to the west, and for the next 2000 years the game was one of the most popular games in West Asia. Through translation of a Seleucid tablet from 177 BCE that contains important details about the rules as well as ethnographic analogy to games with similar geometry, this game is one of the best understood of the ancient games from the region. Based on this knowledge, proposed rules for this game by Irving Finkel are consistent with the ancient sources and indicate a likely way that the game was played. However, the change in board geometry, because of its degree, and persistence, indicates that it is not a superficial change to the game, but something that changed its experience. To measure this, we calculate metrics through AI-simulated play of Finkel’s rules on the Royal Game of Ur and game of twenty squares to explore how change in board geometry may have changed the experience of the game. These metrics include the length of the game (measured by number of turns), Player 1’s advantage, and “drama,” or changes in who is expected to win the game at each turn. Comparing the geographic and chronological distribution of these game with their gameplay metrics may provide indications for changing gameplay preference in the ancient world.

2025. PLAYING PEACE AND UNITY: USE OF POSITIVE ARCHAEOLOGICAL AND HISTORIC NARRATIVES FOR SHAPING BETTER FUTURE VIA BOARD & VIDEO GAMES

**Contribution format:** Oral  
**Contribution authors:** Ivana Pandzic (University of Banja Luka) – Manojlo Maravic (University of Novi Sad) – Zrinka Mileusnic (University of Primorska) – Zlatko Bukac (University of Zadar) – Nenad Joncic (National museum of Serbia)

This paper discusses the role of games, both board and video, based on archaeological and historical facts from the Balkans, from ancient and medieval societies up to today, with a focus how these games could shift the cultural narrative. This study shifts the lens toward games that emphasize peace, collaboration, and communal life, drawing from archaeological and historical records to inspire more positive representations of the past. By examining games as cultural artifacts, this paper discusses how the design and content of these games can influence modern perceptions of history and society. Specifically, we explore the game as a tool that could address contemporary issues by reflecting on how past societies found ways to rebuild and unit, as well as how people in the region had historically found ways to unite, collaborate, and thrive together. Ultimately, this paper highlights the potential of the archaeology of games to reshape historical narratives, reflecting how past societies have overcome challenges through unity and cooperation.

2059. FROM THE FIELD TO VIRTUAL ARCHAEOLOGY: GAME ENGINES IN THE PRACTICE OF ARCHAEOLOGICAL STORYTELLING

**Contribution format:** Oral  
**Contribution authors:** Milena Rakovac-Joncic (IARC) – Nenad Joncic (National Musuem of Serbia) – Ivana Pandžić (Faculty of Philosophy, University of Banja Luka) – Martina Blečić Kavur – Boris Kavur (University of Primorska, Faculty of Humanities, Department of Archaeology and Heritage) – Ivana Ožanić Roguljić (Arheološki institut Zagreb)

Digitization and digitization in archaeology have changed the possibilities of archaeological storytelling in recent decades. Archaeology has been an inspiration in gaming since its beginnings. Some of the games with archaeological themes have become Hollywood blockbusters. However, the real question is how much archaeology has managed to embrace the new possibilities of game engines. Archaeology has fully embraced and largely uses the potential of 3D scanning, 3D modelling, and digital reconstruction. This has led to new disciplines in archaeological science, such as Digital archaeology, which digitizes archaeological heritage; Virtual archaeology, which brings 3D models and reconstructions on displays and virtual reality (VR) and augmented reality (AR); And Archaeogaming, which studies the connections between archaeology and video games. As 3D scanning of

archaeological artefacts becomes more and more popular, the usage of digital twins and game engines in museum presentations is questionable. The idea is to investigate levels of utilization and the possibilities of gaming in archaeological storytelling, through examples from the museums across former Yugoslavia.

35 GRAVE REOPENING IN THE FIRST MILLENNIUM CE - CONNECTING EUROPEAN REGIONS

**Session theme:** 8. Along and across the Danube!  
**Session format:** Regular session  
**Session keywords:** Mortuary practices, Archaeothanatology, Grave disturbances

SESSION ABSTRACT

Taking as our starting point the broad region of central and southeastern Europe in which the conference takes place, this session will discuss evidence of deliberate re-entries into inhumation burials during the first millennium CE. Graves disturbed soon after burial or while cemeteries were still in use are a widespread phenomenon across first millennium Europe. Usually evidenced by disarranged skeletal remains and artefacts and often pits dug to access contents, they have been noted in many countries since the early days of excavation, and have typically been regarded as grave robbery. In post-Roman western Europe, recent research has debunked traditional narratives in understanding grave reopening. Methods from micro-stratigraphy, archaeothanatology, and bioanthropology are being used to better understand natural processes and post-burial interventions, as well as the timing, motives and beliefs behind these actions. Far from theft, the widespread reopening there seems to be a selective activity targeting specific forms of artefact, and is argued to represent extended mortuary customs. The focus of this session is to discuss evidence in central and southeastern Europe against a broader geographical and methodological picture. These regions see even higher intensities of reopening, with whole cemeteries often affected, not least in earlier phases. The territories of the Pannonian Plain, for example, experienced centuries of migrations, warfare, and raiding, and there are cultural discontinuities, as well as elements of continuity. There researchers have observed a widespread phenomenon of grave reopening in numerous necropoli in different phases. However, there are not yet regional discussions, comparisons, or contextualization of the phenomenon within the broader European historical context. The session aims to connect archaeological and bioanthropological research on grave reopening and post-burial interventions, and to share knowledge and approaches. Contributions may include synthetic research, case studies, and methodological reflections. We plan to publish the papers as a proceedings volume.

CONTRIBUTION ABSTRACTS

338. THE PHENOMENON OF REOPENING RECORDED IN THE SARMATIAN CEMETERIES OF THE GREAT HUNGARIAN PLAIN

**Contribution format:** Oral  
**Contribution authors:** Valéria Kulcsár – Eszter Istvánovits (Independent)

Our study deals with the reopening practices in the Sarmatian community of the Great Hungarian Plain in the Roman Age. This culture is special because of the outstandingly high percentage of looted graves. In most of the Sarmatian cemeteries excavated in Eastern Hungary around 80 percent of the burials were robbed. Judging from the position of the parts of the skeletons we can make conclusions on the state of the corpse in the moment of looting. It has been a long discussion in the literature considering the time of grave robbing. It seems that we should count both with the looting cases soon following the act of the funeral, and also with the ones that happened some time later. The phenomenon of disturbing the graves by the members of the same community is still to be understood and explained. We suggest field methods and recording practices to better understand the different ways of burial robbery.

536. GRAVE REOPENING IN NORTHWEST ROMANIA: INSIGHTS FROM SARMATIAN BURIALS IN BIHOR COUNTY

**Contribution format:** Oral  
**Contribution authors:** Lavinia Grumeza (Romanian Academy, Iași Branch, Institute of Archaeology) – Cristina Tica (Globe Institute, University of Copenhagen)

During the 2nd to early 5th centuries AD, the majority of archaeological findings on in the Great Hungarian Plain and the Western Plain of Romania are associated with Sarmatian culture. The funerary practices are characterized by inhumation graves, either flat or barrow graves, often accompanied by circular ditches. This paper focuses on the recently excavated Sarmatian cemeteries of Bihor County, Northwest Romania (sites: V Borș, IX Biharea, and Parc Nervia), comprising 60 graves. Approximately 80% of these graves were reopened after the skeletonization of the deceased, likely by members of the same community. Detailed patterns of disturbance—including disarticulated skeletal remains, mixed bones and emptied graves—indicate selective grave reopening, particularly targeting graves with barrows and circular ditches. These features, highly visible on in the landscape, were likely associated with wealth or status, making them prime targets. By contrast, deviant burials (those in settlement pits and atypical body positions), remained undisturbed. This paper situates the findings within the broader context of the Great Hungarian Plain, exploring potential motivations, cultural practices, and parallels. The study integrates archaeological, bioanthropological, and archaeothanatological perspectives to advance the understanding of grave reopening as a significant and multifaceted mortuary phenomenon in the first millennium CE.

**734. THROUGH THE BIOANTHROPOLOGISTS EYES - BONE WEATHERING TRACES FROM REOPENED SARMATIAN GRAVES**

**Contribution format:** Oral  
**Contribution authors:** Tamara Sarkic (Center for Forensic and Applied Molecular Genetics, Faculty of Biology, University of Belgrade)

Due to recent rescue excavations in the Bačka region (Vrbas area), archaeologists found around 100 graves from Sarmatian times, 3rd-4th century. Field documentation records systematic grave reopening with more than half of the graves being reopened; however, excavations are carried out without bioanthropologists being present. Skeletal material from these excavations underwent bioanthropological research, from basics (preservation, demography, paleopathology) to specialized analysis of bone taphonomy appearance (weathering, coffin wear modifications). To study the effects of grave reopening on bone morphology (cracking, fracturing, peeling, erosion, etc.), a special experimental methodology—blind bioanthropological taphonomy analysis—was conducted during bioanthropological analysis without primary knowledge of archaeological contextual information on grave disturbance (reopened, intact). This approach aids bioanthropologists in maintaining objectivity while examining the effects of grave disturbance on skeletal remains. It promotes a clear understanding of bone taphonomy and the signs of bone weathering linked to the reopening of graves. By differentiating between the taphonomic traces of bone weathering that happened during or after past grave reopenings and those that occurred during excavations, researchers can reduce the risk of interpretative errors. This paper presents findings on grave reopening practices during the late Sarmatian period in the south Pannonian Plain, based on bioarchaeological research, subaerial weathering, and archaeothanatology. We will differentiate the types of reopenings, examine the presence of grave construction during these events, and analyze the possible timing. This research will provide insights into who reopened graves, when and how they did so, and the sociological reasons behind these practices, integrating both bioanthropological and archaeological perspectives.

**1194. INTERPRETING GRAVE RE-OPENINGS OF THE SARMATIAN-PERIOD CEMETERIES IN THE GREAT HUNGARIAN PLAIN**

**Contribution format:** Oral  
**Contribution authors:** Zsófia Masek (HUN-REN Research Centre for the Humanities Institute of Archaeology)

The Sarmatian-period cemeteries (1st-5th centuries AD) in the Carpathian Basin have been subject to systematic looting, a phenomenon that can be attributed, at least in part, to the high proportion of visible grave markings in these cemeteries. The monuments, distinguished by enclosures and mounds in the landscape, remained visible for a longer period, providing an accessible location for grave robbing during the turbulent centuries that followed. The nature of looted graves can vary significantly, and various attempts have been made to classify them. The present study puts forward the hypothesis that this condition may have obscured post-burial interventions that may not have been aimed at simple grave-robbing (i.e., the acquisition of objects). There are separate analyses of the find material from the Sarmatian rite tumuli and the burials surrounded by enclosures. The most common interpretation of the finds from the mounds is that they represent mortuary offerings. The finds of the burials surrounded by ditches show a selective and repetitive pattern of behaviour, which is interpreted as the result of a deliberate deposition process. The features associated with the re-opening of the burials, which yielded archaeozoological material, are treated separately and with uncertainty. In their case, a profane interpretation was more common, interpreting the finds as materials mixed in during robbery. In this presentation, I will attempt to use an interpretive framework to evaluate together the post-burial artefacts found in the enclosures placed in deposition zones, in the layers of the barrows, and in the re-opened burials. Through case studies, I will suggest that it is now possible to hypothesise that some of the grave openings can also be seen as traces of commemorative rites that took place in these liminal spaces.

**2182. RAIDING PRACTICE IN THE 5TH CENTURY CEMETERY NEAR SAJÓSZENTPÉTER (NORTHERN HUNGARY)**

**Contribution format:** Oral  
**Contribution authors:** Krisztián Tóth (Dornyay Béla Museum)

In September 2011, the trial excavations of the main road No 26 at Sajószentpéter have revealed three skeletal graves with few grave goods in the site of Harmadik-vető, 3., along with several Roman Period Germanic settlement features. Based on the results of this excavation, the full scale preliminary excavation conducted during the autumn of 2012. A total of 22 burials were found on the site, belonging to a cemetery. Based on the grave goods it can be dated of the first half of the 5th century. The orientation of the burials shows widely variation and about 50% of them were young individuals. The majority of the graves clearly identifiable with traces of robbery concerned the burials of these younger deceased. In one case, the skeletal remains of a horse were documented in the robbery pit, which clearly showed signs of deliberate manipulation. The paper seeks answers to the question of postmortem disturbance and its various aspects through the chronology and cultural connections of the cemetery.

**944. GRAVE REOPENING IN THE SOMEȘUL MIC REGION (NORTH-WESTERN TRANSYLVANIA) DURING THE GEPIDIC PERIOD**

**Contribution format:** Oral  
**Contribution authors:** Alpár Dobos (National Museum of Transylvanian History)

Grave reopening was a large-scale phenomenon in early medieval Europe. Recently, some areas in Western and Central Europe have been subjects of in-depth analysis that revealed both common trends and regional differences related to this practice in the 5th–7th centuries. During the Gepidic Period (approx. the second half of the 5th century – first two-thirds of the 6th century) Transylvania stood out as one of the areas with the highest proportion of disturbed graves. Despite this, comprehensive research on this topic has only recently been initiated and remains in its early stages. In the second half of the 5th century, a power centre emerged in the valley of the Someșul Mic River, in the surroundings of the ancient city of Napoca (modern-day Cluj-Napoca). This is evidenced by the two princely graves in Apahida and the treasure from Cluj-Someșeni. The importance of the region is signalled not only by finds related to the social elite, but also by several settlements and cemeteries from the 5th–6th century. Most of these were only partially excavated (in many cases just a few graves), some of them without an accurate documentation referring to the grave reopening. Large-scale rescue excavations, prompted by infrastructural investments in the last few decades identified several new cemeteries, some of which have been extensively or fully excavated. Unfortunately, most of these are still unpublished. The presentation will be a micro-regional study focusing on the grave reopening practices in the valley of the Someșul Mic River and its tributaries, based on the available information. The backbone of the research will be represented by two unpublished sites from Șardu and Topa Mică, though data from older and partially published excavations will also be included. Questions related to challenges of documentation of grave reopening during rescue excavations will also be addressed.

**453. DO WE HAVE REOPENED GRAVES IN THE EARLY MIDDLE AGES IN SLOVAKIA?**

**Contribution format:** Oral  
**Contribution authors:** Lucia Nezvalová (Archaeological Institute of Slovak Academy of Sciences)

Grave reopening occurs in various cultures and territories across the world. There is always the same question asked. What can be the cause of that? In some cases, the reasons are relatively clear, in others not. There have been several interpretations of this custom in Slovakia in the period from the 9th to 12th centuries, but there has been hardly any discourse on why these graves were considered to be reopened. In this paper, I would like to focus on the question of whether we have any graves that can be interpreted as reopened in accordance with current research standards. 387 graves from this period were classified as those with posterior interventions and their ratio varies significantly from site to site. There is a cemetery where up to 65% of graves were supposed to be damaged, but we also have ones where no such grave is mentioned. As a reference, use the neighbouring territory of Moravia, which was from the 9th to 10th century and also ruled by the Moymirid dynasty, so the burial customs can be similar.

1350. ARCHAEOLOGICAL AND ANTHROPOLOGICAL PERSPECTIVES ON GRAVE DISTURBANCE AT THE LATE AVAR PERIOD SITE OF NUŠTAR

**Contribution format:** Oral  
**Contribution authors:** Zrinka Premuzic (Faculty of Humanities, University of Zagreb) – Anita Rapan Papesa (Vinkovci Municipal Museum) – Zeljka Bedic (Centre for Applied Bioanthropology, Institute for Anthropological Research) – Mario Novak (Centre for Applied Bioanthropology, Institute for Anthropological Research | Faculty of Humanities, University of Primorska)

The primary goal of this study is to compare archaeological and anthropological evidence of grave disturbance at the Late Avar Period site of Nuštar in eastern Croatia, but also to consider and highlight the contemporary disruption that took place during the site’s discovery. The archaeological excavation, carried out in 2011, revealed that several burials had been disturbed shortly after burial as witnessed by the changes in burial fill, disturbed grave goods, and scattered skeletal remains of the deceased. According to the archaeological context, about 20 graves exhibit these kinds of phenomena. Some of these cases can be traditionally attributed to grave robbery, which is why the artefacts are absent. However, in a few instances, we documented the disturbance of skeletal remains, but the finds remained intact. Consequently, it is necessary to look for alternative explanations. Unfortunately, human skeletal remains from the site are poorly preserved so most of the burials that showed indications of disturbance could not be properly studied. However, several skeletons bear evidence (postmortem modifications such as changes in colour and bone fragmentation) of exposure to elements after being disturbed. Here we will present these cases and discuss the possible causes. The funerary customs of the people of Nuštar are illuminated by this interdisciplinary perspective, which offers an entirely new perspective at the past.

848. REOPENED BURIALS IN EARLY MEDIEVAL WESTERN EUROPE: FROM GRAVE ROBBING TO INTER-ACTIONS WITH THE DEAD

**Contribution format:** Oral  
**Contribution authors:** Alison Klevnäs (Uppsala University)

Across Europe early medieval archaeologists have long recognised significant numbers of graves displaying evidence for intentional post-burial disturbance of skeletons and artefacts. Practices of reopening and manipulating graves soon after burial, traditionally described — and dismissed — as ‘robbing’, have now been documented at cemeteries from Transylvania to southern England. In recent years a series of studies in western Europe have investigated in detail the evidence for the timing and processes of reopening in several geographic areas. Brought together, this new work has resulted in an argument that the reopening of individual graves and removal of selected artefact types should be seen as an aspect of mortuary custom. This treatment of the dead became widely shared for a couple of generations from the later sixth century CE, but in western Europe is rarely seen in earlier phases of the first millennium. This paper will illustrate how these conclusions have been reached through taphonomic analysis of disturbed graves. It will summarize the current state of research and point to some of the many questions that remain open, not least the relationship of reopening practices in western Europe to the substantial earlier evidence in central and eastern Europe.

1254. THE PRESENTDEAD PROJECT: INVESTIGATING INTERACTIONS WITH THE DEAD IN EARLY MEDIEVAL CENTRAL AND EASTERN EUROPE (5TH TO 8TH CENTURIES CE)

**Contribution format:** Oral  
**Contribution authors:** Edeltraud Aspoeck (University of Graz)

The ERC PresentDead project seeks to explore the practical, mental, and emotional aspects of human engagement with the remnants of the deceased (including graves, human remains, and artefacts) in early medieval central and eastern Europe (5th to 8th centuries CE). It utilizes an interdisciplinary approach combining scientific methods, technical solutions, and new theoretical approaches to investigate various contexts of interaction based on archaeological and textual evidence. In early medieval cemeteries bodies were typically buried individually, often accompanied with elaborate objects. Many graves show evidence of human re-entries shortly after burial. This project challenges the notion that disturbed graves offer inferior evidence and argues that these interventions provide significant insights into early medieval practices related to the dead. The project focuses on investigating cemeteries and out-of-cemetery contexts in four central- and eastern European regions with the following objectives: 1. Exploring the range of practices and contexts in the archaeological records. 2. Analyzing textual perspectives across various genres. 3. Integrating material and textual perspectives through an innovative technical solution for semantic data integration. To achieve the archaeological goals, the project outlines methodological objectives: 1. Consolidating methods and establishing research protocols. 2. Developing strategies to address deficiencies in archaeological data. The development of digital tools, which transition from high-resolution to low-resolution evidence, will be fundamental to the project’s approach.

1178. HISTORICAL PERSPECTIVES ON DESPOILING THE DEAD IN THE EARLY MIDDLE AGES

**Contribution format:** Oral  
**Contribution authors:** Thom Gobbitt (Institut für Antike, Karl-Franzens Universität, Graz)

Investigating human interactions with materials of the dead in the ERC PresentDead project, involves a historical approach as well as an archaeological one, critically examining the extent that these disciplines can inform and be informed by each other. I shall outline the historical and literary approaches taken in the project to early-medieval historiographical and legal texts, and present research findings and observations from two historical case studies from sixth-century Francia on grave re-opening and the despoiling of the dead: The laws of the Pactus Legis Salicae (ed. Eckhardt 1962), and Gregory of Tours, Decem Libri Historiarum [Ten books of Histories] (ed. Krusch and Levison 1951). Both of these texts have taken central roles in understanding the intellectual, social and moral framework underlying interpretation of reopened and “robbed” graves from the early middle ages: after all, the Pactus Legis Salicae offers two pairs of laws focused on the despoiling of dead bodies both before (\$14.9 & \$55.1) and after burial (\$14.10 & \$55.4), while Gregory’s account of Duke Guntram Boso’s servants robbing the recent grave of his wife’s relative in the church of St Remedi drips with distaste - and with glee at the ultimate (divine) retribution he incurs. Through “close readings” of these historiographical and legal texts, I shall argue that each reflects only a facet of early medieval attitudes to grave reopening and the despoiling of the dead, deployed for rhetorical ends, and which instead leave space for wider readings of social attitudes that may well compliment rather than contradict archaeological interpretations. Bibliography Eckhardt, Karl August, ed. 1962. ‘Pactus legis salicae’. In Monumenta Germaniae Historica, Leges nationum Germanicarum, 4.1:1–236. Hannover: Hahn. Krusch, Bruno, and Wilhelm Levison, eds. 1951. ‘Gregorii Episcopi Turonensis Libri Historiarum X’. In Monumenta Germaniae Historica, Scriptores Rerum Merovingicarum, 1.1:1–68. Hannover: Hahn.

1405. DIGGING UP THE DETAILS: GRAVE REOPENINGS IN 6TH-CENTURY HUNGARY

**Contribution format:** Oral  
**Contribution authors:** Regina Csordás (Eötvös Loránd University, Budapest) – Eliza Orellana-González (University of Graz) – Astrid Noterman (Uppsala University)

The reopening of graves in early medieval cemeteries has long intrigued researchers, as it offers insights into the complex dynamics of memory, rituals, and material reuse. This paper examines reopened burials in 6th-century cemeteries in Transdanubia (Hungary), aiming to shed light on the mortuary practices of these communities and their adaptation to shifting socio-political and cultural landscapes. The Langobards, a Germanic group that occupied the western part of the Carpathian Basin in the 6th century CE before migrating to Italy, left behind cemeteries that provide critical insights into their mortuary practices. Among these, grave reopenings stand out as a significant yet enigmatic phenomenon. This study uses bioanthropology and archaeoethanatology methods to analyze skeletal remains and associated artifacts, uncovering clues about post-burial interventions. By examining evidence of skeletal manipulation, taphonomic changes, and selective object removal, we aim to distinguish different types of interventions and deepen our understanding of the taphonomic processes within these graves. Through an interdisciplinary approach, this research could provide insights into Langobard mortuary practices and their place within Migration Period burial traditions.

1392. ANALYSING RE-ENTRIES INTO GRAVES AT THE INHUMATION CEMETERY OF ACHAU, LOWER AUSTRIA (7TH-8TH C. CE)

**Contribution format:** Oral  
**Contribution authors:** Jasmin Özyurt – Eliza Orellana-González (University of Graz) – Astrid Noterman (Uppsala University)

The inhumation cemetery of Achau dates to the 7th – 8th century CE and stands out through its richly furnished graves, in particular the multipart belt sets. The cemetery is located south of the Danube in the northern part of the Viennese basin and was discovered in 2014. Around 200 graves were identified through geomagnetic prospection, but further graves are expected outside of the prospected area. In 2020 first excavations were carried out, revealing 19 graves. Generally, Avar period graves vary a lot regarding the proportion of graves that have been reopened, and with 12 out of 19 graves being found disturbed and parts of the grave goods removed their proportion in Achau is rather high. This presentation will focus on the outcomes of applying the PresentDead research protocols for human remains and artefacts, using the results of the 2020 excavations of the cemetery of Achau as a case study. We will introduce our research questions, the research protocols and discuss individual graves and the initial results of our analysis. We will address topics such as the original appearance of the grave and how the reopening modified it; when and how the reopening took place; what types of artefacts were considered as worthy of recovery and what does it tell us about the motivations of the people who did it.

2099. MICRO-ARCHAEOLOGY AT THE 7TH-8TH C. CE CEMETERY ACHAU, AUSTRIA: A HIGH-RESOLUTION STUDY OF FORMATION PROCESSES

**Contribution format:** Oral  
**Contribution authors:** Eliza Orellana-González (University of Graz) – Rebecca Bade (Austrian Academy of Sciences) – Fabian Benedict (Novetus GmbH) – Laura Elmer – Leona Münzer – Jasmin Özyurt (University of Graz) – Caroline Partiot (Austrian Academy of Sciences) – Selina Michelle Sima (University of Graz) – Silvia Wiesinger (Austrian Academy of Sciences) – Edeltraud Aspöck (University of Graz)

The analysis and interpretation of reopened early medieval inhumation graves requires an understanding of their formation processes, i.e. the natural and human factors that contributed to the development of the archaeological evidence of the grave. To increase the understanding of these processes, the PresentDead approach includes a small number of high-resolution case studies that will inform the interpretation of archaeological deposits where there is less information available. In this paper we will present on our ongoing fieldwork at the 7th to 8th c. CE inhumation cemetery of Achau in Lower Austria, where previous excavations discovered a high number of reopened graves. The excavations started in 2024, revealing a grave of a child and a grave of an adult (trench 1), both without any evidence for post-depositional intrusion (so far), whilst in trench 2 evidence of an adult grave with the typical outline of a secondary pit with which the grave was reopened was visible. The graves are excavated with a micro-archaeological protocol including: 3D single-finds recording, including all human bone elements in the ‘disturbed’ parts of a grave with a tachymetre; strategic soil sampling (disturbed and undisturbed samples) and wet-sieving of sediments. We will present the excavation results and the ongoing analysis of the archaeological evidence and its formation.

830. DISTURBED?: A COMBINED MICROMORPHOLOGICAL AND LUMINESCENCE APPROACH TO CHARACTERIZING INTERMENT AND GRAVE DISTURBANCE

**Contribution format:** Oral  
**Contribution authors:** Daniel Fallu – Sofia Voutsaki (University of Groningen)

Understanding the chronology of burial grounds can often be as complex as urban settlement spaces. Initial excavation/construction of burials and monuments can be obscured or obliterated through secondary burial, later re-use, and re-openings. As communities and their social ties become more complex, so often do the burial grounds, resulting in further elaboration. Often, absolute and relative dating methods are insufficient for distinguishing short or closely spaced events. Geoarchaeological methods, namely soil micromorphology and portable optically stimulated luminescence (pOSL) profiling are particularly well-suited for understanding burial history. While both methods allow for the identification of archaeological deposits and site formation processes, portable optically stimulated luminescence (pOSL) profiling adds the ability to better distinguish between gradual and more sudden deposition and to better characterize relative age independent of ceramics. Both methods have proven useful in disentangling depositional history in urban and agricultural contexts, and should permit a greater understanding of the “life history” of cemeteries and burials. Here, we present preliminary results of the geoarchaeological investigation of the 18th-15th century BCE North Cemetery at Ayios Vasileios in Lakonia, Greece. A novel combination of soil micromorphology and pOSL profiling was applied to better understand the formation of the North Cemetery and the use history of the individual burials. This novel combination of methods allows for the distinction between disturbed and undisturbed soils in the burial themselves, as well as the episodes of fill used to build up the cemetery over time. The results will be discussed in light of the recently published absolute chronology of the site with the aim of elaborating on alterations to the cemetery, including disturbance and reopening. Attention will be paid to the further applications of these methods, including in-field hypothesis testing.

37 ...AND THE LORD GOD FORMED MAN OF THE DUST OF THE GROUND... NEOLITHIC FIGURINES – PRODUCTION, HANDLING, DISPOSAL

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Neolithic, Images, Material Culture, Ritual Practices, Find Distribution, Fragmentation  
**Session organisers:** Raiko Krauss (Tübingen University) – Dan Ciobotaru (National Museum of the Banat, Timisoara) – Nenad Tasic (Belgrade University)

SESSION ABSTRACT

Human and animal figurines are among the most fascinating artefacts of the Neolithic period. Against the background of numerous new discoveries in recent years, we want to gain an insight into the production techniques and various practices of handling the figurines. An important aspect in the past was the fragmentation and, in some cases, reassembly of the figurines. We want to investigate the question of whether the observations can be confirmed or falsified on the basis of the more recent excavations. Finally, we will also look at the contexts in which the artefacts were found, which raises the question of how they were deposited and finally put out of use. Starting from research on the Neolithic in Anatolia, the Aegean and south-east Europe, we would like to extend the geographical focus to the entire Old World, especially Europe, West Asia and North Africa. Contributions from the social sciences, behavioural biology and social anthropology are also very welcome.

CONTRIBUTION ABSTRACTS

49. IMAGES OF STONE AGE PEOPLE - SPACE, TIME AND CONTEXTS - AN INTRODUCTION

**Contribution format:** Oral  
**Contribution authors:** Raiko Krauss (Tübingen University) – Nenad Tasic (Belgrade University) – Dan Ciobotaru (Museum of the Banat, Timisoara)

Hardly any other find genre of the European Neolithic is as fascinating as human figurative sculpture. However, numerous new discoveries in the area of northern Mesopotamia from the Pre-Ceramic Neolithic period have shed new light on the figurative sculpture of the European Neolithic. There are also numerous new finds from south-east and central Europe. It is time to discuss the current finds against the background of these new discoveries and, if necessary, to re-evaluate them. What contexts do the figurative representations come from? What or whom do they represent? How can their use be reconstructed? Are there comparable find patterns at different sites? What role do human representations play in other spatio-temporal contexts and can these be transferred to the Neolithic period? The context in which the figurines were found will therefore play a major role alongside questions of production technology. These are the questions we want to address and discuss together in this session.

1586. FROM CLAY TO SACRED FORMS: AN ANTHROPOMORPHIC FIGURINE FROM LIMBA AND ITS ROLE IN FIRST NEOLITHIC TRANSYLVANIAN RELIGIOUS LIFE

**Contribution format:** Oral  
**Contribution authors:** Anamaria Tudorie – Marius Ciuta (Lucian Blaga University from Sibiu)

The geo-spatial position of the archaeological site of Limba-Oarda de Jos (Alba County, Romania), allows its “residents” to control the natural connections between Transylvania and the adjacent areas (Banat, Pannonia, the Danube Plain, Oltenia), due to the fact that the geo-morphological characteristics and the exact location is at the intersection of major communication routes (Mureş, Sebeş and Ampoi Rivers), have made the Neolithic communities that entered the Transylvanian Depression to use the terrace of this site for habitation. This is also the case of the first impulse of Neolithization, characterized by the presence of white on a red painted pottery. Recent excavations have led to the discovery of inhabitation features and specific inventories, including plastic-art objects. A fragmentary anthropomorphic female statuette, discovered in the named Bordane sector (exactly on the northern edge of the terrace), showing specific shapes, drawn our attention to the way elements are to be interpreted as belonging to spiritual life spread in the North Danube area. On this occasion, analyzing similar elements from contemporary sites from this geographic area (Gura Baciului, Şeuşa, Miercurea Sibiului, Cristian, Ocna Sibiului), the authors launch a series of working hypotheses on how religious ideas were reproduced in the daily life of the first Neolithic groups in Transylvania.

441. REPRESENTATIONS OF ONAGERS IN THE NEOLITHIC SETTLEMENT OF LIMBA-OARDA DE JOS (ALBA COUNTY, ROMANIA)

**Contribution format:** Oral  
**Contribution authors:** Ciuta Marius (Lucian Blaga University of Sibiu)

The archaeological site of Limba-Oarda de Jos (Alba County, Romania), located at the intersection of multiple natural communication routes, has provided, since its initial mentions in the specialized literature in the mid-20th century, significant information regarding the succession of Neolithic settlements on the high terrace of the Mureş River. This terrace is situated at the southwestern edge of the Transylvanian Depression, at the point of contact with the Mureş Corridor that connects the region westward to Banat, south-westward to the Danube Gorge, and southward to Oltenia. A distinctive feature of the material inventory of the Neolithic settlements at this site - identified during surface surveys (1970), systematic excavations (1995–2001), and preventive archaeological investigations (2016–2020) - is the exceptionally high number of anthropomorphic figurines. The early phases of

the Vinča culture (phases A and B) alone have yielded over 400 such anthropomorphic and zoomorphic “idols.” A particularly intriguing case is represented by the zoomorphic figurines crafted not only from ceramics but also from alabaster - a material not native to the region. The presence of alabaster figurines within Transylvanian sites has raised numerous questions among Neolithic researchers since the 1970s (N. Vlassa). Our study focuses on the analysis of artifacts depicting equids (onagers?) in the early Vinča contexts, discovered at this site, as well as the interpretation of their significance and function. This is particularly noteworthy given the absence of representations of other animals, such as ovicaprids, bovines, or wild species.

1871. REIMAGINING NEOLITHIC FIGURINES FROM VINČA

**Contribution format:** Oral  
**Contribution authors:** Nenad Tasic (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

In this paper, I present examples contributing to the reconstruction of Neolithic figurines from Vinča. Excavations at Vinča have been ongoing since 1908, revealing a 9-meter-thick cultural layer with rich archaeological material. Over decades, this material has provided insights into chronology and cultural change over 800 years of settlement at Belo Brdo. The collection of archaeological material includes over 1,300 Neolithic terracotta figurines. The figural plastic art from Vinča has been the subject of numerous studies and interpretations, yet the role these objects played in the past remains only partially understood. Stylistic and typological analyses, contextual studies, clay composition analyses, statistical evaluations of gender representation, fragmentation studies, and chaîne opératoire assessments have all been conducted. However, a critical step toward understanding the function of these objects has yet to be achieved. On the other hand, the reconstruction of their original appearance has not been the focus of scientific studies, with previous attempts being largely limited to reconstructions for exhibition and presentation purposes. This study employs an interdisciplinary approach, integrating archaeological, technological, and material science data while adhering to authenticity and ethical transparency. The methodology includes analysis of archaeological contexts, chemical analysis, material identification, and interpretation of stylistic and symbolic aspects, differentiating visually reconstructed elements from preserved originals. As most figurines from Vinča are fragmented, this study reconstructs those with sufficient elements to approximate their original appearance. It examines missing parts, original coloration, the analysis of “stratigraphy” of decorating procedures; the ware of use marks analysis; the reconstruction of lost decorative elements, and, in particular, the reconstruction of hairstyles based on traces of paint and “fitting points” such as perforations or protuberances found on the heads of certain terracotta figurines. This research aims to enhance understanding of these figurines’ function in Neolithic society, whether ritual, religious, or symbolic.

1836. FIGURINES CURATING HOUSEHOLD BIOGRAPHIES IN LATE NEOLITHIC VINČA CULTURE VILLAGES

**Contribution format:** Oral  
**Contribution authors:** Milos Spasic (Belgrade City Museum)

The biographies of Vinča houses are distinctly reflected through numerous instances of spatial reorganization and the symbolic significance ascribed to specific areas of the dwellings, as well as the diversity of commemorative deposits placed within them. In the context of prehistoric settlements, commemorative deposits are generally understood as assemblages of various objects deposited during specific activities carried out by the house’s inhabitants. These deposits, which mark key events such as the construction and abandonment of dwellings, feasts, celebrations, and other ritual and ceremonial practices, have been identified in various houses across prehistoric Europe. However, within the Vinča culture context, the practice of commemorative deposition has been the subject of a significantly smaller body of research. This study explores the ritual practice of depositing clay figurines within Vinča houses, focusing on their role in commemorating the beginning and the end of life in the house. Figurines, therefore, emerge as active social agents in the curation of household biographies, contributing to the formation and negotiation of the social and symbolic landscapes of Neolithic communities.

98. SHIFTING NUMBERS AND THE POWER OF REPETITION: FIGURINE DISTRIBUTION AND DESTRUCTION IN THE NEOLITHIC OF CENTRAL AND SOUTHEASTERN EUROPE

**Contribution format:** Oral  
**Contribution authors:** Valeska Becker – Rune Iversen – Rebecca Bristow (University of Copenhagen)

An overview of figurines and other figurative representations in southeastern and central Europe shows that they are not spread evenly and that their distribution changes in the course of time: regions formerly overflowing with anthropomorphic and zoomorphic figurines suddenly turn empty, and some areas have never even adopted the custom of using these objects at all. In the recent project “A World without images” located at Copenhagen University, we attempted to map figurative finds in southeastern and central Europe in the time between 6000-3000 calBC with the help of a large database. The aim was to shed light on the disappearance of figurines and to find explanations for the discontinuation of their use. In some cases, external or internal crises seem to play a

role, although prehistoric societies could react quite differently to those. For example, after the end of the Linear Pottery Culture, figuration ceased in its western areas (Stroked Pottery Culture, Hinkelstein-Großgartach-Rössen), whereas further to the east, the Lengyel Culture followed with thousands of figurines – apparently two different strategies for dealing with a crisis. The large numbers of figurines in the Lengyel Culture and their curious manufacturing technique – they were assembled from single body parts, which yielded in their breaking along predetermined fault lines – can only be explained by the destruction being one, if not their only purpose. The technique also led to large numbers of very similar fragments. It seems that the repeated action of breaking a figurine and producing similar fragments every time can be read as a means to establish and strengthen a community and to create an equal outcome of a ritual for all its members.

1520. THE WORLD CREATED OF CLAY: PRECUCUTENI-CUCUTENI-TRYPILLIA FIGURINES, GENERAL VIEW

**Contribution format:** Oral  
**Contribution authors:** Nataliia Burdo (Kyiv Regional Archaeological Museum) – Mykhailo Videiko (Kyiv Metropolitan Borys Grinchenko University)

A lot of anthropomorphic and zoomorphic plastic was used in the Precucuteni-Cucuteni-Trypillia cultural unity. Technologically, most of the anthropomorphic and zoomorphic figurines were made of the same material as the pottery. A special category of anthropomorphic figurines was produced of mass with an admixture of grains. Some of the schematic anthropomorphic figurines are made carelessly, probably for single use. Other figurines are carefully processed, ornamented, endowed with detailed features, decorated. The modeling of some of the anthropomorphic figurines from two vertical halves has been recorded, which is due not to technology, but to sacred aspects. The deformation of some zoomorphic figurines indicates that they could be used in rituals without prior firing. Among the zoomorphic figurines there are carefully sculpted and ornamented specimens. In one case, a zoomorphic figurine was modeled from two vertical halves. Anthropomorphic plastic is mostly fragmentary. The context of finds of anthropomorphic plastic in settlements: among the ruins of burned dwellings, in pits (in Maydanetske fragments from one figurine and pits of different dwellings), embedded in plaster (Nebelivka). Non-fragmented anthropomorphic figurines were found in cult sets (Poduri, Isaia, Malinovtsi, Konovka), sometimes accompanied by ceramic chairs (Tymkove). Zoomorphic figurines are much more often found whole. The context of finds of zoomorphic plastic in settlements among the ruins of burned dwellings, in pits, in particular in the form of a set with tokens and miniature terracotta objects. Female figurines were found in some graves of the Vykhvatyntsi cemetery. The fragmentation of the anthropomorphic figurines and the context of their discovery indicate that they were most often used in sacrificial rituals, during which they were deliberately fragmented. Zoomorphic figurines can probably be divided into two groups. Most were used without fragmentation as substitutes for sacrificial animals.

1487. PORTABLE IDENTITIES: NEOLITHIC CLAY FIGURINES IN A CROSS-BALTIC SOCIAL NETWORK

**Contribution format:** Oral  
**Contribution authors:** Jenni Lucenius (Turku university) – Torbjörn Brorsson (Ceramic Studies) – Niklas Stenbäck (Independent)

This presentation explores Neolithic clay figurines from the Åland Islands and Southwest Finland in the northern Baltic Sea, focusing on their provenance, production techniques, and social significance. A total of 42 figurines from the Comb Ceramic Ware and Pitted Ware Culture traditions were analyzed using ICP-MA/ES chemical analysis and thin-section petrography to determine their raw material sources and fabrication methods. Comparisons with Pitted Ware figurines from Sweden, using extensive previously published data, provide further insights into their distribution and cultural context. The results indicate that while most figurines were made from local clays, a significant proportion originated from non-local sources, suggesting interregional movement and exchange within a cross-Baltic social network. Recent excavations on the Åland Islands and in Sweden have uncovered new clay figurines, offering valuable opportunities to contextualize these findings and deepen our understanding of their role in Neolithic societies. These discoveries contribute to a broader framework for interpreting the figurines’ social significance, particularly in relation to mobility, identity, and cultural interaction in the Baltic region. Furthermore, the figurines’ compositions reveal culturally significant choices in clay recipes, including calcareous and plant-based tempers, suggesting symbolic meanings tied to identity and place. By examining these figurines within the wider context of Neolithic social networks, this study enhances our understanding of mobility, identity, and social practices among early hunter-gatherer communities in northern Europe.

1627. “THEN THE LORD GOD MADE A WOMAN FROM THE RIB...” – BONE ANTHROPOMORPHIC FIGURINES FROM THE EASTERN BALTIC, 4000–2000 BC

**Contribution format:** Oral  
**Contribution authors:** Tõnno Jonuks (Estonian Literary Museum)

Around 4000 BC, the Eastern Baltic witnessed the emergence of a new artistic tradition—small, flat figurines crafted from bone sheets in anthropomorphic and zoomorphic forms, including representations of birds and snakes. Many of these figurines have been recovered from settlement occupation layers, while some originate from burial contexts, providing further opportunities for interpretation. This presentation focuses specifically on anthropomorphic figurines and their connections to other non-human species. While previous studies of these figurines have primarily explored their meaning and symbolism, this presentation examines their production and use. Use-wear analysis reveals significant variations in production skill, with some figurines displaying evidence of intensive and even crude handling. As these artefacts were not created for purely aesthetic purposes but were actively used within the society, the wear marks they exhibit are particularly noteworthy. The figurines are well preserved, yet surface scratches suggest prolonged use, with some ultimately being deliberately broken. A detailed analysis further challenges the previously held assumption that the Eastern Baltic anthropological figurines are asexual or female. Some exhibit also features indicative of male characteristics, although it remains uncertain whether distinctions between male and female were of particular significance in this context.

578. MINIATURE STONE ANTHROPOMORPHIC FIGURINE FROM THE SETTLEMENT MOUND TURSKOTO KYUSHE NEAR ELHOVO TOWN, SOUTHEAST BULGARIA

**Contribution format:** Poster  
**Contribution authors:** Todor Valchev (Historical museum - Yambol)

Anthropomorphic plastic art is one of the main elements of prehistoric cultures and remains an important source providing information about the spiritual world of the first farmers on the Balkan Peninsula and in Bulgarian lands. According to the Bulgarian chronological system, the Neolithic dates from 6100 to 4900 BC, as the Late Neolithic period covers the last 600 years. The most common anthropomorphic figurines during the Prehistoric period are made from clay. Much rarer, they are made from marble, stones, or shells. Using the last materials, the prehistoric masters made stylized female figurines without many individual features. The aim of the poster is to present a miniature stone anthropomorphic figurine. It was found during the rescue excavation of the prehistoric settlement mound Turskoto kyushe near Elhovo town. It’s made from green stone. The figure is 2.2 cm long and only 0.2 cm thick. It dates to the Late Neolithic Karanovo IV culture (5200 – 4900 BC). Anthropomorphic plastic art is connected with the religion and world view of Prehistoric people. According to some scholars, human figurines present images of the Great Mother-goddess or goddess Mother-Earth, and they are associated with beginning, fertility, and the continuation of the family through women. Others support the idea that the anthropomorphic figurines are connected with rituals associated with newborn or newly conceive children, and their initiation into the prehistoric society. During this un-written period of human history, it’s very hard to separate sacred from common, but without doubt can say that the miniature stone figure from Turskoto kyushe was charged with unnatural power.

2147. FIRST ENSISHEIM TYPE IDOL NORTH OF THE CARPATHIANS? SOME TAPHONOMIC DILEMMAS AND POSSIBLE INTERPRETATIONS

**Contribution format:** Poster  
**Contribution authors:** Marcin Szeliga (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin) – Grzegorz Osipowicz (Institute of Archaeology, Nicolaus Copernicus University in Toruń)

Bone artefacts represent one of the least numerous categories of finds of the Linear Pottery culture (further LBK). Despite this, the current state of research and source data justify the statement that the processing of this raw material by the communities of this culture was primarily aimed at the production of everyday tools, and to a much lesser extent other products, including in particular non-utility, symbolic or even cult objects. The latter, rarest group of finds seems to include the specimen that is the subject of this presentation, discovered within the LBK settlement at stan. 6 in Tominy, Ożarów commune, in the upper Vistula River drainage basin, in southern Poland. It shows close similarity to rare Neolithic figurative representations from Western Europe, including only three LBK specimens from France, known in the literature as Ensisheim type idols. It is currently the only early Neolithic bone figurative representation of this type on the northern side of the Carpathians, and one of the few Neolithic bone artefacts in Central Europe interpreted as anthropomorphic idols. These circumstances, as well as some marked differences between this specimen and other finds, pose serious interpretative problems, both functionally and culturally. Their presentation, as well as an attempt to clarify them, is the primary focus of the proposed speech.

38 PAST ECOSYSTEMS AS DRIVERS OF CULTURAL ECOLOGY: NEW APPROACHES IN THE ANALYSIS OF THE HUMAN-PALAEOENVIRONMENT INTERACTIONS

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Palaeoecology, Pleistocene, Holocene, Palaeoclimate, Multidisciplinary Approaches, Archaeological Sciences  
**Session organisers:** Ivan Rey-Rodriguez (Centro de Investigación Mariña, Universidade de Vigo, MAPAS lab) – Sandra Bañuls-Cardona (Universitat de València) – Julia Galán (Senckenberg Forschungsinstitut und Naturmuseum, Abteilung Messelforschung und Mammalogie) – Carmen Núñez-Lahuerta (Universidad del País Vasco UPV/EHU)

SESSION ABSTRACT

This session focuses on the critical role of past ecosystems in shaping human societies. It will highlight recent advancements in studying human resilience and adaptation to changing landscapes and climates. Palaeoecological data are essential in reconstructing ancient climate, environment, and biological communities, offering crucial insights for understanding the adaptive strategies of past human populations.Topics of discussion include:(1) The application of multidisciplinary methodologies, such as bioarchaeology, geochemistry, and palaeoecology, to study the long-term ecological relationships that influence cultural changes.(2) Case studies from key archaeological sites that reveal how past ecosystems shaped cultural ecology, providing evidence of resilience, adaptation, and societal transformation.(3) Exploration of new applications for widely used technological tools, such as GIS mapping and ecological niche modeling, to develop models that examine the interrelationships between environmental and cultural changes.The goal of the session will be to foster a deeper insight into how environmental conditions influence cultural adaptation, resource use, and societal organization. Presenters will discuss how prehistoric and historical ecosystems impacted human behavior in the past, emphasizing the complex feedback loops between ecological shifts and cultural evolution. Moreover, this understanding is increasingly relevant in the context of the contemporary global climatic crisis.

CONTRIBUTION ABSTRACTS

57. GOING BEYOND THE “BOS/BISON” CLASSIFICATION: HOW TEETH CAN HELP US UNDERSTAND PREHISTORIC HUMAN POPULATIONS AND PALEOENVIRONMENTS

**Contribution format:** Oral  
**Contribution authors:** Eugenie Capdepon – Sandrine Costamagno – Emmanuel Discamps (UMR TRACES - Travaux et recherches archéologiques sur les cultures, les espaces et les sociétés) – Allowen Evin (UMR ISEM - Institut des Sciences de l’Evolution de Montpellier)

In Western Europe, the subsistence of Palaeolithic hunter was mainly based on the hunting of Ungulates, such as Cervidae, Equidae and Bovinae. From the latter family, the fossil species *Bison priscus* (Steppe Bison) and *Bos primigenius* (Aurochs) are found in the vast majority of faunal assemblages from archaeological and palaeontological sites since the Middle Pleistocene (aside the less common *Bison schoentensacki* and *Bison bonasus*). However, the distinction between the two genera, Bos and Bison, is difficult due to their strong anatomical similarities. It is therefore common in faunal determinations to group bisons and aurochs under the categories “Bos/Bison” or “Bovinae”, without further clarification. Being able to identify the presence of Aurochs and/or Bison have paleo-environmental implications and provide key information for understanding past human-animal interactions, as the behaviour of these species differs. The Steppe Bison is seen as a highly migratory animal favouring wide-open fields, whereas the Aurochs is described as a sedentary grazer, favouring forest cover. While the two species likely represent different preys for humans, their resemblance challenges our ability to determine the hunting choices of Palaeolithic societies. How can we approach the subsistence strategies of humans without being able to distinguish between “Bovinae” taxa? Detailed morphometric analyses through 2D geometric morphometrics could be the answer to that age-old question. In this communication, we present the first results of the morphological shape analysis of lower molars from a solid Bovinae referential, and henceforth propose a new method to distinguish between bison and aurochs. Coupled with dental microwear texture analysis, this multidisciplinary approach allows us to reconstruct paleoenvironment changes, large herbivores communities and to understand past human populations’ place in those environments.

81. RECONSTRUCTING SOUTHWESTERN EUROPE QUATERNARY ENVIRONMENT AND CLIMATE THROUGH RODENT’S ASSEMBLAGES

**Contribution format:** Oral  
**Contribution authors:** Juan Manuel López-García (Institut de Paleoecologia Humana i Evolució Social (IPHES) | Universitat Rovira i Virgili (URV)) – Mónica Fernández-García (Universitat de Valencia (UV) | Institut de Paleoecologia Humana i Evolució Social (IPHES))

The northeastern of the Iberian Peninsula, with the Pyrenees as a geographical barrier, represents a zone of passage for species, including humans, during most of the Quaternary. Through the studies of small rodents that appear in different archaeo-paleontological sites, we will present a small synthesis of the evolution of the climate and landscape during the Quaternary in this region. From the oldest period, the Early Pleistocene, few sites with a diverse chronology have been identified, such as the Pedrera del Corral d'en Bruach, Vallparadís or La Boella where appears extinct rodents such as *Mimomys medasensis*, *M. savini* or *Microtus (Iberomys) huescarensis*, which are related with a Mediterranean coastal climate, and are indicative of stable watercourses and open landscapes with relatively humid environments. The record in the Middle Pleistocene is also scarce, with only two localities: La Cansaladeta and Mollet. Few rodents remains were recovered in La Cansaladeta, but in Mollet species that already have current representatives such as *M. arvalis* or *M. agrestis* were recorded. This site was interpreted as a transitional phase from a more temperate to a colder moment with a well forest development at the end of MIS 7. From the Late Pleistocene and the beginning of the Holocene the sites diversify, and we find well represented sequences where we can study the evolution of the climate and the landscape, such as the Cova del Rinoceront, the Abric Romaní, the Cova de l'Arbreda or Teixoneres, among others. The rodent associations are already current species and their studies have allowed us to detect important environmentally moments for the history of the climate and the landscape, such as the Eemian (MIS 5e), the LGM (Last Glacial Maximum) or the transition from the Late Pleistocene to the Holocene, 11.7 ka.

562. PRE-HISTORIES PROJECT - INTEGRATING HUMAN LATE PLEISTOCENE RECOLONISATION AND ENVIRONMENTAL HISTORIES IN SCOTLAND

**Contribution format:** Oral  
**Contribution authors:** Leia Tilley – Kate Britton – Tim Mighall – Samantha Jones – Lydia Sam – Anshuman Bhardwaj (University of Aberdeen)

There is now increasing evidence of human life in Scotland during the terminal Late Pleistocene (Late Glacial); the traditional archaeological evidence, however, is limited, and the topic is under-researched. Conversely, there exists more than 40 years, a rich tradition, of palaeoenvironmental research in Scotland. A significant proportion of this data is related to the climate and environments of the region following the end of the Last Glacial Maximum (23,000-19,000 cal BP). As a dataset, this could prove integral to contextualising and improving understanding of the emerging evidence for human lifescapes in Scotland during the terminal Late Pleistocene. Indeed, many Late Glacial pollen datasets demonstrate diverse plant communities that could have been foundational to complex hospitable environments for recolonising human (and animal) groups after the retreat of the last British-Irish ice sheet. However, there is a need to generate more data, particularly from sites in proximity to now-established Late Glacial archaeological sites. Consequently, as an aspect of this study, pollen cores from the sites of Raedykes (Aberdeenshire) and Borland Moss (Lanarkshire) are being analysed. Dating to the Late Glacial and early Holocene, high-resolution pollen and NPP records from these sites enable direct consideration of the environments and ecosystems that Late Glacial human (and animal) communities encountered. Brought together with previously published legacy data spanning decades, visualised through GIS methodologies, the wider aims of the PRE-Histories Project are both to map the shifts in vegetation community composition across the Late Glacial in Scotland and to explore how Late Pleistocene human (and animal) communities may have selected environments for recolonisation. This will further discussion on how these pioneer human (and animal) communities engaged with and adapted to, the characteristically dynamic environments of the terminal Late Glacial in Scotland.

1244. PALAEOECOLOGICAL DYNAMICS DURING THE MIDDLE AND UPPER PALAEOLITHIC IN NORTHWEST IBERIAN PENINSULA: THE COVA EIRÓS ARCHAEOLOGICAL SITE

**Contribution format:** Oral  
**Contribution authors:** Hugo Bal-García (Universidade de Santiago de Compostela | Centro de Investigación Interuniversitario das Paisaxes Atlánticas Culturais) – Iván Rey-Rodríguez (Centro de Investigación Mariña, Universidade de Vigo | Centro de Investigação em Ciências Geo-Espaciais, Universidade do Porto) – Arturo De Lombera-Hermida (Universidad de Oviedo | Centro de Investigación Interuniversitario das Paisaxes Atlánticas Culturais) – Mikel Díaz-Rodríguez (Universidade de Vigo | Centro de Investigación Interuniversitario das Paisaxes Atlánticas Culturais) – Carlos Fernández-Rodríguez (Universidad de

León) – Xosé Pedro Rodríguez-Álvarez (Universitat Rovira i Virgili | Institut Català de Paleoecologia Humana i Evolució Social) – Ramón Fábregas-Valcarce (Universidade de Santiago de Compostela | Centro de Investigación Interuniversitario das Paisaxes Atlánticas Culturais)

Cova Eirós (Triacastela, Lugo, NW Iberia) has the most comprehensive archaeological sequence in the northwest-ern Iberian Peninsula, with stratigraphic levels containing rich and well-preserved fauna and lithic industries spanning roughly from at least 41 kyr calBP to 14 kyr calBP. Within this chronological timespan, several signif-icant climatic events took place, most notably the transition between Marine Isotopic Stages (MIS) 3 and 2, a period during which Neanderthal populations went extinct and were subsequently replaced by Anatomically Modern Humans (AMH). In this context, the zooarchaeological record from levels 3 (~41 kyr calBP), 2 (~36-35 kyr calBP) and 1 (~17 kyr BP) provides a key dataset for reconstructing the climatic and environmental condi-tions under which these hominin groups lived, as well as establishing a paleoclimatic sequence encompassing MIS 3, the immediate transition to MIS 2, and a fully developed MIS 2. To achieve this, a multi-proxy approach based on the faunal record has been employed, integrating methods for paleoclimatic reconstruction (Bioclimatic Model), paleoenvironmental reconstruction (Habitat Weighting) and a traditional zooarchaeological analysis. This comprehensive methodology aims to inferring the ecological conditions in which both Neanderthals and AMH populations thrived and elucidating their interactions with the surrounding animal communities across different time periods. Results indicate that throughout the sequence, climatic conditions were consistently colder and slightly drier than today, yet the region maintained a relatively humid and wooded environment, which may have functioned as a refuge area. Furthermore, the zooarchaeological evidence reveals shifts in territorial exploitation and subsistence strategies among hunter-gatherer groups, with a progressive decrease in occupa-tion intensity over time.

1980. FINDING SUITABLE GROUNDS IN THE DUTCH LOWLANDS DURING THE MESOLITHIC-NEOLITHIC TRANSITION: A MULTIPROXY STUDY

**Contribution format:** Oral  
**Contribution authors:** Ana Smuk (Groningen Institute of Archaeology (GIA), Faculty of Arts, University of Groningen) – Elena Familetto (Department of Physical Geography, Faculty of Geoscience, University of Utrecht) – Mans Schepers (Groningen Institute of Archaeology (GIA), Faculty of Arts, University of Groningen) – Kim Cohen (Department of Physical Geography, Faculty of Geoscience, University of Utrecht) – Marco Madella (CASEs, Department of Humanities, Universitat Pompeu Fabra) – Lucy Kubiak-Martens (Biological Archaeology & Environmental Reconstruction, BIAx Consult, Zaandam) – Hans Huisman (Groningen Institute of Archaeology (GIA), Faculty of Arts, University of Groningen)

The environment and its resources played a crucial role in the decision-making processes of past populations, particularly during the transition to agriculture. For many years, the potential of the Dutch wetlands for crop culti-vation was overlooked, as the waterlogged conditions were considered unfavorable. The “Finding Suitable Grounds” project challenges this perspective by focusing on specific environmental niches in this wetland Neolithic land-scape. We investigate off-settlement-site areas surrounding key archaeological sites to better understand how early farmers engaged with the landscape between 6000 and 4000 cal. yr. BC and how this changes over space and through time. We combine geoarchaeological and palaeoecological approaches to reconstruct and evalu-ate the landscape. Integration of soil micromorphology, 14C dating, and multi-proxy archaeobotany (including macroremains, pollen, phytoliths, and charred herbaceous tissues) are used to assess the suitability for agri-culture of two wetland regions of the present-day Netherlands: the central lagoonal area of Lake IJssel and the Rhine-Meuse delta. These regions experienced constant transformation during the Mesolithic-Neolithic transition with meandering fluvial channels, rising sea levels, and repeated flooding reshaping the landscape. Despite this, certain landscape features—such as river levees—show evidence of human activity and early cultivation, provid-ing valuable insights into how Neolithic communities adapted to and exploited dynamic wetland environments.

1033. RECONSTRUCTING WETLAND ENVIRONMENTS IN THE EARLY NEOLITHIC IN NORTH-WESTERN ROMANIA TO UNDERSTAND SETTLEMENT AND SUBSISTENCE PATTERNS - A MULTIDISCIPLINARY APPROACH

**Contribution format:** Oral  
**Contribution authors:** Jonna Bügenburg – Raiko Krauß (University of Tübingen)– Christopher Miller (University of Tübingen | University of Bergen)

The transition from the Pleistocene to the Holocene in the Balkans marks a time when environmental conditions were particularly favourable for Neolithization. During this period, the environment was largely influenced by the dynamic flow of major rivers and their tributaries, which results in the landscape being composed of both

ancient and recent floodplains. In the Banat region of modern-day Romania, evidence of Neolithic settlements can be traced back to around 6000 BC. The interaction of early settlers of these complex fluvial environments are visible in a diverse and untypical archaeological record, such as high consumption of aquatic resources. The aim of this research is to reconstruct geomorphological dynamics of the floodplains surrounding the early Neolithic tell settlement of Movila lui Deciov in northwestern Romania, situated within a highly complex alluvial fan. By combining geospatial prospection methods such as GIS and LiDAR, sediment core analysis, and absolute dating techniques, this multidisciplinary approach seeks to provide a thorough understanding of the local environmental conditions and their resulting cultural adaptation. Geomagnetic images, historical maps and LiDAR scans uncovered several remnants of paleochannels. Three transects with six sediment cores established a detailed stratigraphy of the floodplain area and revealed deposits from a meandering channel. OSL dates taken from these deposits suggest fluvial activity around 5100 BC, which coincides exactly with the Early Neolithic occupation period, indicating that during this time, the landscape featured an active floodplain with slowly meandering streams. The choice to establish a settlement on a stable point bar terrace was a deliberate choice, allowing the community to adapt to and make use of this Dynamic yet resource-rich environment. Archaeozoological and archaeobotanical data further support this interpretation, revealing that aquatic resources made up 50% of the population's diet, highlighting the crucial role of local landscape exploitation and environmental adaptation.

**414. ECOHUB: RECONSTRUCTING SOCIO-ENVIRONMENTAL DYNAMICS THROUGH ECOLOGICAL NICHE MODELLING (ENM) OF BIRCH FORESTS IN WESTERN EUROPE**

**Contribution format:** Oral  
**Contribution authors:** Barbara Mas Velez (Université Côte d’Azur, CNRS, CEPAM | Seminari d’Estudis i Recerques Prehistòriques (SERP), Universitat de Barcelona) – Neftalí Sillero (CICGE – Research Centre on GeoSpatial Sciences, Faculty of Sciences, University of Porto) – Antonio García-Alix (Departamento de Estratigrafía y Paleontología, Universidad de Granada) – Auréade Henry (Université Côte d’Azur, CNRS, CEPAM)

Silver birch (*Betula pendula*) is a pioneer heliophilous species that grows in boreal and temperate deciduous forests, and it occurs in cold to temperate climates with moderate humidity. Its sensitivity to forest overstory density, disappearing as it becomes denser, makes it an excellent indicator of environmental conditions and anthropogenic impact. In addition, birch has been a useful resource for humans since Palaeolithic times. The ongoing ECOHUB project applies ecological niche modelling (ENM) to investigate long-term human-environment interactions in temperate forests, to explore how silver birch responds to climate variability and how changes in its distribution may influence cultural behaviours, such as settlement patterns and resource management. For this purpose, we used ENM-specialised R packages Biomod2 and Dismo, with the MaxEnt algorithm, to model birch habitat suitability across key climate periods over the last 15,000 years. We obtained current occurrences of *Betula pendula* across Europe (from the Atlantic to the Urals) using the GBIF QGIS plugin, with spatial filtering (10 km<sup>2</sup>) and outlier removal. Contemporary bioclimatic data (1970-2000) were downloaded from WorldClim.org. We are currently evaluating whether the palaeoclimatic dataset Oscillayers (implemented in R) can reliably generate past climate data with a fine temporal resolution (2–1.5 kyr). If this resolution is not possible, we will use the paleoclimate data from PaleoClim.org. To assess the spatial relationship between archaeological settlements and the predicted birch habitats, we have also compiled a comprehensive review of palaeoenvironmental records, including archaeobotanical evidence of birch use in Western Europe, such as fuelwood, tar production, and pollen assemblages. Our results aim to improve our understanding of the biogeography of silver birch over time, and how environmental changes may have impacted resource availability and human behaviour. Furthermore, the ECOHUB project aims to establish a robust methodological framework for future ENM applications in archaeobotany, palaeoenvironmental research, and landscape archaeology.

**1179. MODELING PAST BLUE ECONOMIES: AN APPROACH FOR UNDERSTANDING THE RESILIENCE OF COASTAL SOCIOECOLOGICAL SYSTEMS**

**Contribution format:** Oral  
**Contribution authors:** Maria Coto-Sarmiento – Débora Zurro (IMF-CSIC - Consejo Superior de Investigaciones Científicas) – Antonio Canepa-Oneto (University of Burgos) – Lucia López-López (Centro Oceanográfico de Santander (COST-IEO, CSIC)) – Nesly Melissa Bello (IMF-CSIC - Consejo Superior de Investigaciones Científicas) – Virginia Ahedo – José Manuel Galán (University of Burgos)

Coastal economies have historically adapted to specific challenges and have traditionally been viewed as more resilient compared to their inland counterparts. This perception stems from advantages such as their diversified economies and also the higher carrying capacity of coastal ecosystems. Although the archaeological record in coastal environments demonstrates fluctuations in captured species as well as species depletion (diminution of prey sizes), the richness of marine resources is sometimes thought to be endlessly renewable. We outline the

objectives of the project bluePALEOeconomy: analysis of coastal socioecological systems in the long-term through data science. The project will explore blue economies by addressing different aspects including the anthropological impact on marine resources. We aim to identify patterns of anthropogenic impact and resilience in marine ecosystems by integrating environmental and social dimensions. We will assess marine resource consumption and possible resource depletion in coastal socioecological systems through modeling (ABM). Consumption of resources from both benthic and pelagic contexts will be modeled and analyzed, and results will be reviewed in light of existing archaeological data. Additionally, the project will examine gender roles in the production and processing of marine products in blue economies. This objective will be addressed through cross-cultural analysis and data mining of ethnographic and archaeological data that will be confronted to illustrate how advanced technological skills complement traditional methodologies. Computational models in combination with archaeological data will contribute to a broader understanding of the human impact in marine environments, providing insights for both human ecology and the reconstruction of past economies.

**152. HUMAN IMPACT ON ARID/SEMI-ARID ENVIRONMENTS: UNDERSTANDING MIXED URBANIZATION IN THE WATER SYSTEM OF THE MURGHAB RIVER (SOUTHERN TURKMENISTAN)**

**Contribution format:** Oral  
**Contribution authors:** Barbara Cerasetti (FU Berlin | ISMEO Rome)

Since ancient times, Central Asia has been affected by profound climate changes. The consequent radical transformations of the territory by human beings to survive have strongly endangered the delicate ecosystem of these geographical areas, often with catastrophic effects. During the 3rd - 2nd millennium BCE, urbanization extensively modified and deeply influenced the local environment of vast water systems. A specific aspect of this phenomenon deserves to be taken into consideration, i.e., the resulting settlement pattern after the “distribution” of territories between Greater Khorasan Civilization and Andronovo-related populations in the alluvial fan of the Murghab River (southern Turkmenistan). In particular, how the spatial interaction (intra/off-site) between these two cultures has been deeply influenced by the difficult adaptation of the techniques, known at that time, to the exploitation of water and primary resources. The investigation of the multicultural and multifunctional system of Togolok, and the excavation of a long-lived site such as Togolok 1, within the surrounding environment and the ancient water system, could give decisive answers to some of the numerous and unresolved questions that still characterize the Margiana of the Bronze Age.

**370. THE ROLE OF THE ENVIRONMENT IN CHANGING HUMAN DIETS: NEW INSIGHTS FROM ZOOARCHAEOLOGICAL ANALYSES IN HOLOCENE EASTERN AUSTRALIA**

**Contribution format:** Oral  
**Contribution authors:** Loukas Koungoulos – Jane Balme (University of Western Australia) – Sue O’Connor (Australian National University)

The Holocene in Australia has been characterized as a period of dramatic cultural transformation, the impacts of which are widely reflected in the continent's archaeological record. Amongst models aiming to explain these changes, environmental and ecological factors are commonly invoked as causative factors in triggering the transformation of Australian Aboriginal social, technological, and economic organisation. However, these factors are often only vaguely or broadly applied, and though plausible, possible agents of change such as fluctuating temperature and rainfall mostly remain uncritically linked to changes in human culture. To more directly consider whether human diets during the Holocene were influenced by changing environments or ecologies, we present the results of our original zooarchaeological analysis of three key archaeological rockshelter sites in eastern Australia - Curracurrang, Graman, and Gatton - which are representative of regional changes in human diets over the last 6500 years. We examine the evidence for changing environmental conditions and consider how these may have influenced the human communities of each region. In turn, we assess how closely observed changes in the animal diet of people at each site resemble predictions made from models of environmental change based on other palaeoenvironmental data. We find that dietary change is highly regionally structured, rather than broadly continental. Developments in coastal environments occur along a totally different trajectory to inland ones, with further differences observed between inland settings situated in different biomes. Moreover, evidence for causes of change is generally equivocal, with no one outstanding factor responsible in a given context. Our results attest to the complexity of Holocene cultural developments in Australia and their relationship to environmental conditions, and prompt reconsideration of the evidence base for larger synthetic models of subsistence change occurring on a continental basis.

**2444. AT THE EDGE OF CHANGE: ENVIRONMENTAL GRADIENTS AND SOCIAL COMPLEXITY IN AN URNFIELD CULTURE CEMETERY AT THE MAIN-SPESSART INTERFACE**

**Contribution format:** Oral  
**Contribution authors:** Chiara Girotto (LMU Munich)

Every complex system is directly influenced by its environment, with humanity often considered the prime example of a complex adaptive system. Living continuously on the edge, human societies manage resource systems, generate ecological niches, and adapt their technological complexity to meet environmental challenges. Human-environment interactions are therefore a pivotal aspect of social change – especially in transitory, nodal spaces where environmental gradients can create and highlight aspects that might be easily overlooked elsewhere. This paper explores the relationship between environmental conditions and social complexity through a detailed archaeological and osteological study of an Urnfield Culture cemetery in Lower Franconia (Bavaria and Hesse, Germany). The region is unique, as it not only documents shifting preferences in material culture and burial customs but represents the meeting point of the larger Eastern and Western Urnfield Culture horizons. Even on a more local scale, the chosen site sits at the intersection of several regionalized material technocomplexes and highlights the shifting burial customs of the period. The site is positioned at the convergence of three distinct ecological zones: the agriculturally unsuitable Spessart woodlands, the extensive water networks of the lower Main region, and tracts of highly fertile soils. This unique geographical positioning allows us to examine how communities leveraged diverse resource zones and how differential access to resources potentially catalyzed social stratification. The paper presents a preliminary analysis combining comprehensive environmental modeling with regional analysis of spatial and material culture patterns. By integrating these with archaeological and osteological studies of individuals who occupied this space, we deepen our understanding of how environmental factors can shape and accelerate social differentiation in prehistoric societies, particularly at zones of ecological transition.

**1613. LATE IRON AGE COMMUNITIES IN CENTRAL DOBRUJA (ROMANIA): BIOARCHEOLOGICAL INDICATORS FOR HUMAN–ENVIRONMENTAL INTERACTIONS IN THE HELLENISTIC SETTLEMENTS OF MEDGIDIA**

**Contribution format:** Oral  
**Contribution authors:** Eliza Cretu – Margareta Stanc – Mihaela Danu (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology) – Petre Colțeanu (The National Museum of History and Archaeology Constanța) – Paul Donciu – Eduard Cornia – Luminița Bejenaru (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology)

The Late Iron Age settlements studied in this work, named Medgidia Hellenistic 1, 2 and 3, date to the 4th-3rd centuries BC, a span time known as the Hellenistic period for the Dobrujan area. These sites, located in Medgidia (Constanta County, Romania), were excavated during 2022-2024 resulting over 600 archaeological contexts, such as domestic or supply pits, ceramic kilns, dwellings or various types of facilities. The research area is located on the edge of an ancient commercial road, halfway between the shore of the Black Sea (area under the influence of West-Pontic Greek colonies) and the Danube River, at the western end of the Karasu Valley, a navigable channel in antiquity. It is worth mentioning the attestation, for the first time, starting with the 4th century BC, of the presence of a North Pontic (Scythian) population in the central Dobruja area. Phytolith analysis provided valuable insights into local plant use and vegetation dynamics, contributing to the reconstruction of agricultural practices, dietary habits, and environmental management strategies. Archaeozoological analysis is focused on anatomical and taxonomic identifications, age and sex estimations, osteometry, taphonomic evaluation. The faunal samples consists of skeletal remains, almost all attributed to mammals and few to fish. Domestic mammals dominate, and the most prevalent species are cattle, sheep/goat, and horse. Additional remains included dog and pig. Identified wild mammals are hare and red deer. Archaeozoological analysis attests that animal husbandry was very important to the local economy. The mixed exploitation strategy applied to cattle and sheep/goat targeted to obtain meat, milk, and wool, as it is revealed by the analysis of animal selection at slaughter by age and sex.

**1119. LATEST NEOLITHIC IN THE EBRO VALLEY (NORTHEASTERN SPAIN): STATE OF THE ART AND NEW PALAEOENVIRONMENTAL DATA FROM LOS PIOJOS CAVE**

**Contribution format:** Oral  
**Contribution authors:** Carmen Núñez (Departamento de Geología, Universidad del País Vasco/Euskal Herriko Unibertsitatea | Aragosaurus: Recursos Geologicos y Paleoambientes – IUCA, Universidad de Zaragoza) – Julia Galán (Senckenberg Forschungsinstitut und Naturmuseum) – Ximena Pérez-Escamilla (Aragosaurus: Recursos Geologicos y Paleoambientes – IUCA, Universidad de Zaragoza) – Sandra Bañuls-Cardona (Departamento de Prehistoria, Arqueología e Historia Antigua. PREMEDOC. Universidad de Valencia) – Vanessa Villalba-Mouco (Institute of Evolutionary Biology, CSIC-Universitat Pompeu Fabra) – Rafael Laborda-Lorente (Centro de Espeleología de Aragón (C.E.A))

The Neolithic site of Los Piojos is a small cave located in Ricla (Zaragoza, Spain), on the southern flank of the Ebro River, northeast of the Iberian Peninsula. Its sedimentary infill (85 cm depth) is divided in three levels, with an

age of 5084-4903 cal. BP (ending Northgrippian) for the intermediate one. The site has provided interesting archaeological record, remarkably human remains and tools that evidence the sepulchral use of the cave from the late Neolithic. The use of the caves as burial sites is usual in the late Neolithic of the northeastern Iberian Peninsula. This moment is of particular importance due to the cultural and social changes related to the climatic fluctuations of the Holocene, specifically the 4.2 ky event, and the previous Northgrippian Neoglaciation. In this context, the Ebro Valley provides an interesting source of palaeoenvironmental information thanks to the numerous archaeological sites and to its geographic particularities, as it is influenced by both Atlantic and Mediterranean climates. Despite these facts, no deep analysis of the small vertebrate communities of the archaeological sites in the area have been performed yet. Here we present the first data of the small vertebrates of Los Piojos, revealing an assemblage interestingly dominated by open humid habitats and woodland preferences, which contrasts with the general aridity described for this moment. These results highlight the need of more multi-proxy climatic analysis in the area, a project in which this team is currently involved.

**2114. BRONZE AGE HUMAN OCCUPATION AND ENVIRONMENTAL RECONSTRUCTION OF COVA DES RIUETS (FORMENTERA, BALEARIC ISLANDS)**

**Contribution format:** Oral  
**Contribution authors:** Sandra Cardona (university of valencia | Iphes-Cerca | urv) – Damià Ramis (Societat d’Història Natural de les Balears (SHNB)) – Josep López Garí – Ricard Marlasca Martín (Posidonia S.L.)

Studies on the earliest human occupations in the Balearic Islands are of great interest since the available data are scarce. This is what makes the study of Cova des Riuets significant, with an occupation during the Bronze Age (2109-1774 cal BC). The diversity of micromammals is low (three species of bats and three of rodents). Among them, *Apodemus sylvaticus* is the most abundant (67.3%). Additionally, one of the most significant discoveries of this study is the identification of *Mus spretus* (18.4%), representing the first recorded occurrence of this rodent in Formentera. The paleoenvironmental analysis suggests a landscape dominated by extensive wooded areas (Wo 87%). From a climatic perspective, the data suggest a typically Mediterranean environment, associated with *Mus spretus* and *Miniopterus schreibersii*, while species such as *Rhinolophus ferrumequinum* an. *Rhinolophus euryale*. show Eurosiberian preferences with some tolerance to Mediterranean climates. However, the predominance of *Apodemus sylvaticus*, a generalist species, points to a Mediterranean ecosystem in which different ecological niches coexisted in balance. To analyze the type of occupation, we applied the mesowear technique on *A. sylvaticus*. We used this species because it is a generalist that adjusts its diet according to seasonal food availability. Statistical results indicate that the accumulation of micromammals in the cavity always occurs during the same climatic period, specifically suggesting a temperate climate, as we recorded low wear. These conditions favored a greater variety of foods, which are known to cause lower dental abrasion. Additionally, the homogeneous size of the teeth indicates that the cave was vacated during very short periods. It is likely that the inhabitants of this cave took advantage of these moments to move their herds to other grazing areas, temporarily abandoning the cave and allowing birds of prey to use it as a hunting site.

**1142. WHAT CAN FOSSIL BATS REVEAL ABOUT ANCIENT HUMAN POPULATIONS AND THEIR LIVING ENVIRONMENTS?**

**Contribution format:** Oral  
**Contribution authors:** Julia Galán García (Senckenberg Forschungsinstitut und Naturmuseum, Abteilung Messelforschung und Mammalogie)

Small vertebrates like mammals, reptiles, and birds are widely studied in archaeozoology for their insights into past environments and climate. Yet, bats (Chiroptera) are often overlooked, despite comprising over 30% of European mammalian diversity today and being a key component of cave faunas. This work reviews research on Quaternary fossil bats and their potential as proxies in archaeological contexts, focusing on case studies from the Sierra de Atapuerca complex (Burgos, Spain) that I have developed over the last ten years. Fossil bats provide valuable palaeoenvironmental and palaeoclimatic data, as seen in the Lower Pleistocene sequence of Sima del Elefante and the Lower-Middle Pleistocene sequence of Gran Dolina. Notably, they reflect habitat composition on a broader spatial scale than most non-flying vertebrates. Fossil bat assemblages can also provide insights into cave use by both bats and humans. Since certain bat colonies and human occupations were often incompatible, the demographic composition of the taphocenosis in colonial species can reveal seasonal cave use: nursery colonies form in warmer months, while hibernation colonies appear in colder periods. At Gran Dolina, a significant decline in bat populations in the Middle Pleistocene layers coincides with *Myotis myotis* ceasing to use shelters as nursery roosts. Moreover, fossil bats can offer insight into large-scale ecosystem shifts. The study of *Myotis blythii* in Western Europe—the earliest clear evidence of its presence in the area being reported at El Mirador, in Sierra de Atapuerca—suggests that the species expanded westward at the beginning of the Holocene. This raises the question of whether its expansion was linked to a parallel expansion of open landscapes. These

findings highlight the need to better integrate bats into archaeozoological research to deepen our understanding of human-animal-environment interactions throughout history.

1041. SMALL MAMMALS AS PALEOCLIMATIC AND PALAEOECOLOGICAL PROXIES

**Contribution format:** Oral  
**Contribution authors:** Ivan Rey-Rodriguez (Centro de Investigación Mariña, Universidade de Vigo, MAPAS Lab. | Centro de Investigação em Ciências Geo-Espaciais, Faculty of Sciences,University of Porto) – Graciela Sotelo – Adriana Oliver – Adrián Castro-Insua – Sofía Galván – Sara Gamboa – Marta Matamala-Pagès – Eduardo Méndez-Quintás (Centro de Investigación Mariña, Universidade de Vigo, MAPAS Lab.) – Neftalí Sillero (Centro de Investigação em Ciências Geo-Espaciais, Faculty of Sciences,University of Porto) – Sara Varela (Centro de Investigación Mariña, Universidade de Vigo, MAPAS Lab.)

Small mammals are powerful palaeoecological indicators in archaeological sites, providing key insights into past environmental conditions and climatic changes that influenced human societies. Their climatic specialization—ranging from generalists inhabiting multiple climatic zones to specialists restricted to specific ones—makes them valuable proxies for reconstructing ancient landscapes and refining site chronologies. Using a dataset of 4.231 species (Chiroptera, Eulipotyphla, Lagomorpha, and Rodentia), and integrating climatic zone classifications and phylogenetic data, we analyze global patterns of climatic zone specialization among extant small mammals and the relationship between specialization and species-specific diversification rates. Our results reveal that 39% of small mammals are climatic specialists, with the highest proportions found in tropical and arid zones and a marked decline in colder environments, and that specialists tend to show higher diversification rates. This comprehensive approach allows us to evaluate the utility of small mammals in palaeoclimatic and palaeoenvironmental reconstructions, offering new perspectives on human-environment interactions. Our findings suggest that rodent climatic zone specialists, rather than all small mammals, provide the most reliable proxies for past climates. This study reinforces the significance of small mammals in archaeological contexts, contributing to broader discussions on resilience, adaptation, and environmental change in past human societies.

1595. ANIMAL EXPLOITATION IN THE LATE BRONZE AGE SETTLEMENT OF RECEA MARE “VALEA SULDUBA” (SĂLAJ COUNTY, ROMANIA)

**Contribution format:** Poster  
**Contribution authors:** Eliza Cretu (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology) – Ioan Bejinariu (Zalău County Museum of History and Art) – Luminița Bejenaru – Simina Stanc (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology)

The settlement, archaeozoologically analyzed here, is located west of the Meseș Mountains, on the high terrace of a Crasna river tributary. The settlement belongs to the Cehăluț-Hajdúbagos cultural group from the Transylvanian Late Bronze Age. So far it is the only settlement of this period in Transylvania that has been archaeologically fully researched (in 2008). The settlement has a compact structure, with eight buildings and numerous pits with various purposes, as well as external fire installations, all on a small area of about 0.35 ha. Two radiocarbon datings, obtained from animal bones, suggest an evolution of the settlement during the first two stages of the Transylvanian Late Bronze. The archaeozoological study aimed at assessing the animal resources and their exploitation strategies through methods such as anatomical and taxonomic identifications, osteometry, age and sex estimations, and taphonomic evaluation. The analyzed sample consists of 338 remains, all attributed to mammals. Domestic mammals predominate (88.3% of the remains), and the identified species are: cattle, sheep/goat, pig, horse, and dog. Wild mammals (11.7%) include red deer, wild boar, hare, roe deer, and wolf. Among the domestic mammals, the most representative species are cattle (40%; generally slaughtered at over 2 years of age), followed by pig (23.02%; mainly slaughtered at 24-26 months and 9-12 months), and sheep/goat (22.26%; slaughtered mainly over 18 months). Taphonomic analysis revealed 116 faunal remains with different marks: 42% of butchering, 27. of gnawing, 27.6% of burning, and 2.6% of processing. The archaeozoological results suggest that the economy of the Recea community was centered on animal husbandry (cattle, pig, and sheep/goat), with hunting serving as a secondary resource to supplement the intake of animal protein.

39 HEARTHES, OVENS AND COOKING SPACES IN THE MEDITERRANEAN FROM THE LATE PREHISTORY TO THE MIDDLE AGES

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** combustion structures, fire, households, domestic spaces, pyroarchaeology,  
**Session organisers:** Maria Carme Belarte (Institut Català d’Arqueologia Clàssica | Institució Catalana de Recerca i Estudis Avançats) – Marta Mateu Sagués (Institut Català d’Arqueologia Clàssica) – Miquel Molist (Universitat Autònoma de Barcelona) – Elisabetta Borgna (Dipartimento di Studi Umanistici e del Patrimonio Culturale, Università di Udine) – Joaquim Sisa-López De Pablo (Universitat Autònoma de Barcelona)

SESSION ABSTRACT

Combustion structures (hearths and ovens) are key features in the domestic spaces of past societies. They are linked to basic daily activities, especially cooking, lighting, or space heating, and their presence largely determines the organisation of daily life. The location of hearths and ovens (inside or outside the house), their different functions and purposes, their relationship with objects and other structures, or their private or public character are matters to be considered in studying households and domestic spaces. Recently, the application of different analytical techniques has made it possible to investigate various issues related to these structures in greater depth, such as construction techniques and materials, fuels and possible associated activities. Without excluding this type of approach, we intend to delve into social or anthropological aspects related to the use of hearths and ovens by comparing them with current or recent societies. Therefore, methodologies such as ethnoarchaeology or historical and documentary studies are welcome, as they provide valuable information on aspects that we cannot always detect archaeologically (use of certain utensils and objects related to cooking, private or collective use of the structures, especially in the case of ovens, etc.). The aim of this session is thus to approach the study of domestic fire installations from different perspectives, focusing particularly on the use of the structures in different geographical areas and over a long period of time.

CONTRIBUTION ABSTRACTS

643. FIRESIDE CHATS: INVESTIGATING FIRE-INSTALLATIONS IN EARLY SEDENTARY FARMING COMMUNITIES AT THE PRE-POTTERY NEOLITHIC SITE OF TELL HALULA (SYRIA)

**Contribution format:** Oral  
**Contribution authors:** Joaquim Sisa-López De Pablo – Anna Bach-Gómez – Adrián Segarra – Miquel Molist (Universitat Autònoma de Barcelona)

Fire installations are key in archaeology for understanding the organization of social spaces in past societies, as they provide valuable insights into domestic activities, production and consumption practices, and the creation of spaces of belonging. During the transition from mobile hunting-gathering to sedentary agricultural strategies, concepts of space changed, with buildings shifting to rectilinear, multi-roomed structures. In this context, hearths and ovens were less frequently placed in communal areas and were instead incorporated within individual architectural units. This change suggests that fire-related activities became more segregated within distinct social units, which, along with other socioeconomic transformations, emphasized the household as a central unit of production and consumption. This presentation aims to explore the technology and interrelations between fire use, social roles, and cultural practices through the analysis of archival excavation data reporting on three distinct morphological types of combustion structures (oven, hearth and excavated fire installation) identified within domestic spaces at the Pre-Pottery Neolithic site of Tell Halula. The construction, location, and use of these fire installations will be examined to investigate the social dynamics of sedentary early agricultural communities.

103. THE STANDARD, THE STRANGE AND THE BEAUTIFUL: CHALCOLITHIC OVENS FROM TELL YUNATSITE, SOUTH BULGARIA

**Contribution format:** Oral  
**Contribution authors:** Kamen Boyadzhiev (National Archaeological Institute with Museu. at the Bulgarian Academy of Sciences)

Tell Yunatsite is one of the largest tell-sites in South Bulgaria. The Chalcolithic layer (according to Bulgarian periodization) spans over most of the 5th millennium BC. The latest Chalcolithic settlement (BI) was excavated over 1/3rd of the tell surface in the 1990s. Recent excavations have concentrated on a smaller area and remains of five building levels have been studied. More than 20 combustion structures were revealed. A high degree of standardization is attested in levels BII – BVI in terms of their construction and dimensions, while some differences are

visible in level BI. Focus of the presentation is on two structures that stand out of this picture. One of them is a partially preserved oven from level BV with structure and shape similar to the standard ones. However, its eastern wall is covered with in incised ornament: an angular meander with two rhombuses in the center. The motif is often found on pottery vessels, especially storage ones, and is also attested on clay models of ovens. However, the representation on a real oven is unique for the Chalcolithic in the area. The second structure is completely different: an oval shallow pit with specific “channels” on both sides, filled with charcoals and ash. Both field observations and ethnographic parallels suggest its use for cooking. The analyses of the ovens at tell Yunatsite show long-lasting tradition and standardization in their construction, probably related to efficient parameters. At the same time, the two outliers provide grounds to speculate over both specific cooking practices, and another aspect of combustion structures: their association with the “symbolic realm” and possible use in domestic rituals.

**1155. SWEATING THE DETAILS: DIGITAL DOCUMENTATION AND RECONSTRUCTION OF COMBUSTION FEATURES FROM 2ND MILLENNIUM BCE KAYMAKÇI, WESTERN ANATOLIA**

**Contribution format:** Oral  
**Contribution authors:** Catherine Scott (Research Center for Anatolian Civilizations, Koç University) – Christina Luke (Koç University)

Combustion features play an important role in many human behaviors, from domestic practices like cooking to social and religious rituals. However, the ubiquity and (supposedly) obvious role of many of these features can lead us to take them for granted or to make assumptions about their function and meaning in the ancient past. This is particularly true of Bronze Age western Anatolia, where these features are often understudied and even the definition of a feature as a hearth, oven, or kiln can be inconsistent. One way to move forward in our understanding of combustion features is to invest in more detailed documentation of these features, which allows us to engage with their complexity through ethnographic comparison, experimental archaeology, and other approaches. Here, we discuss how the use of an innovative born-digital recording system has facilitated the documentation, analysis, and reconstruction of combustion features at the 2nd millennium BCE citadel of Kaymakçı. A technological innovation of this recording system is the use of structure-from-motion (SfM) photogrammetry to record each context and to create fully 3D “context volumes,” digital surrogates of excavated contexts. This system further incentivizes us to approach features as a collection of individual components (contexts) rather than as a single unit. The result is a wealth of digital data and other material that can be used to understand the history and use of important features, including those that may not have been recognized during initial excavation. To demonstrate the value of this approach, we discuss the case of the first combustion feature excavated at Kaymakçı. Though our initial understanding of this feature was poor, subsequent analysis using digital data and comparison to other examples from the past and the present has allowed us to reconstruct a complex construction history that points to the social significance of this otherwise-mundane feature.

**1483. FIRE INSTALLATIONS AND SOCIAL DYNAMICS IN MIDDLE AND EARLY LATE BRONZE AGE GREECE: THE CASE OF TRAPEZA (EASTERN ACHAEA)**

**Contribution format:** Oral  
**Contribution authors:** Assunta Mercogliano – Elisabetta Borgna (University of Udine)

This paper investigates the social and economic significance of fire installations and cooking facilities in domestic contexts of Middle and early Late Helladic (2100-1600 BCE) settlements in Greece, focusing on the Trapeza village (Eastern Achaea), where the presence of multiple fire installations—including both simple and built hearths as well as an oven—within a multi-phased building sequence, suggests a pattern of food processing and consumption deeply embedded in communal life. The redundancy of fire installations, documented in well-known Helladic settlements such as Lerna, Asine and Eutresis, often accompanied by evidence of small-scale household storage, reflects a broad ideology centred on the transformation of staple goods and the preparation of foods. These facilities likely functioned not only for subsistence on the household level but also favoured social participation in practices such as hospitality and communal consumption, thus playing a crucial role in structuring economic practices and reinforcing social bonds. The evidence from the Trapeza settlement supports the idea that domestic installations held symbolic meaning, serving to maintain community cohesion while also mediating social and economic relationships. By comparing these features with similar installations in contemporary settlements, this paper contributes to a broader discussion on the role of subsistence economies in shaping the social organization of Middle Helladic and early Late Helladic communities.

**1205. DWELLING AROUND THE FIRE IN MBA/EARLY LBA SARDINIA: THE CASE OF GRUTT’I ACQUA/ SANT’ANTIOCO**

**Contribution format:** Oral  
**Contribution authors:** Marie Usadel – Constance Von Rüden – Alexander Klein (Ruhr University Bochum)

Radiating heat, spreading light and disseminating smell hearths can be surely considered as a sensual focus of a household or an even larger community. While there is substantial evidence for hearths and ovens in Sardinia during the Late and Final Bronze Age, findings from the Middle Bronze Age corresponding to the crucial formation phase of the so-called Nuragic material culture are comparatively limited. Recent excavations on the islet of Sant’Antioco have yielded centrally located hearths in the elongated and relatively large ‘capanne’ of this phase. Their material relation to other installations such as benches or grinding zones show that this domestic assemblage clearly differs in their internal organization from the later examples suggesting a distinct daily routines. Furthermore, hearths and fireplaces are not exclusively found in converted spaces; they also serve as a focal point in prominent areas primarily characterized by the presence of natural rocks and boulders. The objective of this study is to provide a comparative analysis of the hearths found in various archaeological contexts. It seeks to elucidate the extent to which these hearths functioned as sensual focal points and communal gathering spaces in these early-stage communities and to analyse their potential role as catalysts for community-building processes.

**543. FIRE INSTALLATIONS AND COMMUNAL ACTIVITIES IN BRONZE AGE LAGOON SETTLEMENTS: TWO CASES FROM THE ADRIATIC SHORES**

**Contribution format:** Oral  
**Contribution authors:** Elisabetta Borgna (University of Udine) – Giulia Recchia – Alberto Cazzella (University of Rome “La Sapienza”) – Susi Corazza – Assunta Mercogliano (University of Udine)

In this paper we intend to address the analysis of functional areas provided with fire installations in Bronze Age settlements by adopting a diachronic perspective and a comparative approach. The study is based on some relevant contexts from two coeval long-term sites of Bronze Age Italy, well comparable for their environmental layout as well as for their strategic position in the maritime connectivity of MBA / LBA Adriatic. The start of a joint project shared by the Universities of Udine and Roma La Sapienza, focusing on sustainability of life in the lagoonal environments of the Adriatic shores, provides the opportunity to implement with additional data the research on the sites of Ca’ Baredi/Canale Anfora in northern Adriatic and Coppa Nevigata in the Tavoliere region, SE Italy, well-known in the international archaeological literature. In both settlements many fire installations including several types of hearths and ovens - which have been already commented on in some devoted publications- are mainly concentrated in specific communal areas where various subsistence practices were carried out. Transformations in size, volume, building and firing technique of the installations and variability of material culture over time suggest that the role played by these areas shifted from food processing collectively performed by various domestic units to resource exploitation in the framework of symbolic and/or specialized activities carried out on a public scale. On the present occasion we intend to explore the social dimension of this transformation. Diagnostic markers of different activities within the spatial and material layouts will be singled out. The symbolic significance of social practices indicated by definite structured deposits related to food preparation and consumption will be analysed in detail.

**815. FROM COOKING TO SOCIAL FUNCTIONS. STUDYING COMBUSTION STRUCTURES IN IRON AGE WESTERN MEDITERRANEAN WITH ETHNOARCHAEOLOGY AND EXPERIMENTATION**

**Contribution format:** Oral  
**Contribution authors:** Maria Carme Belarte (Institut Català d’Arqueologia Clàssica | Institució Catalana de Recerca i Estudis Avançats) – Maria Anguera – Marta Mateu (Institut Català d’Arqueologia Clàssica) – María Pastor Quiles (Universitat d’Alacant)

Combustion structures documented in protohistoric settlements are considered to be defining elements of domestic spaces. In the case of the Mediterranean coast of the Iberian Peninsula during the Iron Age, most of the spaces with a hearth are attributed with culinary functions. The presence of more than one hearth in some cases may indicate that these were multifunctional spaces, where one of the hearths would have been used for cooking, and other(s) could be used for lighting or heating, or even for craft activities. The coexistence of hearths of different morphology seems to confirm this hypothesis. Other usual combustion structures in Iron Age settlements are ovens, related to bread making. Although they can be located inside the houses, they are often in open spaces or in buildings with differentiating features. This suggests a possible collective use for them. The observation of ethnographic cases can provide useful data for interpreting the functions and forms of use of these structures. In our case, we have carried out an ethnoarchaeological study of the uses of traditional ovens in the Rif region of Morocco, that (from a morphological perspective) are similar to protohistoric structures in Iberia. We have recorded the uses and functions of the ovens, where the role of women in the construction, use and maintenance of these structures stands out, as well as the function of these combustion features as points of collective meeting. This research has been completed with experimental work, in which the shape of the ovens in the Rif area has been replicated, as well as the specific way of bread preparation, filling the oven with fuel, and bread baking. Using these approaches to the study of fire installations we intend to gain a broader and more complete perspective for the study of their use in the past.

778. CLAY AND FIRE: UNVEILING DOMESTIC SPACES, HEARTHES, AND OVENS IN THE IRON AGE SETTLEMENT OF NADIN-GRADINA, NORTHERN DALMATIA (CROATIA)

**Contribution format:** Oral  
**Contribution authors:** Martina Celhar (Department of Archaeology, University of Zadar) – Gregory Zaro (Anthropology Department, University of Maine | Climate Change Institute, University of Maine)

Nadin-Gradina is located centrally in Ravni Kotari (Northern Dalmatia, Croatia) and was one of the largest and most distinctive hillforts during the Iron Age, having also undergone significant transformation into a Roman municipium (Nedinum) by the first century CE. The investigation confirmed a continuous occupational history that spanned more than 1,500 years, from the late 11th or 10th century BCE until the end of 6th century CE. Despite complicated depositional sequences, Iron Age architecture is remarkably well preserved. One of the most significant discoveries to come from this work is the preservation of deeply buried Iron Age domestic architecture with numerous documented cooking spaces that included hearths and ovens. From about the 9th to the 2nd centuries BCE, these domestic complexes are characterized by relatively large architectural units defined by compacted clay surfaces and (eventually) dry stone alignments. Our excavation exposed two of these structures, separated from each other by a narrow north/south passage and flanked to their south by a wider east/west street. Although these individual structures clearly underwent multiple renovations over the course of centuries, they did so while utilizing their same locations, dimensions, and similar patterns of internal spatial organization throughout much of the Iron Age. The northern parts of the structures were regularly reserved for storage purposes, whereas the southern parts were designed for more active domestic activities, including kitchen areas and other living spaces. This presentation addresses the physical manifestation and location of hearths and ovens, the continuity of organization of domestic (and cooking) areas through time, and their relationship with objects and other structures during the Iron Age. It also introduces such features documented for the subsequent Roman period at the Nadin-Gradina site.

321. CONTEXTUAL ANALOGIES: INTERPRETING FIRE INSTALLATIONS OF EARLY ISLAMIC PALESTINE (7TH-11TH CENTURY CE)

**Contribution format:** Oral  
**Contribution authors:** Hagit Nol (Goethe University Frankfurt)

Archaeologists employ analogies for the interpretation of objects and features. They compare the archaeological finds with the material culture of modern societies, often pre-industrial ones (ethno-archaeology), and with information found in texts or art. Such analogies have been criticized in the past as too simplistic. This paper offers one method of analogy which might overcome the critique by using the Big Data approach: multiple sources are analyzed within their own contexts and through various sets of research questions, and the results and interpretations of these analyses are then contrasted. The case study to demonstrate the method is fire installations. First, features dated to early Islam (7th to 11th century) in archaeological sites of one region in central Israel are analyzed through spatial methods. The research focuses on adjacent artefacts, raw materials or installations which imply the function of these installations. Second, ovens, hearths and furnaces are searched in the written sources of that period, reflecting their functions as well as their name and possible form. Third, the use of fire in modern societies in the Middle East is observed, with a special attention to the remains it might leave for future archaeologists. Comparing the results of the three corpuses suggests a new interpretation for domestic baking and cooking in archaeology – in the research area and probably beyond.

1716. ON THE USE OF THE TONIR AT THE ARUCH SITE (REPUBLIC OF ARMENIA): AN ETHNO-ARCHAEOLOGICAL ANALYSIS

**Contribution format:** Oral  
**Contribution authors:** Elena Fausti (Università Sapienza di Roma) – Francesca Galanti (Università degli studi Roma Tre) – Sergio Ferdinandi (ISMEO)

The medieval site of Aruch represents an exceptional context for the study of traditional Armenian ovens, called tonir, attested in large quantities and of different types. The unpublished results of this recent excavation conducted by the ISMEO - International Association for Mediterranean Studies in collaboration with the IAE NAS RA - Institute of Archaeology and Ethnography of the National Academy of Sciences of the Republic of Armenia have made it possible to investigate various aspects related to these structures, such as the construction methods and materials used, but also the types of domestic activities associated with them. The study of tonirs was complemented by delving into the social and anthropological aspects related to the use of these ovens in contemporary Armenian communities. Direct interaction with the local community provided valuable information on aspects that cannot always be detected archaeologically, such as traditions related to food preparation and the role of these ovens

as a focus of social interaction, both in private and collective contexts. This multidisciplinary approach makes it possible to link archaeological evidence with current practices, offering a deeper understanding of cultural continuity and transformations over time. The study of the Aruch tonirs not only illuminates aspects of medieval daily life, but also contributes to the enhancement of Armenia’s cultural heritage and the preservation of centuries-old traditions.

1608. A SOCIO-ECOLOGICAL INTERPRETATION SYNTHESIS THROUGH COMBUSTION STRUCTURES FROM BRONZE AGE TO MIDDLE AGES IN SOUTHEASTERN IBERIAN PENINSULA

**Contribution format:** Oral  
**Contribution authors:** Mireia Celma Martínez (University of Murcia)

In social and gender archaeology, domestic combustion structures are one of the most valuable assets for understanding the maintenance tasks carried out in each of the domestic units. The singularity or uniformity of their construction, the place they occupy within the household, their maintenance over time, and the woofuel found are some of the variables to be taken into account when analysing these social spaces. The complete recovery of bioarchaeological remains in the interior and the proximity and immediacy of these specialised structures allows us to delve deeper into the human agency. For this reason, the methodology during fieldwork is key, as well as the processes of analysis of samples and subsamples in the laboratory. The decision-making chain from discovery to data processing will be briefly discussed, as this is crucial to guarantee a faithful approximation of past life forms, which can be compared on a large territorial scale, both synchronic and diachronic. A synthesis of all the available results of combustion structures analysed (use, form, space, woodfuel) is presented in order to establish changes and affinities in the diachrony presented by this territory from a critical point of view and with the aim of providing a summary of results that can be compared with other sites within the established chronological framework. Anthracology provides a unique opportunity to compare the uses of these structures and the feeding needs of the hearths, which have more or less intensive maintenance implications in the search for woodfuel. For all this, the most salient cases are presented in depth as a sample of the exploratory possibilities and to support the research hypotheses.

2149. ANALYTICAL AND EXPERIMENTAL STUDY OF THE NEOLITHIC HEATED STONES FIRE STRUCTURES OF THE LOUVIERS SITE EURE FRANCE

**Contribution format:** Poster  
**Contribution authors:** Ramiro March – Cecilia de March (Umr Creaah 6566 CNRS) – Vincent Dartois (MADE Eure et loire France) – Loic Gaudin – David Aoustin (Umr Creaah 6566 CNRS) – Quentin Broderie (MADE Eure et loire France)

The heating structures of North-West France have very special characteristics in relation to the use of these stone materials and have often created difficulties in defining their functions. This poster will present a recent analytical and experimental exploration study carried out on two combustion structures from the ancient and middle Neolithic Louviers site (Eure- France), based on an analytical and experimental approach of the different types of proxies (anthracological, mineralogical palynological, sedimentary and biogeochemical isotopic lipids data and physicochemical analyses) carried out to understand the modes of functioning and the possible functions of this kind of estimate as theoretical domestic cooking structure. following the approaches practiced from preventive archaeology. The objective is to present our results , questions and innovant methodological approaches to answer the different question related to the use and functions of this kind of structures . Problematics that be part of our Neolithic fire structures studies that we practice at the UMR 6566 Creaah of CNRS.

41 MAKING A WARRIOR: THE SOCIAL IMPLICATIONS OF MARTIAL IDEOLOGIES IN THE PAST

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Discussion session  
**Session keywords:** Warrior identities, Martial ideologies, Identities, Intersectional approaches  
**Session organisers:** Marianne Moen (Museum of Cultural History, University of Oslo) – Ben Raffield (University of Uppsala)

SESSION ABSTRACT

This session seeks to critically reappraise and explore warrior institutions and warriorhood in archaeological interpretation. We welcome perspectives from all regions/periods and seek open discussions around concepts of warriorhood and more. Papers are sought that address the need to situate ‘warriors’, warrior groups, and warrior

ideologies within a wider cultural and social setting, examining their place within and impact upon their societies and environments, as well as perspectives that seek to query modern investment in archaeological concepts of warriorhood. We welcome a broad range of theories from archaeology, literary scholarship, the history of religions, and the social sciences, along with perspectives from intersectional theory and concepts of relational personhood. Papers that critically examine established notions of warriorhood are especially welcome. We aim to untangle the perceived identities of warriors, and to create new understandings of the wider social frameworks of a martial culture. Key subjects that we would particularly like to explore are themes connected to: Defining warrior status and warriorhood: What is understood by the term ‘warrior’? Who could become a warrior and how. Warrior identities: Intersectional approaches to the social construct of the warrior. What types of intra- and inter-group relationships existed within warrior societies? How did religious and aesthetic aspects of identity construction play out among warriors in the past. Martial identities in a wider perspective: We seek to explore the theoretical and analytical frameworks for understanding martial identities. What can be said of relational perspectives in regard to the diversity of roles of warrior groups within society? How do warrior identities and ideologies play out at home and abroad? What about landscapes of power, conflict, and control. Archaeological interest in warriors: addressing the role of modern biases in constructions of the past. As an interdisciplinary session, we appreciate contributions from a variety of viewpoints and disciplines.

CONTRIBUTION ABSTRACTS

74. THE VIKING AGE RUS’: A PARADOX OF WARRIOR-MERCHANTS

**Contribution format:** Oral  
**Contribution authors:** Csete Katona (Adjunct, Institute of History, University of Debrecen)

Recent archaeological and historical studies of early medieval Scandinavian warrior groups—particularly the Viking Great Army active in Anglo-Saxon England and comparable warbands in Frankia—have highlighted the intricate relationship between violence and “peaceful” trade within the operational strategies of these groups. However, research into the eastern sphere of the Viking diaspora, especially concerning the Rus’, remains underdeveloped. This paper seeks to address this gap by examining the interplay between warfare and trade among the Rus’, drawing on contemporary written sources and selected archaeological evidence. It argues that portraying the Rus’ lifestyle as predominantly trade-focused, in contrast to the traditional “Viking” emphasis on raiding, overlooks the inseparable nature of these activities. For the Rus’, trade and violence were not merely interchangeable tools for wealth acquisition—as well documented in the Western Viking world—but deeply intertwined principles that shaped their way of life and mentality. These dual facets influenced Rus’ behaviour and shaped their perception in the eyes of contemporary partners and adversaries alike. By exploring this theme, the paper offers a comparative lens to better understand Viking Age Scandinavian martial identities and, more broadly, illuminates the complex intersection of peaceful and violent dimensions within the social identities of early medieval warrior groups.

922. PUTTING THE “WAR” BACK IN “WARRIOR”: TRYING TO UNDERSTAND WEAPONS, COMBAT AND MARTIAL PRACTICES IN VIKING AGE DENMARK (600-1200 A.D.)

**Contribution format:** Oral  
**Contribution authors:** Gustav Hejlesen Solberg (National Museum of Denmark | University of Copenhagen | Trelleborg Viking Fortress)

While the study of weapons has been a staple of archaeological research since its inspection, relatively little work has been done to understand their application. Recently, a new wave of Combat Archaeology has put such perspectives into focus. This paper explores the utilization and development of the warrior’s most important equipment, their weapons, in Viking Age Denmark. This is done through Metalwork Wear Analysis, Experimental Archaeology, iconography and written sources. This approach aims to understand the warrior through their martial practices, such as their culturally defined training and fencing styles, and how these develop. This is the exploration of how weapons were held and how the grip is designed, how different axe shapes allow for different attack possibilities and what role experience plays in the use of weapons. Finally, this paper explores the relationship and implication of the study of martial practices to our ideas about warriorhood and warrior-ideology in Viking Age Denmark.

1558. MARTIAL MASCULINITIES: REASSESSING WARRIORHOOD IN EARLY IRON AGE AND ARCHAIC CRETE

**Contribution format:** Oral  
**Contribution authors:** Filippou Roussos (Merton College, University of Oxford)

Warriorhood has frequently served as the principal framework for understanding masculine identities in the archaeology of the Early Iron Age Aegean (11th–6th centuries BC). However, in the absence of a dedicated

gender-oriented approach, this perspective has seldom undergone critical examination in relevant scholarship. This contribution seeks to address this gap by exploring the construction of masculinity on the island of Crete through the lens of martial ideology and warrior identity, with particular attention to shifting modes of expression in the transition from the Early Iron Age to the Archaic period. Drawing on archaeological evidence—primarily from major cemeteries across the island, including Knossos, Eleutherna, Prinias, and Kavousi—I investigate how and to what extent martial masculine ideals manifested within the cultural milieu of early Cretan communities. Emphasis is placed on assessing material culture conventionally associated with warfare, such as weapons, and its perceived role in identifying warriors in the archaeological record. At the same time, I foreground artefacts and practices that have traditionally been excluded from the male experience and set in contrast to ideals of warriorhood. Related figurative imagery across various small- and large-scale media—such as pottery, sculpture, and metalwork—provides valuable insights into differing yet often coexisting masculine ideologies on the island. By situating warriorhood at the intersection of gender and social status, I explore how these constructs were visually and materially embodied, contributing to collective memory and social cohesion, as well as to self-representation and individuality. This paper also critically engages with modern perceptions of martial masculinity in archaeological narratives. It reflects throughout on the impact of past and contemporary gender norms on the interpretation of Cretan warrior identities both in scholarly discourse and the narratives presented by regional museums in Crete.

42 DECODING TIME: A TRANSDISCIPLINARY APPROACH TO ADDRESS COMPLEX PALEOLITHIC CONTEXTS

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Transdisciplinary analyses, Multitemporal approach, Palimpsest dissection, Settlement dynamics, Mobility, Seasonality  
**Session organisers:** Valentina Lubrano (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB)) – Maria Joana Gabucio (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV)) – Vincenzo Spagnolo (Dipartimento di Scienze fisiche, della Terra e dell’Ambiente, Università degli Studi di Siena) – Anna Rufá (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB) | PACEA-UMR 5199, CNRS, Université de Bordeaux, MCC)

SESSION ABSTRACT

A key challenge in Paleolithic contexts is the complexity of identifying time lapses. The archaeological record often resembles a palimpsest, where traces of multiple human and natural occupations overlap, complicating reconstructing sedimentological histories. Time in archaeology is multidimensional and cannot be understood through a single discipline or technique. It demands a transdisciplinary approach that integrates insights from a range of fields and time scales. Our session stresses how a transdisciplinary approach is essential for accurately interpreting Paleolithic contexts. Each discipline contributes to reconstructing a comprehensive picture, and their dialectical integration is key to addressing the complexity of the archaeological record. Lithic technology and usewear are closely tied to a range of behavioral chains (selection of raw materials, characterization of production sequences, tool use), the lithics reflect settling and mobility strategies. Zooarchaeology and taphonomy reveal hunting patterns, resource exploitation, and types of occupation and provide insights into subsistence activities. The analysis of micro- and meso-wear contributes to understanding seasonality and mortality within an occupation context. The geostatistical analysis of these data, combined with RMU and refit approach, helps to interpret the taphonomy of the site (palimpsests dissection) and the organization of living spaces. Sedimentological analysis adds another layer of detail, clarifying the processes of site formation and transformation, while precise dating allows these events to be anchored to a defined temporal scale. The transdisciplinary approach allows us to address questions such as the type and duration of occupations, seasonal alternation, and mobility patterns. Additionally, it enables the exploration of variability in subsistence patterns and the dynamics of continuity and change in the strategies adopted by Paleolithic societies. To this end, our session aims to promote an integrated transdisciplinary and multiscalar approach that will optimize our understanding of the complex archaeological timeframes and, consequently, the societies of the Paleolithic.

890. TAPHONOMIC ANALYSIS OF THE FAUNAL ASSEMBLAGE FROM SUBLEVEL TD10.4 (GRAN DOLINA, ATAPUERCA, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Javier Villalobos (IPHES | URV) – Palmira Saladié (IPHES | URV | CSIC Madrid) – Antonio Rodríguez-Hidalgo (CSIC Mérida | IPHES)

The analysis of faunal remains from a taphonomic perspective provides crucial insights into site formation processes and stratigraphic sequences, enabling inferences about past biotic and abiotic dynamics. Faunal assemblages are typically accumulated and modified through the interaction of multiple agents and physical processes. One such case is the faunal assemblage recovered from sublevel TD10.4. Sublevel TD10.4 is the oldest of the four subunits comprising level TD10 at the Gran Dolina site, located in the Sierra de Atapuerca (Burgos, Spain), dated to the Middle Pleistocene (400–450 ka). A comprehensive taphonomic analysis was conducted, encompassing the taxonomic and anatomical composition of the assemblage, mortality profiles, skeletal element representation and preservation patterns, fracturing processes, as well as the nature and distribution of taphonomic modifications observed on bone surfaces. The primary processes influencing the formation of the assemblage occurred predominantly during the subaerial and diagenetic phases, with diagenetic alterations being particularly significant. The karstic conditions of the cavity led to multiple post-depositional modifications affecting the bone surfaces. These alterations significantly transformed the original characteristics of the assemblage and likely influenced the differential preservation of skeletal elements. Such post-depositional processes impose limitations on the interpretation of the assemblage’s formation history. Diagenetic transformations within the cave appear to have played a more determining role than biotic agents. The results indicate the involvement of carnivores of varying sizes during the carcass consumption phase, contributing to both the accumulation and transport of remains. Despite the presence of lithic tools within the sublevel, no direct evidence of anthropogenic activity was identified. This study provides valuable data on the formation processes of Palaeolithic faunal assemblages, particularly in contexts where hominin or carnivore involvement was scarce. Furthermore, these findings contribute to a more comprehensive understanding of the taphonomic complexity of level TD10 within the broader Gran Dolina stratigraphic sequence.

304. HOW DO THE CHARACTERISTICS OF THE SEDIMENTARY MATRIX INFLUENCE THE CLEANING OUTCOME OF ARCHAEOLOGICAL BONES?

**Contribution format:** Oral  
**Contribution authors:** Noé Valtierra (Institut Català de Paleoecologia Humana i Evolució Social | Universitat Rovira i Virgili) – Andrea Díaz-Cortés (Smithsonian’s Museum Conservation Institute) – Héctor Del Valle (Institut Català de Paleoecologia Humana i Evolució Social | Universitat Rovira i Virgili) – Antoine Souron (Université de Bordeaux, CNRS, PACEA UMR 5199) – Miguel Ángel Moreno-Ibáñez (School of History, Classics and Archaeology, University of Edinburgh) – David Martín-Perea (Universidad Complutense de Madrid) – Éric Pubert – Nicolas Vanderesse (Université de Bordeaux, CNRS, PACEA UMR 5199) – Lucía López-Polín (Institut Català de Paleoecologia Humana i Evolució Social | Universitat Rovira i Virgili) – Lloyd Courtenay (Université de Bordeaux, CNRS, PACEA UMR 5199 | Universitat Rovira i Virgili)

Cleaning treatments play an important role in removing sedimentary matrices, enabling the study of archaeological and paleontological bones. These procedures must be carefully adapted to achieve a balance between effective cleaning and minimising the potential impact of the tools employed. The interaction between the tools and bone surfaces can lead to trephic modifications, which should be minimised and thoroughly documented to improve conservation and research outcomes. The effects of cleaning treatments depend not only on the state of bone preservation but also on the nature of the sedimentary matrix and its interaction with the surfaces of the specimens. These factors significantly influence the choice of cleaning methods, tools selection, and even their application. Such decisions, in turn, determine the type and extent of modification caused by the tools. In this study, we analyse samples from three archaeological sites in Spain: Gran Dolina and Galería (Sierra de Atapuerca, Burgos) and Roc de les Orenetes (Queralbs, Girona). The research explores the interplay between three key factors -sedimentary matrix, bone material, and the contact interface - through their study using histology analysis by optical microscopy and scanning electron microscopy, Micro-Computed Tomography (μCT), infrared spectroscopy and X-ray diffracction. While all three sites present bones embedded in concretions, their characteristics differ significantly. The Sierra de Atapuerca sites exhibit strongly adhering concretions, whereas Roc de les Orenetes presents a matrix that, although easier to clean, entirely embeds the specimens. Consequently, the cleaning methods employed, and the modifications produced varied considerably. As a result of this work, it has

been possible to relate differences in the characteristics of the three included sites to variations in the level of modification documented following the application of cleaning treatments. These results contribute to our understanding of the interactions that occur during cleaning and the formation of trephic modifications.

1763. THE ROLE OF THE SCAVENGERS IN THE CAMPSITES: A NEOTAPHONOMIC PROXY TO UNDERSTAND THE HUMAN OCCUPATIONS

**Contribution format:** Oral  
**Contribution authors:** Jordi Rosell – Arnaud Barat – Rubén Llorente-Pérez – Daniel Vivar-Ríos – Maite Arilla – Ruth Blasco (Institut Català de Paleoecologia Humana I Evolució Social (IPHES-CERCA | Àrea de Prehistòria, Universitat Rovira I Virgili (URV))

The prevailing paradigm asserts that prehistoric sites can reflect the entire spectrum of occupational patterns, ranging from short-term occupations by small groups to long-term settlements by larger communities. However, most Middle Palaeolithic assemblages consist of multiple overlapped occupational events that are difficult to disentangle precisely, making their classification challenging. Moreover, current methodologies have yet to identify a specific element—or combination of elements—that allows for unequivocal differentiation between these occupational scenarios. In this study, we analyse archaeological assemblages from several Middle Palaeolithic sites in Western Europe through a zooarchaeological perspective. Despite site-specific variables such as geological, geomorphological, sedimentological, and ecological contexts, most assemblages display strikingly similar characteristics, particularly regarding skeletal profile composition, the representation of bone portions and the spatial dispersal. Based on neotaphonomic studies of modern wild carnivores, we propose that scavenger activity may have played a significant role in shaping the observed uniformity in Middle Palaeolithic zooarchaeological assemblages. While this phenomenon has been acknowledged in the scientific literature, it remains understudied and is not sufficiently integrated into interpretations of site occupation patterns. We argue that considering carnivore scavenging behaviours in human occupation sites is crucial to avoiding misleading inferences about past settlement dynamics.

1626. TAPHONOMIC INSIGHTS FROM QUATERNARY IBERIAN LYNX COPROLITES: IMPLICATIONS FOR PLEISTOCENE BONE ACCUMULATIONS

**Contribution format:** Oral  
**Contribution authors:** Anna Rufà (ICArEHB, Universidade do Algarve | PACEA-UMR5199, Université de Bordeaux/CNRS/MCC) – Montserrat Sanz – Joan Daura (Grup de Recerca del Quaternari (GRQ)-SERP, Universitat de Barcelona)

Pleistocene deposits often result from multiple and overlapping formation processes, making it challenging to identify specific bone-accumulating agents in archaeological contexts. Carnivores play a significant role as bone accumulators, yet distinguishing their contributions remains difficult due to taphonomic biases. Referential studies offer valuable frameworks for interpreting these accumulations, but they are predominantly based on modern collections and may not fully account for the complexities of fossil site formation. This study presents the first taphonomic analysis of fossilized Quaternary Iberian lynx (*Lynx pardinus*) coprolites in a European context. The assemblage, dated to approximately 33 ka BP, originates from layer III of Cova del Gegant (north-eastern Iberian Peninsula), a site interpreted as a lynx den. Building upon previous research, we examine bone remains consumed and excreted by the Iberian lynx to assess its role as a bone accumulator within archaeological settings. Our results align with neo-taphonomic referential studies on lynx accumulations, particularly regarding the dominance of leporid remains. The assemblage exhibits a balanced representation of anatomical elements, with a higher proportion of cranial bones compared to other carnivore accumulations. Taphonomic analysis reveals extensive digestive modifications, with moderate to strong degrees of damage affecting most specimens. These findings enhance our understanding of lynx bone accumulation processes and contribute to broader discussions on carnivore involvement in Pleistocene archaeological sites. Our findings also indicate a dietary consistency between Pleistocene and modern Iberian lynx populations and underscore the importance of incorporating taphonomic data from fossilized coprolites to refine interpretations of carnivore activity in past ecosystems.

508. SHEDDING NEW LIGHT ON THE 18B UNIT OF EL CASTILLO CAVE: REVISITING THE ARCHAEOFAUNAL ASSEMBLAGE

**Contribution format:** Oral  
**Contribution authors:** Natalia Abellán Beltrán (Department of Prehistory and Archaeology (UNED) | International Doctorate School (EIDUNED) | Institute of Evolution in Africa (IDEA)) – Juan Marín-Hernando (Department of Prehistory and Archaeology (UNED) | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Histoire Naturelle de

l’Homme Préhistorique (HNHP, Muséum National d’Histoire Naturelle)) – Jose Manuel Maíllo-Fernández (Department of Prehistory and Archaeology (UNED) | Institute of Evolution in Africa (IDEA))

El Castillo Cave has been a pivotal site for the understanding of European Middle and Upper Palaeolithic and Palaeolithic rock art since its discovery, with a sequence of 23 meters that extends from Early Middle Palaeolithic to Azilian. In that regard, the Quina Mousterian unit 18 of El Castillo Cave still proves to be relevant for the comprehension of Neanderthal behaviour: the hyper specialization in the hunt of red deer (*Cervus elaphus*) exhibited in units 18b and 18c shows adaptative decisions and, possible cultural ones, allowing us to further recognise the great extent of the knowledge these hominins had over their surroundings. Here, we present the preliminary results of the re-study of the complete faunal assemblage of unit 18b to reassess the human-carnivore interaction in this level, the treatment of the carcasses and the different possible hunting strategies carried out by the Neanderthals of the cave, combining traditional taphonomic and zooarchaeological methods with novel ones based on artificial intelligence.

**2005. REINDEER AND NEANDERTHALS ALONG THE SAÔNE-RHÔNE FLUVIAL CORRIDOR: WHAT SUBSISTENCE STRATEGIES AT VERGISSON IV (MIS 4-3, SAÔNE-ET-LOIRE, FRANCE)?**

**Contribution format:** Oral  
**Contribution authors:** Clarisse Chardot (Histoire naturelle des humanités préhistoriques (HNHP - UMR7194), MNHN, CNRS, UPVD | Département de Saône-et-Loire, Musée de Préhistoire de Solutré) – Camille Daujeard (Histoire naturelle des humanités préhistoriques (HNHP - UMR7194), MNHN, CNRS, UPVD) – Pierre Magniez (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA (UMR-7269)) – Marylène Patou-Mathis (Histoire naturelle des humanités préhistoriques (HNHP - UMR7194), MNHN, CNRS, UPVD) – Alain Argant (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA (UMR-7269)) – Guillaume Guérin (Université de Rennes (UMR 7118), Géosciences, CNRS) – Loïc Lebreton (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’Història i Història de l’Art) – Marine Massoulié (AnTET - UMR 7141, Archéologies et Sciences de l’Antiquité, CNRS) – Mathieu Rué (Paléotime, Archéologie des Sociétés Méditerranéennes (UMR 5140), Université Montpellier 3) – Sylvain Soriano (AnTET - UMR 7141, Archéologies et Sciences de l’Antiquité, CNRS)

During the Early and Middle Upper Pleistocene, the Western European climate was marked by a glacial phase (MIS 4), followed by rapid, climatic oscillations (MIS 3), which impacted palaeoecosystems, influenced herbivore mobility, and shaped human settlement patterns. The Saône-Rhône corridor likely recorded north-south migrations of Neanderthals and large herbivores during this period. Vergisson IV, near the right bank of the lower valley of the Saône river Valley, is a critical site for studying Neanderthal subsistence strategies and their relationships with reindeer along this corridor. Excavated by J. Combier (1957-1962) and S. Soriano (2021 & 2023), this narrow karst gallery revealed two archaeological units from the late Middle Palaeolithic (MIS 4-3). Chronology relies on a single 14C measurement, lithic studies, and ongoing OSL dating. The faunal assemblage, comprising around 3,000 faunal total remains, is dominated by reindeer, followed by secondary preys such as horse and large bovids. The carnivore remains are scarce but diverse, including for example cave bear, wolf, artic fox or cave hyena. We have few small mammals, including the Hare. This study demonstrates that Neanderthals were the primary agent of accumulation and carcass processing, with evidence of reindeer, horse, bovines and hare consumption. Skeletal representation and butchery marks suggest that some entire carcasses were brought and processed at the site. Bones damaged by carnivores (around 20%) show mainly small-sized tooth marks and taphonomic signatures which could be attributed to the secondary impact of small-sized carnivores on the assemblage, likely canids. We observe a relative homogeneity of these various activities in both archaeological units. To decipher human and carnivore occupations throughout the sequence, we coupled taphonomic data with microstratigraphic distribution of remains. Our results shed light on the settlement dynamics and territorial organization of the Neanderthals in the northern section of the Rhône corridor in relation with reindeer.

**211. ZOOARCHAEOLOGICAL EVIDENCE AND MULTIDISCIPLINARY PERSPECTIVES ON NEANDERTHAL OCCUPATION DURATION: THE CASE OF TEIXONERES CAVE SUB-UNIT IIIB**

**Contribution format:** Oral  
**Contribution authors:** Valentina Lubrano (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB)) – Anna Rufà (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | PACEA-UMR5199, Univ. Bordeaux, CNRS) – Ruth Blasco (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV)) – Florent Rivals (Institut Català de Paleoecologia Humana i Evolució

Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV) | ICREA) – Jordi Rosell (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV))

When reconstructing Neanderthal behaviour and subsistence strategies, it is important to understand the duration of human occupations at Middle Palaeolithic sites. However, the palimpsest nature of archaeological deposits complicates this analysis, as the overlapping traces of human and carnivore activities blur chronological clarity. This study addresses these challenges by examining faunal remains from sub-Unit IIb of Teixoneres Cave. Located at 760 meters asl near Moià (Barcelona, Spain), Teixoneres Cave holds a nearly six-meter-thick stratigraphic sequence. Sub-Unit IIb, dated to MIS 3 (over 51,000–44,210 cal BP), contains radiocarbon-dated faunal remains documenting human activity. The alternation between human and carnivore occupations offers a unique opportunity to explore site-occupation dynamics. The application of horizontal excavation methods, combined with a multidisciplinary approach, facilitates the reconstruction of the temporal and spatial patterns of occupation. The faunal evidence and insights from previous studies highlight a cycle of short human visits interspersed with carnivore activities. Taking this into account, human activities seem to be concentrated near the entrance, while carnivores predominantly occupy the inner area. Zooarchaeological and taphonomic analyses reveal crucial insights into Neanderthal subsistence strategies, including hunting, butchering, and carcass processing. The findings align with broader patterns observed at other Middle Palaeolithic sites, where factors such as mobility, seasonal variations, and site functionality influenced occupation duration. Moreover, the study emphasizes the challenges of interpreting palimpsest deposits, as overlapping events and post-depositional processes hinder potential interpretations. Positioning Teixoneres Cave within the broader context of Middle Palaeolithic research enhances our understanding of Neanderthal adaptability to dynamic environments and resource use over time.

**1023. SHORT-TERM OR LONG-TERM OCCUPATION? THE LATE MOUSTERIAN SU 14 FROM OSCURUSCIUTO ROCK SHELTER (SOUTHERN ITALY)**

**Contribution format:** Oral  
**Contribution authors:** Vincenzo Spagnolo (Department of Physical Sciences, Earth and Environment, University of Siena | Centro Studi sul Quaternario (CeSQ)) – Jacopo Crezzini (Department of Physical Sciences, Earth and Environment, University of Siena) – Giulia Marciani (Department of Cultural Heritage, University of Bologna) – Francesco Berna (Department of Physical Sciences, Earth and Environment, University of Siena | Department of Archaeology, Simon Fraser University) – Paolo Boscato – Annamaria Ronchitelli – Francesco Boschin (Department of Physical Sciences, Earth and Environment, University of Siena)

Understanding Paleolithic settlement dynamics is a complex task to undertake. The palimpsest effect obscures multiple occupations within a stratigraphic unit, blurring them into a single, indistinct entity. In Paleolithic contexts, the difference between the time it takes for sediments to form and the rhythms and duration of nomadic occupations, further complicates matter, effectively diluting the traces of these occupations within a single opaque horizon. Consequently, identify accurately the “ethnographic time” of each occupation is challenging and requires a robust interdisciplinary approach. The Oscurusciuto rock shelter in southern Italy, with a currently investigated sequence spanning 55-42 thousand years cal BP, offers a unique opportunity to address this challenge, as it contains several intact and well dated living floors and short-term palimpsests constellated by well-preserved hearts. In particular, previous interdisciplinary studies have successfully reconstructed Neanderthal camps life in stratigraphic units (SUs) 13-11. The relative continuity of these occupation patterns, combined with evidence of gradual changes in site organization, suggests a tradition maintained by the same group across generations. This paper focuses on SU 14, a thick tephra unit, accumulated rapidly and containing evidence of a single human occupation during its final stage of accumulation. This context represents both an anomaly (compared to the “normal” palimpsest setting of the other occupational layers) and a unique opportunity to isolate and study a single occupation. This study employs an interdisciplinary approach, integrating zooarchaeology, lithic technology and geostatistics, to determine whether this occupation represents, a short-term or long-term occupation.

**214. A NEW PROJECT AT COVA FORADADA D’OLIVA (VALENCIA, SPAIN). EXPLORING THE MIDDLE AND EARLY UPPER PALAEOLITHIC IN THE MEDITERRANEAN BASIN**

**Contribution format:** Oral  
**Contribution authors:** Aleix Eixea (Universitat de València) – Miguel Ángel Bel (UNIArq–Universidade de Lisboa | Universitat de València) – Yolanda Carrión-Marco (Universitat de València) – Carles Ferrer-García (Servei d’Investigació Prehistòrica–Museu de Prehistòria de València) – Asier Gómez-Olivencia (Universidad del País Vasco) – Álvaro Martínez-Alfaro – Carmen Martínez-Varea – Nahúm Méndez – Cristina Real (Universitat de València) – Alfred Sanchis (Servei d’Investigació Prehistòrica–Museu de Prehistòria de València)

Cova Foradada is probably one of the most important Palaeolithic sites on the Iberian Peninsula. In addition to the large assemblage of industrial and faunal remains recovered from the Middle and Upper Palaeolithic levels, there is an exceptional set of Neanderthal human fossils, including a partial skeleton. This skeleton preserves the skull, the thorax and one of the arm bones found in anatomical position. It was deposited in a small hollow in the wall of the cave, which could correspond to a possible burial. Unfortunately, the archaeological works carried out from the 1970s to the 2000s did not follow scientifically reliable protocols and methodology. On account of this, a new research project started in 2022 led by the Museu de Prehistòria de València and the Universitat de València with four fundamental axes: a) revision of the materials recovered in the previous excavation campaigns in order to confirm the cultural attribution of the cave deposits to the Middle and Upper Palaeolithic; b) To carry out new archaeological excavations with suitable modern working methodologies and a multidisciplinary approach that allow us to record the entirety of the lithic, faunal and archaeobotanical assemblage with the aim of characterise the occupation of the cave more precisely; c) to rigorously document the stratigraphic sequence of the site in order to understand the formation processes of the sedimentary infilling, as well as to carry out a wide range of chronometric to establish the accurate chronology of the occupation levels; and finally, based on all the data obtained, d) to discuss the site within the regional context to assess potential similarities and differences with the population dynamics observed in other contemporary sites.

1426. RAW MATERIAL STUDIES OF THE PALEOLITHIC RECORD FROM HADŽI PRODANOVA PEĆINA IN SERBIA

**Contribution format:** Oral  
**Contribution authors:** Jelena Markovic (National Museum of Serbia) – Vesna Matović (Faculty of Mining and Geology, University of Belgrade) – Bojana Mihailović (National Museum of Serbia) – Dušan Mihailović (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

The site of Hadži Prodanova Pećina is a cave located in the western part of Serbia in central Balkans. Excavations of this Palaeolithic site, carried out in the early 2000s, revealed a small collection of artefacts corresponding to Gravettian and Mousterian contexts. The aim of this paper is to present petroarchaeological study of lithic assemblages and its importance for the reconstruction of behavior in the past. First results of the petrological identification of the artefacts revealed presence of quartzite, quartz, chert and silicified rocks as raw materials for their production with non-identical representation in different Palaeolithic contexts. Analysis of the geological features of the cave’s surroundings, however, shows only a limited occurrence of knappable materials. The possibility to exploit primary and secondary deposits within the local zone was examined. The procurement area, mobility and dispersion of operational sequence were also considered. The results suggest that there is a distinct interdependence among the raw material availability, the site occupation duration and the structure of the lithic assemblages. Raw material studies of Middle and Upper Palaeolithic contexts will be presented first, followed by a comparison of general outlines of raw material economy patterns proposed for both periods.

2141. TIME FOR THE PALEOLITHIC AT LAPA DO PICAREIRO

**Contribution format:** Oral  
**Contribution authors:** Jonathan Haws (University of Louisville | ICArEHB) – Milena Carvalho (ICArEHB) – Michael Benedetti (University of North Carolina Wilmington | ICArEHB) – Grace Ellis (Colorado State University | ICArEHB) – Telmo Pereira (Universidade Autônoma de Lisboa) – Lukas Friedl (University of West Bohemia | ICArEHB) – João Cascalheira (ICArEHB)

In Paleolithic archaeology, time is truly of the essence. This critical factor in understanding the archaeological record is complicated by sedimentation rates, taphonomy, human and animal behaviors that operate at multiple time scales. Unpacking the palimpsest archaeological record requires insights from different methodological perspectives. At Lapa do Picareiro, a Paleolithic cave site in central Portugal, we have excavated a roughly 15 x 15 m cavern to a depth of about 11.5 m, revealing a lengthy sequence of Middle and Upper Paleolithic occupations interspersed with nonhuman predator occupations. Our goal is to understand human responses to climate and environmental change during the last 60,000 years. Total station mapping of artifacts, bones, and features allows us to identify occupation horizons and activity areas. Lithic technological, raw material, and refitting studies provide additional means of establishing contemporaneity of artifact assemblages within the horizons. We use taphonomic and spatial analyses of the faunal remains to determine separate human versus natural accumulations. Over 100 radiocarbon dates throughout the sequence provide age control for the layers and an age-depth model. Finally, we use magnetic susceptibility measurements through the sequence that record paleoclimatic signals that can be visually matched with the Greenland ice core records to correlate human occupations with Late Pleistocene climate phases. Here, we present data from Levels T through X, dated ~24-31ka cal BP, that contain a series of human and nonhuman occupation horizons superimposed over one another. We also include Levels

DD-II, representing discrete human occupations dated ~35-41ka cal BP. With stratified age control and paleoclimatic proxies, we document changes in occupation intensity, raw material acquisition, and technology linked to abrupt climate shifts. The taphonomic data from faunal assemblages provide insights on alternating use of the cave and subsistence adaptations.

2215. SUBSISTENCE STRATEGIES OF UPPER PALAEOLITHIC HUMAN GROUPS IN THE DNIESTER AREA (UKRAINE)

**Contribution format:** Oral  
**Contribution authors:** Laëtitia Demay – Stéphane Péan (National Museum of Natural History, UMR 7194 HNHP MNHN/CNRS/UPVD, France) – Marjolein Bosch (Austrian Archaeological Institute, Austrian Academy of Science | Department of Prehistory, Natural History Museum, Vienna | Department of Prehistoric and Historical Archaeology, University of Vienna) – Marta Połtowicz-Bobak (Institute of Archaeology, University of Rzeszów) – Dariusz Bobak (Foundation for Rzeszów Archaeological Centre) – Philip Nigst (Department of Prehistoric and Historical Archaeology, University of Vienna | Human Evolution and Archaeological Sciences (HEAS), University of Vienna) – Stéphane Pirson (AWaP, Service Public de Wallonie, Direction d’appui Scientifique et Technique, Jambes | European Archaeometry Centre and Department of Geology, University of Liège) – Timothée Libois (Prehistory service, University of Liège) – Aleksandr Sytnik (Ivan Krypiakevych Institute of Ukrainian Studies, National Academy of Science of Ukraine) – Larissa Koulakovska (Institute of Archaeology and Museum, National Academy of Sciences of Ukraine)

The archaeological research conducted in the last decades allowed to highlight important data about the human occupations and paleoenvironmental conditions during the Upper Paleolithic in the East Carpathian area. More recently new sites were discovered and excavated (such as Doroshivtsi III and Korman IX), and new analyses were conducted on collections to better understand the Gravettian and Epigravettian occupations and subsistence practices in this area. We focus on the Carpathian and part of Middle-Podolsk regions of the Dniester basin, bordered by the outer Eastern Carpathians, in Ukraine. We present here an updated synthesis including the last discoveries and studies on known sites, considering chronological and paleoenvironmental data as well as behavioural data from lithic and, particularly from faunal remains. Our objective is to better understand the evolution of subsistence strategies as well as the modalities of territory occupation during the Upper Palaeolithic by the nomadic societies in the western segment of the East European Plain.

2006. TAPHONOMIC INVESTIGATIONS OF A LATE PLEISTOCENE/HOLOCENE FAUNAL ASSEMBLAGE IN THE ZAGROS MOUNTAINS (IRAN) : THE CASE OF THE WEZMEH CAVE

**Contribution format:** Oral  
**Contribution authors:** Angela Nosedà (Histoire naturelle des Humanités préhistoriques, (HNHP, UMR 7194), CNRS, UPVD | BioArchéologie, Interactions Sociétés Environnements (BioArch, UMR 7209), CNRS) – Camille Daujeard (Histoire naturelle des Humanités préhistoriques, (HNHP, UMR 7194), CNRS, UPVD) – Fabrice Bray (Miniaturisation pour la Synthèse, l’Analyse et la Protéomique (MSAP, UAR 3290)) – Xavier Gallet (Histoire naturelle des Humanités préhistoriques, (HNHP, UMR 7194), CNRS, UPVD) – Antoine Zazzo (BioArchéologie, Interactions Sociétés Environnements (BioArch, UMR 7209), CNRS) – Fereidoun Biglari (Paleolithic Department, National Museum of Iran) – Marjan Mashkour (BioArchéologie, Interactions Sociétés Environnements (BioArch, UMR 7209), CNRS | Bioarchaeology Laboratory, Central Laboratory)

Karstic cavities often yield faunal assemblages in the form of palimpsests, as they are commonly visited by many animals, including humans. The taphonomic study of faunal remains from such fossil assemblages can disentangle these mixed collections, and the place each taxon occupied in paleoecosystems. The Wezmeh Cave (Zagros Mountains, Iran) has yielded a large faunal assemblage dated from the late Pleistocene and Holocene. The remains of more than ten carnivore species were found, the most important ones being the red fox, spotted hyena, brown bear and wolf; followed by small and large felids, mustelids, and herpestids. This site counts among the few which document the biodiversity of Pleistocene carnivores in the region. A large collection of herbivore remains was also discovered, consisting mainly of ovicaprines (goats, sheep), suids, and to a lesser extent cervids (red deer, fallow deer), bovines, gazelles, and a rhinocerotid. In addition, a Neanderthal premolar tooth was also recovered. Prior to its discovery, the cave suffered from looting activities that disturbed its stratigraphy, making it difficult to interpret the origin of the accumulations. To better understand the site occupations and chronology, we carry out the taphonomic analysis of over 9,000 faunal remains, complemented by direct 14C dating, and multidisciplinary analyses (osteometry, proteomics, Fourier Transform Infrared Spectroscopy (FTIR)). Our results

shed light on the complexity of ovicaprine accumulations, often resulting from multi-agent processes. We bring forward in particular the major role played by natural processes like trapping or sheltering. Furthermore, 14C dates on collagen sharpen the site’s temporal resolution, clarifying the timing of ovicaprines’ presence. Indeed, dates spanning from the late Glacial Maximum to the mid-Holocene suggest that both wild and domestic herbivores are represented. These dates highlight time lapses in the site’s occupation, and support the occurrence of successive visits over time by carnivores, humans, and herbivores.

**587. DISCERNING PLEISTOCENE CARNIVORE ACTIVITY THROUGH GEOMETRIC MORPHOMETRICS AND MACHINE LEARNING: AN EXAMPLE FROM CUEVA FANTASMA (ATAPUERCA, SPAIN)**

**Contribution format:** Poster  
**Contribution authors:** Rodrigo García-Martín (Department of Archaeology, University of Cambridge) – Palmira Saladié Ballesté (Catalan Institute of Human Paleoecology and Social Evolution (IPHES-CERCA) | Area of Prehistory, Rovira i Virgili University | Unit Associated with CSIC, Department of Paleobiology, National Museum of Natural Sciences) – Julia Aramendi (McDonald Institute for Archaeological Research, University of Cambridge) – Enrico Crema (McDonald Institute for Archaeological Research, University of Cambridge | Department of Archaeology, University of Cambridge) – Juan Marín Hernando (Department of Prehistory and Archaeology, National University for Distance Education (UNED)) – Antonio Rodríguez Hidalgo (Spanish National Research Council, Institute of Archaeology-Mérida (CSIC-Junta de Extremadura) | Catalan Institute of Human Paleoecology and Social Evolution (IPHES-CERCA))

Site formation processes are often difficult to decipher at many archaeological sites due to the interaction of different carnivore species and hominins, generating a palimpsest. Though carnivore and human action can be fairly well distinguished based on the traces both agents leave on the carcasses, equifinality is a significant problem regarding the identification of specific carnivore taxa based on toothmarks. Thus, in recent years efforts have been made to improve classification accuracy. This includes quantitative methods, such as geometric morphometrics and machine learning algorithms. This study aims to discern specific carnivore activity in a sample from Cueva Fantasma (Atapuerca, Spain), a Pleistocene site with deposits preliminarily ascribed from Lower to Upper Pleistocene. The level SF30A of the aforementioned site contains fossil remains from at least four different carnivore species, making a straightforward interpretation of the site difficult. Within this context, a selection of toothmarks has been analysed and compared through geometric morphometrics and machine learning techniques to identify the main accumulating and modifying agent at Cueva Fantasma.

**1994. RATLLA DEL BUBO SITE (ALICANTE, SPAIN) – A PIVOTAL SEQUENCE FOR UNDERSTANDING THE EARLY UPPER PALAEOLITHIC IN THE IBERIAN MEDITERRANEAN**

**Contribution format:** Poster  
**Contribution authors:** Álvaro Martínez-Alfaro (Universitat de València – Grupo de investigación PREMEDOC) – Miguel Ángel Bel (Universitat de València – Grupo de investigación PREMEDOC | UNIAQR – Centro de Arqueologia da Universidade de Lisboa) – Valentín Villaverde – Aleix Eixea (Universitat de València – Grupo de investigación PREMEDOC)

The onset of the Upper Palaeolithic in the central Iberian Mediterranean basin remains poorly documented, mainly due to the scarcity of reliable sequences attributed to the Aurignacian. The antiquity of some excavations, or the lack of detailed studies, has conditioned our understanding of this phase of human evolution. Ratlla del Bubo is a key site for defining the Early Upper Palaeolithic in the Mediterranean basin, although some archaeological materials remained partially unpublished until recent research. The site’s history is complex: initial clandestine excavations were later followed by two phases of scientific intervention in separate sectors (inner and outer), providing only a relative understanding of the occupation sequence. Currently, we know that the earliest occupations are associated with the Evolved Aurignacian, which are subsequently followed by levels attributed to the Gravettian and Solutrean. In 2024, a team from Universitat de València started a new research project that employs a multidisciplinary methodology to address aspects related to lithic techno-typology, lithic raw materials, chronology, botanical and faunal resources, and sedimentology, among others. In this poster, we present the results of an integrated sequence revision, encompassing an analysis of the lithic industry and chronology. We also outline preliminary results from the recent intervention, which have extended the basal sequence to include levels possibly related to the Middle Palaeolithic and shed light on the undocumented archaeological sequence between the Gravettian base of the outer sector and the top of the Evolved Aurignacian of the inner sector. Ultimately, the aim is to update the data and underscore one of the region’s most important sequences, which is set to play a key role in defining not only chrono-industrial aspects but also our overall understanding of the Middle Palaeolithic and the onset of the Upper Palaeolithic in the Valencian area.

**44 REPLICAS, COPIES, AND FAKES: MOVING FROM ISSUE-FREE TO ISSUE-DIFFERENT SOLUTIONS. NEW(-ISH) ETHICAL CHALLENGES IN ARCHAEOLOGICAL PROFESSIONS**

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Regular session  
**Session keywords:** professional ethics, new challenges, replicas, copies, fakes  
**Session organisers:** Nicole Crescenzi – Angela D’Alise (IMT School for Advanced Studies Lucca) – Liv Nilsson Stutz (Linnaeus University)

**SESSION ABSTRACT**

Replicas and copies in archaeology are not a novelty. Pompeii’s casts are renowned worldwide, and in the long-debated restitution process for the Parthenon’s marbles, copies have been proposed as a win-win solution. Using replicas improved museums’ accessibility for the visually impaired and allowed the sharing of artifacts worldwide without moving – and risking compromising – them. They are an integral part of the work of the archaeologist. Today, they are becoming a preferred solution to various ethical challenges, from decolonization to display, from education to accessibility. Yet, this “cure to all evil” might be an “issue-different” rather than an “issue-free” solution. This theme is profoundly intertwined with the realization of fakes, and their relationship is constantly moving. Falsified reconstructions of graves, creations of abnormalities in Wunderkammer (still employed today, either to attract the public or to show examples of bad practices): where do we draw the line. In this session, we will focus on concrete case studies that illustrate the broader ethical challenges we are facing:

- Is it ethical to display falsity, even with the best intentions?
- Should we create replicas when we are unsure of their truthfulness?
- Does the use of replicas undermine our credibility among the public, or does it help us communicate better?
- Facing the potential of new technologies and the ever-growing call for open access and open science: Where does ownership lie? Is it fair to share the raw data, knowing that 3D printers are easily accessible? Who authorizes its creation.

Through these papers, we hope to inspire a discussion that, instead of seeking easy solutions, underscores the importance of a sustained and engaged discussion of archaeological professional practice and ethics in a constantly evolving world. Prof. Liv Nilsson Stutz will provide final remarks to conclude the session.

**CONTRIBUTION ABSTRACTS**

**1379. DIFFERENT FORMATS, SAME PROBLEMS? EXAMINING THE ETHICS OF DIGITAL COPIES OF ARCHAEOLOGICAL HERITAGE**

**Contribution format:** Oral  
**Contribution authors:** Hayley Mickleburgh (University of Amsterdam | Forensic Anthropology Center Texas State University)

Digital copies are increasingly used as go-to solutions for increased accessibility, preservation of originals, and greater engagement with wider audiences. Such digital surrogates appear to offer straightforward ethical advantages: helping to democratize knowledge and protecting original artefacts. But closer scrutiny reveals they can replicate longstanding challenges and dilemmas. Issues of who determines narratives, perpetuation of colonial legacies, and lack of inclusivity do not simply disappear when archaeological heritage exists in the digital realm. For example, 3D replicas are often cited as a solution for reciprocal restitution, yet still have the potential to reinforce power imbalances through digital neocolonialism; the open science movement being a powerful driver of this. The ease of creating and disseminating 3D scanned human remains or culturally sensitive objects raises all too familiar questions regarding dignity and respect. The digital turn introduces additional complexities, however. With the ease of sharing digital copies comes the risk of easy detachment from archaeological and sociocultural context. The speed and reach of digital dissemination can magnify loss of contextual information and increase unintended public consumption. Moreover, digital formats are rarely permanent: they frequently become obsolete as software evolves or when digital curation falls short. While partly unique to the digital format, these issues nevertheless echo longstanding concerns about which materials we choose to preserve or discard, which objects we share and display. It is clear that ethical responsibilities cannot be bypassed merely by shifting to a digital medium. However, the promise of efficiency of digital approaches has obscured the commitment necessary for responsible. ethical curation. Digital copies require continuous care, updates, and thoughtful governance of data, no less labour-intensive than caring for physical collections. This paper examines how both familiar concerns and emerging ethical issues converge in the digital domain, as digital copies present us with both old and new obligations.

1258. ARCHAEOLOGICAL ARTEFACT REPLICAS AS TOOLS FOR CULTURAL DIPLOMACY: A COMPARATIVE DISCUSSION ON TURKEY’S TWO GIFTS AT THE UN HEADQUARTERS, NYC

Contribution format: Oral  
Contribution authors: Zeynep Akture (Izmir Institute of Technology (IZTECH))

The UN headquarters in NYC has a collection of artworks and artefact replicas gifted by the Member States, including two from Turkey. Produced by two state-commissioned artists with very different backgrounds and professional profiles, and gifted respectively in 1970 and 2021, these are catalogued as “Replica of Peace Treaty between Hattusilis and Ramses II” and “Göbeklitepe Limestone Stele”. The corresponding “original”s, unearthed in two UNESCO World Heritage properties, are popularly known as the World’s earliest peace treaty and oldest purpose-built religious site. Instead of being “a copy of an existing original or of another replica”, as in the common definition of a replica, the first is a sizeable bronze wall panel fifteen times larger than the copied clay tablet fragments from the Hittite capital Boğazköy while the second is a half-scale stone sculpture copying T-shaped stele P18 from Structure D at Göbekli Tepe, in isolation from the surrounding steles and walls, and similar adjacent spatial arrangements. While the panel is on display at the entrance to the UN Security Council, the stele is close to a garden gate connecting to the Turkevi Center across the street whose renovation has recently been on the headlines among allegations against the NYC Mayor, Eric Adams. Based on such differences, the proposed paper will compare the two gifts as materializations of a shift in Turkey’s use of archaeology as a tool for cultural diplomacy to highlight usefulness of replica biographies revealing their contexts of (re)production as a basis to discuss the ethical challenges caused by the formal, contextual, intentional, and functional variety of archaeological artefact replicas.

1149. ARE THESE ALL REAL? VISITORS’ PERCEPTIONS ON HUMAN REMAINS AND REPLICAS AT MORGAGNI MUSEUM OF ANATOMY IN PADUA

Contribution format: Oral  
Contribution authors: Giovanni Magno (University of Padua) – Alice Cusan (University of Aberdeen)

Anatomical museums have long occupied a space between science, history, and public curiosity. Visitors often assume that all human remains on display are authentic, yet many collections include reconstructions, modifications, and possible replicas. This case study examines visitor responses to human remains at the Museum of Anatomy in Padua, where historical specimens, artificial reconstructions, and replicas coexist. Analysing visitor perceptions offers insight into how and to what extent uncertainty about authenticity influences engagement and emotional impact. Does the knowledge that a specimen might be a replica change its perceived value. This research situates these questions within broader debates on authenticity and public trust and considers the ethical implications of replicas in museum displays. Replicas are often seen as solutions to conservation, accessibility, and repatriation concerns, yet their presence may introduce new dilemmas. In an era of digital reconstructions and 3D printing, where does authenticity lie, and how should museums navigate the balance between education and ethical responsibility. By addressing these issues, this case study contributes to discussions on the role of museums in shaping public understanding of the past. It invites reflection on how perceptions of authenticity continue to evolve in a world where the line between the real and the reconstructed is increasingly blurred.

311. BRINGING A FAMOUS MUMMY TO LIFE

Contribution format: Oral  
Contribution authors: Elisabeth Vallazza (South Tyrol Museum of Archaeology)

A man was murdered during the Copper Age on an Alpine glacier and, due to a remarkable series of coincidences, remained preserved in ice for over 5,000 years—along with his clothing and equipment. Since 1998, this exceptionally well-preserved mummy has been conserved in the South Tyrol Museum of Archaeology (Italy), where it is also visible to the public. Upon the museum’s opening, a decision was made to create a reconstruction to visualize the individual’s appearance during his lifetime. Over the years, scientific research—particularly DNA analysis—has provided increasingly detailed insights into his physical characteristics. As a result, a new reconstruction was commissioned in 2011. This image has since become iconic and is essential to the museum’s communication. The public is captivated by the lifelike figure, which transforms the mummy back into an individual. However, many visitors assume that this is an exact representation of how he looked in life. In reality, what we present is an artistic interpretation based on scientific evidence, not a 3D-printed replica of the actual person. How should we handle ongoing discoveries about the man’s potential appearance? The figure, a technically sophisticated work by paleo-artists Adrie and Alfons Kennis, cannot be continuously modified or updated. Would a digital reconstruction be a better option for the future?

46. POMPEII CASTS: HUMANS TO BE PROTECTED OR OBJECTS TO BE DISPLAYED? SCIENTIFIC, ETHICAL, AND TECHNOLOGICAL ISSUES

Contribution format: Oral  
Contribution authors: Angela D’Alise – Nicole Crescenzi (IMT School for Advanced Studies Lucca)

October 24th, 79 AD is the date currently accepted for the main eruptive event ever to occur on the Vesuvius in historical times, causing the complete destruction of Herculaneum, Pompeii, Stabiae, and Oplontis, whose ruins were buried until the 18th century. The first excavations in Pompeii were carried out in 1748 under the ruling of Carlo III Borbon. Since the very beginning, the archaeological site represented an essential instrument for his political propaganda. However, it wasn’t until 1863 that what made Pompeii famous worldwide came to light: the casts, which are still today the main tourist attractions. Since their first creation with Giuseppe Fiorelli, Pompeii’s casts, and the human remains contained within, have been the protagonists of research, display, public outreach, newspaper articles, and social media. Often praised for their scientific interest and importance for research, sometimes criticized for showcasing unimaginable pain and violating the past persons’ privacy, they have become increasingly controversial with the increased attention towards professional ethics related to archaeological human remains. Applying new technologies to studying the bones within the casts proved that sometimes the outside does not correspond to the inside. What does this discovery mean? Are the casts replicas of the human person supposedly contained within? Are they fakes, since what we see thanks to the cast may not represent the human remains inside of it? Are they something else entirely? And what professional ethics should be applied to them? In this paper, we will try to answer these questions, bringing together the history of the site, the tradition of the casts, an investigation of the Archaeological Park of Pompeii social media, and the new ethical challenges related to the use of fakes, copies, and replicas of human remains.

1246. OBJECT LESSONS: THE DEER HUNTERS SARCOPHAGUS AND LEARNING TO LIVE WITH AMBIGUITY

Contribution format: Oral  
Contribution authors: Margaret Woodhull (University of Colorado Denver) – Jessica Powers (San Antonio Museum of Art)

In 1990, the San Antonio Museum of Art in Texas (USA) received a fine collection of Greek and Roman antiquities from a well-known collector. Among the objects in the collection was an unusual example of a second-century CE stadtrömische garland sarcophagus, dubbed the Deer Hunters Sarcophagus for the decorative, rustic hunting scenes in the lunettes above the concave swags across its façade. Undocumented when it appeared on the art market in 1989, the sarcophagus’s high-quality, exceptional carving, uncertain origins, and excellent state of preservation have raised questions about its production, historical status, and display in the museum. Comparison of the San Antonio sarcophagus with a near-twin, discovered on the Via Labicana in Rome, now on display in the Museo Nazionale delle Terme and bearing almost identical scenes of hunting in its lunettes, reveals stylistic idiosyncrasies in the former object that offer a compelling framework for discussing questions of authenticity in the San Antonio masterpiece. These issues position the San Antonio sarcophagus in a larger discourse on the value of displaying works of ambiguous antiquity and raise questions of tolerance and pragmatic value which ambiguity can elicit in the absence of certainty. This paper takes an interdisciplinary approach to these concerns by considering the philosophical, economic, artistic, and archaeological significance of artefact ambiguity through a close study of the Deer Hunters Sarcophagus and its museum context.

277. RECYCLING ANTIQUITY: THE CONFLICT BETWEEN MATERIAL VALUE AND CULTURAL SIGNIFICANCE IN 19TH-CENTURY COLLECTORS’ MODELS

Contribution format: Oral  
Contribution authors: Eliška Petreková (Masaryk University, Brno)

The early 19th century witnessed the rise of a new group of artisans, the Scarpellini or stonemasons, who crafted architectural models using marble sourced from ancient ruins. Although these models were widely available and mass-produced, their material—ancient marble originating from historic structures—bestowed them with prestige and uniqueness. Therefore, these models paradoxically combined popular accessibility with the authenticity of cultural heritage. This paper focuses on two ethical questions associated with these models. The first explores the boundary between souvenirs and cultural heritage: When did these models make antiquity accessible to a broader audience, and when did they trivialize its value? The second question focuses on the secondary use of authentic ancient marble itself—why was it considered legitimate at the time, and could there have been a balance between appreciating the material’s authenticity and protecting cultural heritage? Using these models as a case study, this paper demonstrates how historical collecting practices can serve as a foundation for contemporary debates on the ethics, preservation, and presentation of cultural heritage. Additionally, it raises the question of how modern society perceives and evaluates these controversial symbols of collecting passion.

45 THE LONG LASTING END OF THE MIDDLE AGES BETWEEN THE MEDITERRANEAN AND THE NORTH SEA. APPROACHES, METHODS, MODELS

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Regular session  
Session keywords: postmedieval archaeology, transition, middle ages, methodologies, theoretical approaches  
Session organisers: Carlo Citter (University of Siena) – Josè Maria Martin Civantos (University of Granada) – Marco Milanese (University of Sassari)

SESSION ABSTRACT

Archaeological evidence has shown that traditional timelines of the transition from the Middle Ages to the modern era do not adequately capture the complexity of the situations encountered in this field of research. The Black Death served as a pivotal moment for many regions, yet its effects were not uniform. The introduction of new plants from the Americas in the 16th century initiated a significant transformation in land use, a process that unfolded over a long period. While the development of capitalism has been widely discussed, archaeology still has much to contribute. Europe and the Mediterranean experienced divergent paths, and researchers often focus on individual regions, missing the chance to exchange methods and interpretive models. This session seeks to unite researchers from both postmedieval/historical and medieval archaeology to discuss recent case studies and offer a broader perspective. Another goal is to publish the session proceedings in an open-access format to stimulate wider debate within the scientific community. We invite proposals from those engaged in large-scale projects as well as localized case studies. We encourage submissions from various European regions to showcase differing outcomes, timelines, and methodologies. Additionally, we welcome contributions from both freelance and professional archaeologists alongside academics and those employed by central and local public institutions.

CONTRIBUTION ABSTRACTS

972. METHODOLOGICAL APPROACHES TO ANALYZING THE CALABRIAN CONTEXT IN THE TRANSITION FROM THE MIDDLE AGES TO THE MODERN ERA

Contribution format: Oral  
Contribution authors: Alessandra Coleschi – Assunta Campi – Camilla Felicioni – Marco Martini (University of Siena)

The contribution presents three distinct case studies from Calabria, a region in Southern Italy, which highlight both unique and shared aspects of the transition from the Middle Ages to the Modern Era, comparing and reflecting on the application of different research methodologies. The first case concerns the excavation of a medieval castle, where structural analysis, combined with the archaeological findings, reveals a long-lasting use of the site that extended into the Modern Era. The second study focuses on the rural landscape, aiming to contextualize the dynamics changes surrounding the medieval castle extending up to the current era. The third case investigates a defensive wall circuit through architectural analysis, concentrating on wall readings and structural characterization. By comparing these three case studies, the contribution illustrates the various methodological approaches employed in archaeological research, proving to offer a deeper understanding of this crucial period of historical transition often overlooked by documentary sources.

1975. INSIGHTS INTO THE LATE MEDIEVAL TRANSITION FROM TEST PIT EXCAVATION IN RURAL SETTLEMENTS ACROSS NORTHERN EUROPE AND ITS WIDER POTENTIAL

Contribution format: Oral  
Contribution authors: Carenza Lewis (University of Lincoln)

This paper will review data from two large-scale projects involving large numbers of localised case studies of rural settlements to show what light they throw on the late medieval to early modern transition in northern Europe, and to consider how transferrable this methodology might be to understanding late medieval change other regions. The methodology used has been excavation of 1m square test pits, used in the CORS (Currently Occupied Rural Settlements in England) and CARE (Community Archaeology in Rural Environments)) projects in more than 100 northern European rural settlements in England, Netherlands, Czech Republic, Germany and Poland. The use of the same methods to excavate every test pit allows the amount of pottery recovered from different test pits to be compared, and mapping this data can show which parts of settlements were in use at different times. This shows when and how the settlements appeared, grew, contracted or were abandoned, while comparing the patterns in different settlements allows common patterns to be observed, and divergent trajectories identified. This paper will firstly consider what light this work has thrown on the transition from the later medieval to early

post-medieval periods, as the pottery data shows how communities responded to event as diverse as the Black Death to the religious wars of the sixteenth century which affected different places in Europe in different ways. Secondly, this paper will consider the potential opportunities and pit-falls of using this approach even more widely to provide a pan-European multi-scalar picture of change over time, and consider how the challenges of calibrating analytical thresholds to ensure inferences are valid in different regions could be met.

2079. LIFE AND TRADE AT THE MARGINS OF MODERN STATES

Contribution format: Oral  
Contribution authors: Alice Lucchini (University of Zadar) – Eleonora Delpozso (Università Ca’ Foscari di Venezia) – Marta Laureanti (CESVI)

This paper presents the remains of a flat-bottomed riverboat discovered in the lower Oglio River, in the province of Mantua. Emergency archaeological work conducted during the severe drought of the summer of 2022 led, for the first time, to an intervention by the Cultural Heritage Office and to the documentation and sampling of the shipwreck to assess its value. At the time of its emergence, the remains were already known to local inhabitants, but they had not been reported to the authorities, as they believed them to be those of an old working boat from the 20th century. Others speculated a possible connection with an old dogana (customs station), recorded in the toponymy of modern cartography and traced back to the 18th century. However, radiocarbon dating revealed a much older origin, placing the boat’s construction between the 15th and early 17th centuries. The boat was found in a liminal territory that, over these centuries, served as a borderland between the Duchy of Mantua and the Duchy of Milan, transitioning from Spanish to Austrian rule, and eventually being incorporated into the Kingdom of Lombardy-Venetia. The study examines the archaeological remains of the boat and its possible functions, correlating the findings with data from the UAV survey conducted in the area. It also considers other nearby watercraft remains and written sources to explore the possible continuity of trade before and after the establishment of customs stations in the region, while also reflecting on the role of these stations in the emergence of modern states.

2517. THE PROJECT MED2MOD: THE OTHER TRANSITION

Contribution format: Oral  
Contribution authors: Carlo Citter (University of Siena)

This paper presents a multiscalar, multiagent project focused on the transition from the Middle Ages to capitalism in central and southern Italy. While centred on a specific region, the project seeks to situate Italy within the broader Mediterranean context. At the start of this process, Italy was a core part of old Europe, but by the end, it had become a peripheral province in the global network. The project functions as an umbrella, encompassing several sub-projects. Each sub-project is centred around a primary site for long-term excavation, with the surrounding landscape studied through survey. The wealth of material data gathered challenges traditional historical models based on literary sources, offering a fresh narrative for this pivotal period that shaped today’s landscapes. The project benefits from the support of various public institutions and European universities. The preliminary results of this project are already available at the website [www.med2mod.it](http://www.med2mod.it). Last but not least the project aims to promote a social engagement and to boost local economies thanks to the valorisation of the archaeological heritage.

2525. THE LONG MIDDLE AGES: THE VIEWPOINT OF ARCHAEOLOGY

Contribution format: Oral  
Contribution authors: Marco Milanese (University of Sassari)

The aim of this contribution is to reflect on the length of the Middle Ages, with the doubl. observatory, both from the point of view of political or eventual history, and from the point of vie. of archaeology. The fragility of a historical chronology based on exact dates, such as 1453 or 1492 in the case of the end of the Middle Ages, is well known, a fragility that becomes clear when confronted wit. economic structures, society, but particularly with archaeological data. The French historian Jacques Le Goff has formulated a counter-current assertion, namely that the Middle Ages came to an end in the 19th century and that its pattern of values did not die ou. completely until the middle of the 20th century. The statement may seem harsh and unacceptable to historians of written sources, whereas fo. archaeologists working on material sources this viewpoint is sharable and does not give rise to any misgivings. In urban and rural archaeology, this becomes clear if we note that the ceramic record in stratigraphic sequences and archaeological contexts from the 13th to the 18th century shows a technological continuity that can make materials indistinguishable for over 500 years, if not in the face of careful morphological and possibly decorative study of ceramic productions. Handicraft production structures are often extremely conservative, so much so that they remained unchanged from Middle Age until the 20th century and were completely indifferent to the impact of the industrial revolution, which in the Mediterranean area was limited to a few production centres.

2528. TRADITIONAL IRRIGATION SYSTEMS. A RESILIENT HISTORY FROM THE ISLAMIC PERIOD TO GLOBAL CHANGE IN SOUTHEAST SPAIN

Contribution format: Oral  
Contribution authors: Jose Maria Martin Civantos (University of Grenada)

This paper presents a general historic approach to irrigation systems from an integrated approach based on their resilience capacity to face political, social economic changes from the Islamic period to the most recent challenges and threatens provoked by Global Change, and more specifically due to the intensification and industrialization processes and policies. The irrigation structure, the governance institutions and the local ecological knowledge have allowed not only to resist, but also to adapt to changes. The work already carried on by the MEMOLab, laboratory of Biocultural Archaeology of the University of Granada, has allowed us to know better all these mechanisms and promote the restoration and an innovative social intervention in these irrigation systems during the last 10 years.

800. DIALOGUE BETWEEN MATERIALS AND METHODS. SÃO FRUTUOSO DE MONTÉLIOS IN THE CONSTRUCTION OF THE EARLY MEDIEVAL LANDSCAPE OF BRACARA (PORTUGAL)

Contribution format: Oral  
Contribution authors: Francisco Andrade (UAUM, Lab2PT, UMinho, IN2PAST) – Rebeca Blanco-Rotea (Lab2PT, UMinho, IN2PAST) – Jorge Sanjurjo-Sánchez (University of A Coruña)

The city of Bracara Augusta underwent a major transformation in Late Antiquity that affected not only its urban landscape but also its relationship with the surrounding area. The new Bracara was built on a pre-existing space that represented an urban nucleus and an important network of roads that linked it to its hinterland, while at the same time communicating it with other centres of power on the Iberian Peninsula such as Lucus Augusti, Asturica Augusta and Augusta Emerita. In this transformation, the role played by the ecclesiastical centres was fundamental, elements that articulated the landscape and the dynamics of power in the surroundings of Bracara, while introducing new forms and construction techniques, materializing the heterogeneity of the new social, political, cultural and economic reality of the Early Medieval Ages in Europe. São Frutuoso de Montélios is one of the great centres erected in Bracara during this period. The mausoleum has an architectural model that is not usual in the Iberian Peninsula. Its approach from an interdisciplinary study that interweaves social and natural sciences leads us to develop new methodological approaches and interpretative frameworks in the study of medieval archaeological reality. In this paper, we will try to show this perspective from the dialogue between materiality and research methods in Medieval Archaeology.

46 WHAT CAN BODIES DO? THE ARCHAEOLOGY OF EXPERIENCE

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Regular session  
Session keywords: embodiment, the body, lived experience, landscape, bodily skills, bodily becoming  
Session organisers: John Chapman (Durham University) – Dimitrij Mlekuz (University of Ljubljana)

SESSION ABSTRACT

The main focus of this session concerns archaeological ways to approach embodiment. We begin with the body – quintessentially the subject and existential ground of culture. The body is not simply ‘flesh and bones’, an autonomous actor or the result of signification. Rather, it can be understood as a repository of biological impulses and cultural–neurological habits emergent through its interweavings with the world. This requires us to re-think the materiality of the body and focus on what bodies can do and how they take shape through interactions with other objects, bodies and landscapes. Embodiment depends on how the body is used. Our bodies are mutable because living in a body means being affected, moved, put into motion and shaped by its total surroundings. The disclosive nature of being in the world is available only through bodies and bodily competencies. Think how the skill of skiing completely changes our landscape by transforming an impassable, hostile wasteland into a locus of fun and enjoyment. We are interested in archaeological case studies which examine how skilled bodies emerge with the landscape by engaging the practices and technologies of bodily becomings. Relevant case studies could include:

- (1) The practices and material culture of swimming, sailing, diving, and fishing, which shape our interactions with land- and sea-scapes.
- (2) relationships between hot springs, swimming, pleasure and the body (e.g., settlements related to hot / mineral springs).
- (3) Embodiment in a specific landscape, where bodies in upland landscapes must learn the skills of negoti-

- ating steep terrain in order to follow animals, hunt or search for minerals.
- (4) The example of how the stonemason’s craft co-constructs their body in the course of building a great Mediaeval cathedral.

In this multi-period, multi-regional and multi-disciplinary session, we encourage profound new reflections creating a deeper understanding of embodiment and lived bodies.

CONTRIBUTION ABSTRACTS

1856. HOLDING THEIR BREATH. UNDERSTANDING UNDERWATER EXPERIENCES OF ANCIENT DIVERS.

Contribution format: Oral  
Contribution authors: Emilio Rodríguez-Álvarez (Universidad de Salamanca)

Diving physiology, especially that of competitive apneists, is a well-researched topic in medical science, with extensive analyses on the different stresses, both mental and physical, that humans must endure when confronting the depths of the ocean on a single breath. While free-diving for food gathering and even naval warfare was a common practice in the ancient world, the lack of familiarity by ancient and modern authors about the responses and risks that diving triggers on human bodies has caused a misinterpretation of the scarce written sources that have survived. While ancient authors did not comprehend the physiological responses the sailors and fishermen are trying to describe to them, modern scholars have often addressed these confusing descriptions as sort of a fictional account or bravado of these informants describing their experiences underwater. No scientific value has been traditionally given to these narratives. This work addresses these problems through the application of a new research paradigm, free-diving ecology, and demonstrates that a careful, structured analysis of these literary sources can prove them to be, despite their limitations, a very accurate reflection of the physiological processes ancient divers endured. Furthermore, the cross-cultural comparison with both artifacts and human remains around the globe provides these written records with a feedback rooted on material evidence that permits to extrapolate the conclusions of this study to other regions of the planet, showing how human bodies have adapted and changed through their constant interactions with the underwater world.

2522. “THOUSANDS HAVE LIVED WITHOUT LOVE, NOT ONE WITHOUT WATER” (W.H. AUDEN) – SWIMMING, DIVING AND THERMAL SPRINGS IN THE EUROPEAN NEOLITHIC

Contribution format: Oral  
Contribution authors: John Chapman (Durham University)

Our very first experience in life – inside the womb – is an aqueous experience, so it is not perhaps surprising that children soon developed an empathetic relationship with water and watery environments. Prehistorians tend to explain the obvious and strong relationship between site location and water - whether on coasts, rivers and streams or next to wetland sites or springs – in terms of resources (drinking water, fishing, shell-collecting, hunting water-birds). But there were advantages for personal hygiene, while the bodily pleasures of swimming, especially in warmer seasons, would have led to the development of new embodied skills, which could also occasionally have had life-saving results to avoid drowning. We suggest that swimming skills were as important in differentiating between persons as their skills in potting or woodworking. Strong swimmers were more likely to have developed skills in diving, with positive benefits in retrieving shells for eating or ornament-making (e.g., Spondylus gaederopus). While swimming in the sea and swimming in rivers offered different experiences, a third context – the thermal spring – provided a new and intensively pleasurable kind of swimming. In an exploratory study that seeks to go beyond the anecdotal (e.g., the Palaeolithic cave near Miskolc, Hungary, with thermal springs inside the cave), the distribution of thermal springs in Bulgaria is compared with that of prehistoric tells to study any possible impact of hot springs on settlement location in the Neolithic or Chalcolithic.

172. THE NAUTICC (NORMS AND USES OF TECHNIQUES IN PREHISTORIC COASTAL COMMUNITIES) DATABASE: A TOOL FOR PREHISTORIC MARITIME TECHNIQUES

Contribution format: Oral  
Contribution authors: Giada Pirrone (CReAAH lab Umr 6566 CNRS | Université de Rennes)

The interaction between coastal hunter-gatherer communities and the surrounding environment is mediated through the application of various technical actions. The full spectrum of activities, from those solely related to subsistence to those involving more symbolic and ritual aspects, is organized into distinct tasks that necessitate specialized physical capabilities. This body of knowledge plays a crucial role within these communities and is transmitted from generation to generation via processes of cultural transmission and social learning, which facilitate gradual specialization and refinement in tandem not only with technological evolution but also with the relationship between human bodies and raw materials. The latter is most readily observable in the prehistoric archaeological record, which provides a partial yet precise depiction of the skills developed and deployed

in the dual and liminal context of coastal life. As part of the MSCA doctoral network ArChE, through my doctoral research I will develop a tool to organize and gather data regarding technical systems employed by prehistoric coastal societies: the NAUTICC relational database (NORMS AND USES OF TECHNIQUES IN PREHISTORIC COASTAL COMMUNITIES). Designed to systematically record and organize data from diverse sources, this data-base is organized around the concept of tasks and techniques, facilitating the extrapolation of new archaeological insights into the type of activities carried out in the sites and the social structures of coastal communities. The project analyzes data related to key aspects of Mesolithic life, including hunting, fishing, cooking, dwelling, tool making and symbolic practices. By synthesizing a vast array of data across four geographical areas (Northern Spain, Western France, Southeastern Norway and coastal Latvia), this research provides new perspectives on the norms and practices of prehistoric coastal communities on local scales, as well as patterns of cultural continuity and change across regions.

1634. MISCHIEF FOR IDLE HANDS: DOMETICATION OF HANDS IN THE NEOLITHIC

**Contribution format:** Oral  
**Contribution authors:** Dimitrij Mlekuž Vrhovnik (University of Ljubljana)

Keeping hands occupied has always been a fundamental aspect of human life, shaping both individual experience and social structures. This study examines how Balkan Neolithic people engaged their hands in daily life, exploring the ways manual activity mediated their interactions, work, and self-regulation. Psychoanalysis sees the body as shaped and driven by both desire and drive, constantly negotiating between excess and restraint. Desire reaches outward toward something beyond us, while drive seeks to quell an internal agitation. The hand embodies both: it reaches out as an image of desire, yet also functions as an organ of drive, overflowing with restless excitation. Through the hands, this excess finds form, whether in gestures of reaching, grasping, or compulsive, restless activity. The bodily energy that saturates us is directed through the hands, which serve as both a medium of desire and a technology of drive—creating, transforming, and shaping action. Yet, this raw movement must be cultivated, disciplined, and refined through practices that structure both the self and society. From fidgeting to weaving to handling objects, hands act as a primary site of transformation, channeling internal tension into structured activity. Whether through learned habits, cultural norms, or personal rituals, the body is not merely a passive vessel but an ongoing project of mediation, regulation, and adaptation. Hands are also deeply intertwined with speech and listening, demonstrating how language and embodiment are inseparable. As we listen, our hands often seek movement—doodling, touching objects, or engaging in repetitive gestures—suggesting that processing speech is not purely cognitive but also physical. This study explores how Neolithic manual technologies emerged alongside new social spaces, where interactions became more complex. Various objects served as instruments of mediation, allowing people to be both present and abstracted, engaged and withdrawn, in the evolving fabric of Neolithic society.

928. MOTIONS AS ARTEFACTS AND MATTER AS AN ENDOSPORE: AN ARCHAEOLOGICAL APPROACH TO RESEARCHING LATE-MEDIEVAL GERMAN MARTIAL CULTURE

**Contribution format:** Oral  
**Contribution authors:** Maciej Talaga (University of Warsaw, Faculty ‘Artes Liberales’)

This presentation takes the theoretical lens of ‘becoming’, ‘embodied materiality’, and ‘affordances theory’ to explore the capacity of material relics to preserve past embodied knowledge and reactivate it in the present. Drawing from new materialist philosophy and ecological cognitive science, it explores how they serve as repositories of generative information rather than mere inert traces of the past. Artefacts are reconceptualised as remnants of functional units where objects and living bodies were once tightly intertwined, their forms shaping and being shaped by culturally constructed motions. Thus, tangible artefacts are approached as inseparable from the intangible kinetic artefacts, for which they serve as cenotaphs. Starting from this observation, I then argue that the missing link between the tangible material relics and their corresponding intangible motions is not actually lost forever and can be retrieved, when the researcher’s physical body is added to the equation. As a form of matter, past artefacts resist human manipulation, thus providing constraints which may guide present human practice towards that of the past - or towards the kinetic artefacts. Hence, I propose to see them as endospores rather than cenotaphs. The discussed theory is confronted with a short case study on a swordfighting technique described in a late-medieval German fight book (manuscript 3227a, Germanisches Nationalmuseum). The example demonstrates how a dynamic configuration of material objects, human body, and ephemeral materiality of motion may bridge the gap between historical and present experiences by supplying affordances and steering interaction, thus challenging conventional views of memory, materiality, and historical continuity. By functioning as endospores rather than mere relics, artefacts actively shape present practice, allowing past knowledge to resurface through embodied engagement.

60. ‘TURNING RED’: OCHRE-BASED UNGUENTS AND BODY PAINTING AS A LONG-LASTING PRACTICE OF HUMAN ADAPTATION.

**Contribution format:** Oral  
**Contribution authors:** Simona Todaro (University of Catania)

Ochre is a generic term used by archaeologists to describe earth pigments that are typically red, yellow or brown-coloured. Analyses have highlighted that the difference in colour depends on the elemental composition (haematite, goethite, limonite), and have also clarified that red pigments can derive from haematite as well as from cinnabar or burnt limonite. At Middle Stone Age sites in Africa haematite-ochre was preferred to other types even when its acquisition required travel over long distances. Ethnographic analogy with African tribes, such as the Himba in Namibia, and the contextual associations of archaeological haematite ochre suggest that it was prized for its unique properties as a smell neutralizing and photo-protective agent. Red ochre, mixed with animal fat could be smeared on the body as a second skin, protecting it from sunburn. These properties transformed bodies allowing them to travel through new landscapes and settle in new ecological niches that otherwise would be out of reach. Building on these studies, this paper will focus on Holocene uses of ochre and will argue that modern humans acquired, early on, an experience-based awareness of specific photo-protective and mosquito’s repellent properties of haematite and, through time, exploited them to conquer new environments or to continue living in the same places under different conditions. More specifically, it will argue that the discretionary use of red ochre in the funerary rituals of certain groups might suggest that ochre-based unguents, created by mixing ochre powder with animal fat or butter-milk and kept in purposely made ochre containers, were used during life to improve on nature, in two specific circumstances: habitation in marshy areas of alluvial plain, potentially affected by malaria, and early seafaring.

2362. THE LAND, THE SEA AND THE NEANDERTHAL BODY

**Contribution format:** Oral  
**Contribution authors:** Christina Papoulia (Department of History & Archaeology, University of Crete)

The robust Neanderthal body has been interpreted as a result of biological adaptation to severe climatic stress, and the distinctive Neanderthal nose as an efficient respiratory mechanism in extreme cold weather conditions. Neanderthal bodies have been reconstructed in various means and in diverse ways, from Kupka’s absolute brut to the fully modern Neanderthal in a suit of the Neanderthal Museum, Mettmann. The scientific community and the public engage with the Neanderthals’ lived experience based on their material culture via archaeological narratives that tend to change over time. Recent advances in Neanderthal archaeology allow for a deeper understanding of the skills and techniques related to such a highly innovative species. The embodied performances of Neanderthals’ everyday life involve moving through coastal landscapes, upland regions and snow-covered terrains, but also diving in waterscapes or floating on material containers. This talk deals with Neanderthal technologies, materiality and embodiment, what Mauss called “techniques of the body”, through the study of activities such as knapping, hunting, swimming, diving, body ornamenting, dancing or burying a loved one.

2122. BECOMING A FARMER. MOBILE BODIES, EMBODIED KNOWLEDGE AND THE INITIAL DISPERSALS OF AGRICULTURE IN THE AEGEAN (7000-6200 BC)

**Contribution format:** Oral  
**Contribution authors:** Peter Tomkins (University of Catania)

How did farming first reach Europe? While archaeology long ago narrowed priority to the regions of Europe that border the Aegean Sea, the precise nature of the transfer and the agencies involved continues to be debated. A consensus still (just about) prevails that farming was brought by groups of farmers, migrating into regions of southeast Europe from homelands in southwest. However, there is growing uncertainty about the cogency of the demic diffusion model – at least as conventionally formulated – as an explanation of the evidence in all its complexity. This paper suggests that progress from this impasse depends less on new evidence emerging, welcome though this would be, and more on addressing a lacuna in our theorisation of agricultural knowledge and practice, specifically how it was formed, re-formulated and transmitted among the societies of the Early Holocene Aegean. It suggests that the demic diffusion model under-theorises this (1) because being a farmer is viewed as a normal part of ‘early farming culture’, where culture was understood, at least originally, as closed, normative and fixed, with stable mechanisms for its (internal) transmission; and (2) because the agents of dispersal are already farmers and so the question of how they became so seems irrelevant. Taking an explicitly embodied perspective, this paper considers what it might have meant to become a farmer in the landscapes of the Aegean. How, by whom and from whom, might agriculture have been initially learnt in the mobile, connected societies of the early Holocene Aegean? How and in what contexts might farming - as a nexus of embodied knowledge and practice – have been reformulated? The paper explores these questions using case studies drawn from the first millennium of farming in the Aegean.

1446. WHAT BODIES CAN DO. INTERWEAVING BODIES AND ARCHITECTURE IN THE PRE-POTTERY NEOLITHIC AND BEYOND

Contribution format: Oral  
Contribution authors: Alexander Gramsch (Römisch-Germanische Kommission)

The Levantine Pre-Pottery Neolithic (PPN) is well-known for human remains placed in certain areas of domestic architecture and for the elaborate treatment of bodies and bodily remains. I want to use these data as a starting-point to consider possibilities how architecture and bodies deliberately get entangled through a wide array of body-centred transformative practices. My aim is to combine a phenomenological understanding of the human body as a ‘fait social’ sensu Durkheim and Merleau-Ponty, shaping the world by experiencing it, with an understanding of the interweaving of body and architecture as a process. Many peri- and post-mortem practices result in a separation of the perishable and the imperishable, of moist, soft, decaying biomass and dry, hard bones. Evidence for the dismemberment of bodies and excarnation is scarce for the PPN, but available in later Neolithic contexts in Europe. Whatever method or process was chosen in the PPN, it resulted in dry bones that were easy to handle and to transform further, e.g. using plaster. This process of ‘ossification’ or even ‘petrification’ of human remains runs parallel to the process of transformation of social relationships and social memories. Moreover, this petrification process is linked to another petrification process, i.e. the planning, the construction, and the maintenance of domestic architecture. Recent studies point to the use of lime plaster produced explicitly for the application both in PPN architecture including the recurring renewal of walls and floors as well as in mortuary rituals (skull modelling). In my contribution I try to disentangle these processes, the materiality involved, and the question how the constant interaction of body and architecture in this process shaped both mutually.

415. ROCK ART AND ARCHAEOLOGY OF BODILY MOVEMENT

Contribution format: Oral  
Contribution authors: Manuel Santos-Estévez – Regina Zaghi-Lara (Incipit-CSIC, XSCAPE project)

This study is part of the project “XSCAPE: Material Minds”, in which we want to understand the interactions between the mind, objects, and the world. In line with this question, this work proposes to analyse how rock art sites condition human behaviour, paying special attention to posture and body movement. This study takes a historical approach; it analyses changes throughout prehistory and whether they relate to social and cultural transformations. For instance, in Paleolithic, it is sometimes necessary to adopt very different body postures, lie on the ground, bend down... to be able to observe the panels. However, postures and body movements are becoming more constraining as we move forward in time. In European rock art from the Neolithic period, visitors could position themselves around the panel due to these panels having several viewpoints, and they tend to move around. However, in Bronze and Iron Age sites, groups of people had to be placed in front of the panel because fewer viewpoints were available. These differences could be linked to increased movement control and body position in later societies. The configuration of the rock sites may be related to strategies for controlling human behaviour by restricting their movements and body postures. To define the relationship between body and rock art, we conducted experiments utilizing movement-tracking technologies to document body positions and movements within sites, offering insights into human-environment interactions through spatial navigation. We chose two sites for the experiment: one Neolithic site featuring geometric designs on irregular, horizontal, and convex surfaces and one Iron Age site showcasing quadruped motifs on steep surfaces. By quantifying bodily behaviors in these environments, we gain insights into how the act of viewing art was not just a visual experience but a deeply embodied one, shaped by the constraints and affordances of the surrounding landscape.

1685. CAVES ACROSS BODIES OF PAST AND PRESENT

Contribution format: Oral  
Contribution authors: Stella Katsarou (Ephorate of Palaeoanthropology-Speleology, Ministry of Culture, Athens)

Caves in the Aegean and everywhere are more than ancient ‘sites’; they are places, spaces, and landscapes where ancient communities constructed meanings. Humans did not just ‘use’ caves; they traveled to them on land and sea, climbed to their entrances, crawled inside their crevices, touched their stalagmites, got wet in their drip water, and struggled to navigate their darkness. Caves created expectations and promises for shelter and resources, offered transcendence for communities to place their deceased, inspired awe, or became places people escaped with fear. In this paper, I will draw on archaeological research in the Aegean to explore the range of corporeal interaction of prehistoric humans with cave spaces. This exploration takes on two perspectives. First, it seeks insights into social knowledge, ritual expertise, and long-lasting traditions, including mythological narratives, that emerged and formed within the prehistoric communities of the Aegean as direct responses to the physical restrictions and challenges posed by specific cave spaces, particularities, and locations. Second, it emphasizes the role of modern archaeologists, who, through their own embodied experiences in caves, become the empirical

and subjective mediators of prehistoric bodies and their dynamic engagements with caves.

1422. ECHOES OF CONFLICT: INVESTIGATING TRAUMA AND SURVIVAL IN MEDIEVAL MANASTIRIŠTE

Contribution format: Oral  
Contribution authors: Nikolina Manojlovic (Zavičajni muzej Župe Aleksandrovac/Homeland museum of Župa Aleksandrovac) – Dušan Kojić (Zavičajni muzej Gradiška/Homeland museum Gradiška) – Dragana Vulović (Arheološki institut Beograd/Institute of Archaeology Belgrade)

The Manastirište site, located on the right bank of the Lubina River in the village of Kijevci, in the territory of Gradiška, Republika Srpska, offers a unique opportunity to investigate the physical and cultural impact on bodies through time. Archaeological excavations, which began in 2004, have revealed a Roman agricultural estate, a medieval church with a cemetery, two wooden churches, and an unexplored Object III. The investigation of the medieval cemetery, which spans over the Roman objects, provides insight into the evolution of burial practices from the 12th to the late medieval period. During the most recent research campaign in 2024, two closely positioned graves were examined. The individuals buried in them show distinct signs of trauma: a fatal head injury inflicted by a sharp object in one individual and a massive skull injury caused by a blunt object in the other, who survived. These studies offer an opportunity to analyze the impact of physical injuries on bodies, and the adaptation of surviving individuals to their environment and society. We will attempt to understand how changes in the physical state of the body impact the quality of life in the context of the Middle Ages in the Balkans, with an emphasis on how human bodies cope/interact with trauma. How does the elasticity of life energy vary from one individual to another?

47 BIOARCHAEOLOGY OF CHILDHOOD: NEW PERSPECTIVES ON CHILDREN IN EUROPEAN PREHISTORY

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Regular session  
Session keywords: bioarchaeology of childhood, children, health and diet, growth and development, puberty, social status  
Session organisers: Mina Amzirkov (Department of Archaeology, Faculty of Philosophy, University of Belgrade) – Ana Herrero-Corral (Austrian Archaeological Institute, Austrian Academy of Sciences) – Marija Krečković Gavrilović – Marija Marin – Jelena Marković (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

SESSION ABSTRACT

Children in the archaeological record have been discussed for decades, still, their roles and contributions were often underrepresented in research, possibly due to perception of their minor influence on society or due to limitations in anthropological methods. In recent years, with significant advancements in analytical techniques, particularly those applied to non-adult skeletal remains the archaeology of childhood has emerged as an important field for understanding past populations. Despite existing limitations, with these advances, and the application of scientific methods in archaeological research, it has become possible to reconstruct the life histories of children. This has opened up new avenues for studying children’s health and diet, growth, and developmental stages such as puberty. Further, observing these factors within the archeological context allowed us to better understand their social roles and how prehistoric communities interacted with their children, seeing them as both future adults and as the future of the community. This session aims to present new perspectives on childhood during European prehistory by welcoming papers dealing with the bioarchaeology of childhood using different bioarchaeological and archaeological methods such as dietary and weaning stable isotope analysis, also strontium and oxygen isotope analysis, genetic analysis, radiological imaging, paleopathology, dental analysis, tooth peptide analysis, highlighting how the implementation of scientific methods can be used to reconstruct the lives of these tiny but significant members of past societies.

CONTRIBUTION ABSTRACTS

978. GENDER AND SEX IN CHILDREN’S FUNERARY RITUAL DURING THE BRONZE AGE: MAROS CULTURE CEMETERY IN MOKRI. (2100-1800 BC)

Contribution format: Oral  
Contribution authors: Mina Amzirkov – Marko Porčić (Department of Archaeology, Faculty of Philosophy, University of Belgrade) – Katharina Rebay-Salisbury (Department of Prehistoric and

Historical Archaeology, University of Vienna | Austrian Archaeological Institute, Austrian Academy of Sciences) – Fabian Kanz (Unit of Forensic Anthropology, Medical University of Vienna) – Michael Wolf (Department of Analytical Chemistry, University of Vienna) – Lidija Milašinović (National Museum Kikinda) – Sofija Stefanović (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

The beginning of the Bronze Age in Europe brought many changes and new social structures, with societies becoming stratified and more complex. Emergence of social stratification during the Bronze Age of Europe influenced the human perspective on assets and marriage and redefined the relationship between men and women. These effects are notable in differences in burial norms between adult male and female individuals with estimated sex, based on their skeletal remains, buried at the Maros culture necropolis in Mokrin. As well as by observing other aspects of their funerary ritual such as orientation, burial shape and depth, and the difference in grave goods, that can be characterized as typically male or female. Still, the question arises whether these changes influenced the burials of boys and girls of all ages. To reconstruct the influence of biological sex and age on the funerary ritual of children, we have determined biological sex using enamel peptide analysis on 57 skeletal remains of children with available teeth samples aged between 2-18/22 years. The results have shown that almost all of the analyzed boys and girls follow the same funerary ritual as adults. They were buried in shallower burial pits, in a north-south/south-north orientation, with the same variation in burial pit shape, where the boys followed the same ritual as adult men and girls for adult women. Grave goods in children’s burials follow the same categorization as in the burials of adults. Based on these results, it is noticeable that the biological sex of children older than 2 years, played a significant role in their gender representation.

**309. IS IT A BOY OR A GIRL? PROTEOMIC AND OSTEOLOGICAL SEX ESTIMATIONS OF NORTHERN IBERIAN BRONZE AND IRON AGE INFANTS**

**Contribution format:** Oral  
**Contribution authors:** Javier Salcines-Montaña – Teresa Fernández-Crespo (University of Valladolid)

Sex estimation is fundamental for the reconstruction of human identity and experience, correlating with a range of biocultural behaviors and population dynamics. On skeletal remains, sex has routinely been approached by morphometrical features arising from post-pubertal sexual dimorphism. A maximum accuracy of ~95% is possible for adult individuals when both the skull and the coxal bone are well preserved. However, for non-adult individuals –particularly infants– conventional osteological sex estimations are challenging because sexually-dimorphic markers are still to be developed and, therefore, they are rarely undertaken and/or considered. Here, we present matching proteomic and osteological sex estimations of 78 Late Bronze and Iron Age infant individuals aged from 30 gestational weeks to 5 years old that were buried in domestic contexts of La Hoya settlement (Rioja Alavesa region, present-day Basque Country). The aim of the research is double: 1) to evaluate the diagnostic capability of dimorphic enamel peptide analysis on developing deciduous teeth and 2) to assess relative reliability of often-used osteological methods in comparison to peptide sex data. Results show that it is possible to confidently determine sex through peptide analysis in the majority of cases, although some samples failed due to insufficient mineralization of tooth enamel. Agreement between peptide and osteological methods is often limited and the main causes of inconsistency are evaluated. We conclude that proteomics constitutes an important complement or alternative to osteological sex estimation in infants, particularly when destructive analyses, like DNA, are not a possibility.

**282. WHEN THE TOOTH FAIRY DOESN’T VISIT: DENTAL PATHOLOGY AND DENTAL ENAMEL PEPTIDE ANALYSIS IN CHILDREN FROM THE HUNGARIAN BARBARICUM**

**Contribution format:** Oral  
**Contribution authors:** Cristina Tica (Globe Institute, University of Copenhagen) – Marine Morvan (Globe Institute, University of Copenhagen | Novo Nordisk Foundation Center for Protein Research, Proteomics Program, University of Copenhagen) – Csilla Líbor – László Schilling (New Archaeological Collection, Hungarian National Museum) – Sándor Évinger (Department of Anthropology, Hungarian Natural History Museum) – Jesper Olsen (Novo Nordisk Foundation Center for Protein Research, Proteomics Program, University of Copenhagen) – Enrico Cappellini (Globe Institute, University of Copenhagen)

Childhood paleopathology, while a challenging and underrepresented area of archaeological research, remains a vital and highly informative subfield of bioarchaeology. By combining methods from paleoproteomics and biological anthropology, this study shifts the lens of interrogation from the Roman Empire to the forgotten ‘barbarians’ outside its borders, to explore any sex difference in childhood health in communities east of the Roman limes. Non-adult individuals with age-at-death of ~1-12 years-old from 10 sites on the Great Hungarian Plain have been

selected for macroscopic assessment of oral pathologies and childhood stress indicators: dental calculus, dental caries, and linear enamel hypoplasia (LEH) have been identified based on well-established criteria and scored as present or absent on both deciduous and permanent teeth. LEH has been used as a non-specific indicator of physiological stress in past populations, and extensively used in bioarchaeology to reconstruct general health status and population trends. Because we are working with archaeological skeletal remains that have not reached puberty, osteological sex estimations based on morphological techniques are notoriously unreliable and problematic. Instead, we used a streamlined mass spectrometry-based workflow for the estimation of sex using targeted amelogenin (AMELX/AMELY) peptides from dental enamel by employing a minimally invasive sampling strategy via acid etching and high-resolution liquid chromatography coupled to mass spectrometry using parallel reaction monitoring assay. The current investigation focuses on teeth for several reasons. First, they are the most highly mineralized body structures and the better preserved skeletal remains for the examined collections. Additionally, as enamel is produced only once, during the period of crown formation, spanning prenatal through late childhood periods of development, it provides invaluable insights into past childhood experiences. Dental enamel forms incrementally and does not remodel or repair, retaining a record of the developmental process, including both physiological growth changes and alterations due to abnormal stress events.

**1467. INFANT FEEDING PRACTICES IN ANCIENT ROME: A SEX-BASED EXAMINATION OF SUPPLEMENTATION, WEANING, AND LEAD CONSUMPTION**

**Contribution format:** Oral  
**Contribution authors:** Leigh Oldershaw (Ohio State University) – Federico Lugli (University of Bologna | University of Modena and Reggio Emilia) – Alessandra Sperduti (Museum of Civilizations) – Alfredo Coppa (Sapienza University of Rome) – Debbie Guatelli-Steinberg (The Ohio State University) – Luca Bondioli (University of Padua | University of Bologna) – RobertAnczkiewicz (Polish Academy of Sciences) – Alessia Nava (Sapienza University of Rome)

Recent studies of Roman infant feeding practices have used Laser Ablation-Inductively Coupled Plasma-Mass Spectrometry (LA-ICP-MS) time-resolved profiles (Sr/Ca, Ba/Ca, Pb) to reconstruct individual infant feeding timelines. Coupling elemental profiles with paleoproteomic studies of the sex-related isoforms of amelogenin provides an unprecedented opportunity to further explore sex-based differences in infant feeding practices. Here we use histologically-guided biogeochemical analyses to examine sex-based differences in the use of supplementary non-human milks, age at the onset of weaning (Sr/Ca and Ba/Ca), and variations in lead concentration in 52 molars from 48 individuals of amelogenin-derived known sex from across 1st-5th century CE Roman Italy. Results show: 1) a variability in Roman infant feeding practices, 2) the use of supplementary non-human milks prior to six months of age, 3) an increase in Pb concentration with the onset of weaning, and 4) that no sex-based differences existed within our sample. This is significant given that recent isotopic studies have provided limited evidence of sex-based differences in the diets of Roman children as young as 4.5 years of age, as well as sex-based variation in weaning timing. These results significantly broaden our understanding of sex-based variation in early infant feeding practices, allowing for a clearer understanding of the role that biology and culture played in shaping the infant feeding process in ancient Rome.

**1003. FROM CHILDHOOD AND BEYOND — MULTI-ISOTOPIC ANALYSIS OF HUMAN REMAINS FROM TWO NEOLITHIC SITES IN NORTHEASTERN HUNGARY**

**Contribution format:** Oral  
**Contribution authors:** Eniko Somogyvári-Lajtár (Institute of Archaeological Sciences, Eötvös Loránd University | Institute for Geological and Geochemical Research, HUN-REN RCAES) – Kitti Köhler (HNMPCC, Hungarian Natural History Museum, Department of Anthropology) – Alexandra Anders (Institute of Archaeological Sciences, Eötvös Loránd University)

For this research, we have chosen dental material from the burials of two Neolithic (5500-4500 BCE) sites around Polgár (Polgár-Ferenci-hát, Polgár-Csőszhalom), to get an insight into the childhood diet and thus the lifestyle of the deceased in childhood and those who lived to adulthood. Polgár-Ferenci-hát is one of the largest sites in the Middle Neolithic, and Polgár-Csőszhalom is an iconic site of the Late Neolithic period in the Carpathian Basin, Hungary. In both sites, the graves were located in the vicinity of the houses. Such a project has not been done before in the field of Hungarian prehistoric research. From Polgár-Ferenci-hát we analysed 29 teeth from children and 25 teeth from adults. From Polgár-Csőszhalom we examined 29 teeth from children and 79 teeth from adults. We have taken one tooth sample from children (mainly M1, or one of the deciduous teeth). In the case of adults, we have chosen two samples (M1, M2) to study different stages of childhood. The research questions were: (1) Are there differences in childhood eating habits between those who died young and those who survived to adulthood? (2) Are there differences in the breastmilk feeding habits between the two groups mentioned above? (3) How does the weaning process compare between children and adults? (4) Is there a gender difference? (5) How

do results from the two sites over 1000 years compare in terms of changes over time and space? We excavated and measured tooth collagen and hydroxyapatite portions of the samples at the Archaeoisotope Laboratory of the Institute of Geology and Geochemistry of the HUN-REN Centre for Astronomy and Earth Sciences. We analysed stable carbon, nitrogen, and oxygen isotope ratios to reconstruct breastfeeding signals, the weaning process, and dietary habits.

1887. INFANT DIET OF GIRLS AND BOYS IN THE BRONZE AGE MOKRIN NECROPOLIS (2100-1800 BC)

**Contribution format:** Oral  
**Contribution authors:** Jelena Markovic (Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade) – Elissavet Ganiatsou – Christina Papageorgopoulou (Laboratory of Physical Anthropology, Democritus University of Thrace) – Sofija Stefanović (Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade)

The Bronze Age was a period of major cultural and social transformation, marked by pronounced social stratification and defined gender roles. While extensive research has examined how these shifts affected adult men and women, little is known about their impact on children, particularly the age at which gender began to shape children’s lives. Considering that children, especially during the first years of life, have limited input in their dietary choices, the decisions of caregivers about what is socially and culturally acceptable for them to eat can significantly influence their growth, development, and overall health. Since breastfeeding and weaning are heavily culturally reliant, studying these behaviors can provide an important insight into childhood and societal perceptions of gender children’s lives, and how their communities perceive them. Our project investigates breastfeeding and weaning patterns in the Mokrin necropolis (Banat, Serbia, 2100–1800 BC) using incremental dentine analysis. This is a novel technique that reconstructs diet through the isotopic shifts of carbon ( $\delta^{13}\text{C}$ ) and nitrogen ( $\delta^{15}\text{N}$ ) on the sequential layers of dentine with sub-annual precision. We sampled the deciduous or permanent first molar from 50 individuals with determined sex based on the peptide analysis, that correspond to dietary changes from birth through childhood (6-7 years old). Elevated  $\delta^{15}\text{N}$  shows breastfeeding duration, while  $\delta^{13}\text{C}$  shifts indicate the type of weaning foods introduced. With this assay, we aim to assess the duration of breastfeeding and weaning and report potential differences between male and female individuals. This study is the first to examine the influence of gender roles on infant diet at one of the most significant Bronze Age sites in Europe, offering new perspectives on childhood and social organization in prehistoric communities.

1832. WEANING PRACTICES THROUGH GEOCHEMISTRY: COMPARING TECHNIQUES

**Contribution format:** Oral  
**Contribution authors:** Michael Allen Beck De Lotto (Department of Cardiac, Thoracic, Vascular Sciences and Public Health, University of Padua) – Alessia Galbusera (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University) – Alice Paladin (Institute for Mummy Studies, Eurac Research, Bolzano) – Manuel Rigo (Departement of Geosciences, University of Padua) – Szymon Mianowski (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University | Polish Academy of Science, Kraków) – Robert Anczkiewicz (Polish Academy of Science, Kraków) – Luca Bondioli (Department of Cultural Heritage, University of Padua | Polish Academy of Science, Kraków) – Alessia Nava (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University)

Reconstructing weaning practices in ancient populations is crucial for understanding nutritional strategies and infant care. However, the precise identification of the transition from breastfeeding to solid foods remains a methodological challenge. This study compares two different approaches applied to odontoskeletal remains from the Picene necropolises of Matelica (8th-6th century BCE, central Italy): bulk  $\delta^{15}\text{N}$  isotopic analysis of 44 individuals elaborated through the WARN model (Weaning Age Reconstruction with Nitrogen isotopes) and histology drive. geochemistry of dental enamel by LA-ICP-MS (Laser Ablation Inductively Coupled Plasma Mass Spectrometry). The WARN analysis, performed on 44 non-adult individuals, was based on an approximate Bayesian computational model proposed in 2013 by Tsutaya & Yoneda. The results indicate an onset of weaning at approximately 3.6 months ( $t_1 = 0.3$  years) and a complete transition to solid foods at 24 months ( $t_2 = 2.0$  years). The nitrogen enrichment value (2.9‰) and the weaning diet  $\delta^{15}\text{N}$  (8.5‰) suggest a post-weaning diet rich in animal proteins or other nitrogen-enriched foods. In parallel, five thin sections of deciduous molars from five different individuals were analysed for Trace Elements (TE) concentration variation with particular attention to the key markers of weaning (Sr and Ba). An increase in Ba/Ca and Sr/Ca ratios between 100 and 150 days (3-5 months) suggests an early introduction of solid foods. The comparison between WARN model and dental geochemistry shows good agreement in the timing of weaning initiation, while highlighting potential variability in the full transition to solid foods. The integration of these two approaches provides a more comprehensive understanding of infant

feeding strategies in past societies.

516. THE IMPACT OF BREASTMILK CONSUMPTION IN THE FORMATION OF DENTAL ENAMEL HYPOPLASIA: A HISTOMORPHOLOGICAL AND STABLE ISOTOPE APPROACH

**Contribution format:** Oral  
**Contribution authors:** Elissavet Ganiatsou – Panagiota Bantavanou – Christina Papageorgopoulou (Laboratory of Biological Anthropology, Democritus University of Thrace)

Dental Enamel Hypoplasia (DEH) is a pathological marker caused by insufficient secretion of mineral and organic substances during enamel formation, as a result of physiological and metabolic stress during infancy. DEH is frequently associated with infections and malnutrition, particularly during the weaning process. Despite extensive research, the precise aetiology of DEH remains partly understood. This study explores the relationship between breastmilk consumption, weaning duration, and DEH formation as critical factors influencing infant growth and development. To investigate this, 26 individuals from ancient Thessaloniki, primarily dating to the Roman period (168 BC–324 AD), were analyzed. Histological sections of permanent canines were prepared to assess the severity and age-at-formation of DEH microscopically. Stable isotope analyses of nitrogen and carbon, combined with Bayesian mixing models, were performed on first permanent molars to estimate weaning duration and the proportion of breastmilk in the diet. The results demonstrate that individuals consuming less than 50% breastmilk during weaning developed multiple DEH defects, with a mean age of formation at 2.59 years. These defects predominantly occurred near or after the estimated mean weaning age of 2 years. This correlation suggests that reduced breastmilk intake and early weaning significantly contribute to the appearance of DEH. These findings have broader implications for understanding DEH in ancient populations, where the condition is particularly prevalent. This assay combines cutting-edge analytical and computational techniques to offer valuable insights into early dietary practices and developmental stress across time. This research is part of the ERC-Consolidator Grant entitled CityLife (Project: 101126337).

724. CHILDHOOD STRESS AND ADULT HEALTH: INVESTIGATING HARRIS LINES AND ENAMEL HYPOPLASIA IN BRONZE AGE POPULATIONS OF NORTHERN BANAT

**Contribution format:** Oral  
**Contribution authors:** Marija Kreckovic Gavrilovic – Sanja Nestorović (University of Belgrade, Faculty of Philosophy. Laboratory for Bioarchaeology) – Tamara Vučinić (Clinical Hospital Zvezdara, Belgrade) – Sofija Stefanović (University of Belgrade, Faculty of Philosophy. Laboratory for Bioarchaeology)

Research on both modern and past populations has demonstrated that adverse early-life conditions can have a significant impact on long-term health and longevity. This perspective was notably advanced by D. Barker and colleagues through the Developmental Origins of Health and Disease (DOHaD) hypothesis, which originally established a correlation between low birth weight and an increased risk of cardiovascular disease in later life. In recent years, scholars have explored the applicability of this hypothesis to archaeological populations with varying degrees of success. This study examines childhood physiological stress in Early and Middle Bronze Age populations from the necropolises of Mokrin and Ostojićevo, Serbia, through the analyses of Harris Lines (HL) in tibiae and enamel hypoplasia (EH) in teeth. These methods were selected because they enable the reconstruction of childhood health status from adult skeletal remains. By utilizing adult skeletons to assess the childhood health status, we are able to expand the usually limited picture provided by subadult skeletons, as well as take into account the survivors of childhood stress, thus circumventing the osteological paradox. Previous research on this skeletal series identified a potential relationship between EH and reduced age at death. To expand upon these findings, we analyzed 113 individuals from both sites using digital X-ray imaging and the Harris Line Tool. This study aims to determine whether the patterns observed with EH can also be detected using another marker of non-specific physiological stress and to assess the similarities and differences between these indicators in reconstructing early-life health experiences. We expect to see the correlation between the shorter lifespan and episodes of growth arrest, as well as a correlation between the presence and frequency of EH and Harris lines.

1878. COMPARING DENTAL SIZE DIFFERENCES BETWEEN BOYS AND GIRLS IN THE BRONZE AGE MOKRIN NECROPOLIS (2100-1800 BC)

**Contribution format:** Oral  
**Contribution authors:** Sofija Stojkov – Nina Dragicevic – Mina Amzirkov Amzirkov – Marija Krečković Gavrilović – Sofija Stefanović (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

Data on the dimensions of the teeth of girls and boys in the Bronze Age are almost non-existent due to the

limitations in determining the sex of children based on their skeletal remains. A unique opportunity to study dental dimorphism among 57 Bronze Age children is provided by the fact that their biological sex was previously determined through peptide analysis. Our analysis included a metrical study of teeth from 24 boys and 33 girls who lived between 2100 and 1800 BC, buried at the Maros culture necropolis in Mokrin (Banat, Serbia). The mesiodistal and buccolingual diameters of permanent maxillary and mandibular molars were measured on an optical digitizing device. For this research, we have also measured the same diameters on all adults with available teeth and estimated sex by standard anthropological analysis. All the results were then compared to calculate the sexual dimorphism of the Bronze Age Maros population buried in Mokrin cemetery. Also, we compared the obtained results between children and adults. This way we gain insight into sexual dimorphism and differences in dimorphism expression in various ages in the Mokrin population, as well as the question of whether sexual dimorphism is noticeable in the teeth of boys and girls/men and women in Maros communities.

**1486. LIVE-BORN AND STILLBORN CHILDREN IN THE MIDDLE BRONZE AGE HORIZON AT THE OSTOJICEVO NECROPOLIS (1650-1500 BCE)**

**Contribution format:** Oral  
**Contribution authors:** Bojan Petrovic (Faculty of Medicine, University of Novi Sad) – Marija Marin – Sofija Stefanović (Faculty of Philosophy, University of Belgrade)

An important question that this study seeks to address is how society during the Middle Bronze Age treated newborn children. To explore this, we analyzed child burials from the Ostojićevo necropolis (1650-1500 BCE) in northern Banat, Serbia, where 103 children, aged up to 7 years, were laid to rest in ceramic vessels. This practice represents a distinctive burial tradition, unparalleled in scale during this period in the region. We investigate whether stillborn children, like their live-born counterparts, were interred within the necropolis and subjected to similar burial practices. In order to ascertain whether the neonates were stillborn or born alive, we conducted an analysis of the neonatal line, followed by an examination of various aspects of mortuary practices. The neonatal line (NNL) is typically the first discernible incremental line on dental enamel, and its presence reflects the infant’s exposure to the physiological stress associated with birth. As such, it serves as a reliable indicator for confirming that the neonate was born alive. The material analyzed consisted of longitudinally ground sections of 15 deciduous maxillary and mandibular incisors and canines from individuals in the perinatal and neonatal stages up to 1 year of age. Potential variations in burial practices between stillborn and live-born individuals were investigated through the analysis of burial orientation, the size and depth of the burial pit, the dimensions, type, and decoration of burial containers, grave offerings, and spatial distribution within the necropolis.

**1482. PALEODEMOGRAPHY OF THE MIDDLE BRONZE AGE (1650-1500 BCE) HORIZON OF THE NECROPOLIS IN OSTOJICEVO**

**Contribution format:** Oral  
**Contribution authors:** Marija Marin – Marko Porčić (Faculty of Philosophy, University of Belgrade) – Bojan Petrović (Faculty of Medicine, University of Novi Sad) – Sofija Stefanović (Faculty of Philosophy, University of Belgrade)

The Middle Bronze Age horizon (1650-1500 BCE) of the necropolis in Ostojićevo (Banat, Serbia) is notable for its large number (103) of child burials in ceramic vessels. The primary question is why children were buried in this unusual manner and what prompted this distinctive and unique (for the period and region) practice. In this presentation, we explore this issue from a paleodemographic perspective. We aim to explore whether the burial site at Ostojićevo functioned as a regular necropolis for the nearby living population during the period between 1650 and 1500 BCE, or whether the burials—particularly child burials in vessels—reflect an unusual event or process. Specifically, we analyze the age distribution of the Ostojićevo Middle Bronze Age mortuary population to determine whether the mortality regime was unusual or consistent with the expected preindustrial pattern of attritional mortality. To achieve this, we examine the ratio of adults to subadults, and we compare the age distribution of children within the subadult population to the corresponding distributions from the preindustrial model life tables. The age structure of subadult individuals interred within the Middle Bronze Age horizon at the Ostojićevo necropolis was reconstructed through the analysis of a sample involvin. 48 individuals. Periapical and orthopantomographic (OPG) dental radiography were employed for the examination of the entire sample. The age of individuals, ranging from 30 weeks in utero to 23 years, was estimated using the London Atlas (AlQahtani 2010). Radiographs deemed diagnostically acceptable for individuals exceeding 20 years of age were further analyzed using the Kvaal method (Kvaal 1995).

**797. CHILDHOOD IN ABORA STONE AGE SETTLEMENT**

**Contribution format:** Poster  
**Contribution authors:** Anna Batraga – Gunita Zariņa (University of Latvia, Faculty of Humanities, Institute of Latvian History)

Children are an important part of prehistoric societies. In many cases, the preservation of archaeological material makes it difficult to accurately describe the role that they played in their respective communities. While many studies have been done on the physical evidence of children, like toys or children-made tools, attention has also been paid to the social status of this age group and whether they even had a different social status relative to adults. One of the ways to try to identify this is through the diet of the individuals. This research will look at the diet of children from the Neolithic settlement of Abora (dated 3484 – 1925 cal BC), Latvia. In order to determine whether there are differences between the diets of children and adults during the Neolithic, stable carbon (d13C) and nitrogen (d15N) isotope analyses were performed on sequential dentin samples from the first permanent molars of six individuals. The age range of 4 to 8 years was chosen for the child diet because the beginning of this period marks the definitive end of weaning for all individuals, while 8 years of age remains within the first molar. Adult isotopic values of the same individuals were obtained from cranial fragments. The isotopic results show that the children had a diet similar to that of the adults. However, it can be seen that children had a slightly higher consumption of freshwater resources than adults, because these resources could have been easily accessible. This tendency does not seem to change between Middle Neolithic and Late Neolithic. This research was prepared within the Latvian Council of Science funded project “The environment and early farming of the Abora Neolithic settlement in lake Lubāns wetlands” (project No. lzp-2022/1-0300).

**48 REFLECTIONS OF VUČEDOL CULTURE: CHRONO-CULTURAL AND INTERDISCIPLINARY PERSPECTIVES**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Vučedol culture, Copper Age, third millennium BC  
**Session organisers:** Jacqueline Balen (Archaeological museum in Zagreb) – Elena Leghissa (ZRC SAZU, Institute of Archaeology, Ljubljana) – Ina Miloglav (Faculty of Humanites and Social Sciences, University of Zagreb) – Federico Bernardini (Dipartimento di Studi Umanistici, Università Ca’ Foscari)

**SESSION ABSTRACT**

The Vučedol culture stands as one of the most significant cultural phenomena in southeastern Europe during the third millennium BC. Originating in the region of Eastern Croatia, its influence extended widely across central and southeastern Europe, shaping cultural developments in areas such as present-day Croatia, Slovenia, Serbia, Bosnia and Herzegovina, Montenegro, Albania, Hungary, Austria, Italy, Slovakia, Czech Republic and Romania. The Vučedol phenomenom holds parallels with other pivotal European cultural groups, which collectively played key roles in shaping the prehistoric European landscape. The session aims to gather contributions from both regional and supra-regional studies, offering fresh insights that enrich broader discussions on cultural interaction, technological advancements, and social complexity in prehistoric Europe. We welcome also research that moves beyond regional specifics to examine the wider impact and connections of the Vučedol culture within European prehistory. By positioning Vučedol in the larger narrative of European development, this session seeks to foster interdisciplinary dialogue and highlight the culture’s lasting legacy. Therefore, we welcome contributions that offer: 1) new research findings and discoveries of recently identified Vučedol sites, offering fresh perspectives on this pivotal culture; 2) case studies that focus on settlement patterns, economic activities, cultural contacts and mobility, while also considering the broader European connections and exchanges; 3) interdisciplinary methodologies—ranging from geo-spatial analyses to archaeometric investigations—of diverse material remains, which allow for a more comprehensive reconstruction of the Vučedol way of life and social organization, and its impact on neighbouring regions; 4) ongoing challenges of refining the chronological phasing of the Vučedol culture, with a focus on its development across the Europe; 5) new proposals that enhance our understanding of the culture’s defining characteristics, its social dynamics, and the scope of its influence across south-eastern and central Europe, as well as its connections to the broader European context.

1372. BITS AND PIECES OF VUČEDOL STRATIGRAPHY

**Contribution format:** Oral  
**Contribution authors:** Danijela Roksandic Vukadin (Forensic Science Office, University of Zagreb | Faculty of Humanities and Social Sciences, University of Zagreb) – Slavica Bošnjak (Forensic Science Office, University of Zagreb | Faculty of Humanities and Social Sciences, University of Split) – Mirela Hutinec (Vučedol Culture Museum) – Zdravka Hincak Daris (Forensic Science Office, University of Zagreb | Faculty of Humanities and Social Sciences, University of Zagreb)

The Vučedol site, the largest settlement and the starting point for the spread of Vučedol culture, has been studied for over a hundred years. It spans over 8 ha, where a diverse and complex stratigraphic situation has been documented at several positions (Vineyard Streim, Vineyard Karasović, Cornfield Streim and Gradac) within large and small trenches and test probes. Continuous settlement in prehistory can be traced from the Neolithic (Starčevo culture) through the Bronze and Iron Ages, and there is also evidence from the period from Antiquity and the Late Middle Ages. However, the best-preserved layers are those of the Vučedol culture, which can be traced through its Classic Vučedol phase. The earliest phase of settlement, Vučedol A, has not clearly been recognized and defined, while the most prominent layers belong to the Classic Vučedol B1 and B2 phases. Recent excavations at the Cornfield Streim position identified the final layers of Vučedol culture, classified as the Late Classic Vučedol phase, tentatively named B3. This work will present and summarize not only the established knowledge about the stratigraphy and chronology of the site but also the results of the latest research and discoveries. It will also depict the interrelations of the stratigraphy from previously excavated positions, as well as the connections of Vučedol culture with the Baden, Kostolac, and Somogyvár-Vinkovci cultures.

1380. MASTERING METAL: EVIDENCE OF ENEOLITHIC METALLURGY IN NORTHERN CROATIA

**Contribution format:** Oral  
**Contribution authors:** Slavica Bošnjak (Forensic Science Office, University of Zagreb | Faculty of Humanities and Social Sciences, University of Split) – Danijela Roksandić Vukadin – Zdravka Hincak Daris (Forensic Science Office, University of Zagreb | Faculty of Humanities and Social Sciences, University of Zagreb)

This research examines the emergence and development of copper metallurgy among Eneolithic communities in Northern Croatia, spanning from 4500 to 2500 BC. It covers the final phases of the Sopot culture, and the subsequent Lasinja, Retz-Gajary, Baden, Kostolac and Vučedol cultures. Initial experimentation with copper metallurgy began during the Middle Eneolithic with the Retz-Gajary culture. The Baden culture saw significant technological advancements and increasing production particularly in area of Brodsko Posavlje, with widespread use of arsenical copper, crucibles and one-piece moulds. The Vučedol culture represents the peak of Eneolithic metallurgy in this region. This period is characterized by significant technological advancements, including the use of two-piece moulds, the development of regionally distinctive types of metal objects, the production of standardized metal artefacts, and the emergence of metal hoards. The research analyses archaeological material indicative of metallurgical activity, such as technological waste and metallurgical tools, with a special emphasis on recognizing these materials within their archaeological contexts. This study incorporates new and unpublished evidence to broaden our understanding of copper processing in these communities. By tracing independent technological advancements and their contributions to the development of metallurgical traditions, this study clarifies the origins of copper metallurgy in Northern Croatia and its role in shaping developments leading up to the Bronze Age.

654. LATE COPPER AGE TELL-SETTLEMENTS IN EASTERN CROATIA: A CASE STUDY OF THE PRISUNJAČA SITE

**Contribution format:** Oral  
**Contribution authors:** Ina Miloglav (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

The multi-layered site Prisunjača-Ciganica is one of the most recently excavated Vučedol sites systematically studied in the area of Eastern Croatia. The settlement is located in a prominent, elevated position in the landscape, once surrounded by a stream on three sides. Geophysical surveys suggest that the settlement was fortified by a ditch that enclosed the area, which was the typical settlement pattern throughout the entire Late Copper Age. Based on the archaeological research conducted since 2019 we can clearly distinguish two phases of habitation of the Vučedol population on the site, with 14C dates ranging from 2890–2670 BCE and 2667–2472 BCE. The remains of three house structures, with the evidence of construction repairs, indicate specific settlement dynamics

and organization. Spatial analysis of the pottery assemblages suggests certain active and specific zones within the settlement. Special focus will be on the results from the excavation conducted in 2024, which revealed the remains of the Vučedol house (4.5x8.0 m), with the entire inventory left in the object before abandonment due to fire destruction and preserved in situ. More than 30 vessels were found within the two-room house, along with other stone and bone artefacts which were used in everyday activities.

1660. SUBOCKI GRAD: A NEWLY DISCOVERED VUČEDOL HILLFORT IN WESTERN SLAVONIA

**Contribution format:** Oral  
**Contribution authors:** Ivan Drnić (Archaeological Museum in Zagreb)

Subocki grad, also known as Gradina, is a fortress located in a hilly area northeast of Novska, in western Slavonia, Croatia. During the late Middle Ages, Subocki grad (castrum Zombathel) was held by the Svetački noble family (de Zempche). Systematic archaeological research which began in 2021, primarily focuses on the late medieval period. However, excavations have revealed evidence of much earlier occupation, including by the Vučedol culture. A large pit, accompanied by several postholes, was unearthed along the plateau’s northern edge. Originally used as a storage pit and later for waste disposal, this feature, lay beneath a medieval leveling layer containing artifacts from the Copper, Bronze, and Iron Ages. The remains of the settlement structures of the Vučedol culture and the associated archeological material will be presented and interpreted in this lecture. In addition, this newly discovered site will be placed in its typo-chronological context and its relationship to the surrounding Late Copper Age hillforts will be examined.

672. LATE COPPER AGE DITCHES – A NEW RESEARCH FOCUS FOR LATE COPPER AGE SETTLEMENTS IN CROATIA?

**Contribution format:** Oral  
**Contribution authors:** Miroslav Vukovic (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology) – Jacqueline Balen (Archeological Museum in Zagreb) – Ina Miloglav (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

In recent years remote sensing techniques have been more widely applied in various archaeological research projects and excavation campaigns in Croatia. For eastern Croatia the focus has been mainly on magnetometry, a geophysical technique, which has proven to be especially successful in prehistoric archaeological contexts. With the arrival of a detailed LiDAR dataset for the whole country we gained another tool that was initially not considered as beneficial for the research of Late Copper Age sites and potential features. The remote sensing data revealed wide ditches surrounding the Late Copper Age settlements whose presence was always assumed but never properly researched. Their imposing size (often more than 20m wide) is problematic from an excavation perspective, but the new remote sensing data can help us with defining these large infrastructural features. LiDAR data has also revealed a new Vučedol culture site in northwestern Croatia with thinner double ditches around the settlement. In light of this new data, we will present our preliminary research of this important but neglected feature and present our research strategy which will help us tackle wider questions about Late Copper Age settlement patterns.

1095. PRELIMINARY RESULTS FROM THE FIELD SURVEY OF A FORTIFIED VUČEDOL SETTLEMENT AT SZILVÁS IN SOUTHEAST TRANSDANUBIA (HUNGARY)

**Contribution format:** Oral  
**Contribution authors:** Martin Furholt – Kata Furholt (Kiel University) – Mira Majdan – Gabor Bertok (Janus Pannonius Museum, Pécs) – Fynn Wilkes – Sebastian Schultrich (Kiel University)

We present the results of the new geophysical and archaeological prospections at the Vučedol fortified settlement Szilvás in Southeast Transdanubia (Baranya County, Hungary). The multiperiodic site was in use from the Late Copper Age to the Migration Period, but most pottery sherds are associated with the Vučedol pottery style. The find of a possible wheel model highlights the role of technological innovations. Through our geomagnetic investigations, we were able to identify a complex enclosure system with five ditches and a large number of pits, suggesting that we deal with a densely built, fortified settlement connected to the Vučedol complex. This complex is to be seen in the context of important social and economic transformations in Southeast and Central Europe in the early 3rd millennium BCE, during the Late Copper and the Early Bronze Ages. However, only a few Vučedol settlements have so far been excavated and published. Thus, the site of Szilvás opens up the possibility of gaining a better understanding about domestic activities, subsistence economy, the layout and structure of the settlement, and its complex spatial organisation.

916. VUČEDOL ‘DESCENDANTS’: SOME NEW EARLY MAKÓ AND NYÍRSÉG SITES FROM EASTERN HUNGARY

Contribution format: Oral  
Contribution authors: Janos Dani (University of Szeged | Déri Museum, Debrecen)

The Vučedol culture is one of the most emblematic and important archaeological cultures of the Carpathian Basin’s Bronze Age, perfectly representing the ’transition’ between the Late Copper Age and the Early Bronze Age in many aspects. More and more is known about the life, burial rite, settlements, distributio. and chronology of the Vučedol, both from sites in eastern Croatia and in southern Hungary. However, the further development and history of the ‘Vučedol tradition’, which fertilized the Bronze Age of the Carpathian Basin and SE-Europe, has always been a priority issue for research. From this point of view, the sites and material culture of the Makó-Kosihy-Čaka culture (2600-2300 BC), which developed partly from Vučedol traditions, and of the subsequent Nyírség culture (2300-2100 BC), which spread in the Upper Tisza region, are of particular importance. The latter’s decorative fine ceramics is strikingly reminiscent of the ‘original’ Vučedol decorative technique, but a real, existing link between the two cultures and areas is at the moment not interpretable, partly because of geographical distance and partly because of the chronological gap. In the last two decades, a few new sites of the Makó-Kosihy-Čaka and Nyírség cultures have been excavated in Eastern Hungary. The presentation aims to present the most important features of these sites, complemented by some interdisciplinary background

1278. LOWER STYRIA AND PREKMURJE REGIONS (NE SLOVENIA) IN THE LATE 4TH TO MID-3RD MILLENIUM BC: TRANSITION TO INTENSIVE OCCUPATION

Contribution format: Oral  
Contribution authors: Bine Kramberger (Institute for the Protection of Cultural Heritage of Slovenia (IPCHS) | Institute of Archaeology, ZRC SAZU)

This paper presents a comprehensive overview of settlement dynamics in Styria and Prekmurje regions (NE Slovenia) from the late 4th to the mid-3rd millennium BC. Over the past 25 years, large-scale infrastructure projects, including the construction of the A1 motorway and the Pragersko bypass, along with research on medieval castle sites, have led to the discovery of numerous prehistoric settlements. These findings provide new insights into settlement patterns during this transitional period. An analysis of material culture, supported in part by radiocarbon dating, indicates that the region was sparsely populated between the late 4th millennium BC and the early 3rd millennium BC. The scarce evidence from this period can be broadly linked to the Boleráz and Vučedol cultural horizons. However, with the emergence of the Somogyvár-Vinkovci culture (mid-3rd millennium BC), the number of settlements increased significantly. From this point until the Early Bronze Age (circa 1600 BC), no major fluctuations in settlement density are observed. The reasons for the sparse occupation during the Boleráz and Vučedol culture horizons remain unclear. The absence of graves from this time has so far prevented ancient DNA and isotopic analyses, limiting insights into demographic changes and mobility patterns. Additionally, paleoenvironmental data remains scarce. However, comparisons with neighbouring regions in the southeastern Alpine area and the western Pannonian Plain suggests that these trends may reflect broader regional developments rather than gaps in archaeological research alone. By placing these findings within a broader European context, this study contributes to ongoing discussions on cultural transitions, settlement patterns, and population dynamics during the 3rd millennium BC.

432. RE-EVALUATING THE VUČEDOL CULTURE IN THE SOUTH-EASTERN ALPINE REGION AND BEYOND

Contribution format: Oral  
Contribution authors: Elena Leghissa (ZRC SAZU, Institute of Archaeology, Ljubljana)

The Vučedol culture is one of the most significant phenomena of the third millennium BC in the south-eastern Alpine region and beyond. Among the most notable sites linked to this culture are the prehistoric pile dwellings of Ljubljansko barje in central Slovenia. Recent archaeological and interdisciplinary research has challenged long-standing interpretations, offering a more sophisticated understanding of the development of the Vučedol culture and its post-Vučedol aspects in this area. Traditionally regarded as a manifestation of the late Vučedol phase (Vučedol C) based on Stojan Dimitrijević’s framework, key findings from the Dežman’s pile dwellings near Ig and the Špica site in Ljubljansko barje—supported by radiocarbon and dendrochronological analyses—present a more nuanced picture. These sites do not merely reflect a late cultural phase but reveal a distinct variant, termed the Ljubljansko barje Variant, which partially overlaps chronologically with the classical Vučedol phase. This research highlights the strategic role of Ljubljansko barje as a dynamic cultural zone engaged in broader networks of exchange and communication within the Vučedol cultural sphere. The presentation will explore the implications of this variant, examining technological and material evidence, cultural interactions, and new chronological insights. By re-examining the dynamics of Vučedol in Slovenia, including sites in central Slovenia and the Vinomer site in Bela Krajina, this study contributes to a broader understanding of the culture’s regional

diversity and European significance.

300. THE SITE OF ZÓK – GRADINA IN BARANYA REGION: SOME ASPECTS OF ECONOMY AND CRAFT PRODUCTION

Contribution format: Poster  
Contribution authors: Jovan Mitrovic (National Museum of Serbia | Faculty of Humanities University of Primorska) – Selena Vitezović (Institute of Archaeology, Belgrade)

The site of Zók – Gradina (Várhegy) is situated in the Baranja (Baranya) region, in the vicinity of modern town of Pécs in Hungary. Large-scale excavations carried out in 1920 by National Museum in Belgrade revealed a rich multi-layered settlement and rich and diverse portable findings. Recent revision of the archaeological material stored in the National Museum of Serbia provided some new information about the prehistoric communities that inhabited this site. The majority of these findings may be attributed to the late phases of the Vučedol culture. Among other findings, relatively rich assemblage of osseous artefacts offered some insight into the economic activities and craft production within the settlement. Collecting and processing red deer antlers was rather important activity, since large amounts of both finished, used tools, and unfinished items and manufacture debris were recovered. Furthermore, many of these objects have manufacturing traces produced by metal weapons, thus providing some indirect evidence on the presence and usage of metal objects by these communities.

1376. COMPUTERIZED 3D FACIAL RECONSTRUCTION OF AN LATE COPPER AGE WOMAN FROM THE SITE VUČEDOL - CORNFIELD STREIM (VUKOVAR, CROATIA)

Contribution format: Poster  
Contribution authors: Danijela Roksandic Vukadin (Forensic Science Office, University of Zagreb | Faculty of Humanities and Social Sciences, University of Zagreb) – Irena Ćirić (Forensic Science Office, University of Zagreb) – Tomislav Staroveški (Faculty of Mechanical Engineering and Naval Architecture, University of Zagreb | Forensic Science Office, University of Zagreb) – Mirela Hutinec (Vučedol Culture Museum) – Slavica Bošnjak (Forensic Science Office, University of Zagreb | Faculty of Humanities and Social Sciences, University of Split) – Zdravka Hincak Daris (Forensic Science Office, University of Zagreb | Faculty of Humanities and Social Sciences, University of Zagreb)

Facial reconstruction is a fast-developing part of forensic sciences and medicine as an identification technique, while in bioarchaeology, with its multidisciplinary approach, brings ancient faces back to life. The basis consists of biological anthropology’s morphological and osteometric analysis methods, followed by methods of reconstruction that assume a relationship between the soft tissue and the underlying skull substrate. The research presented here focused on reconstructing the face soft tissues, resulting in an approximate representation of an individual as she would have appeared during her lifetime. The reconstruction was based on skull number 23, which belonged to a young female. Her remains were found in collective grave pit 6 at the Late Copper Age site of Vučedol — Cornfield Streim. The field excavation of this grave pit, which contained the remains of twenty-one individuals, was conducted during the years 2021 and 2022. The result shows the applicability of digitizing devices and free software for 3D modelling in forensic anthropology. Constant technological development enables new sources and devices in the praxis of forensic anthropology. Thanks to non-contact scanners, it can gather and process information about objects without causing any damage. The reconstruction starts by identifying the skeletal remains, with an emphasis on craniofacial anthropometry. The primary sources of information required for further reconstruction are provided. The process continues with a 3D scan and 3D modelling using the software Blender, MakeHuman, OrtogOnBlender, and a short animation as a final result. It is important to emphasize that the most likely face approximation is possible to achieve in the bioarcheological cases with faces from the past. This research illustrates one of the various methods of facial reconstruction. It examines the advantages and limitations of computer-based techniques for 3D facial reconstructions, emphasizing their significance in biological anthropology and the transfer of cultural knowledge.

50 NEW APPROACHES TO ARCHAEOACOUSTIC STUDIES

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Regular session  
Session keywords: archaeoacoustics, sound, musical instruments, methods, soundscapes  
Session organisers: Joshua Kumbani (University of Tübingen | University of Johannesburg) – Margarita Díaz-Andreu (Institució Catalana de Recerca i Estudis Avançats (ICREA) | Institut d’Arqueologia UB (IAUB)) – Zorana Đorđević (Departament de Història i Arqueologia,

SESSION ABSTRACT

Music and sound played a crucial role in past societies, yet much of this evidence has been lost due to the intangible nature of sound and the fragile nature of many musical instruments. Reconstructing past music and understanding how sound and acoustics were perceived present significant challenges. The absence of sound and music from archaeological reconstructions risks leaving a key dimension of past human experience unexplored. This session is open to researchers investigating the impact of sound in prehistoric and historical contexts, exploring diverse time periods and methodologies. The goal is to encourage dialogue on the practices associated to music and sound in social, ritual, and recreational contexts. We also aim at exchanging knowledge about the methods and perspectives that may be used to approach sound and music in the past. Papers may focus on musical instruments, sound-producing artifacts, the acoustics of built spaces, as well as urban and natural soundscapes. In summary, we seek to promote discussion on various approaches to reconstructing the acoustic experiences of past communities, fostering new perspectives and debates on the theoretical and methodological aspects of archaeo-acoustics. While organised by the Artsoundscapes and the Cult-Aural projects, this is an open call to researchers worldwide, working across different historical periods, who are studying how past communities interacted with sound in various cultural contexts.

CONTRIBUTION ABSTRACTS

726. EXPERIMENTAL APPROACHES TO ARCHAEOLOGICAL MUSICAL INSTRUMENTS ACOUSTICS: BONE CLAPPERS AND BULLROARERS FROM MATJES RIVER SITE, SOUTH AFRICA

**Contribution format:** Oral  
**Contribution authors:** Joshua Kumbani (University of Tübingen | University of Johannesburg)

Experimentation is essential for understanding the acoustics of archaeological musical instruments. This study examined the acoustic properties of two “traditional” South African instruments bullroarers and possible bone clappers recovered from the Later Stone Age Matjes River site in the southern Cape. Bullroarers, known for their aerodynamic sound production, and bone clappers used for percussive rhythm, have historical associations with ritualistic and entertainment practices. Through experimental methods, it is possible to reconstruct and test replicas to analyse their frequency ranges, sound propagation, and potential cultural applications. Replicas of both bullroarers and bone clappers were made and played. The analysis included microscopic analysis and comparative analysis of archaeological artefacts and replicas. The results provided insights into the role of these instruments in indigenous musical traditions and demonstrated the value of experimental archaeology in studying ancient soundscapes. This research enhances our understanding of the sound production of past societies and underscores the significance of reconstructing historical musical practices through empirical testing.

819. NEOLITHIC SHELL TRUMPETS IN CATALONIA: AN ARCHAEOACOUSTICAL APPROACH

**Contribution format:** Oral  
**Contribution authors:** Miquel López Garcia (Departament d’Història i Arqueologia, Universitat de Barcelona) – Margarita Díaz-Andreu (Departament d’Història i Arqueologia, Universitat de Barcelona | Institut d’Arqueologia Universitat de Barcelona (IAUB) | Institució Catalana de Recerca i Estudis Avançats (ICREA))

The use of marine shells from the genus Charonia as lip-vibrated aerophones has been documented in various cultures, both past and present, worldwide, for diverse purposes. Archaeological research indicates that these instruments, commonly known as marine shell trumpets, rank among the oldest aerophones, with evidence dating back to the Magdalenian period. In present-day Catalonia, a remarkable collection of Neolithic shell trumpets has been preserved. However, these instruments have received relatively little scholarly attention compared to examples from neighbouring regions such as the Bay of Cádiz, the Mediterranean islands or the Italian region of Liguria. Notable examples in Catalonia include shell trumpets from the Can Tintorer Mines (Gavà) and Mas d’en Boixos (Pacs del Penedès). The study of the shell trumpets undertaken in the framework of the Artsoundscapes project seeks to document, record, and experiment with those found in Catalonia. The aim of the project is to explore their potential uses, functions, practices, and meanings in the distant past. Given that some specimens still retain their ability to produce sound, we have undertaken several archaeoacoustical analyses that have enhanced our understanding of these instruments and their role within prehistoric communities. In this paper we will discuss the shell trumpets dated to the Middle Neolithic in the V-IV millennium BC. We argue that their appearance marked the emergence of new forms of social organization, shaping novel relationships with the landscape and its economic exploitation. One compelling example is the potential use of these horns as signalling devices within mining activities.

772. MUSIC AND PERFORMERS OF THE PAST: ARCHAEOOMETRY OF MUSICAL INSTRUMENTS MADE FROM BONE AND ASSOCIATED HUMAN REMAINS

**Contribution format:** Oral  
**Contribution authors:** Raquel Jiménez Pasalodos (Universidad de Valladolid) – Olalla López-Costas (Universidad de Santiago de Compostela | Stockholm University) – Susana De Luis Mariño (Museo Arqueológico Nacional)

The materials preserved in the collections of the National Archaeological Museum, though often originating from older excavations, offer a unique opportunity to recover, explore, and reconstruct complex historical narratives and aspects that have long been underexplored in archaeology, such as cultural expression through music. One such example is the musical instruments finds from the site of Castro (Retortillo de Soria, Castilla y León), located on the northern slope of the Sierra de Pela, which forms the watershed between the Duero and Tajo river basins. The only excavations at this site were conducted by the Marquis of Cerralbo between 1908 and 1911, with additional work mentioned by Blas Taracena in 1926, though the results were never published. Like the rest of the Cerralbo Collection, the finds from this site were donated to the National Archaeological Museum. However, both the field survey carried out for this research and a typological study suggest that the chronological attributions proposed by earlier scholars are questionable. An archaeometric analysis of the remains—including a bone string holder, a bone whistle flute, and a human skull associated with the former—could provide new insights into the chronology of the site and reveal additional musically significant details.

1030. COSMOLOGY, SOUND AND FORAGER SOCIETIES. THE ARCHAEOACOUSTIC STUDY OF SITE 26LN211, WHITE RIVER NARROWS (USA) AS A CASE STUDY

**Contribution format:** Oral  
**Contribution authors:** Margarita Díaz-Andreu (Institució Catalana de Recerca i Estudis Avançats (ICREA) | Universitat de Barcelona (UB)) – Lidia Alvarez-Morales – Daniel Benítez Aragón – Diego Moreno Iglesias (Universitat de Barcelona (UB))

What role did sound play in forager societies? Can archaeoacoustic studies help archaeology explore the ontological beliefs associated with how people understood the landscape? These are two key questions we aim to address in this paper. Our discussion is based on the archaeoacoustic study conducted by the ERC Artsoundscapes project at Site 26LN211, a rock writing location in the White River Narrows Archaeological District (WRNAD). This research, carried out in March 2024 as part of an integrated management strategy, sought to deepen our understanding of the placement of rock imagery. We examined the relationship between echoes, directive sound reflections, and the positioning of rock imagery. Our acoustic tests also investigated the sound interactions between two vision quest blinds—small U-shaped enclosures built against the cliff face above Site 26LN211—and the petroglyph site below. Finally, we assessed how distant sounds attenuate between rock-marked shelters and their surroundings. Our findings, presented in tables and graphics, provides insights into the site’s acoustic properties. But how can we go beyond these measurements? The paper concludes with a reflection on the contribution of archaeoacoustics to understanding the belief systems of the people who created the art.

377. THE RESONANCE OF HISTORY: FLUTE INSTRUMENTS IN ANCIENT INDIAN ART RELIEFS

**Contribution format:** Oral  
**Contribution authors:** Divyanshi Gupta (Institute für Indologie und Zentralasienwissenschaften)

The flute holds significant historical and cultural importance in ancient Indian society, serving as a symbol of artistic expression and social prestige. Ancient Indian art reliefs frequently depict flutes in diverse settings, including courtly performances, solo renditions, and orchestral ensembles. These representations not only highlight the prominence of the flute in daily life but also provide valuable insights into the musical knowledge, traditions, and evolving practices of the time. This study examines ancient Indian art reliefs and paintings featuring flutes from the 2nd century BCE to the 7th century CE. The analysis reveals the flute’s widespread acceptance in society, its important role in religious and ceremonial contexts, and the technical advancements in music during this period. Employing iconographic analysis and comparative studies with ancient texts, this paper also explores the stylistic elements of the flute’s portrayal, offering a deeper understanding of its artistic, cultural, and symbolic significance in ancient India.

947. ACOUSTIC MEASUREMENTS IN FINLAND’S HISTORICAL TAFONI

**Contribution format:** Oral  
**Contribution authors:** Jami Pekkanen (University of Helsinki, Cognitive Science) – Riitta Rainio (University of Helsinki, Department of Cultures)

We present an acoustic study of four Finnish tafoni—rock cavities formed by natural weathering processes. The tafoni have smooth, concave walls and inner cavity sizes ranging from approximately 30 cm to 190 cm. Their rare natural combination of smooth reflective surfaces and geometrical symmetries gives rise to distinctive, highly frequency-specific acoustic resonances. Using novel equipment suited to measuring such small spaces, we identified resonances ranging from 126 Hz to 953 Hz, fitting well within the human vocal range. The frequency-specific reverberation extends up to 1.4 seconds, though the duration and strength of resonances vary significantly across the different sites. At its strongest, the phenomenon creates a drone effect in speech and music. The tafoni hold a place in local folklore, associated with beliefs and stories about spirits, gnomes, offerings, refuges, liquor burning and cooking. Oral traditions describe their role as spaces for communication with more-than-human entities and even locations where sages conducted healing rituals, usually involving incantations. Given the accounts referring to auditory aspects and the distinctive acoustics observed, humans in past centuries likely recognized and utilized the tafoni’s unique soundscapes. One of the four sites was further scanned with a mobile phone LiDAR and exhaustively photographed with an aerial drone. The LiDAR and photography were combined to form a geometrically accurate textured 3D model of the tafone and its environment. Together with the high signal-to-noise impulse response estimates such models can be also used for computational analysis of the acoustics, laboratory based behavioral studies, musical performances in virtualized spaces and for immersive public exhibitions. . The new measurement and analysis methodology presented here enables detailed acoustic studies of small structures, and tafoni’s highly distinctive acoustics make them an interesting new target for archaeoacoustical research.

**1865. THE TOWERS ARE LIT, ARE THEY ALSO HEARD? EVALUATING THE SENSORY INTERACTION BETWEEN NURAGHI AND THEIR LANDSCAPE**

**Contribution format:** Oral  
**Contribution authors:** Tim Klingenberg (Institute of Archaeological Studies – Ruhr-University Bochum)

The focus of research into the Nuragic period is the analysis of the eponymous buildings from the Sardinian Bronze Age. These buildings are significant in two respects: first, they characterise a specific chronological period; and second, they are indicative of the surrounding landscape. Previous research has described the Nuragic buildings as bastions with their own territory, leading to the assumption that they functioned as a centre for the ruling population. However, more recent research has developed alternative interpretations of the use of these buildings on the basis of landscape analyses. Driven by these approaches, geographic information systems (GIS) have led to novel approaches and questions about the landscape around the nuraghi themselves. Sensory analyses, in most cases visibility, have also found their way into Sardinian research, although this only partially represents the everyday interactions of the prehistoric population with the landscape. The aim of this study is, to combine the visibility with an acoustical analysis of the landscape surrounding the prehistoric Sardinian tower constructions. The study is conducted on the island of Sant’Antioco, located in the south-west of Sardinia. This functions as an ideal study area because it is a self-contained micro-region and the at least 29 nuraghi present on the island offer a promising basis for studying the landscape in prehistoric times. The paper deals with the perception of the landscape by the Bronze Age population and its possible interactions with the monuments. It employs a multifaceted approach, utilising prospection methods and personal sensory experience in the landscape with geographical information systems.

**76. SOUNDSCAPES OF ERANSHAHR**

**Contribution format:** Oral  
**Contribution authors:** Domiziana Rossi (Cardiff University)

Archaeological evidence alone sometimes fails to fully provide the complete sensory experience of the past, as it often overlooks aspects such as taste, smell, texture of food, and the impact of sound, and other stimuli in ancient environments. Archaeology does, however, provide the tools to construct an environment in which human senses can be conceived. By employing the concept of soundscape, closely associated with sensory archaeology, we can address this gap by using evidence to build the auditory environment of past societies. This research aims to investigate soundscapes in Sasanian cities (224-651 CE). The methodology involves a comprehensive analysis of historical sources, complemented by extrapolating sound-related data from excavations and archaeological investigations. By examining materials, tools, language, faunal, and climatic analysis and archaeo-botanical remains, and then integrating these sources of evidence, this study seeks to provide a more nuanced portrayal of the sensory landscape of Sasanian cities. A 5-minute-long soundscape model will be produced as a case study city. The result will display a taste of the auditory experience and perceptions in an ancient urban setting along with developing an approach to and assessing sensory potential. This research based on the analysis of available data and the application of theoretical frameworks from sensory archaeology has the potential to provide the auditory experiences of Sasanian city dwellers and deeply enhance our understanding of the daily lives across different regions.

**1308. WHISPERS OF THE DIVINE: WIND, SACRED SOUND, AND ORACULAR COMMUNICATION AT DODONA**

**Contribution format:** Oral  
**Contribution authors:** Erica Angliker (Unicamp)

Recent scholarship has devoted considerable attention to the role of music in religious ceremonies at sanctuaries. It is now well established that music was not only a prestigious offering to the gods but also played a crucial role in the structure and efficacy of ritual performances. However, comparatively less attention has been given to the role of natural sounds—such as the murmuring of water, the rustling of wind, and the reverberation of echoes—which could be integrated into ritual practices and serve as mediators between worshippers and the divine. This paper examines the significance of wind-generated sound at the ancient sanctuary of Zeus at Dodona, one of the oldest and most revered oracular sites in Greece. Unlike other sanctuaries characterized by monumental architecture, Dodona functioned as an open-air cultic site centered around a sacred oak tree, believed to serve as an instrument of divine communication. The sound of the wind rustling through the leaves of the sacred tree played a fundamental role in shaping religious experience at the sanctuary, as it was perceived as the voice of Zeus and became a key element in oracular interpretation. By analysing literary sources, archaeological evidence, and comparative studies on ritual acoustics, alongside psychological theories on the acoustic projection of non-vocal sounds, this paper will examine how the rustling of the leaves provided a compelling auditory medium through which worshippers experienced the divine voice. This study argues that the perception of these natural sounds as divine speech was not merely symbolic but rather a crucial mechanism that reinforced the efficacy of its oracles.

**740. A CONVOLUTION METHOD FOR RECONSTRUCTING CLASSICAL SOUNDSCAPES**

**Contribution format:** Oral  
**Contribution authors:** Ella Peltonen – Mikko Mäkitalo (University of Oulu) – Laura Nissin (University of Tampere)

Latin literature describes ancient Roman perceptions of irritating noises, such as barking dogs, bakers working at night, cart traffic, and loud human voices, including commands to draught animals and rowdy customers of taverns. Recent archaeological research has seen an increase in the sensory investigation of ancient living spaces and urban culture, including archaeoacoustic research in the hope of discovering how such sounds influenced urban and domestic spaces. However, the sensory understanding of antiquity is still in its early stages, while different methods to investigate past sensations are being developed. Our work defines a methodological base-line for reconstructing the ancient soundscapes with digital twins. We performed LiDAR scanning in Pompeii and Herculaneum in November 2024; these 3D models form a base for soundscapes within a digital twin. We will model the environments with a convolution method to create accurate archaeoacoustic soundscapes that can be digitally reconstructed with different scenarios. We will use convolution signal processing to convolve sounds and on-site recorded binaural acoustic impulse responses. Thus, we can study the propagation of sounds inside and outside buildings and the changes in the in-building soundscape caused by sounds coming from outside. As Roman case studies, we use the House Wooden Partition III,11 in Herculaneum and the House of Marcus Lucretius IX,3,5 in Pompeii. For evaluation, we will first test the methodology in Turkansaari Open Air Museum (Finland), aiming to digitally reconstruct the acoustic features of different building materials. In our presentation, we report the initial Turkansaari results and our plan on how to extend the methodology into Roman buildings. Our goal is to form a holistic understanding of how sensory encounters influence domestic and urban space. Distinguishing the sensory experiences will lead to a better understanding of how cultural norms, use of space, and physiological necessities influence each other.

**1191. RESONATING ACROSS THE LANDSCAPE: PERCUSSION INSTRUMENTS AS COMMUNICATION DEVICES**

**Contribution format:** Oral  
**Contribution authors:** Zorana Dordevic (Departament de Història i Arqueologia, Universitat de Barcelona) – Joshua Kumbani (University of Tübingen) – Margarita Díaz Andreu (Departament de Història i Arqueologia, Universitat de Barcelona)

Before the innovations of electric communication systems, such as the telegraph and telephone in the 19th century, long-distance communication relied entirely on sound signals produced by sound-producing devices, often also used as musical instruments. This archaeoacoustic study explores how percussion instruments transmitted messages across landscapes, focusing on their acoustic properties and communicative functions. Our investigation follows two main lines of inquiry. First, we analyze the sound range and coverage area of these instruments, considering not only their acoustic properties but also the influence of environmental factors such as weather conditions, topography, and vegetation. Second, we examine how messages were encoded and transmitted. For instance, the manguaré, a pre-Columbian drum set, conveyed complex messages by mimicking the tonal patterns

of spoken language. The rhythmic sequences of semantron and church bells in Europe and gongs in various parts of Asia communicated important announcements, summoning communities, marking religious ceremonies, and issuing warnings across vast distances. By synthesizing data from archaeological, ethnomusicological, and acoustic studies, this research highlights the role of percussion instruments as sophisticated long-distance communication tools in diverse cultural contexts. Our findings contribute to a broader understanding of sound-based communication systems and their interaction with the environment, offering new perspectives on archaeoacoustics and the study of past soundscapes.

1150. RECONSTRUCTING THE 14TH-CENTURY SOUNDSCAPE OF THE GREAT CHAPEL AT THE PALAIS DES PAPES: ARCHAEOACOUSTIC METHODS AND VISITOR ENGAGEMENT

**Contribution format:** Oral  
**Contribution authors:** Julien De Muynke (Eurecat, Technology Center of Catalonia, Barcelona | Sorbonne Université, CNRS, Institut Jean Le Rond d’Alembert) – Stéphanie Peichert (Talkartive S.A.) – Julien Ferrando (Aix-Marseille Université, CNRS, IDEAS, Aix-en-Provence) – Brian F. G. Katz (Sorbonne Université, CNRS, Institut Jean Le Rond d’Alembert)

Archaeoacoustics investigates the soundscapes of the past, including the reconstruction of room acoustics to better understand the sonic environments of historical spaces. Complementing the study of ancient instruments and historical sound sources, the acoustics of built spaces significantly influenced how sounds were perceived by both performers and listeners. This study examines the Great Chapel of the Palais des Papes in Avignon, reconstructing its 14th-century acoustics during its use for Papal Masses. Ray tracing acoustic modeling was employed, integrating historical records on the chapel’s architecture and ornamentation to generate a virtual acoustic model of the space. The results reveal significant differences from its modern-day acoustics. The modeled acoustics were implemented in a real-time auralization system, enabling singers from a choir ensemble specializing in the Ars Nova repertoire—which flourished at the Papal Court—to experience and perform within the reconstructed acoustics. The system, combining individual proximity microphones and static binaural reproduction through semi-open-back headphones, allowed singers to engage with the historical acoustics, supporting a historically informed performance. The resulting dry recordings were used to reconstruct the chapel’s historical soundscapes as they would have been perceived by medieval listeners and were integrated into an interactive audio guide for visitors, offering an immersive and scientifically informed sensory experience of music’s role at the Papal Court.

51 SERIAL CRAFTERS. TOOLS AND METHODS FOR STUDYING ANCIENT SERIALITY AND SERIAL PRODUCTIONS

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Material culture, Seriality, Serial production, Archaeometry, Artefact studies  
**Session organisers:** Léonard Dumont (Ghent University, Department of Archaeology | Université de Bourgogne, UMR 6298 ARTEHIS) – Fabrice Monna (Université de Bourgogne, UMR 6298 ARTEHIS)

SESSION ABSTRACT

Seriality and serial productions are two very similar concepts. The first one refers to the reproduction of visually identical copies of a model, whereas the other one refers to the mass-production of objects belonging to one or several series. If serial productions existed in virtually every period, seriality first appeared with the development of metallurgy and the invention of molding and casting, enabling the (re)production of series of artifacts with very limited variations. Such objects can be manufactured using different techniques and be used in very different contexts, from everyday tools to prestigious artifacts made of precious materials. They can therefore provide information regarding the organization of production, use and diffusion of material productions in different spheres of ancient societies. However, investigating seriality or serial production is challenging. Because of the high degree of similarity enabled by that type of production and the partial archaeological data available, traditional tools used in material culture studies, such as typological classifications based on stylistic features, often fail to describe these productions and to identify variations in time and space. There is a need for alternative tools and methods to better characterize these artifacts, for example through the identification of production batches, which can be achieved by investigating chemical compositions or production techniques, but also using tools provided by geometric morphometrics, allowing for the quantification of morphological variations within and across series. This session aims at gathering archaeologists and researchers from interrelated fields of research to present and discuss different methods and tools allowing us to progress in the investigation and understanding of these productions.

CONTRIBUTION ABSTRACTS

563. BREAKING THE MOULD - EXAMINING THE LIMITS OF BRONZE AGE SERIAL PRODUCTION VIA CASTING EXPERIMENTS

**Contribution format:** Oral  
**Contribution authors:** Bart Cornelis (Curt-Engelhorn-Zentrum Archäometrie | University of Groningen)

Hoarding objects has been practiced throughout prehistory. However, hoards gain an entirely new character in the (later) Bronze Age as bronze objects are now assigned to the ground in large quantities. This is particularly the case for large axe hoards containing typologically uniform artefacts, which tend to be ascribed to a form of serial production or standardization via the use of casting moulds. Traditionally, serial production is studied using methods based on measurements, weight classes or chemical compositions, which are complicated by statistical approaches using standard deviation or the coefficient of variation (CV). However, finding evidence of standardization in hoards is often challenging as many axe types vary in size, weight or have heterogenous chemical compositions. Moreover, previous studies made statements about serial production based on CV’s in percentages without knowing the accuracy of bronze age production methods. Nevertheless, heterogenous axe hoards may still show signs of serial production since Bronze Age methods may be less accurate than anticipated, suggesting that modern standards may be projected on prehistory. This paper aims to advance the understanding of prehistoric serial production by assessing the minimum variation attainable via casting techniques using experimental archaeology, by serially producing twenty axes from two bivalve mould types, soapstone and ceramic. The experiments explored whether moulds can be reused and whether reuse produces identical objects. This is achieved by studying the casts using measurements, weight and CV’s. Moreover, shape consistency is assessed via 2D geometric morphometrics. The results indicated that moulds are reusable and able to produce standardized objects. However, ceramic moulds are more friable and its output is less uniform with more variation in shape despite being serially produced. The experiments created a potential standard on how to assess serial production in the archaeological record and suggests that serial production can be less uniform than anticipated.

1466. BRONZE AXES, LANDMARKS, OUTLINES, 3D MODELS, AND TRACES. ARE WE ABLE TO IDENTIFY OBJECTS FROM THE SAME CASTING MOULDS?

**Contribution format:** Oral  
**Contribution authors:** Marcin Maciejewski (Institute of Archaeology, Maria Curie-Skłodowska University) – Agata Hałuszko (Institute of Archaeology, Maria Curie-Skłodowska University | Archeolodzy.org Foundation, Świdnica) – Maksym Mackiewicz (Archeolodzy.org Foundation, Świdnica) – Kamil Nowak (Austrian Archaeological Institute, Austrian Academy of Sciences) – Agnieszka Pawlina (Institute of Archaeology, Maria Curie-Skłodowska University)

The Late Bronze Age Rosko hoard (NW Poland) is an unusual find compared to other hoards from this period. While most of them are collections of very different objects (so-called mixed hoards), the Rosko assemblage can be interpreted as the result of a very strict selection. Most are socketed axes of two very similar types. In addition, the dimensions of most of them are very similar too. What is more, the hoard also included casting moulds for the production of socketed axes. These similarities prompt a variety of questions. Especially those related to the organisation of production. For example, what was the number of potential casting moulds used to cast these objects? Also relevant was the question of whether the typologically and metrically similar axes discovered in the Rosko area could have been made using the same moulds. Would subtle typological differences be confirmed by methods focused on morphology and detailed measurements? 71 axes from the Rosko hoard and other contexts, as well as one two-part casting mould, were subjected to 2D and 3D geometric morphometric method analyses, 3D morphometric analyses, and use-wear analyses. The use of such a range of methods has given some answers but also provokes further questions. In addition, compare the various methods focused on morphological and metric data.

1677. THE SERIALKEY PROJECT. EXPERIMENTING NEW METHODS FOR INVESTIGATING THE MANUFACTURE OF EUROPEAN LATE BRONZE AGE (950-800 BC) SERIAL PRODUCTIONS

**Contribution format:** Oral  
**Contribution authors:** Léonard Dumont (Ghent University, Department of Archaeology | Université Bourgogne Europe, UMR 6298 ARTEHIS) – Fabrice Monna (Université Bourgogne Europe, UMR 6298 ARTEHIS)

Bronze Age is characterized by the spread of copper alloys metallurgy in Europe. The outbreak of casting techniques allowed for the development of seriality, that is the production of series of visually identical artefacts.

We observe a striking development of these serial productions at the European scale at the end of the period (ca. 10th-9th centuries BC) thanks to the mass production of reusable bronze moulds. Serially-produced artefacts, by their wide distribution and the existence of moulds pointing to production areas, have potential for a better understanding of the organization of production and of the diffusion of artefacts and techniques over long distances. However, investigating serially produced goods is a challenging task. Because of the important level of standardization, traditional methods such as typo-chronology are ineffective for the identification of meaningful chronological and spatial variations. The SerialKey project aims at developing new methods for identifying production batches within serially produced goods at the end of the European Bronze Age. Instead of studying morphological and ornamental variations, this project seeks out alternative methods to characterize production techniques and evaluate technological variability within series of mass-produced artefacts. The potential offered by systematic  $\mu$ CT scanning is being explored to identify batches based on porosity analysis and geometric morphometrics. We will present the first results and the potential of these methods based on the study of Late Bronze Age socketed axes from Belgium.

**249. SERIES OF ORNAMENTAL RINGS FROM THE ATLANTIC MIDDLE BRONZE AGE: BETWEEN ADORNMENTS, BRONZE STOCKS AND MONEYS?**

**Contribution format:** Oral  
**Contribution authors:** Thibaud Poigt (Université Bordeaux Montaigne, Ausonius) – Marilou Nordez (UMR 6566 CReAAH, Nantes Université)

During the Atlantic Middle Bronze Age (1500-1300 BC), there was a considerable increase in the mass of bronze hoarded, with several tons of metal being removed from the production-consumption-recycling cycle over a period of approximately 150 years. This bronze was primarily utilised for the fabrication of palstaves and ornaments. The majority of palstaves were found in northwestern France, while ornaments were also present in significant numbers. In contrast, on the other side of the Channel, ornaments were predominant, leading to the formation of a so-called ‘Ornament Horizon’. This level of abundance was never again attained subsequently. During this period, ornaments were predominantly found in hoards, i.e. in non-funerary contexts and in non-functional positions. Since the late 19th century, scholars have debated the significance of these substantial quantities of bronze, forgot or abandoned underground all across Europe. This has led to the proposal of a model of adoption of monetary practices, based on the hypothesis of an increasing standardisation of objects, resulting in the emergence of coinage. In this model, adornments, and especially rings, represent the earliest step of the process, where these finished products, roughly similar in shapes and weight, could be used as means of payment, like other kinds of adornments described by ethnographic studies. The present study aims to address the question of the degree of standardisation of Atlantic Middle Bronze Age arm rings. This will be achieved by examining the way they were manufactured and analysing their metrics (length and mass) from a metrological point of view. The study will explore the relationship between mass production, standardisation and monetary functions.

**1843. PRODUCTION OF BRONZE TRILOBATE ARROWHEADS WITH INNER SOCKETS AROUND THE DANUBE BEND**

**Contribution format:** Oral  
**Contribution authors:** Bence Soós (Hungarian National Museum Public Collection Centre, Hungarian National Museum)

Trilobate bronze arrowheads with inner sockets are among the most recognizable elements of the Early Iron Age in the Carpathian Basin. Their occurrence in the region is usually seen as a sign of the influence of the peoples of the steppe on the local cultural milieu. With the selective adoption of various arrowhead types from the east, the local population implemented the production of these efficient weapons, which occur in both funerary and settlement contexts. Trilobate bronze arrowheads are generally seen as an efficient weapon type that is easy to produce in large quantities. However, the places where local production took place, and the mechanisms and choices in the process of crafting these items, have remained largely undetected and left out of discussion. Recently, surveys of Iron Age sites in the wider area of the Danube Bend in northern Hungary yielded large sets of bronze trilobate arrowheads with inner sockets, including semi-finished and defective specimens. Local production of these items is also suggested by bronze moulds found at one of these sites. In my paper, my aim is to examine the process of casting and finishing these arrowheads. In spite of the seemingly homogeneous body of evidence, by examining the shape, dimensions and structural properties of the arrowheads, a detailed picture of their production and the process of casting can be revealed. Additionally, by comparing the sets of arrowheads from various sites, my aim is to study the circulation of these ‘mass-produced’ items around the Danube Bend.

**864. EXPLORING DIE STUDIES OF ROMAN COINS FROM Balsa AND OSSONOBA (ALGARVE, PORTUGAL)**

**Contribution format:** Oral  
**Contribution authors:** Alice Baeta (UNIARQ | University of Lisbon | FCT)

Roman coins represent a remarkable example of serial production in antiquity. The growing demand for currency, particularly during the Roman conquests, exceeded the capacity of Rome’s mint before the end of the Republic. In response, several cities across the Iberian Peninsula started minting their own coinage to sustain local economies, which had transitioned to a monetary system under Roman occupation. Balsa and Ossonoba were among the cities that produced coins, even though briefly and in limited series. By conducting a die study of these issues, it is possible to reconstruct the minting processes, establish a chronological sequence of coin production, and estimate the volume of currency issued. This analysis provides insights into these cities’ monetary supply and their capacity to meet local economic demands. Both series analyzed here are of bronze league coins, the ones from Balsa are classified as ACIP (2510 to 2512) /MIB (170/3 to 6), with three subtypes and 65 units, while Ossonoba’s series are classified as ACIP (2639) /MIB (181/1), with two subtypes and 32 pieces. The methodology used in this project emphasizes the comparative study of high-resolution images of coins, supplemented by 3D scanning techniques. These tools enhance the precision of die identification and enable a more detailed understanding of the minting process.

**1346. COUNT ON ME: EVIDENCE OF SERIAL PRODUCTION OF COPPER ALLOY FURNITURE HINGES FROM THE VESUVIAN AREA**

**Contribution format:** Oral  
**Contribution authors:** Susanna Faas-Bush (University of California, Berkeley)

Apart from rare instances where furniture casts were made during excavation, the particular types of ancient Roman furniture that the copper alloy furniture fittings from Pompeii such as hinges, locks, and decorative elements like studs came from are largely unknown. In the process of conducting dissertation research on the legacy data artifacts and archival material from the Villa della Pisanella, a villa rustica just outside of Pompeii, I am working to investigate any patterns of use between particular types or sizes of fittings and the furniture made with them. Studying the fittings carefully has revealed previously undocumented evidence about their manufacture and use, as well as the cross-craft interaction between metal casting and carpentry. 26 of the 71 copper alloy hinges studied thus far preserve numerals inscribed into the flat faces of hinge arms in open-faced molds while the metal rapidly cooled. These hinges fall into three distinct groups based on form and dimension. In this paper, I will present this dataset and my hypotheses so far about what it reveals about the production batches, commission practices, and furniture construction in the Vesuvian area.

**909. PATTERNS OF SERIAL SCULPTURAL PRODUCTION IN THE MARBLE NETWORKS OF ROMAN THRACE**

**Contribution format:** Oral  
**Contribution authors:** Petya Andreeva (National Archaeological Institute with Museum - Bulgarian Academy of Sciences) – Vasiliki Anevlavi – Walter Prochaska (Austrian Archaeological Institute - Austrian Academy of Sciences)

This paper offers a new perspective on the study of sculptures in Roman Thrace, focusing on the serial production of marble statues and their role in the Romanization process within the region. Situated at the crossroads between East and West, Thrace was pivotal in the interaction between Roman and Eastern artistic influences. The use of local marble resources, controlled by Roman authorities, alongside the integration of the region into broader marble trade networks, played a crucial role in shaping sculptural production. The study adopts a bottom-up approach by examining pre-fabricated statues and replica series to explore marble trade connections, market dynamics, and distribution patterns. It links mass-produced statue types to specific marble sources. Petrographic analysis, chemical analysis (ICP-MS), and isotopic analysis ( $\delta^{18}O$  ‰,  $\delta^{13}C$  ‰) were conducted on the sampled sculptural artifacts, which were then statistically analyzed and compared with a comprehensive database of over 5,700 geological samples from key Mediterranean marble quarries. This framework provides new insights into the intersection of serial sculptural production with art, economy, and cultural transformation in Roman Thrace. By combining archaeological evidence, archaeometric analysis, and historical context, this paper presents a novel approach to understanding the role of mass production and prefabrication of sculptures as a form of artistic expression, contributing to the broader narrative of cultural integration under Roman rule.

2383. METALLURGY OF THE PRZEWORSK CULTURE IN THE AREA OF THE MIDDLE BZURA IN THE ROMAN PERIOD

Contribution format: Poster  
Contribution authors: Wojciech Rutkowski (University of Lodz, Instytute of Archaeology)

The poster entitled “Metallurgy of the Przeworsk culture in the middle Bzura section at the end of the early and late Roman period” will be an incentive for further research on metal products from the Central European Barbaricum area. The concept of metallurgy, including goldsmithing and casting of the Przeworsk culture, has not yet been comprehensively developed. In the Roman period, the specificity of the funeral rite resulted in a significant loss of potential research objects. Elements of the costume burned together with the deceased on the funeral pyre were partially or completely destroyed. In contemporary regions, such as the Bzura river basin, Kujawy, Podlasie and the northern part of Mazovia, archaeological remains are recorded indicating human activity related to local customs, in relation to which the burning of jewellery on the pyre did not always occur. Selecting material from the indicated areas allows for conducting in-depth analyses on a supra-regional scale. In the specialist literature, there are only studies based on the results of individual discoveries. Reinterpretation of these works, with the simultaneous participation of new components, will provide an opportunity for a holistic view of the metallurgy of Barbarian Europe. This scientific poster will be the first attempt to solve the problem of specialized jewelry production in the late early and late Roman period for a selected settlement region

52 SHARED ROADS OF INTERTWINED COMMUNITIES: SHAPING POINTS OF CONTACT AND DIVIDE IN ISLAMICATE SOCIETIES

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Regular session  
Session keywords: Islamic Archaeology , networks, connectivity , frontiers  
Session organisers: Jelena Živkovic (University of Tübingen | Institute of Archaeology, Belgrade) – Jose Carvajal-López (Institute of Heritage Sciences (INCIPIT), Spanish National Research Council (CSIC)) – Alicia Hernandez Robles (University of Granada) – Irina Shingiray (University of Oxford) – David Govantes-Edwards (Universidad de Córdoba)

SESSION ABSTRACT

Development of long-distance maritime and terrestrial networks is a trait closely linked with the rise of Islamic states. From state-driven conquests to the everyday movements of people and goods, these networks facilitated various socio-economic interactions. Islamic Archaeology has shed light on multiple meanings of material culture and landscape diversity involved in these interactions, especially concerning large systems such as the Mediterranean, Indian Ocean, Silk Road, and Hajj. However, other communication axes, including riverine networks, caravan and mountain roads have often been overlooked or have remained the focus of more localised archaeological studies. For many communities, particularly non-Muslims and those living away from urban centres, local roads and rivers enabled the only contact with Islam. This Islamic Archaeology session invites discussions on how different contemporary communities - religious, military, economic, ethnic and others - in Islamicate societies shared available networks to gain economic benefits, conquer, travel, or negotiate their social identities. We invite colleagues to reflect on cases where different political, cultural, and environmental contexts influenced social interactions along routes shaping intercommunal cultural experience on one hand or creating divisions on the other. The latter is particularly common in frontier regions, where routes with communication potentials, such as rivers, were often used as borders that divided (same) communities. Archaeological case studies concerning all types of maritime, riverine and terrestrial networks are welcome, especially those that have been underrepresented in Islamic Archaeology. These studies can focus on or combine material culture, landscape and bio archaeologies as well as written and ethnographic evidence.

CONTRIBUTION ABSTRACTS

2532. RELIGIOUS AND SOCIAL INTERACTIONS IN EARLY MEDIEVAL URBAN MARKETS AND LOCAL EXCHANGE NETWORKS OF SYRIA-PALESTINE

Contribution format: Oral  
Contribution authors: Ian Simpson (Leiden University)

This paper explores the intersection of religious identity and market practices in early medieval Syria-Palestine, focusing on how interreligious interactions were facilitated by local commercial networks and urban marketplaces. In cities like Damascus and Jerusalem, the mingling of Muslim, Christian, and Jewish communities within

bustling urban markets created a space where religious differences and commonalities were negotiated. Yet this relationship between market and religion has been overlooked, especially in less central network nodes. Using archaeological and historical evidence, this paper examines material culture and practices in the exchange of goods, showing how marketplaces and inland local exchange networks acted as sites of religious and social interaction. These spaces and networks did not simply reflect Islamic practices but rather enabled a fluid, liminal zone where different religious and place-based identities were differentiated, maintained, and transformed. Market products, such as handheld lamps, acted as vehicles for negotiating and expressing local identities, with their diverse inscriptions and designs reflecting the influences and interactions between Muslim, Christian, and Jewish communities. I will argue that early medieval urban markets and local exchange networks were not only commercial but also a site for the negotiation of religious and place-based identities, where people engaged in cross-cutting partnerships, influencing both the religious and social fabric of a place.

451. THE MYSTERY OF THE QATARI POTS IN YUGHBI: WHEN THE CONNECTIONS OF THE GULF DIDN’T MATCH

Contribution format: Oral  
Contribution authors: Jose Carvajal Lopez (Incipit, CSIC)

In this paper I analyse the archaeological evidence of Yughbi, the earliest Islamic-period site found in Qatar, to raise some interesting questions about provenance and connectivity in the early Islamic Arabian/Persian Gulf. Yughbi was excavated in 2018 within the context of The Crowded Desert Project. The excavation uncovered three phases of the site during the earliest part of the Islamic period, and in particular its second phase, dated with AMS C14 to the Umayyad period, provided abundant materials. These materials have been studied, and particularly ceramics and stone cooking pots have been subjected to macroscopic, microscopic and compositional analysis with the aim of obtaining clues about their technology of production and provenance. The results, which will be explained in this presentation, draw an interesting map of networks of connectivity of the site of Yughbi in the Umayyad period. The most interesting aspect of this map is that it matches little with what we know of other networks of connectivity in the Gulf in the same period, with the exception of Sohar in Oman. IN this presentation I will try to offer some ideas to explain this mystery.

588. COMMERCE, SEDENTARIZATION AND ISLAMIZATION IN MEDIEVAL HORN OF AFRICA: THE CASE OF AIYANLE (AWBARRE, ETHIOPIA)

Contribution format: Oral  
Contribution authors: Jorge Rouco Collazo (Institute of Heritage Sciences (INCIPIT-CSIC))

The Horn of Africa has long been integrated into networks of contact and long-distance trade due to its geographical position within the broader Indian Ocean system since very early times. The medieval period of the Horn was no exception to these dynamics, playing a key role in the emergence and development of the Islamic sultanates that succeeded one another in this region. In this paper, we introduce the preliminary results of archaeological excavations carried out in 2023 and 2025 at the medieval site of Aiyarle (Awbarre, Ethiopia) within the framework of the ERC project “Statehorn: Pathways to Statehood,” which aims to study, through archaeology, the development of the Islamic sultanates of the Horn of Africa. The excavation has provided significant insights into the domestic spaces of this rural site, which was occupied between the 14th and 16th centuries, coinciding with the duration of the Bar Sa’ad dīn Sultanate. The material culture clearly reflects connections with Indian Ocean long-distance trade, and the site’s abandonment aligns with the collapse of the sultanate and the disruption of this trade network. These new findings will be discussed in relation to other archaeological data from the region, which highlight the importance of the Indian Ocean trade network in the emergence of the sultanates, the Islamization of the population, and the establishment of a widespread network of permanent settlements in a previously nomadic region. This process of sedentarization was interrupted in the 16th century with the collapse of the Bar Sa’ad dīn Sultanate and the disruption of the trade network, leading to the abandonment of most sites.

1565. SILK ROADS AND CART LOADS: ARCHAEOLOGY OF NOMADIC ROUTES AS PLACES OF ISLAMIC CONTACT AND EXCHANGE IN NORTH CASPIAN STEPPE

Contribution format: Oral  
Contribution authors: Irina Shingiray (University of Oxford)

Islamic cultural and trade currents reached the nomadic lands of the Northern Caspian Steppe by the 9th-10th centuries CE. Various branches of the so-called Silk Roads and important overland routes and waterways were meeting and intersecting in that steppe ecoregion; and so were the nomads, the merchants, envoys, and religious missionaries, who came into contact with each other traversing the steppe lands. The regional nomads, who politically controlled the steppe, were the engine and the facilitators of that trade and exchange; thus, they will be in the center of this presentation. This paper will deal with archaeological contexts of nomads and the

meeting points along the steppe roads over the long term. It will use results of several regional surveys and kurgan burial excavations, as well as some stray finds from this territory. It will focus on archaeological contexts of burial practices, of stopping and camping stations, of material exchange including luxury and everyday items, including those of long-distance trade. The goal is to survey and highlight the rich fabric of Islamic exchange culture in the seemingly remote region that was largely devoid of significant urbanization up until the Mongol Period in the 13th century CE, and was mainly the land of pastoral nomads.

212. THE MUSLIM CEMETERY OF KARAKORUM: AN ISLAMIC COMMUNITY AT THE HEART OF THE MONGOL EMPIRE

**Contribution format:** Oral  
**Contribution authors:** Julia Olive Busom – Alice Toso – Susanne Reichert (University of Bonn) – Dunburee Batsukh (Institute of Archaeology, Mongolian Academy of Sciences) – Jan Bemmann (University of Bonn)

Karakorum, the former capital of the Mongol Empire (13th to 14th centuries), was home to a rich fabric of cultures, which included Chinese artisans, Muslim merchants, and captives from different corners of the empire. All of them were part of the intricate system that not only served the Khan’s court but also articulated a multicultural trading hub. During archaeological campaigns carried out between 2023 and 2024, 29 skeletons and 27 graves were excavated as part of a Muslim cemetery located just outside the northern gate of the city. This was the maqbara of the Muslim community of Karakorum, who most likely settled there as part of a forced relocation instigated by the Khan’s effort to populate the newly established city. Historically, little is known about this community beyond the fact that they had their own neighbourhood and engaged in long-distance trade. The presence of a Muslim cemetery, with a diverse paleodemography, further confirms the settlement and growth of this community. Furthermore, certain formal aspects related to the disposition of the graves and the biological characteristics of the individuals buried there suggest possible traces of a Sufi community, whose settlement in Karakorum is already attested by a commemorative stele. Here, we discuss the possible connections and similarities that this community, settled at the edge of the Muslim world, yet at the centre of the Mongol world, shared with the broader Dar al-Islam from a bioarchaeological (including palaeopathological and stable isotope analyses) and funerary perspective. We also examine signs of observed disruption and their possible connection to a process of religious and cultural syncretism or to the community’s minority status.

737. ALMUNIAS AND LIVESTOCK ROADS IN THE UPPER FRONTIER OF AL-ANDALUS

**Contribution format:** Oral  
**Contribution authors:** Jesús Brufal (Universitat Autònoma de Barcelona)

There is an interesting historiographical debate about the concept of almunia in the territories of the former Upper Frontier of al-Andalus. This discussion is based on the term almuniae or almunia, which is clearly visible in 12th-century Latin documents, especially from the 1230s to the 1260s. This word refers to places in Andalusian territory, usually areas suitable for agricultural use, which the conquerors, whether nobles or clergy from the feudal kingdoms and counties, appropriated, gave away or sold. However, there is no record of this term in the scarce Arabic documentation that has been preserved. Archaeology, for its part, does locate and identify small fortified settlements at high altitudes, but without any data to link them to these unique almunias. When looking at the landscape of the old district of Lleida, which borders the kingdom of Aragon and the counties of Ribagorça, Pallars, Urgell and Barcelona, these almunias can easily be linked to communication routes. Of these, a few have been recognised since Roman times, especially those linking the ancient Roman civitas, now integrated into either the Andalusian or county political reality. However, there are many other routes that connect the territory, mainly for moving livestock for grazing. These not only run within the district, but also easily reach the Pyrenean area, which borders the aforementioned counties. We can therefore affirm that, despite the political border, there were intense contacts between the two sides in terms of land use, including trade, but also military confrontations. In this context, the enigmatic type of almunia settlement plays a prominent role, if the textual data does not confuse us.

2526. AT THE CROSSROADS OF WORLDS: THE FORTRESS TYAGIN

**Contribution format:** Oral  
**Contribution authors:** Svitlana Biliaieva (Institute of Archaeology of NAN of Ukraine)

The creation of the fortification system on the southern border of the Grand Duchy of Lithuania by Grand Duke Vitovt at the end of the 14th/beginning of the 15th century was an important factor for bringing diverse cultures and civilizations together—those from the West and East, from Christian and Islamic societies. The Tyagin fortress, located on the Lower Dnieper River was part of that fortification system and it presents a brilliant example of this kind of multicultural phenomenon in the North Black Sea region. It belongs to the type of stone castle fortresses

of the Constantinople style, which possessed a donjon and corner towers. Some archaeological finds unearthed from the fortress had Lithuanian origin, such as cross-shaped linings on bags, crossbow bolts, and a slab with the heraldic sign of one of the Lithuanian families, with a possible close connection to Vitovt himself (the letter “v” was depicted near the heraldic sign). Among other finds, there were Genoese bombard stone balls and multiple iron artifacts, which attested to the mass production of iron in Lithuanian and Ukrainian culture. There were Tatar coins with countermarks of Genoese Kafa, as well as Polish coins of the first half of the XV century, and some coins of the Crimean Khan Mengli Geray. There were also various influences from the Islamic lands, such as the use of a Seljuk decoration at the tower of a monumental building. And there were numerous ceramic wares, which have analogies in the ceramics of Crimea. This syncretic Cristian and Islamic culture is characteristic of all the fortresses in the Black Sea region and they played an important role in the creation of multicultural spaces in that area.

324. SHAPING CONNECTIVITY ALONG THE DANUBE, SAVA, AND DRAVA RIVERS UNDER THE OTTOMANS

**Contribution format:** Oral  
**Contribution authors:** Jelena Živkovic (University of Tübingen | Institute of Archaeology, Belgrade) – Vesna Bikić (Institute of Archaeology, Belgrade)

This paper discusses the preliminary results of an archaeological study on ceramics from Ottoman-period riverine settlements (the 16th-17th centuries) located in the Middle Danube region. The focus is on the marshland situated between the Danube, Sava, and Drava rivers, an area that was part of the long-standing frontier between the Ottoman Empire and Hungary. Following the conquest of Belgrade in 1521, the Ottomans took control of all settlements between the rivers, initiating the forced resettlement of local population and waves of migrations. Within this dynamic socio-political landscape, a new horizon of material culture emerged, characterised by the wide distribution of pottery with uniform morphological traits. This phenomenon reflects the regional connectivity of communities settled along the rivers, shaped within the Ottoman network in Southeastern Europe. The study investigates this connectivity through patterns of common pottery distribution across the Srem region in Serbia. This pottery was used in medium-size towns connected by the rivers. The research examines the regional variability of ceramic wares by comparing data on their morphology, quantities and technological traits. All data were systematically recorded in a database and interpreted in relation to archaeological and historical evidence concerning settlements, the fluvial environment, migration patterns, and broader socio-economic conditions.

964. PERSIAN FAIENCE WARE IN OTTOMAN HUNGARY

**Contribution format:** Poster  
**Contribution authors:** Tünde Komori (Hungarian National Museum)

Asian decorative ceramics have been a topic of Ottoman archaeology research in Hungary since the beginning of the field. Among these objects, Persian faience has been identified early on and has been separated from Iznik ware and Chinese porcelain. Recently, a comprehensive study has been conducted on Asian decorative ware unearthed at Hungarian Ottoman-period (1541-1699) sites, resulting in a revision of the existing typology of these objects. This revised typology brought about the identification of Persian faience has been further refined. This partly meant the separation of Kütahya ceramics from the Persian types, and partly the identification of the Gombroon type among the Persian pieces. The latter is a previously unidentified type in Hungary, bringing a new angle into not only the history Ottoman material culture, but also to the history of trade and trading networks. The appearance of Gombroon ceramics in the second half of the seventeenth century in the Ottoman Empire represents the contemporary trading networks of the early modern Silk Routes that persisted throughout this period, showing the importance of key geographical points such as the Persian Gulf. The aim of this poster is to present the separation of Kütahya ware from Persian faience, as well as to present the types connected to partly the main Safavid production centers such as Kirman and Mashhad, and partly to Gombroon. Furthermore, the trading routes through which these objects might have moved from the Safavid Empire to present-day Hungary are also presented.

53 NEANDERTHAL-HOMO SAPIENS SUBSISTENCE DIFFERENCES 60,000 TO 40,000 YEARS AGO IN CENTRAL AND SOUTHEAST EUROPE

**Session theme:** 8. Along and across the Danube!  
**Session format:** Regular session  
**Session keywords:** Middle to Upper Palaeolithic transition, Zooarchaeology, Subsistence strategies, Late Neanderthals and early Homo sapiens, Central and Southeast Europe  
**Session organisers:** Anna Wagner – Geoff Smith (University of Reading) – Lia Vidas (Institute for

**SESSION ABSTRACT**

Exploring differences in subsistence strategies between Neanderthals and Homo sapiens during the Middle to Upper Palaeolithic transition is crucial for reconstructing the behavioural and biological evolution of both species. Central and Southeast Europe were key migration corridors, as seen by sites like Bacho Kiro Cave (Bulgaria) and Ranis (Germany), but they have remained rather underexplored, leaving gaps in our understanding of survival strategies during this period. To bridge these gaps, our session will leverage a combination of traditional zooarchaeological, morphological, taphonomic, and biomolecular methods, such as isotopic analysis, palaeogenomics, and palaeoproteomics, including Zooarchaeology by Mass Spectrometry (ZooMS). These approaches maximise data retrieval, enrich our understanding of past human subsistence patterns and hominin-environment interactions, and challenge prevailing assumptions about the evolutionary trajectories of Neanderthals and Homo sapiens. Building on the potential of these integrated approaches, our session aims to gather current zooarchaeological research on the last Neanderthals and the earliest Homo sapiens in Central and Southeast Europe (from ca. 60,000 - 40,000 years ago, covering the area from Germany to Greece). Our primary objective is to outline the subsistence behaviours and strategies that distinguished late Neanderthals from early Homo sapiens, shedding light on variations in their diets and survival. This includes, but is not limited to, subsistence behaviour, site use, taphonomic features, prey selection, hunting strategies, carcass acquisition, transport, and butchery practices. We welcome contributions (virtual or in-person) that challenge existing paradigms, introduce novel datasets, offer interdisciplinary perspectives using zooarchaeological data as part of case studies, local and supra-regional overviews, or new discoveries focused on investigating differences in subsistence in the region. This will provide an opportunity to gather a range of perspectives, assess behavioural variations, and discuss whether differences in subsistence practices contributed to the eventual disappearance of Neanderthals and the ultimate survival of our species, Homo sapiens.

**CONTRIBUTION ABSTRACTS**

**1652. MAXIMISING DATA FROM FRAGMENTED BONE TO UNDERSTAND THE COEXISTENCE OF NEANDERTHALS AND EARLY HOMO SAPIENS IN CENTRAL AND SOUTHEAST EUROPE**

**Contribution format:** Oral

**Contribution authors:** Karen Ruebens – Frankie Tait – Anna Wagner – Geoffrey Smith (University of Reading)

Recent studies of late Neanderthal DNA continue to provide direct evidence for Neanderthal-Homo sapiens interbreeding. However, questions on the chronological and geographic extent of Neanderthal-Homo sapiens coexistence in Europe, their behavioural differences and interactions, remain poorly understood. The goal of project COEXIST, which was selected by the ERC and funded by the UKRI, is to apply cutting-edge methodologies from archaeological science, proteomics and genetics to small bone fragments to determine the behavioural variation of local late Neanderthals and Homo sapiens entering Europe, identify periods and regions of their coexistence, and clarify the role of subsistence differences in the eventual disappearance of Neanderthals. Recent discoveries have been revolutionary in showing that early groups of Homo sapiens had already arrived in Bulgaria, Czechia, and Germany more than 46,000 years ago. These findings raise fundamental questions concerning current models on the timing and extent of coexistence between late Neanderthals and early Homo sapiens, illustrating an overlap in this region for several millennia. They also emphasise the importance of the archaeology of this region. Central and southeast Europe, covering the area from Germany, Czechia and Slovakia, over Romania, Serbia and Montenegro, into Greece, were strategic crossroads between east and west during the Palaeolithic. This talk will lay out the background to this project and present its methodology, which is aimed at maximising the potential of existing faunal collections in the region, especially the bone fragments which cannot be identified based on morphology alone. Moreover, an important component of the project is focussed on further advancing the integration of zooarchaeological and ZooMS datasets. This presentation will set the context for two other talks in this session, Wagner et al. and Smith et al., which will be discussing the first results of two COEXIST case studies.

**568. INTEGRATING ZOOMS AND ZOOARCHAEOLOGY TO UNDERSTAND MIDDLE PALEOLITHIC SUBSISTENCE STRATEGIES AT HOHLE FELS (SWABIAN JURA, GERMANY)**

**Contribution format:** Oral

**Contribution authors:** Britt Starkovich (Senckenberg Centre for Human Evolution and Palaeoenvironment at the University of Tübingen) – Fei Yang (Institute for Archaeological Sciences, University of Tübingen) – Samantha Brown (Centro Nacional de Investigación sobre la Evolución Humana, CENIEH) – Nicholas Conard (Department of Early Prehistory and Quaternary Ecology, University of Tübingen)

The Swabian Jura in Southern Germany contains numerous iconic sites with long Middle through Upper Paleolithic sequences. The sites preserve ample lithic and faunal material, in addition to the oldest known art and musical instruments, which date to the Aurignacian period. Biomolecular preservation is particularly favorable in the region, which opens the door to a range of analytic techniques – including ZooMS – which can then be integrated into larger analyses of past hominin-animal interactions. Archaeologists have generally considered the Middle Paleolithic of the Swabian Jura to be more ephemeral than the Upper Paleolithic, with lower artifact densities at nearly all sites. In 2020, excavators uncovered Middle Paleolithic layers at Hohle Fels that are rich in lithics, burned and unburned faunal remains, and the first leaf point found in situ in the Swabian Jura in the modern era. The horizons underly layers that date to 62,500 +/- 4,000 BP. In this paper, we present faunal remains from the newly excavated Middle Paleolithic layers at Hohle Fels using a novel approach to integrate zooarchaeology and ZooMS. We first analyzed the assemblage taxonomically and taphonomically using standard zooarchaeological techniques. We then selected 1) specimens that were identifiable to anatomical element but were taxonomically ambiguous, and 2) bone retouchers, to analyze using ZooMS. The integrated analysis shows that Middle Paleolithic hominins at Hohle Fels ate large game including reindeer, wild horse, ibex, mammoth, and rhinoceros, and used fragments of horse and mammoth bones as retouchers. Our analysis also provides us species-specific information on body part transport strategies and anthropogenic modifications.

**1138. USING ZOOMS AND ZOOARCHAEOLOGY TO INVESTIGATE NEANDERTHAL DIET AT CRVENA STIJENA, MONTENEGRO**

**Contribution format:** Oral

**Contribution authors:** Geoffrey Smith – Anna Wagner – Frankie Tait (Department of Archaeology, University of Reading) – Eugèn. Morin (Trent University, Ontario, Canada) – Goran Pajovic (Curator of Archaeology National Museum Cetinje, Montenegro) – Mile Bakovic – Nikola Borovinic (Center for Conservation and Archaeology Ministry of Culture Cetinje, Montenegro) – Gilbert Tostevin – Gilliane Monnier (Department of Anthropology, University of Minnesota Minneapolis) – Karen Ruebens (Department of Archaeology, University of Reading)

Crvena Stijena is a large rock shelter in the Dinarides mountains in western Montenegro. Thanks to its rich and deep stratigraphy, the site is one of the most important Palaeolithic sites in the Balkan peninsula. The sequence contains at least 15 meters of Middle Paleolithic occupations capped by a volcanic ash (the Campanian-Ignimbrite Y5 eruption in Italy), which was deposited ca. 40,000 years ago. Within the framework of COEXIST, we conducted ZooMS on unidentifiable material from Layers XI (containing the CI-tephra) and the underlying M1 and M2 occupations that are approximately 40,000-45,000 years old. This included material from the 2015 excavations led by R. Whallon and M. Bakovic (n = 352) and the 2019 excavations (n = 32) led by the National Museum of Montenegro and the University of Minnesota. Collagen preservation is excellent with ca. 90% of the bones identifiable to taxa using the AmBic ZooMS protocol. Our results illustrate a range of species including cervids (red deer, roe deer), Bos/Bison, caprines, horse and bear alongside rarer species such as pig and birds. Both carnivore and human bone surface modifications were identified on the fauna, though the predominance of anthropogenic marks suggests Neanderthals played a larger role in bone accumulation. Further work will seek to contextualise our findings with current archaeological and faunal studies at Crvena Stijena to investigate human diet and ecological adaptation. This study provides a good starting point for further exploration of late Neanderthal and early Homo sapiens diets in southeast Europe, and using ZooMS to provide new insights into subsistence strategies and human-animal interactions.

**82. PALAEOPROTEOMIC ANALYSIS OF BONE FRAGMENTS FROM PALAEOLITHIC CRIMEA REVEALS NEW SUBSISTENCE INSIGHTS AND HOMININ REMAINS**

**Contribution format:** Oral

**Contribution authors:** Emily Pigott – Konstantina Cheshmedzhieva – Laura Sluis (University of Vienna, Department of Evolutionary Anthropology | Human Evolution and Archaeological Science (HEAS) Network, Vienna) – Thorsten Uthmeier (Institut für Ur- und Frühgeschichte, FAU Erlangen-Nürnberg) – Victor Chabai (Institute of Archaeology, National Ukrainian Academy of Science, Kyiv) – Marylène Patou-Mathis (Muséum National d’Histoire Naturelle, Institut de Paléontologie Humaine) – Ron Pinhasi – Martin Kuhlwilm – Katerina Douka – Thomas Higham (University of Vienna, Department of Evolutionary Anthropology | Human Evolution and Archaeological Science (HEAS) Network, Vienna)

The Crimean Peninsula is a key location for understanding the replacement of Neanderthals by Homo sapiens, with several important sites and abundant lithic and subsistence evidence. Human remains are, sadly, extremely rare and this problem is exacerbated by the considerable number of fragmented, unidentifiable bones (<2-3cm in

size) in the assemblages which, while they might contain hominin fragments, have not been able to be formally identified. . In this study, we used collagen peptide fingerprinting, also known as Zooarchaeology by Mass Spectrometry (ZooMS), to identify morphologically unidentifiable bones to genus or species level and screen for potential human remains. We analysed 628 bone fragments with ZooMS, the vast majority of which were faunal remains that could be attributed with confidence to a range of animals subsisted upon during the Palaeolithic in the region. Importantly, three bone fragments displayed collagen fingerprints matching the Hominidae: two from the site of Starosel'e and one from the Siuren site. Radiocarbon dating of the Starosel'e bones revealed them to be 44–46,000 and 42–44,000 years old, close to the transition between the disappearance of Neanderthals and early dispersal of Homo sapiens. We obtained ancient DNA analysis from the younger bone, finding very low endogenous content (<0.1%). However, we could recover a 1-fold coverage of mitochondrial genome which, when placed in a mtDNA tree, showed that it fell on the line of the Neanderthal mitochondria lineage. The results demonstrate that ZooMS is a powerful tool for identifying previously unrecognised faunal remains, which help reconstruct paleoenvironments and ancient climates. It also enables rare new hominin remains to be identified that can be directly dated, genetically sequenced, and analysed for dietary isotopes.

**2004. AGE-SEX SELECTIVITY IN ARTIODACTYL HUNTING ACROSS THE LATE MP-EARLY UP AT ÜÇAĞIZLI CAVES I AND II (TÜRKİYE)**

**Contribution format:** Oral  
**Contribution authors:** Mary Stiner (University of Arizona (Tucson))

Prey selection biases are important to understanding cultural and strategic variation in Paleolithic forager societies. This study compares mortality patterns and sex structures in Bezoar goat, Mesopotamian fallow deer, and roe deer in the Paleolithic layers of Üçağızlı Caves II and I. These caves are situated 1 km apart on the Hatay coast of southern Türkiye, at the interface of rich coastal plains and forested hillsides. They span the late Middle Paleolithic through early Upper Paleolithic (Ahmarian and Initial UP) periods. The zooarchaeological results are compared to cases from the Levant, Anatolia, and southern Europe. Stark prey age selection differences are found that relate to specific-specific utilities and on-site activities. When focusing on wild goats, hunters preferred prime-age adults, whereas yearlings were preferred in the case of fallow deer. The roe deer assemblages display either of the two prey selection modes. The yearling bias in the deer assemblages seems to relate to a need for large but delicate hides. Similar patterns of prey age selection are found within the Middle and early Upper Paleolithic periods; species dominance varies with time, but the distinct age biases for goats versus deer are similar. The bias against old adults in the goat assemblages suggests heavy use of the hunting grounds around the caves. In the Ahmarian and Initial Upper Paleolithic layers of ÜcI, consistently high frequencies of end-scrapers and their micro-damaged edges confirm the importance of hide preparation on site. Side scrapers are common in the Middle Paleolithic layers of ÜcII, but the tools have not been studied for microdamage. The diversity and richness of refuse in the sites indicates that they functioned as residential camps at which a broad range of activities were carried out in both Paleolithic periods.

**827. EARLY UPPER PALAEOLITHIC HUMAN SUBSISTENCE AND PREY CHOICE: ARCHAEOZOOLOGICAL EVIDENCE FROM BUKOVAC AND ORLOVAČA ROCK-SHELTER SITES, SERBIA**

**Contribution format:** Oral  
**Contribution authors:** Jovana Jankovic (Department of Archaeology, Faculty of Philosophy, University of Belgrade) – Tamara Dogandžić (MONREPOS Archaeological Research Centre and Museum for Human Behavioural Evolution, LEIZA) – Vesna Dimitrijević – Dušan Mihailović (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

The research on the Early Upper Palaeolithic in the Central Balkans had a significant role in providing new information on demographic and cultural changes, settlement patterns and population dispersals. Bukovac and Orlovača rock-shelters are situated in the broader Velika Morava river valley in Eastern Serbia. Discoveries of Protoaurignacian and Early Aurignacian layers were made at Orlovača and a Late Aurignacian layer is present at Bukovac, while the Middle Paleolithic occupation had only been detected at Orlovača. The focus of this study is on Early Upper Palaeolithic occupations and analysis of faunal remains from Aurignacian layers of both sites, with the aim to explore trends in human activity, subsistence behavior and prey choice. Faunal remains consist of a wide range of species. The primary taxon at Bukovac is alpine ibex and at Orlovača it is the cave bear. Taphonomic analysis showed presence of human modifications and butchery on several bones, as well as traces of carnivore modifications on bones, which suggests that both groups were responsible for the accumulation of animal remains at these two sites. The high level of bone fragmentation, including bones with cut and percussion marks, led to taxon identification based on animal size and limited information on hunting strategies, prey choice and transport. Traces of human butchery are mostly present on long bones of large mammals. Results of the archaeozoological analysis indicate that the carnivore activity was greater, especially in Orlovača which was used as a shelter by cave bears, while hunter-gatherer groups occasionally used these rock-shelters as temporary

hunting camps. The obtained results provide new information on human presence and subsistence in the upland region of Central Balkans, since these sites are situated above 250 m above sea level, which is uncommon as the majority of the Aurignacian sites are situated at a lower altitude.

**616. REFINING NEANDERTHAL DIET AND CHRONOLOGY: ZOOMS ANALYSIS OF FAUNAL REMAINS FROM BOROȘTENI PEȘTERA CIOAREI**

**Contribution format:** Oral  
**Contribution authors:** Anna Wagner – Geoff Smith – Frankie Tait (Department of Archaeology, University of Reading) – Cornel Pop (Columbia College, Vancouver) – Helen Fewlass (Department of Anthropology and Archaeology, University of Bristol) – Marin Cărciumaru (The Museum of Human Evolution and Technology in Paleolithic; Valahia University of Targoviste) – Karen Ruebens (Department of Archaeology, University of Reading)

Advances in palaeoproteomics, particularly Zooarchaeology by Mass Spectrometry (ZooMS), have transformed the study of fragmented faunal remains at Palaeolithic sites, providing new insights into subsistence strategies and hominin-environment interactions. By integrating ZooMS with morphological and taphonomic analysis, and radiocarbon dating, we can refine our understanding of faunal assemblages, subsistence patterns, and chronologies. This pilot study is part of the COEXIST project, which is focused on late Neanderthal and early Homo sapiens coexistence in central and southeast Europe. Here we present new data from the Boroșteni Peștera Cioarei site in Romania. Through a multidisciplinary approach combining ZooMS, taphonomic analysis, and radiocarbon dating, we investigate morphologically unidentifiable bone fragments from this late Neanderthal cave site. Our goal is to enhance understanding of the site's faunal composition, the interactions between hominins, carnivores, and prey, and to refine the chronology of its late Middle Palaeolithic layers. We analysed 64 faunal samples from layers J (250cm–255cm) and K (202cm–208cm), excavated in 1994–1995, using ZooMS, an. radiocarbon dated five bones. Preliminary results indicate exceptional collagen preservation, with 96.9% yielding successful identifications. The analysis reveals a predominance of Ursidae, along with one individual of Castor sp. and herbivores such as Cervid/Saiga, Caprinae, and Bos/Bison. Taphonomic evidence, including carnivore digestion, indicates the site functioned as a carnivore den during the deposition of these layers, although the presence of low quantities of archaeological material suggests ephemeral hominin occupation. This study lays the groundwork for further exploration of late Neanderthal and early Homo sapiens diets in southeast Europe. The agreement between the zooarchaeological (Pathou-Mathis 2000) and ZooMS analyses in these layers underscores their value for reconstructing past subsistence strategies. The COEXIST team will continue investigation of the unstudied material from Boroșteni Peștera Cioarei, with the expectation of yielding further revelations on Neanderthal ecology.

**1746. TRIAL BY FIRE – THE STORIES HEATED LITHICS TELL ABOUT PLEISTOCENE FIRES**

**Contribution format:** Oral  
**Contribution authors:** Adrian Dobos – Alexandru Giornei (Institute of Archaeology „Vasile Pârvan”) – Wei Chu (Leiden University)

Fire as a tool is intrinsically connected to human evolution throughout the prehistory, but the knowledge on the topic, particularly in the Balkans, is still incomplete. Our presentation explores the relationship between hominins and anthropogenic fire use through the analysis of heated chert lithic artifacts from the Early Upper Paleolithic site of Românești-Dumbrăvița in Southwestern Romania. The site has two discrete UP levels, one belonging to the proto-Aurignacian and a sparser one from the Epigravettian. Our approach investigates the potential of heated lithics to provide information about the temperatures they were exposed to in a site which preserve no other testament of Pleistocene fires. We used cherts with the same properties as those knapped by the Paleolithic communities from the site and replicated fire exposure at several temperatures and for different time durations. We examined and quantified the changes occurred to the lithics in terms of color, density, and crazing. The results indicate a correlation between temperature and changes in the physical properties of the lithics, whereas fire duration plays a minor role. An ad-hoc discrimination can be made between ‘low’ and ‘high’ temperatures for the particular type of chert which was analyzed. Furthermore, we were able to discern three combustion zones in the proto-Aurignacian level solely through the properties of the heated lithics, as other features related to fire (charcoal, ashes) have not preserved. Our results have implications on reconstructing hominin subsistence strategies at the beginning of the Upper Paleolithic by providing information on the location of the hearths at a site-scale and on fuel economy. Furthermore, they provide ground for comparative analysis with (Late) Middle Paleolithic sites. The research was funded through the CNCS – UEFISCDI grant TE 99/2022 and ERC-Consolidator grant HOME: Palaeolithic Shelters in East-Central Europe

178. PALAEOPROTEOMIC ANALYSIS OF BONE FRAGMENTS FROM PALAEOLITHIC CRIMEA REVEALS NEW SUBSISTENCE INSIGHTS

**Contribution format:** Poster  
**Contribution authors:** Emily Pigott – Konstantina Cheshmedzhieva – Laura Sluis (Department of Evolutionary Anthropology, University of Vienna | Human Evolution and Archaeological Science (HEAS) Network) – Thorsten Uthmeier (Institut für Ur- und Frühgeschichte, FAU Erlangen-Nürnberg) – Victor Chabai (Institute of Archaeology, National Ukrainian Academy of Science, Kyiv) – Marylène Patou-Mathis (Muséum National d’Histoire Naturelle, Institut de Paléontologie Humaine) – Ron Pinhasi – Martin Kuhlwilm – Katerina Douka – Thomas Higham (Department of Evolutionary Anthropology, University of Vienna | Human Evolution and Archaeological Science (HEAS) Network)

The Crimean Peninsula contains a number of significant Palaeolithic sites, including Kabazi II, Kabazi V, Siuren I, Starosel’e, and Chokurcha I. The region was occupied for long periods by Neanderthals and later, during the Middle to Upper Palaeolithic transition, by early Homo sapiens. At all sites a considerable number of fragmented, unidentifiable animal bones (<2-3cm in size) were discovered, too small to be taxonomically identifiable and to all intents and purposes of little use to formal zooarchaeological study. In the last 15 years, however, collagen peptide mass fingerprinting, also known as Zooarchaeology by Mass Spectrometry (ZooMS), has been developed and increasingly applied to such assemblages to identify morphologically unidentifiable bones to genus or species level. This method takes advantage of small differences in the peptide mass sequences of Type 1 collagen most commonly, to enable bone fragments to be identified to species/genus level, using mass spectrometry. We analysed 628 bone fragments from several Palaeolithic sites with ZooMS, finding that 82.3% had sufficient collagen preservation for taxonomic identification. Our results suggest Palaeolithic humans in Crimea primarily hunted horses (Equidae), which is highly represented at Kabazi II, Kabazi V, and Starosel’e at over 89%. The second highest taxonomic group is Bovidae and Cervidae across all sites. There is also a prominence of mammoth, and other large ungulates, offering insights into the region’s paleoenvironment and subsistence strategies. Kabazi II had a large amount of samples collagen failing (17.8%), which may be due to the preservation at an open-air site. We interpret the results of the ZooMS-generated data with previous zooarchaeological data and draw conclusions about the subsistence behaviours of Neanderthals and modern humans in the Crimea during this important stage of the Middle to Upper Palaeolithic.

54 CULTURAL HERITAGE, ARCHITECTURE, AND ARCHAEOLOGY AS INTERTWINED PRACTICES: FROM MANAGEMENT TO ALTERATION AND SUSTAINABLE DESIGN

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Intertwined position, Profession, Epistemology, Heritage, Value and Quality, Transformation  
**Session organisers:** Magnus Rönn (Kulturlandskapet (The Cultural Landscape)), – Helena Teräväinen (Aalto University) – Leif Östman (Novia University of Applied Sciences) – Paula Molander (Kulturlandskapet (The Cultural Landscape))

SESSION ABSTRACT

**Abstract** This multidisciplinary session is combining three fundamental ideas. Firstly, the built environments must be understood as intertwined and as a perceived world in its wholeness. Secondly, the transformation of cultural heritage must include deep site knowledge combining architecture and archaeology in framing a sustainable design perspective. Thirdly, authorities and private companies are intertwined in safeguarding and managing cultural values as well as designing strong, sustainable architectural qualities. The overall aim of this interdisciplinary session is to identify, explore, and critically reflect on the intertwined positions of architecture, architectural conservation, and archaeology. Scope and invitation We invite scholars to present papers that shape our perception and understanding of processes in the ongoing transformation of the surrounding cultural environment run by public authorities and private companies. Intertwined positions may be identified, clarified, and become accessible for critique through studies of architecture and urban design, archaeology, and cultural heritages when sites are transformed. The involved professions may have very different approaches and understanding of sustainability. Four tracks We are looking for papers by scholars in architecture and urban design, architectural conservators, and archaeologists to be discussed in the multidisciplinary session. The framework focuses on profession and transformation of cultural heritages as material artefacts. Of special interest in this framework are contributions presenting different kinds of intertwined positions in the four following tracks: 1)

Design in intertwined relations between epistemologies and new and old policies in built environments including cultural heritage: 2) Competing positions: Exploitation, protection and inclusion or separation as approaches in design and development epistemologies: 3) Reflection on concepts showing intertwined positions in architecture and urban design, architectural conservation, and archaeology: 4) New ways of seeing and understanding cultural heritage, archeology and architectural qualities in relation to an expanding liberal market agenda.

CONTRIBUTION ABSTRACTS

36. ARCHITECTURE, PROFESSION, AND INTERTWINED POSITIONS: COMPETITION AND DESIGN IN AREAS HAVING PROTECTED CULTURAL HERITAGE VALUES

**Contribution format:** Oral  
**Contribution authors:** Magnus Rönn (Kulturlandskapet (The Cultural Landscape))

This contribution deals with intertwined positions in architecture and planning projects. The aim is to show, examine and analyze how intertwined positions are expressed in competitions taking place in areas with valuable cultural environments. Competitions are often organized to find good design solutions to conflicting interests regarding exploitation and conservation. In these assignments, complex relations can be found among professionals such as architects, architectural conservators, and archaeologists. The understanding of cultural heritage values and architectural qualities as design problems can be assumed to include both the separation of concepts and integration of key ideas in architecture and planning projects carried out as competitions. These positions may be outspoken as well as embedded in planning processes, detailed development plans, competition programs, design solutions, judgement, implementation and building permits.

**Objectives and Research Questions**

The intention is to clarify the following questions in architecture and planning projects:

- What kind of positions can be identified among professionals with responsibility for cultural values and architectural qualities?
- How can these positions be described?
- Are there any typical patterns of separation, integration, and intertwined positions in architectural and planning projects conducted as competition in areas having cultural heritage values.

**Method and result**

The contribution has an explorative approach in a case study methodology. A selection of instructive cases of competitions are going to be studied with the support of document analysis, site visits, architectural critique, and interviews with key players. The result is expected to be “thick descriptions” of a limited number of cases showing how driving forces for separation, integration, and intertwined positions among professionals change in architectural and planning projects from start to build permit.

77. INTERTWINED CULTURES OF CONSERVATION MANAGEMENT IN FINLAND

**Contribution format:** Oral  
**Contribution authors:** Leif Östman (Novia, University of Applied Sciences)

This paper investigates current planning processes in the management of cultural heritage, aiming to incorporate citizens, development aspirations, facts, and knowledge into a productive, democratic dialogue. It examines current regulations and conservation practices within the framework of Planning Law, which is instrumental in facilitating diverse inputs of factual data, criticism, and transparent political decision-making. The theoretical underpinning for this evaluation draws from democratic ideas by John Dewey and Jürgen Habermas, and considers ideological aspects embedded in critical heritage. Additionally, Pierre Bourdieu’s concepts of cultural and commercial powers are discussed to address commercial interests, which often appear as destructive forces when developmental interests are involved. These interests are interpreted as legitimate powers and key drivers of development, thus important in making sense of present society. The paper aims to dissect current practices through theoretical lenses, interpreting value standards based on rationality and democracy. It recognizes differing values and interests as legitimate, advocating for a management process capable of handling conflicts and producing solutions that are meaningful to community members regarding the development of their culture.

100. THE INTERTWINING OF ARCHITECTURE AND ARCHAEOLOGICAL HERITAGE WITH MODERN CULTURAL URBAN SUSTAINABILITY. THE CASE OF HADRIAN’S LIBRARY IN ATHENS

**Contribution format:** Oral  
**Contribution authors:** Athanasios Kouzelis (Kulturland)

The scientific interest in the issue of linking cultural heritage with sustainability does not only derive from the international treaties that have been established, but also from the interest of local societies in the sustainable restoration of monuments and archaeological sites within an urban environment aiming to a cultural regeneration

and upgrading . It is pointed out that applied policies at the European and Greek State level that seek the sustainable development of cultural heritage are considered insufficient in terms of their intended result, because they ignore the principles of compensatory planning and the contribution of archaeological restorations to the cultural upgrading of the urban space. Based on the above, this work aspires to explore the possibilities and perspectives arising from the planning of cultural heritage as an element of the image and city life according to the basic principles that make up the concept of sustainability. The restoration of Hadrian’s Library, an architectural masterpiece built in 132 AD, and one of the most emblematic present monuments of antiquity in modern Athens, is chosen as a case study. The research method of the work concerns the following objectives: a) In the first phase, the rendering of the concept of archaeological heritage as a cultural resource that makes up a sustainable urban environment is sought. b) Next, it is sought to connect the architectural archaeological heritage of an existing monument (Hadrian’s Library) with the managed cultural map of the city of Athens and finally c) to draw scientific conclusions that will highlight the critical factors of planning the cultural heritage of antiquities, which contribute to shaping the image of the city and the sustainable development of the urban space.

**593. THE ECONOMIC GROWTH DISCOURSE OF CITIES CHALLENGING CULTURAL HERITAGE PRESERVATION IN URBAN PLANNING**

**Contribution format:** Oral  
**Contribution authors:** Helena Teräväinen (Aalto University)

Urban Planning processes are executed by professional planners but guided by politicians. The Finnish Land Use Act is reformed but still appreciates the cultural heritage. The political voices don’t always follow the scientific, multifaceted reasoning. The world is departing, there are rich cities as well as impoverishing regions. Developers impact on real estate policies; cities always aim to grow. Recently in Finland we have seen several examples, where objects of preserved, cultural built heritage are in danger. Finland has after the II World War continuously been living in the atmosphere of demolishing everything old, to build new and bigger instead. This still goes on, even though scientific reports are warning about emissions into airspace due to heavy demolitions and on the other hand researchers are concerned on the loss of the valuable built heritage. The former capital Turku has a rich archaeological heritage but a long history o. dismantling the wood house history. The current capital Helsinki is planning huge constructions and not only by dismantling comparatively new buildings but also by filling important historical free public squares, for example in front of the central railway station. In other, smaller cities valuable historic buildings may become threatened because they seem to be in bad condition, without any use – and the lack of funding prevents renovations. This kind of reasoning has started to threaten even church buildings, which earlier were seen as the most important built heritage. The aim of this paper is to research, how the argumentation varies in public discussions, when some valuable subjects of cultural built heritage are threatened by demolition. The research material consists of newspaper texts as well as official documents in municipal decision processes, in selected comparative cases. The collected data is categorized in themes and analysed using text and discourse analysis.

**898. PRECARITY AND COMPLEXITY OF TRADITONAL VILLAGES IN CHINA**

**Contribution format:** Oral  
**Contribution authors:** Su Yin (University College London)

The hyper industrialisation of China in the recent past presents a scale of challenge to traditional cultural practice that is unprecedented any when-and-where-else in the world. This highlights the urgency of attempts in Chinese heritage to respond to the acceleration of cultural transitions that have been underway for a generation. The designation of Traditional Villages as a category of heritage in China dates from 2012. This relatively new heritage management category does however provide an opportunity to reconsider established heritage management practices in vulnerable heritage places subject to the duel intense pressures of urban expansion and rural decline. To explore how Traditional Villages (TVs) can be effectively conserved and managed amidst the precarity and complexity of rural transformations in China, the complexity of the village needs to be understood, which is addressed by this research. On the one hand, villages are experiencing the precarity; on the other hand, villages are involved in a complex network, interacting with different agents all the time. This research starts from reviewing the huge transformations that rural areas have experienced. Then the national policies and strategies are reviewed, like Three Rural Issues and Rural Revitalisation, responding to the precarity, which influence the village from multiple dimensions. Shaozhuang Village are applied as a case study, and this research employs document analysis, interviews, and participant observation to examine the complexity of the village as an entity. Shaozhuang Village is considered in its broader contexts before considering how the designation of Traditional Village engages in that complex network. The interactions among village, town, county and city, the relationship between village and surround environment, village and food chain and village and internet are examined to explore. Then the everyday life in Shaozhuang Village is investigated, which is one of the essential dynamics of the village.

**1072. HOW TO UNLOCK THE HERITAGE POTENTIAL OF A SITE WHILE DEVELOPING IT IN A CONSIDERATE WAY**

**Contribution format:** Oral  
**Contribution authors:** Urban Nilsson (Nyréns Arkitektkontor | Göteborgs universitet)

Through a comparative study the paper explores how the iterative method of Nyréns functions in different projects launching the cultural heritage agenda intertwining it with several other perspectives in the urban design process. In the early stages of the planning process this method makes sure that the heritage perspective is intertwined. Contemporary urban design is functioning within the planning and environmental legislation and the reality of the real estate market. The businesses are watching their interests by using consultants to drive projects and to break deals with other parties. Opposing planning interests need to be solved in order to realize the new plan. The heritage must be advocated by professionals in the field. A conservationist contributes with cultural historic expertise in a process where different societal interests collide. Initially a survey is written mapping the history, the physical remains and the cultural value of the site. Recommendations are formulated as a venture point discussing heritage matters. As a heritage preserver it is vital to take part in the process of prioritizing what structures to keep and what to let go. In this unpacking of the site new knowledge is produced which should be used in the repacking of it. A selection of physical expressions to integrate in the design are decided on for further adaptation blending old and new. A new cityscape is thus created containing a considerable share of the history of the site: for the benefit of users, visitors and residents thus offering social sustainability. Keeping existing structures, refurbishing and reusing them ought to be the highest form of sustainability while reducing the carbon dioxide emissions. Through the architecturally curated existing structures the transformed site can be explained.

**1776. THE SOCIAL-ECOLOGICAL VALUE OF URBAN HERITAGE FOR THE SUSTAINABLE DEVELOPMENT OF CAUCEL, MERIDA, YUCATAN**

**Contribution format:** Oral  
**Contribution authors:** Benjamin Vis (Universidad Autonoma de Yucatan | Universite Libre de Bruxelles)

Present-day Caucel, Yucatan, represents a gradually grown vernacular settlement pattern that has been heavily adapted from precolonial regional practices, consisting of urban blocks divided into ample houselots. In my applied archaeology project studying urban morphology in the Merida region over the long-term, I implemented an urban survey of Caucel. Recently, this satellite town (of Merida) has become virtually encircled (walled) by large-scale expansion neighbourhoods. The local community also grew the historical residential core itself, occupying the buffer of communally administered lands with the contemporary vernacular of autoconstructed dwellings. Most traditional vernacular architecture has disappeared. Few examples of colonial historical styles exist. The unrestored and unconsolidated rubble pyramid just behind the school is scantily recognised. Archaeological evidence emphasises the persistence of lowland Maya agro-urban landscapes, characterised by low built-up densities and the frequent and extensive integration of green or open space. I sought an understanding of the use and value local residents place on current green and open space, as well as the perceived relationship with regional archaeological heritage. This critically contextualises my assertion of social-ecological value encapsulated in the heavily modified, now endangered, remnants of traditional land-use patterns and problematises the disturbed close-knit interdependency between town and landscape. Merida suffers from a scarcity of green space. Eco-archaeological parks are marginally positioned and seem underutilised. Meanwhile in towns like Caucel traditional plots remain an unrecognised social-ecological resource for sustainable urban development. Seeking to influence and provide guidance to urban planners and sustainable spatial design using the deep past as a researcher, implies an intertwined position that highlights conflicting development interests between growth, transitions towards sustainability, subaltern and disadvantaged populations and cultures, and conserving and benefitting from heritage. Can urban heritage take a leading role in increasing the potential of long-term social-ecological urban viability by reinventing regionally appropriate patterns for urban development?

**1853. INTERTWINED DATASETS : STRUGGLING WITH CONCEPTIONS OF LINKED PASTS**

**Contribution format:** Oral  
**Contribution authors:** Loup Bernard (Université de Strasbourg | CNRS)

With over a decade of aggregated datasets, the ArkeoGIS platform (<https://arkeogis.org/>) is a good example to understand how different colleagues and institutions have put archaeological knowledge into digital boxes and how we have managed to link this information. ArkeoGIS is a simple webGIS solution: datasets about the past (sites, artefacts, samples, cores...) are uploaded on the platform and can be queried by any identified professional archaeologist. For open datasets, the ArkeOpen platform is a good tool for visualising and querying the data. The example of the Upper Rhine Valley, with linked extracts from archaeological service inventories, researchers, Masters and PhD theses, projects and palaeoenvironmentalists from different countries, will provide a concrete

case for discussing the possibilities and limitations of these juxtapositions. The presentation will focus on chronological issues, mapping, ontologies and filling in the gaps using datasets from different institutions and fields. Understanding how the data were originally constructed is necessary to better understand how cultural heritage and archaeology can be useful in deciding what and where to excavate or core. In other words, having online access to the state of the art for modelling taphonomy -or planning further exploration- will be key to this presentation.

**2347. UKRAINIAN CASTLE AS AN OBJECT OF CULTURAL HERITAGE LANDSCAPE OF THE CITY OF THE EARLY MODERN PERIOD**

**Contribution format:** Oral  
**Contribution authors:** Larysa Vynogrodska (Institute Of Archaeology National Academy Of Sciences Of Ukraine)

In connection with the expansion of Ukrainian society’s interest in national culture, monuments of defensive and sacred architecture, there is a need to study all the characteristics of castles depending on their regional features. The castle, as an object of architectural heritage in the natural landscape of cities and towns of Ukraine, includes a complex of various aspects that require careful and critical study. This is fortification, archeology, architecture, urban landscape, and many other aspects that together give a complete description of the monument. Note that the majority of Ukrainian castles in the early modern period also had a defensive function. The main problematic issue of the cultural landscapes of Ukrainian castles and cities is the need for their preservation and research, primarily archaeological, since cultural landscapes include material culture, the analysis of which gives a comparative description of the life of the inhabitants of the castle and the city and allows to reveal its common features and individual ethnic manifestations, which are reflected in the residential landscapes of city streets and sacred buildings. The effectiveness of the landscape approach to the processes of urbanization in Ukrainian cities and towns was manifested in the formation of new heritage objects that combine natural and cultural values unique to each historical city. In addition, this approach makes it possible to develop tourist routes through the historical cities of Ukraine, both educational and regional, taking into account natural, architectural, archaeological, urban monuments, since the accelerated development of cities destroys the remains of old streets that have been preserved in historical cities. Today, there is a need to preserve the cultural landscapes of castles, monasteries, and city defense structures, as well as sacred monuments, quarters, and streets of historical cities, by establishing them as protected territories of cultural heritage.

**2348. TRANSFIGURATION OF THE MEDITERRANEAN ARCHITECTURAL HERITAGE: THE CASE STUDY OF THE MANI REGION IN SOUTHERN PELOPONNESUS, GREECE**

**Contribution format:** Oral  
**Contribution authors:** Antigoni Katsakou (Oxford Brookes University)

The concept of cultural landscape encompasses the notion of a synergy between human material culture and natural systems. In many regions, intensified tourist activity, systematically encouraged by both state policies and private developers, as well as difficulties in clearly identifying tangible and intangible heritage qualities have led to a definite split between the primary components of cultural landscapes. Within this context, how is it possible to promote cultural and ecological resilience, through effective building guidelines, rightfully applied? This paper examines the region of Mani, in Southern Peloponnesus, and the small, fishing settlement of Limeni, which has recently emerged as a popular holiday destination, of unique cultural value. Drawing on practice-based research, the author will demonstrate how, in truth, an unprecedented construction boom oriented towards tourist infrastructure and secondary residences, consistently prioritising financial gain over cultural value has altered the settlement’s character and challenges notions of social and cultural authenticity, causing irreversible damage to the natural landscape. Using an ongoing project from her professional practice as a case study, the author will provide an overview of the current situation and explore existing policies and overburdening, time-consuming procedures to obtain building permit. Text-based and morphological analysis will show how archaeological and architectural control committees, often lacking required expertise tend to apply rigid, sterile interpretations of debatable ‘canons’, thus discouraging innovation and adaptive solutions that could actually enhance liveability. The case study eventually resonates with a perpetuating transfiguration of the Greek cultural landscape on a national scale. The paper looks to highlight alternative approaches to applied guidelines and control mechanisms that could promote valid concepts of resilience and heritage protection. The study thus seeks to contribute to a broader discussion on sustainable development in the Greek territory.

**2371. BALANCING HERITAGE AND DEVELOPMENT - COMPENSATION MEASURES IN SUSTAINABLE PLANNING**

**Contribution format:** Oral  
**Contribution authors:** Linda Jungbeck – Stig Swedberg (Kulturlandskapet (The Cultural Landscape))

Sustainable development is often described as resting on three pillars - economic, social and ecological perspectives - in the cultural heritage sector, a cultural perspective is often included as the fourth. Swedish legislation

recognizes both natural and cultural environments as shared values to be protected and managed for future generations. The Cultural Environment Act emphasizes that all remains are protected against damage, and that society bears a shared responsibility for cultural heritage. The Environmental Code contains provisions on natural environment compensation in connection with development, while the Planning and Building Act partially emphasizes the importance of preserving these cultural and historical values. In practice, however, we see that compensation measures for natural environments are more established and implemented to a greater extent than corresponding measures for cultural environments. This presentation explores - based on a practical example from an archaeological survey in Sweden - how conservation and development can end up in competing positions in the context of sustainable community development. By discussing the management of cultural environment compensation in relation to natural environment compensation, it highlights how different professions and actors interpret and apply legislation in planning processes, and how these perspectives can be integrated into the design of future built environments.

**2475. FROM PUTEOLI TO POZZUOLI. DIGITAL TOOLS FOR MANAGING A MULTILAYERED URBAN FABRIC,**

**Contribution format:** Oral  
**Contribution authors:** Luisa Del Giudice (Sapienza, Università di Roma)

The contribution aims to investigate the evolution of the urban fabric of Pozzuoli, a municipality in the Phlegraean Fields affected by the phenomenon of bradyseism: vertical movements of the ground linked to volcanic activity in the Campi Flegrei. The ancient center is Rione Terra, a tuff bank that already hosted the maritime colony of Puteoli in 194 BC and likely earlier, the Greek colony of Dicaearchia. Since then, the fortress has undergone transformations, also influenced by seismic activity in the area. The village was inhabited until March 2, 1970, when it was evacuated due to a severe bradyseismic crisis. Following the evacuation, the Archaeological Heritage Department initiated the first excavation operations, and in 1993, the Campania Region launched a recovery and enhancement program, including ongoing archaeological investigations. The population has not returned to live in the village, only as visitors; however, the site remains accessible despite the ongoing work. Today, the people of Pozzuoli face a new bradyseismic crisis, drawing attention once again to the city’s vulnerability. This contribution, part of a broader doctoral research project, aims to investigate current methods of managing and conserving cultural heritage in relation to recent seismic events, and considering the relation between archaeological site, architectural complex, and new perspectives for the historic district. The study will utilize Digital Urban History tools, particularly HGIS (Historical Geographic Information Systems), to integrate iconographic and documentary sources, archaeological evidence, topographical and geological features of the area, current urban structure, and political and social influences, alongside the historical memory of citizens. The research output can serve as a tool for authorities responsible for land preservation and management, providing a solid analytical basis for policies aimed at conserving urban identities and planning future interventions for the preservation of historic cities.

**1822. COMPENSATION MEASURES IN CULTURAL HERITAGE – THE CASE OF BJÖRKEMOSSEN HERITAGE SITE**

**Contribution format:** Poster  
**Contribution authors:** Paula Molander – Stig Swedberg (Kulturlandskapet)

This poster examines the cultural heritage compensation measures made in Lursång windfarm, Sweden, focusing on the decision to create a digital platform as the primary compensatory measure. It also briefly reviews the reasons why compensation measures are needed within archaeology, architecture or cultural heritage as a way of handling negative impacts on sites, and how online platforms can serve this compensatory purpose. The case with Lursång windfarm and the compensation of Björkemossen cultural heritage site does not concern any significant physical exploitation, but rather visual and audible alterations to the site. The site itself is also not easily accessible. This raised the question on how a compensation measure could best be outlined. The project opted for a website to document and present the cultural heritage sites affected by the construction. This approach was chosen due to accessibility and capacity to engage a broader audience, beyond the physical site. The website presents archaeological sites and visual documentation, ensuring the preservation of archaeological knowledge, despite the impact of the windfarm’s construction. This case aligns well with Track 2 of session #54, by addressing the balance between exploitation, protection, and inclusion in development, through digital means. This compensation measure was one of four ongoing projects examined in the study” Kulturarv i samhällsplaneringen – Kompensation av kulturmiljövården”. The final outline of this project is reviewed in relation to the study.

55 NETWORKS OF CARE AND NEGLECT IN THE ARCHAEOLOGICAL RECORD

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Regular session  
Session keywords: Archaeology of care, Social networks and identities, Structural violence, Bioarchaeology, Social inequality  
Session organisers: Ben Raffield (Uppsala University) – Christina Fredengren (Uppsala University | Stockholm University) – Anna Kjellström (Stockholm University) – Madeleine Lamer (University of British Columbia)  
Session discussant: Renate Larssen (University of Leicester)

SESSION ABSTRACT

The aim of this session is to problematise and explore how concepts of care and neglect were operationalised in the past. The last ten years have witnessed a relative surge of interest in this subject, often with a focus on the bioarchaeological dimensions of care. While this work has shed much-needed light on the perception and treatment of individuals suffering from common or rare ailments, less attention has been afforded to the social context or networks within which various iterations of care were provided. Relatively few attempts have similarly been made to identify and examine care as a form of social praxis – something that was deliberately provided or indeed withheld from human and more-than-human bodies and the environment based on a range of intersecting factors. This raises interesting questions regarding the possibility of identifying and delineating an ‘archaeology of care’ alongside a corresponding ‘archaeology of neglect.’ To what extent is it possible, for example, to identify disparate iterations of care that were extended to members of different social groups or even individuals within the household and community based on institutional conditions? Was the provision of care, furthermore, contingent on the social identities, status, and roles of those who received it? Furthermore, at which points might notions of ‘minimal’ or ‘mandatory’ care intersect with neglectful and perhaps even violent networks of social interaction. In seeking to address these and other questions, we welcome contributions from across the field of archaeological enquiry, and encourage papers that showcase a range of diverse theoretical and methodological approaches, applied across varied regional and chronological contexts.

CONTRIBUTION ABSTRACTS

720. CARE AND NEGLECT IN THE ARCHAEOLOGICAL RECORD: EXPLORING DIMENSIONS AND NETWORKS OF SOCIAL PRAXIS

Contribution format: Oral  
Contribution authors: Ben Raffield (Uppsala University) – Christina Fredengren (Uppsala University | Stockholm University) – Anna Kjellström (Stockholm University)

This paper will open up the session by problematising and exploring how practices and relations of care and neglect were operationalised in the past. In the last ten years, there has been a relative surge of interest in the archaeological study of care, often with a focus on bioarchaeological approaches that have shed much-needed light on the perception and treatment of individuals suffering from common or rare ailments. In this paper, we seek to expand this perspective by considering care as a networked form of social praxis – something that was deliberately provided or indeed withheld from individuals based on a range of intersecting factors. This also raises questions concerning the potential to identify and delineate a corresponding archaeology of neglect in the material record. To what extent is it possible, for example, to identify disparate iterations of care that were extended to members of different social groups or even individuals within the household and community, based on institutional conditions? Was the provision of care, furthermore, contingent on the social identities, status, and roles of those who received it? In considering these and other questions, we make a case for the development of interdisciplinary frameworks to support the study of care and neglect across varied regional and chronological contexts.

30. THE ARCHAEOLOGICAL RECORD OF CARE THROUGH EARLY MEDIEVAL MATERIALITY (4TH–8TH CENTURIES AD) IN THE NORTHWEST OF THE IBERIAN PENINSULA

Contribution format: Oral  
Contribution authors: Celtia Rodríguez-González (Ausonius UMR 5607, Université Bordeaux-Montaigne | Centro de Investigación Interuniversitario das Paisaxes Atlánticas Culturais, CISPAC | Grupo Síncriis, Universidade de Santiago de Compostela) – Ana Delia González-Jimenez (Universidad Nacional de Educación a Distancia (UNED))

The study of the Early Middle Ages in the northwest of the Iberian Peninsula has seen significant advancements in recent decades, primarily due to the growing number of case studies stemming from archaeological research.

However, this historical period still lacks a renewed theoretical framework that would allow for a more in-depth exploration of everyday practices. In this context, the present study provides an initial approach to examining these practices, with a particular emphasis on care and social experiences. This research is situated within the framework of the “COIDARQ: Care, Materialities, and Spaces” project, which aims to analyse and disseminate the everyday practices of early medieval societies from a gender perspective. The study presents preliminary theoretical and methodological progress based on the analysis of archaeological contexts dated between the 4th and 8th centuries AD in the northwest of the Iberian Peninsula. Drawing on the theory of social practice, it explores everyday experiences within settlements and funerary contexts, emphasising the central role of care in social reproduction and the development of both past and present communities. Parallel to the research, we propose a knowledge transfer strategy aimed at enhancing the value of the findings through dissemination and outreach via digital platforms and collaborative activities with local communities. This approach seeks to provide a critical and socially engaged perspective on early medieval social practices and care, emphasizing their significance for understanding historical dynamics and their relevance to contemporary challenges.

636. RECONSTRUCTING SOCIAL STRATIFICATION IN LATE IRON AGE SCANDINAVIA: BIOARCHAEOLOGICAL INSIGHTS FROM VIKING AGE BURIAL SITES

Contribution format: Oral  
Contribution authors: Anna Kjellström (Department for Archaeology and Classical Studies, Stockholm university) – Benjamin Raffield (Department of Archaeology and Ancient History and Conservation, Uppsala University) – Christina Fredengren (Department for Archaeology and Classical Studies, Stockholm university)

The social stratification of individuals during the Late Iron Age in Scandinavia was distinctive. Although it was not entirely impossible to alter one’s social role, the majority of people likely remained in the position into which they were born throughout their lives. Furthermore, enslavement was a phenomenon that marginalised a significant portion of the population. Some contemporary Arabic sources, as well as some modern researchers, suggest that the enslaved were so devalued that they were not accorded burial after death, the ultimate sign of neglect (Skre 2001). This would imply that analyses of burial sites may be significantly skewed, as a crucial segment of the original population is excluded. However, those interred in the Viking Age cemeteries under investigation may still have belonged to varying social strata, as these sites are often associated with entire households. The task of identifying the embodiment of social stratification through bioarchaeological analysis is fraught with challenges. In bioarchaeology, clear indicators such as trauma, pathological changes, and diet have been utilised to identify the unfree in other contexts (Marti. & Osterholtz 2012). When analysing social hierarchies in Late Iron Age burials, it is essential to recognise that few such clear physical differences between groups should be expected. The focus of this study will be on a Viking Age site, which demonstrates the need for a nuanced approach to understanding the complexities of Viking Age social stratification and institutionalised networks of care and neglect.

369. INVESTIGATING SLAVERY IN VIKING AGE KOPPARSVIK, GOTLAND USING SKELETA. DATA

Contribution format: Oral  
Contribution authors: Madeleine Lamer (The University of British Columbia) – Benjamin Raffield (Uppsala University) – Michael Richards (Simon Fraser University) – Darlene Weston (The University of British Columbia)

Slavery in the Viking Age is difficult to identify archaeologically, however, historical documents as well as numerous Sagas testify to the existence of slavery and human trafficking. The difficulty in identifying slavery in the archaeological record lies in the lack of consistency in the members of this social group, a lack of material culture and variation in burial rites. The plasticity of the human skeleton embodies the physical and biological stressors experienced during life and therefore allows enslaved individuals to embody the neglect they experienced as members of a marginalized group. A population-wide investigation of socioeconomic status, stress, and occupation in skeletal materials from the Viking Age (900-1050AD) Kopparsvik burial site on Gotland, Sweden, has sought to identify patterns of fractures and disease load characteristic of enslaved individuals. The analysis of fracture patterns and disease load allow for the interpretation of activities and health status, as well as for the interpretation of risk and quality of life. Sex, age, burial position and style, and the presence of grave goods have been incorporated in the analysis. By determining who in a burial population was enslaved, and by studying the patterns of stress and trauma present, we can better understand the lived experiences of these marginalized individuals. This project illuminates the more nuanced aspects of the past and gives a voice to those who were previously silent.

1730. HEALING COMMUNITIES: THE LIVING AND THE DEAD IN ENGLISH MEDIEVAL HOSPITALS

**Contribution format:** Oral  
**Contribution authors:** Martin Huggon (Bishop Grosseteste University) – Samantha Tipper (Anglia Ruskin University)

The term hospital in the English medieval period encompassed spaces caring for a diverse range of people, from those suffering sickness and poverty to old age and infirmity, or who, as pilgrims and travellers, were isolated and potentially vulnerable. These were both religious and secular spaces, tackling issues that were both spiritual and physical, but often in a manner that implied they were seen just as much as a societal ailment or issue as they were spiritual or physical. This paper will introduce preliminary results from two current hospital excavation projects in Lincoln, St Mary Magdalene Hartsholme and the Malandry, and begin exploring the interplay between the communities of the living and the communities of the dead. A key focus centres on who is being buried at these sites and why were these sites chosen as places of burial for these individuals, including infants and children, and what role they played in the daily life of the hospitals. This will be framed by current developments in what archaeology shows us about strategies and principles of healing, curing, redeeming, and caring for both living and dead, and the connections and divergences between the physical and the spiritual.

56 HERITAGE AND ARCHAEOLOGY DURING LATE CAPITALISM

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Regular session  
**Session keywords:** Capitalism, Commodification, Market, Funding, Popularity, Contract Archaeology  
**Session organisers:** Artur Ribeiro (Christian Albrechts Universität zu Kiel) – Zsuzsanna Varga (Aquincum Museum)

SESSION ABSTRACT

In our current age, we have grown accustomed to the fact that it is the market that dictates how we deal with heritage management and archaeology. Contract archaeologists have had to deal with the rapid gentrification of cities and its effects on past realities; museums and institutions have had to commodify heritage so as to appeal to wider audiences and make their work profitable; academic and research institutions have had to jump on the latest popular topics in order to obtain funding; and archaeologists of all sorts have had to oversell and consequently overwork themselves in the hopes of gaining permanent employment. Underlying all this is a late-stage capitalist logic that demands the 24/7 circulation of capital, the constant optimization of the workforce, and the commodification of all aspects of life. Developing late capitalist subjectivities has had several effects. We have lost the capacity to slow down and tell empathetic stories of past peoples and their lives. Everything is now subject to a short term logic, with ideas, facts, and institutions, rapidly becoming “outdated”, and contract archaeologists having to conduct work constantly under urgent conditions. Additionally, the worth of archaeology and heritage has become reduced to measurable values, such as citation indices and number of museum visitors. Overall, late capitalism has affected all aspects of heritage and archaeology in Europe, from students, to contract archaeologists, museum specialists, researchers, and professors. The aim of our session is to explore the absurdities of late capitalism and its effects on heritage and archaeology, and in turn, how these have conditioned peoples’ personal lives (e.g. burnout, constant migration). Finally, although difficult to conceive, we wish to discuss how these effects can be countered and what can be done in response to the demands of late capitalism.

CONTRIBUTION ABSTRACTS

294. THE POLITICS OF AUTHENTICITY IN ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Artur Ribeiro (University of Kiel)

One of the marks of our current times is authenticity. This means to not let external influences dictate how one behaves and represents oneself. In practice, this entails evading the consumption of large corporate brands, avoiding mainstream music such as Taylor Swift, and shunning big retailers. More specifically, in archaeology, this has meant a continuous state of producing research that is original, generating new facts as often as possible, and constantly avoiding outdated ideas and theories. Unlike classic capitalism (aka imperial capitalism), late capitalism expects people to be free, dynamic, and authentic. Whereas in earlier stages of capitalism, discipline was enforced onto citizens in order for them to produce, we now live in an age where that discipline is unnecessary. The capitalism of today is not disciplinary, it is seductive. In archaeology, this has meant a workforce that is constantly seduced into finding the most interesting sites, promoting the latest and greatest ideas, and

constantly promoting oneself in the press. This constant state of being authentic has, however, led to its opposite effect: the incapacity to generate anything truly new. The archaeological knowledge of today is one of constant recycling and re-branding of ideas. Rather than a slow and deliberate exploration of the past, we are just in a state of hectic scrambling for the next big thing, without ever truly finding it. Like everything in late capitalism, the economy has found a way to commodify the “new”, and this talk aims to explore how this has affected archaeological knowledge production.

2160. BETWEEN MEMORY AND PROFIT: THE TRANSFORMATION OF MAMULA ISLAND AND THE CHALLENGES OF CULTURAL HERITAGE PRESERVATION IN MONTENEGRO

**Contribution format:** Oral  
**Contribution authors:** Ana Velickovic Kastratovic (University of Belgrade, Faculty of Philosophy)

Montenegro faces significant challenges in the protection and preservation of its cultural heritage, as highlighted by the case of Mamula Island. Despite its rich historical significance, including its role as a 19th-century Austro-Hungarian fortress and a World War II prison camp, Mamula has been transformed into a luxury resort, raising concerns about the prioritization of profit over historical preservation. This transformation reflects broader issues in Montenegro’s legislative and institutional frameworks, which lack adequate policies to safeguard cultural assets. The government’s decision to lease Mamula to a private company for 49 years, despite local and international opposition, underscores the tension between economic development and heritage conservation. Similar trends are evident in other Montenegrin sites, such as the Budva Citadel and a fortress near Petrovac, which have been converted into commercial venues. These developments highlight a regional tendency in the Balkans to favor economic gain over the preservation of cultural and historical values. This presentation will examine the implications of these trends for Montenegro’s cultural heritage, advocating for a more robust legislative and institutional approach to preservation, as well as greater public awareness of the importance of cultural heritage for societal identity and historical memory. The case of Mamula serves as a poignant example of the broader challenges facing cultural heritage conservation in the Balkans and beyond.

2359. WHAT ARCHAEOLOGY DO WE WANT? THE IMPACT OF DEVELOPER-FUNDED ARCHAEOLOGY IN HOW WE DIG, THINK, AND EXIST

**Contribution format:** Oral  
**Contribution authors:** Guillermo Díaz De Liaño (MOLA (Museum of London Archaeology))

Departing from evidence from the UK context, but with the aim of extrapolating and comparing with other places, this paper will examine the myriad ways in which the conditions of commercial archaeology are not only affecting our research methods, but also impacting our very epistemologies, and producing significant changes in our disciplinary cultures. This paper will argue that while our close connection with development might bring some advantages, it also entails numerous risks for our profession, as we increasingly adapt our way of operating to the demands of the commercial environment without realising the degree to which this compromises our ability to conduct good research, contribute towards social wellbeing, and maintain a healthy workforce. It will argue that if archaeology aims to be sustainable, not only at the environmental but at the social and professional level, numerous changes are required, and although some of them might seem far away, as they imply tackling the monsters of late Capitalism, others are within reach, especially if we accept that the solutions to many of the problems in the Western world can only come from the epistemologies of the Global South.

387. ARE WE THERE YET? ASSESSING THE INTEGRATION OF ARCHAEOLOGICAL HERITAGE INTO LOCAL DEVELOPMENT STRATEGIES IN POLAND

**Contribution format:** Oral  
**Contribution authors:** Aleksandra Chabiera (Adam Mickiewicz University in Poznań)

Viewing the local community as a collective entity allows for the balancing of growth pressure with sustainable social development. The social approach includes, but is not limited to the economic side of development. A wealthy community is rooted in a specific space, with a recognized history understood by its residents. Heritage can and should play a role in community development by supporting its healthy, socially sustainable goals. However, the crucial step in this process is to incorporate this approach in strategic documents. Since it is the competence of self-government to set and implement development direction, local administration must include an understanding of monuments social values in the strategies; otherwise, substantial change will not occur. This presentation discusses data from Polish municipalities to analyze whether, and how local strategies incorporate the role of archaeological heritage in local development. The analysis is based on survey conducted during my PhD study. This is the first in-depth study assessing the inclusion of archaeological heritage in the strategic documents across Polish municipalities. A CAWI survey was sent to over 99.1% of them (i.e. 2452 municipalities). With a response rate of approximately 21%, the sample is representative, allowing the results to be generalized to

the entire population of municipalities. To gain a deeper understanding, I also examine selected case studies that highlight effective inclusion of local archaeological resources in strategies. The findings of my research present some good examples, but most importantly, they emphasize the critical need for cooperation among stakeholders. Polish municipalities may have the goodwill to utilize their assets, but in order to do so they must also recognize their social values and learn how to integrate these assets into the communities' life.

### 870. “MONEY MAKES THE WORLD GO AROUND”: THE CABARET OF CULTURAL HERITAGE

**Contribution format:** Oral  
**Contribution authors:** Daniel Evans (Arcadis Consulting Limited)

Today, the bright lights don't read Sally Bowles but draw on the corporate realm's feasting of the capitalist stage. Stepping into the Kit Kat Klub to escape today's reality would be the indulgence of scandal that is not filling in your timesheet; alongside the banning of passive aggressive buzz phrases such as 'per my last email'. In the UK, recent discussion on planning reform specifically to drive an ambitious 1.5 million house builds in this 5-year parliament, is the epitome of late capitalism in the acceleration of production. But to what risk and opportunity to heritage. Heritage professionals strive to improve the quality of life for our clients and community end users of our projects, by bringing to life the stories of the past as part of our projects. Aspects of place-making in master planning and the increasing Social Value agenda are narratives frequently lost in communication of corporate strategies and the drivers of cost and programme. The current rhetoric in the UK is to blame the 'newts and bats' for stopping the capitalist's production harmonies. But how much of this is an umbrella term towards all environmental impact disciplines. This paper will seek to discuss the position of heritage within the current planning system of the UK. The risks we as an industry and individuals, face in the short to medium term but also the opportunities for heritage to become a driver (of some sort) to the capitalist programme- demonstrating our value and worth to clients and the communities we seek to share our stories with.

### 1597. TOWARDS NEW NARRATIVES FOR “ARTAEOLOGICAL” ARTEFACTS TO COUNTERACT THE MARKET (AND LOOTING)?

**Contribution format:** Oral  
**Contribution authors:** Jaime Almansa-Sanchez (CRETUS Universidad de Santiago de Compostela | Asociación Némesis) – Ignacio Rodríguez-Temiño (Asociación Némesis | Conjunto Arqueológico de Carmona)

The market of antiquities can be considered the original sin of archaeology with regard to capitalism. In the beginning of the discipline, the artistic value of heritage stood over the creation of knowledge about the past. Two direct consequences arise from this: On the one hand, the market of antiquities itself, that still today affects the protection of archaeological heritage with crimes against sites and museums. On the other hand, a narrative of treasure and beauty that permeated society up to a point that it even affects professional management. The subsequent conception of archaeology as art (“artaology”) that dominates current narratives, populating museums (and auction houses), tourism flyers (and academic journals), or popular perceptions (and even professional expectations), orbits other aspects of daily practice. Addressing this dissonance might help to understand and counteract these dynamics. What is the actual value of archaeology and archaeological heritage? Can a different narrative help to mitigate the dynamics of the market? How could this new narrative prevail over current capitalism, especially when decades of professional archaeology have yet to make an impact on it? This proposal will address the matter, and explore how a new valuation of archaeological heritage might help in the process.

### 897. HISTORICAL REENACTMENT BETWEEN NATIONALISM AND LATE CAPITALISM

**Contribution format:** Oral  
**Contribution authors:** Zsuzsanna Varga (Aquincum Museum)

Historical reenactors are hardly ignorable players in the interpretation of archaeological legacies and in creating visions of history: they contribute to experimental archaeology and draw in crowds for special museum events, history festivals, and fairs. While they have the potential to bring in multi-vocality, I suggest we look at how reenactors' subjectivities are shaped by late capitalist forces that produce their own focal points and social exclusions. Recently Hungarian reenactors specializing in tenth-century Magyar history have started to pay accentuated attention to detail, which they see as a transition from amateurism to professionalism and as a commitment to historical authenticity. The upscale, however, is also in accordance with late capitalist expectations, such as careful self-styling, the pursuit of Instagram-worthy appearance, and the display of disposable income and time spent making garbs and equipment. So is the phenomenon that where there is reenactment, there is likely to be a museum shop or a historical fair nearby with recrafted archaeological finds for sale – or alternatively these items may be purchased 24/7 online. As sociologist Dorit Geva points out, today in Hungary full national inclusion rests on ethnicity and on the ability to consume (2021), and I interpret reenactment as

running the risk of reproducing such nationalist and neoliberal logics: the pre-modern in technical production is appreciated and consumed, but the question of what happened to pre-modern forms of belonging, sociability, genders, work patterns remains unasked.

### 2171. MAMULA ALL INCLUSIVE

**Contribution format:** Poster  
**Contribution authors:** Ana Velickovic Kastratovic (University of Belgrade, Faculty of Philosophy)

Mamula Island, also known as Lastavica Island, is a small islet located at the entrance of the Bay of Kotor in Montenegro. Historically, it is renowned for the 19th-century fortification built by the Austro-Hungarian Empire, named after General Lazar Mamula. The fort was part of a defensive strategy to protect the strategically significant Bay of Kotor, which served as a key naval base. During World War II, the fort was repurposed by Italian fascist forces as a prison, gaining notoriety for its harsh conditions and the suffering of its inmates. This dark chapter has left a lasting mark on the island's legacy. Today, Mamula Island exemplifies the challenges Montenegro faces in preserving its cultural heritage. Despite its historical significance, the island has been transformed into a luxury resort, raising concerns about the prioritization of profit over the preservation of history. This development reflects broader issues in Montenegro's approach to cultural heritage protection, where economic interests often overshadow the need to safeguard historical and cultural values. The case of Mamula Island highlights the urgent need for stronger legislative and institutional frameworks to balance economic development with the preservation of Montenegro's rich cultural heritage.

### 57 RECONSTRUCTING THE PAST: BIOARCHAEOLOGICAL APPROACHES IN THE LEVANT, MESOPOTAMIA, AND IRAN

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Discussion session  
**Session keywords:** Bioarchaeology, Levant, Mesopotamia, Iran, Multi-Disciplinary Approaches  
**Session organisers:** Matteo Giaccari (Department of Earth Science, Sapienza University of Rome) – Andrea Göhring (Leibniz Laboratory for Radiometric Dating and Stable Isotope Research, Kiel University) – Arkadiusz Soltysiak (Department of Bioarchaeology, Faculty of Archaeology, University of Warsaw)

#### SESSION ABSTRACT

Bioarchaeology, which encompasses the study of human, animal, and plant remains as well as environmental reconstructions, provides a comprehensive framework for understanding the complex interactions between past populations and their environments. Based on often multi-disciplinary approaches, bioarchaeology offers unique insights into how ancient societies adapted to and shaped their environments. The different disciplines inform us about subsistence strategies, ecological resilience, health and disease, mobility, and socio-cultural practices, allowing for a holistic reconstruction of ancient lifeways. The Levant, Mesopotamia, and Iran are regions of immense importance for the development of agriculture, early urbanism, and state formation. The Levant, a major crossroads for human migration and technological diffusion, features early farming communities and rich biodiversity. Iran's diverse ecosystems and highland-lowland dynamics fostered multiple human-environment interactions and supported unique subsistence strategies. Mesopotamia, the cradle of civilisation, provides evidence of early urban societies whose development was closely linked to their manipulation of the landscape through irrigation and agriculture. This session brings together multidisciplinary bioarchaeological research to examine how ancient communities in these regions adapted to environmental pressures such as climate variability and resource scarcity, and how they interlink in complex social and economic networks. Topics include human health and dietary transitions, animal domestication and management, plant cultivation, and environmental change over time. By integrating data from human, animal, and plant remains, landscape reconstructions, and environmental studies, this session will illuminate the complex factors and relationships that shaped ancient civilisations in these key regions, offering new perspectives on their adaptation or resilience.

#### CONTRIBUTION ABSTRACTS

### 934. SPATIAL AND TEMPORAL VARIABILITY OF SUBSISTENCE PATTERNS IN IRAN INDICATED BY STABLE CARBON AND NITROGEN ISOTOPES IN HUMAN COLLAGEN

**Contribution format:** Oral  
**Contribution authors:** Arkadiusz Soltysiak (Faculty of Archaeology, University of Warsaw)

Research on diet and subsistence in Iran using light stable isotopes was not very popular in the past, with only four papers on this topic published before 2025. However, all available published and unpublished data represent 13 sites, with the chronological range from the Chalcolithic to the Late Antiquity. Such a dataset enables some preliminary assessment of spatial and temporal variability in subsistence patterns, which is clearly higher than in Northern Mesopotamia. At some sites located at the alluvial fans, a high level of manuring is indicated by enrichment in  $^{15}\text{N}$ , with relatively low  $\delta^{13}\text{C}$  values. In later periods, more extensive agriculture with a higher contribution of millet produced lower  $\delta^{15}\text{N}$  and higher  $\delta^{13}\text{C}$  values. This variability provides evidence of a flexible economy, with specific adaptations to local environmental conditions in a region that is not very favourable for agriculture, extending between high mountains and arid deserts and therefore forcing specific land management measures in prehistorical and early historical human societies.

**1181. DIETARY PRACTICES AT ABU TBEIRAH: EXPLORING SUMERIAN LIFE THROUGH A MULTI-ISOTOPIC APPROACH ( $\Delta^{66}\text{Zn}$ ,  $\Delta^{18}\text{O}$  AND  $\Delta^{13}\text{C}$ )**

**Contribution format:** Oral  
**Contribution authors:** Matteo Giaccari (Department of Earth Science, Sapienza University of Rome) – Licia Romano (Department Italian Institute of Oriental Studies, Sapienza Università di Roma) – Silvia Soncin – Sofia Panella (Department of Environmental Biology and MAREa, Sapienza Università di Roma) – Francesca Alhaique (Museo delle Civiltà, Rome) – Franco D’Agostino (Department Italian Institute of Oriental Studies, Sapienza Università di Roma) – Klervia Jaouen (Géosciences Environnement Toulouse (GET), Observatoire Midi-Pyrénées (OMP), Toulouse) – Mary Tafuri (Department of Environmental Biology and MAREa, Sapienza Università di Roma)

In the study of ancient Mesopotamia, cuneiform tablets serve as powerful indirect evidence of individual lives. However, their use is limited by their predominantly administrative nature and the perspectives of the elite who produced them and for whom they were intended. Nonetheless, they offer insights into the dietary practices by documenting the rations allocated to specialized workers. Despite this indirect evidence, systematic direct investigations, such as isotope analysis, have been limited only to the northern part of the region, with only one focused on southern Mesopotamia. One of the difficulties encountered in southern Iraq is linked to the nature of the soil, which exhibits high salinity and therefore poor collagen preservation. This is the case at Abu Tbeirah, an Early Dynastic site dated to the second half of 3rd millennium BCE, located about 15 Km SE of Ur (Nasiriya, Dhi Qar province, Southern Iraq). The site has been excavated systematically over the past decade, yielding a significant number of human and animal remains. In addition, Abu Tbeirah is located in an area rich in natural hydrocarbons sources, with most of the archaeological layers containing bitumen artefacts. For these reasons, the bone remains recovered here are prone to post-depositional disturbances that result in the alteration of their organic components (e.g. collagen). In view of these challenges, we apply a multi-isotopic approach, coupling traditional isotopic proxies ( $\delta^{18}\text{O}$  and  $\delta^{13}\text{C}$ ) with innovative techniques ( $\delta^{66}\text{Zn}$ ) to investigate food practices and different types of herd and animal management using the inorganic fraction of skeletal remains (i.e., tooth enamel), as this is less prone to diagenesis. This study represents the first multi-isotopic approach to investigate human dietary habits in an archaeological site from southern Mesopotamia involving zinc isotope ratios and demonstrate a differential access to animal foods within the population buried at Abu Tbeirah.

**1924. FROM TEETH TO TALES: INVESTIGATING HISTOLOGICAL, PROTEOMIC, AND GEOCHEMICAL SIGNATURES IN DENTAL REMAINS FROM JIROFT NECROPOLISES (IRAN, 3RD MILLENNIUM BCE)**

**Contribution format:** Oral  
**Contribution authors:** Claudia Stefani – Alessia Galbusera (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University) – Leonardo Tauro (Department of Geosciences, University of Padua) – Szymon Mianowski (Polish Academy of Science, Kraków | Department of Odontostomatological and Maxillofacial Sciences, Sapienza University) – Federico Lugli (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia) – Robert Anczkiewicz (Polish Academy of Science, Kraków) – Luca Bondioli (Polish Academy of Science, Kraków | Department of Cultural Heritage, University of Padua) – Nasir Eskandari (Department of Archaeology, University of Tehran, Tehran, Iran) – Massimo Vidale (Department of Cultural Heritage, University of Padua) – Alessia Nava (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University)

The study of Jiroft culture (3rd millennium BCE, southeastern Iran) faces significant challenges due to looting, which has seriously compromised the archaeological record. Nevertheless, a number of dental remains recovered from Hookerd, Rigambar, and Mahtoutabad provide a direct glimpse into the biological and social life of

this ancient communities. Indeed, teeth, due to their durability, contain a permanent record of biological markers helpful for understanding growth patterns, physiological stress events and human-environment interactions. In archaeological contexts where skeletal remains are poorly preserved, dental remains become the main tool for reconstructing life histories. This study examines 13 dental specimens using a multi-analytical approach to explore growth trajectories, health, diet and mobility during infancy and childhood. Histological examinations of enamel microstructures provided insights into growth patterns and physiological stress event prevalence. Proteomic analyses via liquid chromatography-tandem mass spectrometry (LC-MS/MS) enabled sex determination through the identification of amelogenin isoforms in dental enamel. Additionally, histologically controlled laser ablation inductively coupled mass spectrometry (LA-ICP-MS) of trace elements revealed dietary transitions during infancy, while laser ablation multi-collector ICP-MS of strontium isotopes ( $^{87}\text{Sr}/^{86}\text{Sr}$ ) offered evidence of individual mobility at the highest temporal resolution. Despite the challenges posed by diagenesis and sample fragmentation, our integrated analytical approach provided valuable insights, albeit with some limitations. Methodological adjustments helped mitigate some diagenetic alterations, underscoring the potential value of a multifactorial approach in analytical techniques where applicable. These findings offer a glimpse into the multifaceted aspects of individual lives, shedding light on a range of biological and cultural factors that contribute to the life history of this ancient population.

**2278. GENETIC MAKE-UP AND DEMOGRAPHIC INSIGHTS IN NORTHERN MESOPOTAMIA: ANCIENT DNA ANALYSES FROM THE BRONZE TO IRON AGE TRANSITION**

**Contribution format:** Poster  
**Contribution authors:** Raffaella Bianco (Max Planck Institute of Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean) – Xiaowen Jia (Max Planck Institute of Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean | Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, LMU) – Alexander Pruß (Institute of Ancient Studies, Johannes Gutenberg-University Mainz) – Alexander Tamm (Institute of Church History, Friedrich-Alexander-University Erlangen-Nürnberg) – Carsten Witzel (Institute of Biology and Chemistry, University of Hildesheim) – Dirk Wicke (Institute of Archaeological Sciences, Goethe University Frankfurt) – Lutz Martin (Vorderasiatisches Museum, Berlin) – Önhan Tunca (Department of Sciences of Antiquity, Liège) – Johannes Krause (Max Planck Institute of Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean) – Philipp Stockhammer (Institute for Pre- and Protohistoric Archaeology and Archaeology of the Roman Provinces, LMU | Max Planck Institute of Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean)

The Mesopotamian Bronze Age (approx. 3100-1180 BCE) witnessed the formation of large urban centers with increasingly complex societies which formed into states with political influence as well as a flourishing trade with neighboring cities and states. Over the time span from the Bronze Age deep into the Iron Age, the region of present-day North-Eastern Syria was part of different states and empires and was finally incorporated into the Assyrian Empire in the 9th century BCE. However, due to the scarcity of ancient DNA data from this area, the effects of these profound societal shifts on human mobility and demographics remain unknown. This is mainly due to poor molecular preservation expected from the prevalent climate in the region. Thanks to recent advancements in ancient DNA technologies, we could recover genomic data and generate genome-wide SNP data from a total of 62 individuals from four different sites: Tell Knedig (n=19), Tell Chuera (n=27), Tell Abu Hgaira (n=5), and Tell Amarna (n=11), all of them located in northern Syria and presenting the largest genetic dataset available for Bronze Age Mesopotamia so far. Population genetics results show that there is intraregional genetic continuity from the Bronze Age to the Iron Age, which challenges historical accounts on great human mobility for the region.

**58 DIGITAL TOOLS FOR SURFACE ANALYSIS OF ARCHAEOLOGICAL ARTIFACTS: INTEGRATING QUALITATIVE AND QUANTITATIVE APPROACHES**

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Regular session  
**Session keywords:** surface analysis, digital archaeology, technological study, material culture, methodology  
**Session organisers:** Giusi Sorrentino (Ca’ Foscari University of Venice) – Simon Radchenko (University of Stavanger)

SESSION ABSTRACT

The study of surface modifications—such as wear traces, engravings, cut and perforation marks, graffiti, butchering marks, gnawing marks, and technological traces—on various archaeological findings is essential for understanding the production technology, use, and function of archaeological artifacts. Traditionally, qualitative approaches based on various imaging techniques have been central to this research. However, introducing digital tools revolutionized the field and fostered the rapid development of quantitative methods. These two approaches — qualitative and quantitative — are often perceived as dichotomic: the former relies on expert interpretation and emphasizes descriptive aspects, offering cultural and contextual insights; the latter, on the other hand, provides numerical data for objective measurements of artifacts geometry and surface texture. While these approaches may appear distinct, and objectivity is often pursued at the expense of qualitative input, their synthesis is crucial for a more comprehensive understanding of an artifact’s use and life history. Rather than being mutually exclusive, qualitative and quantitative methods complement each other. For example, 3D models created via scanning, photogrammetry, or confocal microscopy provide detailed imagery for qualitative interpretation while simultaneously yielding numerical data for quantitative assessment. Moreover, each approach can scaffold the other, offering new interpretive clues and directions. Combining qualitative insights with quantitative data enables validating results, refining hypotheses, and gaining a more nuanced understanding of an artifact’s biography. This session explores the integration of qualitative and quantitative approaches in surface analysis, focusing on modifications involving material removal or loss, including but not limited to those produced by chiseling, carving, scratching, grinding, and other means of reduction. We invite methodological contributions as well as case studies from all areas of archaeology and welcome studies on bone, rock, antler, clay, wood, and any other surfaces’ modifications on a broad chronological span from prehistory to the present.

CONTRIBUTION ABSTRACTS

1444. TOO MANY THINGS WE DON’T KNOW: PROBLEMS AND SOLUTIONS IN WORKING WITH THE ENGRAVED SURFACES’ REFERENCE COLLECTION

**Contribution format:** Oral  
**Contribution authors:** Simon Radchenko (University of Stavanger)

Whether qualitative or quantitative, our understanding of surface modification techniques derives from comparing archaeological data with what we think surface modification marks look like. This knowledge is not granted but is obtained in laboratory research and numerous experimental sessions. Indeed, experimental data yield great potential for providing reference datasets during the technological assessment of various archaeological materials. Moreover, given the more widespread material types used throughout prehistory (such as bone, antler, flint, and clay), it seems possible to apply these references consistently on a larger scale instead of using them for specifically designed research. Out of all types of data, 3D models stand out as capable of providing the widest variety of qualitative and quantitative data and translating them — quantifying the visual or visualizing the numbers. Moreover, it is by now the most informative way to share such data and make them useful outside of the scope of a particular research effort. Therefore, 3D models are gaining momentum as a comparison tool between archaeological artifacts and experimental replication. However, using them this way faces various obstacles, from administrative to research-related: data management and FAIRness, nuances of data acquisition techniques, the tight connection between the design of the experiment and the nature of quantifiable data, and various quantification methods. On the other hand, applying 3D to bridge archaeological and experimental data opens new analytical perspectives. It enhances the research process, allowing the oscillation between different data sources in the most possibly informed manner. This talk will share reflections on creating and using the pilot 3D database of experimental and archaeological data to study the engraved surfaces. It outlines the pros and cons of the approach, highlighting issues to be solved in the future and presenting results that are effectively applied in the present.

2016. RECONSTRUCTING MEDIEVAL CRAFTSMANSHIP: METHODOLOGIES FOR DOCUMENTING AND ANALYZING TECHNOLOGICAL TRACES IN STONE EPIGRAPHS

**Contribution format:** Oral  
**Contribution authors:** Giulia Previti – Beatrice Luci (Sapienza University of Rome, Department of Ancient Sciences) – Salma Kusumastuti (Universitas Gadjah Mada, Indonesia, Department of Archaeology | Sapienza University of Rome, Department of Ancient Sciences) – Luca Malatesta (Sapienza University of Rome, Department of Environmental Biology) – Cristina Lemorini (Sapienza University of Rome, Department of Ancient Sciences)

The presentation investigates technological traces in medieval stone epigraphs to reconstruct the methods, tools, and gestures used by artisans. It aims to analyze the techniques behind these inscriptions, highlighting skills,

challenges, and interactions between craftspeople and stone, as well as territorial differences. Experimental archaeology enables the creation of a reference collection of replicated inscriptions, providing a comparative framework for technological trace analysis. By integrating experimental archaeology with traceological analysis, this research introduces a novel methodology for epigraphic studies through qualitative and quantitative approaches. A key contribution is the use of micro-photogrammetry as a non-invasive, non-destructive documentation technique, particularly valuable for fieldwork. This method enables high-resolution, meso-scale recording of inscriptions, even on immobile surfaces, common in epigraphic studies. Detailed 3D models generated through micro-photogrammetry facilitate further analysis via Digital Elevation Models (DEMs), processed in GIS platforms to extract data on surface roughness and slope profiles. Both qualitative and quantitative analyses are applied to interpret technological traces, including fatigue and abrasive wear. These traces reveal information on the direction, depth, and angle of engraving, shedding light on artisans’ techniques and challenges. Stereomicroscopy – both in transmitted and reflected light – and micro-photogrammetry allow a detailed qualitative assessment of craftsmanship. Quantitative methods refine the analysis by providing precise insights into the engraved surface topography. They identify variations in execution quality, distinguishing smoother strokes from more complex sections with directional changes or rounded extremities. Moreover, slope analysis clarifies tool orientation and movement, enabling the visualization of trace profiles and validating qualitative observations.

699. IDENTIFYING THE RAW MATERIAL OF THE TOOLS USED TO INCISE THE ANCIENT MAYA SCRIPT ON A JADE CYLINDER FROM TIKAL

**Contribution format:** Oral  
**Contribution authors:** Juan Melendez (Archéologie des Amériques UMR 8096 – CNRS / Université Paris 1, Panthéon-Sorbonne) – Emiliano Melgar (Museo del Templo Mayor)

During the last decades, advances in the decipherment of glyphs that comprise the logosyllabic ancient Maya writing system have transformed our understanding of calendrical cycles but also refined the complex meaning of certain notions within the sociopolitical and ideological spheres. Ancient Maya scripts were written on numerous surfaces, either painted on bark paper codices, ceramic vessels, and murals, or carved on wood, stuccoed surfaces, shells, bones, and soft stones such as limestone. Moreover, we find scripts sculpted on rigid greenstone (e.g., jadeitite) items, the latter considered as precious, symbolically loaded, and valued by the Maya. While some suggestions have been brought forward by scholars regarding the nature of the raw materials (hereafter RM) of the tools used to incise the glyphs written on several portable greenstone items, this remains to be proven. To fill this knowledge gap, we endeavored to identify the RM of the tools used to incise sections of four of the twelve glyphs written on the lid of a mosaic cylinder (hereafter GMC) through qualitative traceological approaches. This GMC was found within the tomb of a ruler buried during the first half of the mid-eighth century CE below the iconic Structure 5D-1 in Tikal, Guatemala. Metallurgy was not a practice developed by Maya artisans at that time, and therefore the potential RM of the tools used to incise the script is limited to a certain number of rocks. These include sedimentary (e.g., chert; locally found in Tikal), metamorphic (e.g., jadeitite; sources located ~ 200 km from Tikal), and even volcanic rocks (e.g., obsidian; closer sources located ~ 250 km from Tikal). Finally, following a relational ontology approach we also argue that the potential tools were likely entities awarded with personhood capable of reciprocating and mediating between the modified agent (i.e., GMC) and the craftsman.

104. TVT – A TOOL FOR TOPOGRAPHY ENHANCEMENT AND DATA GENERATION FOR DEEP LEARNING WORKFLOWS

**Contribution format:** Oral  
**Contribution authors:** Ashely Green – Christian Horn – Rich Potter (Department of Historical Studies, University of Gothenburg)

For shallow and small carvings, like those often seen in prehistoric Swedish rock art, visualisation with traditional landscape and other enhancement methods is still unable to highlight all motifs. We developed Topography Visualisation Toolbox (TVT; <https://tv.t.dh.gu.se/>) to better visualise these types of carvings and generate material that could be used in AI tasks while still requiring moderate computing power. The user interface aims to make the tool accessible to archaeologists and does not require any programming knowledge or a high-power GPU. TVT is still under development with the aim of introducing new tools and features based on feedback from users outside rock art research. This talk will provide an overview of the open-source tool and its potential applications. The core tool in TVT, Topo Vis, generates derives a range of enhanced and basic topographic maps from 3D models and plots them as greyscale and colour images. Topo Vis relies on open-source python libraries, including Open3D, scikit-learn, scipy, and scikit-image, to process the input model(s) into points, create a local relief, and generate and then enhance the topographic visualisations. While the tool was initially developed for rock art panels in West Sweden that have shallow carvings and a pronounced global curvature, it has also been used more widely recently. In rock art research, the visualisations were used to train object detection and semantic segmentation models, which led to the discovery of new motifs, and are now disseminated online though the

Swedish Rock Art Research Archive (SHFA; <https://shfa.dh.gu.se/>). Beyond rock art, TVT has been used in other domains to visualise graffiti in Saint Sophia Cathedral (Kyiv, Ukraine), and to reconstruct erased inscriptions on modern gravestones.

711. INNOVATIVE 3D ANALYSIS OF CHINESE NEOLITHIC POTTERY: INSIGHTS FROM THE TACHIXIGOU SITE

**Contribution format:** Oral  
**Contribution authors:** James Loftus (Institute of Science Tokyo) – Yang Bai – Chen Shan (Liaoning University)

The Tachixigou Site in Liaoning Province, China, is a crucial site linked to the Xinglongwa Culture, one of the earliest Neolithic cultures in Northeast Asia. Occupied approximately 7600–7400 years ago, this settlement provides key evidence of early agricultural practices, social organization, and craft technological innovation. Formally excavated by Liaoning University in 2017, the site has yielded a dozen dwelling foundations and a remarkable assemblage of pottery that reflects a transition toward early specialized craft production, offering unique insights into the social and economic developments of early agricultural communities in the region. However, while qualitative assessments of the pottery are ongoing, little has been done to digitize these vessels and systematically analyze their surface features, which has hindered in-depth research into pottery manufacturing techniques. To address this gap, this exploratory study utilizes advanced 3D surface scanning techniques, including “Morphometric Mapping” and “Sliced Segmental Extraction,” to analyze the pottery surfaces from Tachixigou. These methods allow for the detailed investigation of surface curvature, tool marks, and decorative patterns, aiming to uncover insights into manufacturing techniques, standardization, and the potential emergence of craft specialization. While ongoing, this study highlights the importance of the Tachixigou Site as a case study for understanding Neolithic craft production and the broader social and economy shifts in Northeast China during this period. Furthermore, it demonstrates the transformative potential of integrating digital tools with traditional methods, laying the groundwork for future interdisciplinary research on Neolithic material culture in the region.

314. ANALYSING UPPER PALEOLITHIC GROUND STONE TOOLS THROUGH COMPUTATIONAL MECHANICS MODELS

**Contribution format:** Oral  
**Contribution authors:** Maria Rosaria Marulli – Giusi Sorrentino – Marco Paggi (IMT School for Advanced Studies Lucca)

Analyzing wear and damage on Upper Paleolithic ground stone tools (GSTs) is crucial for understanding Homo sapiens’ daily activities and resource use. Over recent decades, archaeologists digitized and analyzed GSTs using imaging techniques, alongside experimental archaeology establishing replicative collections [1-2]. This study introduces innovative methodologies to investigate GSTs use-wear patterns, relying on cutting-edge computational mechanics models. Building on the findings in [3], two approaches are presented: a finite element (FE)-based digital twin [4] and a multi-scale contact mechanics framework [5]. Developed from 3D photogrammetric reconstructions, the FE digital twin model simulates damage evolution during pounding and grinding tasks, investigating the limits and possibilities to accelerate the time-consuming experimentation done with manual use of GSTs replicas. The contact mechanics-based simulations enhance this analysis by linking macroscale photogrammetric data with microscale profilometric surface maps, enabling detailed predictions of contact areas and pressure distributions. This research offers archaeologists robust tools for analyzing and quantifying GSTs use-wear, refining experimental designs, and contextualizing archaeological evidence. It demonstrates the transformative potential of computational technologies in archaeology, complementing traditional approaches for more comprehensive interpretations.

260. DID NET WEIGHTS PRECEDE BOW-AND-ARROW IN BRAIN EVOLUTION? USE-WEAR FINDINGS SUPPORT NET WEIGHT TOOL USE OF BLOMBOS CAVE “BEADS”

**Contribution format:** Oral  
**Contribution authors:** Silvia Stein (Independent)

My hypotheses that Blombos cave punctured Nassarius shells (72 ya) were net weights, is based on my experience ocean fishing. The close proximity of punctured Nassarius shells to the net style designs inscribed in Blombos cave ochre stones (Wynn, et al, 2024) supports my net weight hypothesis. Use-wear evidence is used to support my shell weight interpretation. Testing my hypothesis requires constructing a replica of the shell weight use of Blombos “beads” on, what I suspect, was a casting net. To sink a net weight below the water line the prehistoric punctured shells need to weigh about 10 grams at each point, perhaps in pairs, and knotted in place (Keegan, et al, 2009). And, the 72 ya Blombos, South Africa, seaside cave “beads from levels CA and CB were more similar to the experimental arrangement with knotted pairs of dorsally joined shells” (Hatton, et al, p. 3). The equal distance between knots holding punctured and coupled shell net bead weights would have improved the shell

weight aerodynamics to spread-out evenly, sink, and exit in unison from the water. “Experimental reproduction of the wear facets suggest that the MSA [Middle Stone Age] shell beads must have been in regular contact with an acid aqueous solution” (Vanhaeren, et al, 2013), which could include, I suggest, sea water (Keegan, et al, 2009). Development of nets and shell net weights might have preceded the early development of the 80 ya bow and arrow (Lombard, 2024). Blombos cave deposits date from 100 ya to 70 ya (Hatton, et al, 2020). The use of the bow and arrow paralleled the enlargement of the precuneus in human brain development (Lombard, 2024, p. 823). And the precuneus is involved in manual manipulation of string and calculating the distance needed in aiming an arrow or a net (Lombard, 2024).

2369. OBJECT BIOGRAPHY AND GROUND STONE TOOLS

**Contribution format:** Oral  
**Contribution authors:** Laura Longo (DAIS, Ca’ Foscari University of Venice) – Clarissa Cagnato – Giusi Sorrentino (Ca’ Foscari University of Venice)

Among the non-flaked lithic industry, ground stone tools (GSTs) occurred in late MIS 3 assemblages (40-25 ka cal BP). Their study disclosed their involvement in the processing of various raw materials spanning vegetal, animal and mineral resources. In order to disentangle the different uses, functional analyses were performed on selected GSTs from the Upper Palaeolithic site of Dzudzuana (Imereti, Caucasus). Use-wear traces, residues characterization and chemoprofiling and quantitative measurement of rock material are supportive of the involvement of these stone tools in the processing of a plant that could have been transformed used as a colourant, as medicine, or indeed for both. The integrated multidisciplinary approach will be discussed: use-wear traces were investigated by means of different microscopes (OM, SEM and 3D confocal), the biogenic residues were imaged and chemo-profiled by means of non-invasive spectroscopic techniques such as  $\mu$ Raman and  $\mu$ FTIR. Finally X-ray Computed  $\mu$ -Tomography aided with synchrotron brilliance (SR- $\mu$ CT) was used to investigate the 3D pore geometry of the stone pebbles. The research design allows to reconstruct the ground stones’ biography, opening new scenarios on the polysemic dimension of percussive tools by identifying wear-traces and use-related biogenic residues, to inferring unexpected behavioral strategies performed by Homo sapiens in the Caucasus during its successful colonization of the Pontic Steppe Belt.

609. BRIDGING THE GAP: A MULTI-SCALE FUNCTIONAL ANALYSIS ON FLAKED AND NON-FLAKED TOOLS THROUGH CONFOCAL MICROSCOPY AND 3D SURFACE TEXTURE ANALYSIS

**Contribution format:** Oral  
**Contribution authors:** Fiona Pichon (Cultural Landscapes, IMF-CSIC | CNRS, UMR 5133 – Archéorient, Maison de l’Orient et de la Méditerranée) – Andrea Zupancich (Diet and Ancient Technology – DANTE laboratory, Sapienza Università di Roma) – Juan José Ibañez (Cultural Landscapes, IMF-CSIC)

In recent years, the field of use-wear analysis on archaeological artefacts experienced and benefited from the integration of a different range of quantitative methods. Among these, confocal microscopy and 3D surface texture analysis have increasingly been employed to examine changes in stone tool surfaces and has proven to be an accurate technique for quantifying use-wear texture. However, its application varies across materials and tool types. In this talk, we will present two complementary perspectives on the use of confocal microscopy and 3D surface texture analysis for the study of use-wear on flaked tools made of flint, obsidian and non-flaked tools made of limestone and basalt, which differ in surface properties, wear formation processes, and analytical challenges. Our approach demonstrates how a quantitative framework can be shared while still accounting for the specificities of each raw material. We discuss the challenges of interpreting numerical surface roughness parameters in relation to functional hypotheses, as well as the need for cross-validation with experimental and contextual data. Through a comparative methodological framework, we demonstrate that integrating high-resolution digital surface analysis across different tool types enhances our ability to infer past tool use and technological choices while bridging the gap between qualitative and quantitative data in functional studies of both flaked and non-flaked tools, highlighting the advantages of a multi-scale approach to use-wear analysis. Our goal is to foster meaningful discussions on methodological standardisation, interpretive challenges, and the broader implications of quantitative methods in functional studies.

822. QUALITATIVE AND QUANTITATIVE ANALYSIS OF LITHIC ARTIFACT SURFACE MODIFICATIONS: EVALUATING THE USE OF MOLDS

**Contribution format:** Oral  
**Contribution authors:** Giusi Sorrentino (Department of Environmental Sciences, Informatics and Statistics, Ca’ Foscari University of Venice) – Marco Paggi (IMT School for Advanced Studies Lucca) – Laura Longo (Department of Environmental Sciences, Informatics and Statistics, Ca’

Foscari University of Venice) – Fabrizio Antonelli (Department of Architecture and Arts, Iuav University of Venice) – Laura Falchi – Elena Badetti (Department of Environmental Sciences, Informatics and Statistics, Ca’ Foscari University of Venice)

The study of lithic industries is central to prehistoric archaeology, with manufacturing traces and use-wear patterns essential for reconstructing artifact life histories. Since the 1970s, silicone-based molds have been widely used to replicate surface textures for microscopic analysis, valued for their fine detail reproduction and dimensional stability. This has enabled both morphological analysis and quantitative measurements using techniques such as profilometry and confocal microscopy. However, despite their widespread use, few studies have rigorously assessed their accuracy in reproducing surface details, particularly their ability to percolate in surface valleys and capture fine textures. Most research has focused on bones, teeth, and flint tools, while their effectiveness on other lithic artifacts, such as ground stone tools (GSTs), remains poorly investigated due to surface unevenness and heterogeneous textures, complicating evaluation from the sampling stage onward. Additionally, the potential impacts of molding, including surface damage and silicone contamination, are difficult to assess. To ensure reliable qualitative and quantitative analyses, these factors need to be studied and quantified. This research applies imaging techniques, morphometric evaluation, CT scanning, and physical-chemical analysis to a reference collection of GST replicas constructed based on archaeological artifacts from various Upper Paleolithic sites, exhibiting diverse lithologies and textures. By evaluating mold replication accuracy and its effects on GSTs, this research will support informed decision-making in archaeological studies of surface modifications, as well as conservation and restoration strategies. This study was performed with the support of SMarT4BioArCH project: Ministero dell’Università e della Ricerca of Italy, Project PRIN2022 2022XX8BRT PNRR, CUP Master B53DZ3014020006. Next Generation EU, is gratefully acknowledged for financial support.

1262. EXPLORING TRACE FORMATION VARIABILITY ON QUARTZ, QUARTZITE, AND SILCRETE: A QUALITATIVE AND QUANTITATIVE APPROACH

**Contribution format:** Poster  
**Contribution authors:** Marzena Cendrowska (University of Bergen, SFF Centre for Early Sapiens Behaviour (SapienCE)) – Francesco D’Errico (Université de Bordeaux, CNRS, Ministère de la Culture, PACEA, UMR5199 | University of Bergen, SFF Centre for Early Sapiens Behaviour (SapienCE)) – Karen Van Niekerk (University of Bergen, SFF Centre for Early Sapiens Behaviour (SapienCE) | University of Witwatersrand, School of Geography, Archaeology and Environmental Studies) – Christopher Henshilwood (University of Bergen, SFF Centre for Early Sapiens Behaviour (SapienCE) | University of the Witwatersrand, Evolutionary Studies Institute)

Quartz, quartzite, and silcrete were commonly used as raw materials in the Middle Stone Age (MSA) in South Africa. This study examines wear traces on these three materials, comparing use-wear pattern formation through qualitative analysis via optical microscopy and quantitative assessment using confocal microscopy. We sourced raw materials within a 30 km radius of Blombos Cave. Quartz and quartzite were readily available nearby, while silcrete required longer-distance transport and knowledge of the high-quality sources. Simple flakes were produced using direct hard hammer percussion. ProvilNovo silicone casts of the working edges were taken and repeated halfway through each experiment. We conducted experiments dedicated to working bone, hide and wood, as well as butchering, scraping ochre, cutting reeds, and peeling tubers. Some activities involved variations in the materials used. In total, we performed over 50 experiments spanning 40+ hours and approximately 100,000 cutting or scraping motions. Wear traces were analysed using a metallographic Motic BA310MET-H (magnifications 50–500×) and a confocal MarSurf CM Mobile (160 S, 100× lens). On a qualitative level, we assessed the variability of trace formation based on the materials worked and compared the appearance of both micro and macro traces across the three rock types. Furthermore, we evaluated the effectiveness and precision of both microscopy methods in locating and documenting use-wear traces on quartz, quartzite and silcrete. Use-wear quantification was conducted by measuring high-resolution surface topography (20 areas per experimental piece at 160×160 μm). Roughness parameters (defined in ISO 25178), scale-sensitive analysis, and furrow dimensions were tested to classify and distinguish use-wear traces. By integrating qualitative and quantitative data, our results provide new insights into wear pattern formation and recognition on archaeological artefacts.

59 CRAFTING IDENTITY: A MULTIDISCIPLINARY APPROACH TO THE RELATIONSHIP BETWEEN MATERIAL CULTURE AND GENDER IN THE MEDITERRANEAN FROM PREHISTORY TO US

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Craft Activities, Social Identities, Gender Socialization, Gender Roles, Mediterranean,  
**Session organisers:** Carmen Ramírez Cañas (University of Seville, Department of Prehistory and Archaeology) – Nina Ferrante (Sapienza University of Rome) – Violeta Moreno Megías (University of Seville, Department of Prehistory and Archaeology) – Patricia Rosell Garrido (INAPH- University of Alicante) – Francisco Gomes (UNiarQ - Centre for Archaeology of the University of Lisbon)

SESSION ABSTRACT

The Mediterranean has historically been a crossroads of exchange and interaction, where enduring traditions have coexisted with a continual openness to new influences. The material bases of such processes have been intensely investigated, but one blind spot in this research has only recently started to be systematically addressed: the interplay of gender relations and roles and economic activities. It is a well-known fact that the production and use of objects – whether in pottery, metal, glass, stone, textiles, or other media – played a crucial role in shaping and expressing social identities, including gendered identities. But, conversely, how did the workings of those identities impact the changing configuration of the craft activities which produced those objects? In order to further ongoing work addressing this topic, this session invites contributions from various archaeological, anthropological, and material science perspectives to examine how craft production, artisanal practices, and the materiality of objects were embedded in the negotiation and performance of gender identities. We aim to highlight case studies from different Mediterranean cultures and regions, focusing on the technological, social, and symbolic dimensions of craft production. Key questions include: Were craft activities associated with specific gender roles? How did the transmission of craft knowledge and skills contribute to reproducing (or challenging) gender norms? How did access to certain materials and techniques influence the construction and display of gendered identities? What does the archaeological record reveal about the intersections of gender, power, and production in these societies? By bringing together a diverse range of methodological approaches, including archaeometry, bioarchaeology, ethnoarchaeology, and gender theory, this session will contribute to a deeper understanding of how material culture and gender interacted in the formation of social identities during this period. We aim to foster interdisciplinary dialogue and promote new research directions that challenge traditional gender dichotomies in the archaeological record.

CONTRIBUTION ABSTRACTS

424. TEXTILE PRODUCTION, GENDER, AND THE FABRIC OF BRONZE AGE SOCIETY IN SOUTHERN PORTUGAL: INSIGHTS FROM THE TRANSTEXTEC PROJECT

**Contribution format:** Oral  
**Contribution authors:** Catarina Costeira (Uniarq - Centre for Archaeology. University of Lisbon | Sintra Municipality) – Francisco Gomes (Uniarq - Centre for Archaeology. University of Lisbon) – Ricardo Basso Rial (Universidade de Granada) – Nunes Carina (Faculdade de Letras, Universidade de Lisboa) – Linda Melo (Uniarq- Centre for Archaeology. University of Lisbon) – Nelson Almeida (Universidade de Évora) – Cleia Detry (Uniarq- Centre for Archaeology. University of Lisbon) – Eduardo Porfírio – Sérgio Gomes (CEAACP - Centro de Estudos em Arqueologia, Artes e Ciências do Património da Universidade de Coimbra)

In recent years, research on textile production in the Southern Portuguese Pre- and Protohistory has progressed considerably. Advances regarding the study of production technology have been coupled with the first explorations of the economic and social role of textile activities between the Late Neolithic and the Iron Age. However, the Bronze Age remains a significant blind spot in such studies. Regional textile production for this period, which is now recognized elsewhere in Europe and the Mediterranean as the time of a “textile revolution” with the diffusion of wool and the attending shifts in technology, economy, and aesthetics, remains poorly understood. With the goal of overcoming this gap, a new project – ‘Exploring transitions in textile technologies and economies in the long 2nd millennium BCE (2200 – 700 BCE): the Southern Portuguese territory as a case study’ (TransTexTec) – was launched. The project combines material studies, focusing especially on textile tools, zooarchaeological studies, deploying innovative techniques to trace sheep husbandry practices, and bioanthropological studies, focusing on dental and skeletal markers of textile activities. This contribution will present the state of the art regarding Bronze Age textile production and showcase the preliminary results of the project. In particular, it will focus on

the issue of the identity, social status and role of textile craftspeople by systematically reviewing the evidence of textile tools in funerary contexts, as well as the bioanthropological markers for textile activities. This evidence points to a central role for craftswomen in textile production, highlighting the often overlooked economic and social role of women during this period, and somewhat redressing the traditional focus on male-attributed craft activities, such as metallurgy. Future research avenues to understand the Bronze Age textile value chains, and thus the economic impact of women’s work, will also be outlined.

**757. “RAZORS” FORM IRON AGE ETRURIA: A RE-EXAMINATION OF THEIR FUNCTION AND SOCIAL SIGNIFICANCE**

**Contribution format:** Oral  
**Contribution authors:** Christina Monroe (University of Oxford)

The bronze, strongly curved blades, referred to as lunate “razors,” found in Early Iron Age (EIA) and Orientalizing Period tombs in Etruria and Central Italy have commonly been used to assign the male sex (and, thus, a gender) to the deceased. As the name implies, these objects have been assumed to be hair (usually facial hair) removal tools. However, lunate razors have been found with burials that have been identified as female through other grave goods, and the curving of the blades would not have been very conducive to shaving a semi-flat surface. Furthermore, the iconography on the razors shows images of axes, animals, and human-animal interactions like hunting, suggesting that the razors were linked to the world of hunting and animal management. Thus, due to inaccurate gender assumptions and the tendency to group lunate “razors” with razors of other shapes, it is timely to reassess their function and social significance. I propose that the lunate razors were instead mainly used for cutting animal hides, probably during leatherworking. Although no primary evidence is available for the function of lunate razors in EIA Etruria, I found evidence depicting lunate knives being used for leather cutting in paintings from tombs of Ancient Egypt (1450–1190 BCE) and on an Attic black-figure amphora (c. 500 BCE). Also, lunate knives have been found with other leatherworking tools from La Tène, Switzerland (c. 300 BCE) and a lunate knife was found in a tannery in Pompeii, Italy (c. 79 CE). Thus, the iconographical and archaeological evidence—showing lunate blades being used for leatherworking in different cultures that span about 2000 years—could indicate that lunate razors should be renamed lunate knives and that they were meaningful objects owned and used by (and then buried with) young and old men and women.

**1705. WHO CAME FIRST: FEMALE GENDER CONSTRUCTION OR TEXTILE PRODUCTION? INTERTWINING SOCIETY AND WORK IN THE PROTOHISTORY OF SOUTHEASTERN IBERIA**

**Contribution format:** Oral  
**Contribution authors:** Patricia Rosell Garrido (Inst. Univ. de Investigación en Arqueología y Patrimonio Histórico-INAPH (University of Alicante))

Textile activity is one of the main productions and tasks that every culture needs, as it is fundamental for clothing the group and for obtaining other types of products that help in day-to-day life and for fitting out homes. The evolution of this activity starts from a work of self-sufficiency for the family itself until it reaches the weight of specialised work and production that requires precise management to obtain the best textile products, optimise the production chain and expand the economy and market of the communities. This is what we observe happening in the Iberian Culture during the Protohistoric period in the southeast of the Iberian Peninsula. Thanks to the study of 9 sites of different typology and chronology (6th-5th to 2nd centuries BP), it has been possible to locate the spaces and instruments of this textile activity in order to get to know it and understand its socio-economic value. At this point, the female figure stands out, as both in the classical written sources and in the archaeological remains themselves, the close link between women and this work and the important development of the activity over time can be seen. Thus, from the 4th century BP onwards, it emerges as an extremely important task for these communities and, to this end, the accumulated female knowledge and the transmission of this information in their own spaces and networks of contact is what allows such a high level of production to be developed. At the same time, this analysis allows us to understand how also, due to this relationship, women create and ratify their Iberian feminine gender through this work, observable thanks to the iconographic scenes in which they appear developing this activity or carrying these instruments.

**1361. CRAFTING IDENTITY INSIDE GOLD THREADS. TWO CASE STUDIES TO UNDERSTAND LOMBARD SOCIETY THROUGH TEXTILE AND EXPERIMENTAL ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Lorena Ariis (Independent)

The funerary archeology of the Lombards in Italy has highlighted many aspects of the material culture and identity of the community. The burials of the first generation of Lombards in Italy indicate the multicultural component of the people who emigrated from Pannonia to Italy. In the Early Middle Ages there was also a lot mobility amongst

women through mixed marriages and in the female monasteries. Women of different ethnic groups brought different customs and types of weaving and embroidery into the community. Some aspects of crafting identity emerged from the funerary remains of gold threads, the only surviving evidence directly connected to textiles. Various technical aspects of weaving and embroidering with gold thread suggest that the different methods of production belong to personal cultural traditions. The remains of gold thread in Italian Lombards burials from the point of view of the thread used is under-researched area. In this study, two cases will be presented from the Lombards graves of Cividale del Friuli, a woven gold lamella and the tiny tubular gold beads. Through the experiments, materials very similar to the originals in size and weight were obtained using golden aluminum, a material compatible with gold in terms of physical characteristics. The materials were used in the reconstruction of textile artifacts, such as a woven sleeve edge and an embroidered funeral veil. The textile experiments can also support interpretations about the organization of women’s crafts in Lombard society.

**446. HOLY POTS! WOMEN, WORSHIP, AND THE ART OF OFFERING**

**Contribution format:** Oral  
**Contribution authors:** Marcella Boglione (École Pratique des Hautes Études, Paris | Univeristät Bern)

This study examines the relationship between material culture, gender, and religious practice in the Greek colony of Himera, with a particular focus on the role of pottery in shaping women’s ritual experiences. While craft production and artisanal activities have long been recognised as integral to ancient Mediterranean societies, their connection to gendered identities within religious contexts remains underexplored. This paper investigates how the presence and absence of specific ceramic forms in sanctuaries reveal the ways women engaged with material culture to construct social and religious identities. By analysing the selection, deposition, and use of ritual objects, this study considers how materiality influenced the negotiation of gender roles and communal memory. It explores whether certain craft practices were gendered and how access to specific objects and techniques shaped religious expression. Were these artefacts passive ritual tools, or did they actively contribute to the performance of gendered identities. Drawing on archaeological, anthropological, and gender theory perspectives, this paper situates women’s religious materiality within broader discussions on craft production and social dynamics in the ancient Mediterranean. In doing so, it offers new insights into how ritual, craft, and gender intersected to define individual and collective identities.

**1819. RELATIONSHIPS BETWEEN GREEK POTTERY PRACTICES, TECHNOLOGY, AND GENDER IN EARLY IRON AGE ITALIC COMMUNITIES AT THE DAWN OF ‘GREEK COLONIZATION’**

**Contribution format:** Oral  
**Contribution authors:** Anna Maria Desiderio (Umr 7041 ArScan) – Arianna Esposito (Université Bourgogne Europe, ARTEHIS)

The Italian peninsula during the Iron Age offers a privileged setting for investigating the relationship between the archaeological ceramic record and the negotiation and representation of gender roles. Previous studies have shown that the growing system of relationships, exchanges and widespread mobility affected the entire central and western Mediterranean from the 9th to the 7th century BCE. Within this framework, early Iron Age Italic communities underwent crucial social and economic changes. Interactions between the Italian peninsula and Greece are well documented in historical and archaeological literature. The transmission and appropriation of pottery is a crucial tool in the analysis of socio-economic dynamics. We aim to focus on wealth consumption and on Greek Geometric pottery found in Italy, which dates no later than MGII (775/750 BC). Our analysis seeks to examine the relationship between local pottery traditions and the evolution of Greek or Greek-style pottery in the Peninsula. Are these ceramics part of social strategies that reflect established practices? Can recurrent forms be identified? How are local productions and the technological changes they entail related to the maintenance and reproduction of social groups and power relations? Gender, crafts, and technology are socially embedded practices. Do we observe the same choices in prominent male and female tombs? Following the perspective of archaeological and anthropological works, this contribution aims to explore how gendered practices and constructions were intertwined with craft and economic innovations to achieve particular social goal. Our analyses point to a complex link between gender roles, local agency, technological change and external cultural patterns by specific social trajectories.

**101. GENDERED LABOUR, FEMALE AGENCY AND POTTERY PRODUCTION IN MODERN AND CONTEMPORARY CATALONIA: SOME CONCERNS ABOUT THE MATERIAL APPROACH**

**Contribution format:** Oral  
**Contribution authors:** Esther Travé Allepuz (Universitat de Barcelona) – Sonia Medina Gordo (Universitat de Barcelona | Centre d’Estudis Martorellencs) – Joan Vicens Tarré (Universitat de Girona)

Written records rarely identify women explicitly as “potters,” with the title invariably attributed to men, reflecting

a longstanding gender bias in historical sources. This discrepancy belies the reality of artisanal production, where women contributed significantly to pottery making, albeit in roles often regarded as auxiliary. Ethnoarchaeological evidence from Catalonia, alongside testimonies from present-day potters who recall the pottery practices of their families, attest to the numerous contributions women made to the chaîne opératoire. From gathering clay to firing the kiln, the production process involved multiple actors, with women frequently tasked with adding adornments—such as handles or spouts—to pre-formed vessels. This complex division of labour raises important questions about how material remains, apparently devoid of explicit gender markers, can be interpreted to uncover women’s contributions. Through extensive research across diverse sources, we have developed a data-rich corpus that allows for an intersectional analysis of artisanal practices and their gendered biases, identifying pottery workshops and the family members who ran them, along with some of the products that are still preserved today. Using deep mapping techniques, we explore the spatial and diachronic mobility of potters (both male and female) and their families. Migration patterns, such as young couples relocating to major production centres, suggest that women played a role not only in maintaining or transmitting but also in shaping pottery traditions. Our contribution invites a methodological reflection on how to overcome gender biases inherent in both written and material sources. Can we identify “female hands” in the pottery housed in our museums or recovered from our archaeological excavations? By integrating written records, archaeological finds, and 3D reconstructions, this paper argues for intersectional approaches to re-examine artisanal economies and challenge traditional narratives of gendered labour division.

2291. LIKE A VIRGIN? CRAFTING WOMEN’S IDENTITIES IN IRON AGE SOUTHERN IBERIAN SANCTUARIES

**Contribution format:** Oral  
**Contribution authors:** Carmen Ramírez Cañas (Department of Prehistory and Archaeology, University of Seville)

Terracotta figurines constitute the widest range of female representations in the Phoenician-Punic societies of the Western Mediterranean. This study examines the relationship between material culture, gender, and religious practices that took place in some sanctuaries of the southern Iberian Peninsula during the Iron Age, with a particular focus on a very characteristic craft production: female terracottas. These offerings served not only as offerings to the gods but also as means of defining collective identity. As ex-votos, they facilitated personal and communal connections, establishing a relational identity between people and terracottas. The production and corporeality of these figurines highlight how gender differences were perceived and adjusted through bodily transformations, linking gender construction to other factors such as rank and age. In this sense, the creation of social identity is shaped by the interplay of objects and gestures. By applying gender theory to archaeological material, this work examines the religious materiality associated with the female sphere, within broader discussions of craft production and social dynamics. It offers new insights into how ritual, craftsmanship, and gender converge in the construction of identities. Future research avenues will also be outlined to understand the active agents involved in the production of these terracottas during the Iron Age and, thus, the economic impact of women’s work in this context.

1969. MATERIAL CULTURE AND GENDER IN EARLY IRON AGE INLAND IBERIA THROUGH THE PACER PROJECT

**Contribution format:** Oral  
**Contribution authors:** Juan Jesús Padilla-Fernández (Universidad de Salamanca)

This proposal aims to present the Pottery landscapes during the Early Iron Age in the inland of Iberia (PACER) Project. This project intends to explore different ways to understand ceramics and their technology as social issues and, therefore, as a means to articulate and express specific ontologies and social codes. This breaks with the general perception that ceramics have today in archaeology. This perspective does not assume a separation between ceramic objects and those who create them. It understands that archaeological works on technology must analyse the social processes that operate on a micro-scale and not only describe the explicit set of prehistoric activities of a context-given society. In this case, the concepts of ceramics and society are assumed to be equivalent, as both are products of the same social patterns. Based on these approaches, this investigation aims to reinterpret in a novel way the different networks of relationships and connectivity of the First Iron Age. The central starting hypothesis honestly believes that the world in that period would be much more complex and heterogeneous, comprising highly connected communities structured through multiple ties of reciprocity. The distinction of several ceramic traditions, with different proportions and in contemporary archaeological sites, would help confirm the existence of heterarchical relationship regimes at the beginning of the Iberian Peninsula Protohistory. Depending on these, specific communities could cooperate, sharing territories and a series of expressed cultural patterns, culture, etc., based on equality. It is possible that potters (most of them women) played a central role, acting as itinerant artisans, accompanied by their ideas and belongings, in the articulation of fluid schemes of reality based on network-organized systems. The search for alliances and strengthening of

power shares would foster a complex world characterised by the movement and constant contact of people and objects at different levels.

855. ENGENDERED DIVISION OF LABOR IN NEOLITHIC AEGEAN TEXTILE PRODUCTION

**Contribution format:** Poster  
**Contribution authors:** Gerasimoula Ioanna Nikolovieni (Brown University)

Gender studies in the Neolithic Aegean (approximately 7000 -3000 BCE) focus on how Neolithic communities have conceptualized, constructed, and expressed gender roles and identities. Archaeology of gender draws data from archaeological assemblages and the representation of the human figure through clay figurines in order to discuss women’s role in society. Affected by modern notions of what the “domestic” sector consists of and its role in socioeconomic changes, as well as women’s role in the ritual sphere, certain craft production has been associated with women. In particular, pottery and textile production, alongside food processing and preparation, has been considered “women’s work” by both academic literature and popular media. This paper is a preliminary discussion of engendered divisions of labor in textile production in Neolithic Aegean communities. This work primarily looks at how normative interpretations of engendered divisions of labor in textile production were established and questions whether textile production activities in the Neolithic communities of the Aegean were associated with specific gender roles.

60 RESEARCH COLONIALISM AND SOCIAL INEQUALITY AT FRONTIERS AND FRONTLINES

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Session with keynote presentation  
**Session keywords:** colonialism, inequality, critical reflection, conflict, frontier,  
**Session organisers:** Simon Radchenko (University of Stavanger) – Dmytro Kiosak (Leibniz-Zentrum für Archäologie (LEIZA))

SESSION ABSTRACT

The rise of international transdisciplinary projects highlighted different roles and levels of agency that scholars with different backgrounds can have — from passive legitimation of territory-specific data to active involvement in the project design. Archaeological research is still marked by the colonial tendencies rooted in the scholars’ background that creates frontiers between Europe and the rest of the world or between Western and Eastern Europe. Colonialism can express itself in appropriating cultural heritage objects, the patronizing attitude, the policies regarding authorship and roles in the project, and the distribution of payment and praise. As long as international projects do not aim to overcome these inequalities, the gaps between “data deposits” and research centers will continue to grow. Colonial tendencies are more visible in projects in conflict areas such as Ukraine or Syria, where the urge to act prevails over the inclusive research design. They revealed a need for reflection on making heritage preservation activities fruitful in the long run instead of producing a short-term output. This session will discuss colonial trends and inequalities in archaeology and search for a way to conceptualize and reduce them. Taking the reflexive approach as a background, we are welcoming both theoretical and case-based contributions on:

- Social, economic, and agency inequalities in academia in general and archaeology in particular;
- Unequal access to producing the interpretation of archaeological data between scholars with different ethnic and academic backgrounds;
- Frontiers of academia in Europe and beyond;
- History of colonial behavior in the archaeology worldwide;
- Colonial tendencies in international and transdisciplinary archaeological projects;
- Cultural heritage preservation activities in the conflict and post-conflict zones — how they avoid or support research colonialism;
- Decolonization in the archaeological projects’ design;
- Ways of creating a two-sided dialogue between the interacting agents, divided by inequality.

CONTRIBUTION ABSTRACTS

2513. KEYNOTE: THE “COMPRADOR” INTELLIGENTSIA IN ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Artur Ribeiro (University of Kiel, Institute of Pre and Protohistory)

The neocolonial paradigm discussed in archaeology is usually that of past European colonial enterprises, such as those that exploited regions such as Africa and India. Given how damaging these enterprises actually were, it is not surprising that we look at them as the basis of XXI century neocolonialism. However, during the colonizing period there were also some relationships between centre and periphery that were considerably more subtle, which have survived to today. Macau was a Portuguese outpost in Southern China, a place where Portugal traded with China. For trade to operate smoothly, “compradores” (buyers) were necessary – these were people who were bilingual, knowing both Chinese and Portuguese, and acted on behalf of the traders. The Portuguese were smart in securing as many compradores as possible, since that would give them an advantage in negotiations. Centuries later, we created a new form of comprador, the comprador intelligentsia, someone who in archaeology translates the world of the past and of the non-West. More than actual multi-national, multi-cultural, multi-disciplinary teams, what large scale global archaeological projects creates are small elites composed of compradores intelligentsia. These elites, more than paying respect to their homeland and the knowledge there created, are subservient to their donors and their interests. The aim of this talk is to explain this concept of the comprador intelligentsia, and to show that the knowledge they produce is nothing more than hegemonic discourse disguised as “cooperation”, “interdisciplinarity”, and “multivocality”.

**2180. SHIFTING THE NARRATIVE: TOWARDS BETTER PRACTICES IN ARCHAEOLOGICAL COOPERATION**

**Contribution format:** Oral  
**Contribution authors:** Alisa Demina – Oleksandra Ivanova (National University of Kyiv-Mohyla Academy)

The cultural heritage of humanity does not align with modern political borders, yet these borders define present-day inequalities. Archaeological research cooperation often reflects (post-)imperialist dynamics, where institutions with better access to resources set research agendas and dominate knowledge production. While international collaboration is, of course, crucial for any scientific field, the way to make it sustainable and beneficial for all parties still needs to be paved. Ukraine’s archaeology has long been at the crossroads of different postcolonial forces. Under the Russian Empire and later the Soviet Union, its heritage governance was centralized, and its past instrumentalized for political purposes. This resulted in both the direct removal of archaeological heritage from Ukraine’s territory and more subtle forms of epistemic dominance. Western academia, in turn, has often treated Ukraine as a source of “data” rather than an equal partner in shaping archaeological narratives. Ukraine became a place where research was conducted but not where its vision was defined. At the same time, since independence, the country’s political turmoil and postcolonial past have further limited the development of independent theoretical and methodological frameworks. As a result, past dependencies remained - particularly within the Russian sphere of influence. Today, the current war has made Ukraine more visible in global academic discourse. The destruction of cultural heritage and illegal excavations in occupied territories have intensified debates on research colonialism. However, does this increased attention lead to a genuine reconsideration of Ukraine’s role in global archaeology, or does it merely reinforce paternalistic approaches? One way to address these issues is through open discussion. We initiated the series of public events “Why Archaeology Matters? A Ukrainian Perspective” to explore these challenges and promote dialogue, both within the Ukrainian archaeological community to establish a shared vision for research and, internationally, to develop better practices in collaborative archaeology.

**1991. COLLECTIVE MEMORY, IDENTITY AND CULTURAL HERITAGE: RUSSIAN OCCUPATION AS AN ACT OF SYSTEMATIC COLONIAL VIOLENCE**

**Contribution format:** Oral  
**Contribution authors:** Anna Sietak (University of Vienna)

Memory is inherently dynamic, flexible and shaped by various dimensions. To make history tangible, communities embed it within different collective memory sites and forms: memorials, museums, monuments, landscapes, literature, holidays, traditions etc. By creating a network of cultural symbols and acts of remembrance, they reinforce their identity and ensure its continuity. Since 2014, with Russia’s occupation of Ukraine, thousands of illegal excavations have taken place in Crimea and other occupied regions. Looted artefacts are constantly exported and exhibited in Russian museums, while archeologists from occupied territories are relocated for “training programs” in Russia. Focusing on tangible cultural heritage, proposed paper aims to analyze Russian occupation as an act of systematic colonial violence that seeks to destroy collective memory and to rewrite history using its own narratives. Under occupation, identity loses its space for expression, becoming more vulnerable and exposed to change. The right to access and research own cultural heritage and history is stolen — turning memory into a contested and distorted space. Documenting and exposing these mechanisms is crucial for tracking colonial narratives, resisting historical erasure and holding perpetrators accountable.

**1602. WITH A LITTLE HELP FROM MY [METROPOLITAN] FRIENDS**

**Contribution format:** Oral  
**Contribution authors:** Semen Prokopenko (NAS of Ukraine) – Simon Radchenko (University of Stavanger)

Like many research fields, archaeology emerged as a colonial practice of extracting cultural heritage products from non-Western contexts without profound ethical consideration. While we recognize this practice as inappropriate nowadays, it is challenging to consider archaeology and cultural heritage preservation free from colonial trends and behavior. The development and transformation of archaeological research hid colonial practices behind the veil of research design, complicating their deconstruction. This talk points out several newer aspects where archaeological and cultural heritage projects can be covertly colonial today. Like many other things in the globalized digital world, research colonialism in archaeology became digital. This includes large initiatives to collect data from multiple sources worldwide and reconstruct their global perspective. While these projects can consist of hundreds of co-authors from non-Western countries, they are often treated as sample providers used to legitimize the data acquisition approaches. However, as the reconstruction of the global picture is still done from the research center, it often lacks local perspective and might be short on quality in terms of specific contextual details. Another neocolonial archaeological trend is related to the cultural heritage preservation projects in the war zones, where Western communities often invest significant resources to secure heritage preservation activities. While aiming for good, such actions often impose their perspective in the alien context without learning the ‘local way’ of doing things. As a result, projects are often implemented with nearly zero outcomes, barely producing anything except scarce deliverables and abundant financial reports. All these neocolonial initiatives share something in common: they perceive cultural heritage as an object of their research or preservation efforts. My claim is that cultural heritage must be considered an institution instead — a long-lasting ephemeral structure that should be able to develop and reproduce without the constant support from the initial center.

**2512. KEYNOTE: TWO NEOLITHICS OR TERMINOLOGICAL CONFUSION? THE MISLEADING CONCEPT OF NEOLITHIZATION WITHOUT AGRICULTURE IN EASTERN EUROPE**

**Contribution format:** Oral  
**Contribution authors:** Dmytro Kiosak (Leibniz-Zentrum für Archäologie (LEIZA) / Zentrum für Baltische und Skandinavische Archäologie)

For a long time, pottery-bearing hunter-gatherers in Eastern Europe and the USSR were classified as Neolithic. However, it is becoming increasingly clear that they do not fit this definition, as they neither practiced agriculture nor herding. Despite this, some scholars strongly advocate for maintaining this classification, citing reasons ranging from long-standing tradition to the unique historical trajectories of Eastern Europe, where pottery-making supposedly can be equated with societal advances related to the Neolithic status. However, being ‘Neolithic’ is not an honorific title bestowed by archaeologists; it is a scientific concept that must be clearly defined and unambiguous. The author argues that this inconsistent usage is rooted in a long-standing evolutionist perspective, reinforced by Russian and Soviet imperialism. Vulgar Marxism, the official ideological framework of Soviet historical science, posited that humanity progressed through defined stages of development, with some societies deemed “backward” for reaching these stages belatedly. However, the core peoples of the great empire—and their ancestors—could not be classified as such. This necessitated the construction of an independent early Neolithic for them. Consequently, with the collapse of its supporting ideology, the notion of a “special Neolithic” in Eastern Europe endures more out of inertia than scientific rigor. Nowadays, restoring the empire requires a renewed search for historical primacies.

**697. VOICES FROM THE MARGINS: TRACING INDIAN SURVEYOR CONTRIBUTIONS TO COLONIAL ARCHAEOLOGY THROUGH THE ARCHIVAL LENS**

**Contribution format:** Oral  
**Contribution authors:** Indu Prasad (Birkbeck, University of London)

The British Empire mounted multiple successful archaeological expeditions through the late nineteenth and early twentieth centuries. Of these, the Hungarian-British archaeologist Aurel Stein’s expeditions in the early decades of the twentieth century were crucial in the access and construction of one of the largest archaeological collections in the Empire’s museums of the period, which today continue in their post-colonial diasporas in the museums of the Commonwealth. While known eponymously as the Stein Collection, the related archival records, mainly housed in the extensive India Office Records and Stein’s personal papers, reveal the complex collective nature of its construction, most significantly in the contributions of the Indian surveyors who accompanied him. The Indian surveyor on Stein’s expeditions, deputised by the Survey of India, was not merely a surveyor. He adopted Stein’s mission of the expedition by mapping archaeological sites, sourcing antiquities, liaised with the larger teams – porters, camel men, baggage handlers etc, was fixer-in-chief on the field and when dealing with local authorities or people, was Stein’s official representative and by extension the British Raj. This paper draws on

the lives of select Indian surveyors who accompanied Stein, from multiple archival sources to crucially reflect on the surveyor’s role in colonial archaeological knowledge production and through it, critically re-evaluate the Stein Collection. By refocusing on the surveyors’ contributions to archaeological practices in British South Asia, this paper presents their work as captured in their own voice in the archives.

2275. DODOS, BEACHES, SUGAR, AND URBAN ARCHAEOLOGY: NAVIGATING (DE)COLONIAL ARCHAEOLOGY IN MAURITIUS

Contribution format: Oral  
Contribution authors: Diego Calaan (Ca’ Foscari - Venice University)

Since 2009, I have participated in several internationally funded archaeological projects in Mauritius, focusing on landscape archaeology and the archaeology of slavery and indenture. Since 2019, I have led an urban topo-graphic archaeological project in Port Louis, reconstructing the capital city’s development through a GIS-based approach. Funded by the Italian Ministry of Foreign Affairs, this initiative integrates historical data, topographic surveys (historic houses, public buildings, and infrastructure), and analyses of urban space usage. As part of cultural diplomacy, the project’s funding scheme seeks to bridge diverse academic methodologies and foster cultural hybridization. As Principal Investigator, I have adopted a global and multicultural perspective, chal-lenging the traditional view of colonial cities as spaces solely shaped by ruling powers. Instead, the project examines how enslaved people, freed individuals, laborers, artisans, sailors, merchants, officials, and military personnel adapted to and transformed this cosmopolitan urban environment. Designed with local scholars and authorities, the project has been well received, yet raises critical questions on its coloniality: What does it mean for Western scholars to study a city built within colonial frameworks yet defined by an insular cosmopolitanism blending African, Southeast Asian, Indian, European, and Chinese influences? Similarly, the material culture of the Indian Ocean world is vast, yet scholarship prioritizes Western artifacts, reflecting established archaeologi-cal paradigms. Additionally, calls for heritage preservation, particularly of “old buildings,” raise concerns about potential colonial and paternalistic narratives. Ultimately, while this project explores creolization as a cultural and historical process, it also questions whether our archaeological methodologies themselves are “creole”. Do our predominantly Western frameworks adequately capture the layered hybridity of the past we seek to understand?

2327. DECOLONIZATION DURING WARTIME: A CASE STUDY OF ODESA’S OLDEST MUSEUM (UKRAINE)

Contribution format: Oral  
Contribution authors: Mariia Lobanova – Oksana Hrytsiuta (Odesa Archaeological Museum of the National Academy of Sciences of Ukraine)

Since the full-scale invasion of Ukraine, the decolonization process has gained momentum, becoming a subject for academic research and public discourse. Decolonization is understood as reexamining relationships to histor-ical events and figures while highlighting previously silenced topics. A key aspect of this process is the role of museums in re-evaluating collections and launching broader societal conversations. In Odesa, this process is unfolding actively, sometimes dramatically. The Odesa Archaeological Museum forms a part of this discussion as it celebrates its 200th anniversary in 2025. Founded in 1825 during the Russian Empire, the museum was part of a vibrant academic community that conducted significant archaeological research. This raises a critical ques-tion: Which works and collections might be considered colonial, and how should colonialism be defined in this context? One of the museums’ core functions is engaging with the community and shaping narratives that influ-ence perceptions and conclusions. A review of the Odesa Archaeological Museum’s past exhibitions, displays, and public events reveals the omission of many important topics. As contemporary decolonization efforts progress, it is essential for these discussions to include the cultural diversity of the South of Ukraine, gender equality, and inclusivity, addressing the complex layers of history and identity in the region.

61 MOVING AWAY FROM FORWARDS: ANALYSING THE METAPHORICAL STRUCTUR-ING OF ARCHAEOLOGICAL THOUGHT

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Discussion session  
Session keywords: Metaphors, Archaeological Theory, Reasoning, Language, Cognition  
Session organisers: Guillermo Díaz De Liaño (MOLA (Museum of London Archaeology)) – Ana González San Martín (Joukowsky Institute for Archaeology and the Ancient World (JIAAW) Brown University) – Kevin Kay (University of Leicester) – Alice Clough (MOLA (Museum of London Archaeology) | University of Bristol)

SESSION ABSTRACT

It is difficult to think about the past without the use of rhetorical figures. In our efforts to organise and convey information about concepts such as time, space, the body or the self, we commonly use structural metaphors (Lakoff & Johnson, 1980). Visual and verbal metaphors do not passively reflect data or ideas, but shape the ques-tions that archaeologists ask (or don’t ask), the work we do to answer them, and whether specific understandings feel ‘reasonable’ or ‘unsatisfying’. They are easy to undertheorise. Metaphors for similar concepts can vary widely depending between cultural contexts (Fuhrman & Boroditsky, 2010), shaping the way people systematise and represent information about topics. From diffusionism to structuralist textual metaphors, to the stratification of time and society or the tree-like diagrams of social complexity (Simonetti, 2015), archaeological thinking is intrinsically metaphorical. Archaeological diagrams and charts intertwine data and interpretation, and often-times we can find similar metaphorical devices being used to explain widely different phenomena, such as human evolution and the genealogy of archaeological paradigms. But what is the true impact of these figures in shaping archaeological thought? How innocent, useful, or dangerous are metaphors which, rather subtly, encapsulate entire cosmovisions, like the computational metaphor in cognitive archaeology, or the different biological anal-ogies used to explain how societies organise themselves? The aim of this session is bifold. We want to reflect on the use of popular rhetorical and metaphorical structures in archaeological thought, and we want to challenge traditional models by using an innovative and hopefully playful format, where we discuss current metaphors but also propose alternative ones. Communications can follow different formats, including oral presentation, but also the use of artistic techniques, performances, etc. Participants from diverse backgrounds are encouraged to participate, and the proposal of rhetorical figures from non-English speaking contexts is particularly welcomed.

CONTRIBUTION ABSTRACTS

1824. BETWEEN FAMILY TREES AND FUZZY RHIZOMES: THE POWER GAP IN KINSHIP METAPHORS

Contribution format: Oral  
Contribution authors: Kevin Kay (University of Leicester) – Marianne Hem Eriksen (National Museum of Denmark)

With new data (aDNA) and a renewed interest in middle-range theory, kinship diagrams have made a come-back in archaeology. The metaphor of a branching tree of person-to-person connections calls back to old-school anthropologies, which interrogated kinship as a totalising cultural system overlaid on biology. Tree diagrams simultaneously posit kinship as profoundly political—defining the foundational identities through which commu-nities are assembled—and curiously apolitical, insofar as kin relations are seen as simultaneously abstract and objective, largely exempt from any sort of contestation or material disruption. There is a reason this kind of analysis has largely been abandoned in anthropology. Alternative metaphors have been proposed, most notably Marshall Sahlins’ idea of kinship as ‘mutuality of being’. Seeing kinship as a rhizomatic blurring of the bound-aries between bodies fits the zeitgeist of relational theory, and helpfully grounds kinship in material practice (or ‘kin-work’). Yet it also decentres non-mutual aspects of kinship—a parent and child might ‘mutually exist’ through one another, but ‘parent’ and ‘child’ are not equal roles, and in many cases come with steep power differ-ences attached. We want to dwell on the way both metaphors detach power from what it means to relate as kin, and explore where archaeology can go from here. Can we capture aDNA’s insights into social processes, without stripping the flesh-and-blood politics out of sex, pregnancy, childhood, friendship, and similar? Can we embrace the mutual becoming of people, animals, and things, without obscuring the harm that becoming always entails? What other metaphors might draw out other kinships in archaeological data?

2519. “HIC SUNT DRACONES”: FIGURAL THINKING AND AFFECTIVE MULTITEMPORALITY IN MEDITERRANEAN MINING LANDSCAPES

Contribution format: Oral  
Contribution authors: Ana Gonzalez San Martin (JIAAW, Brown University)

Throughout the ancient Mediterranean, mining landscapes were not merely passive sites of resource extraction, but dynamic, volatile environments shaped by the interplay of human and non-human agencies. This paper explores the figural and affective dimensions of different aspects of ancient mining through geo-teratology (Ureta and Flores, 2018) -the study of geological “monsters”- to examine how mining communities engaged with the unpre-dictable agencies of mineral-rich landscapes. Drawing from archaeometallurgy, non-representational theories of material agency, and deep-time ecological approaches, this paper proposes reframing extractive practices as an ongoing negotiation with geophysical instability rather than a straightforward technological or economic process. The metaphor of the dragon and other beasts is often invoked in relation to metallurgical landscapes, and I will argue that it provides a conceptual, non-representational bridge between material transformations and human experience. Ore bodies, oxidation zones, and mining waste impoundments were not just economic affordances

to be exploited, but instead, volatile entities requiring adaptation, environmental awareness, and ritualized care. Inspired by case studies ranging from Iberia to the Levant, and informed by contemporary mining ethnographies, I propose a new metaphorical framework to approaching how miners and metalworkers in antiquity may have experienced these landscapes as both materially immediate and affectively charged; a delicate, care-based and continuous negotiation of wealth, environmental risk, and sustainability. By reassessing mining landscapes through figural (Auerbach, 1984) and geontological (Povinelli, 2016) frameworks, this paper seeks to challenge extractivist narratives that treat metallurgical and mining environments as inert and exhausted, posing them instead as agentic and affective places where the scars of ancient and contemporary metallurgical activity remain chemically and conceptually active; dragons that, though wounded, still breathe.

257. MEDIEVAL AS METAPHOR: THE NOT-SO DISTANT MIRROR

**Contribution format:** Oral  
**Contribution authors:** Robert Hedge (University of Leicester)

The medieval period is uniquely placed within the 21st century European imagination: simultaneously close enough to us that its legacy frames our daily experience — in the city streets, the villages, the churches, the place names, and the languages that structure the rhythms of our lives — and yet sufficiently distant as to appear a blank slate onto which we can project interpretive frameworks. These interpretations mirror the values of their declaimers: “medieval life was nasty, brutish and short; medieval society was inherently violent; medieval people rarely bathed... haven’t we come far? Aren’t we fortunate to live in a more advanced society?” Conversely: “medieval society built staggering architectural treasures; it was a time when people knew their place; it was a time of certainty, conviction, chivalric honour... isn’t that appealing? What have we lost?” From these framings, ‘medieval’ becomes metaphorical, synonymous with the best or worst of the human condition. A prominent UK politician recently railed against “alien cultures who possess medieval attitudes”. Perceptions of the medieval past have crept beyond the pages of childrens books and playful fantasy, and into a dark, dangerous discourse that breeds intolerance and justifies violence. Our archaeological research is inextricably woven into these narratives: of particular concern is our framing of change, and the linearity of archaeological interpretation. In examining metaphorical framings of the medieval in the archaeological imagination and beyond, this paper will examine their origins, their diffusion and their enduring popularity. It will present an alternative: a visual exploration of a complex and diverse millennium, in which ordinary people were shaping, naming and framing a world rich in its own visual metaphorical structure. It will offer participants a methodological framework for challenging the structural straightjackets of their own research topics, and to look through the distant mirror with a fresh perspective.

62 OTHER WAYS TO EXPLORE THE SURFACE. SPATIAL TECHNOLOGIES APPLIED TO TERRITORIAL ANALYSIS IN ARCHAEOLOGY

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Spatial technologies, Machine learning, Remote sensing, GIS, Predictive modeling, Virtual landscapes  
**Session organisers:** Carolina Cabrero (University of Granada) – Marco Cabras (University of Cagliari) – Francisco JoséSánchez Díaz (University of Seville) – António Manuel Diniz (University of Evora) – Ivo De Jesus Santos (University of Evora | Complutense University of Madrid)

SESSION ABSTRACT

The integration of cutting-edge spatial technologies is opening new perspectives in archaeological research, offering innovative ways to analyze landscapes and territories. This session highlights experimental approaches that enhance our understanding of past human-environment interactions and redefine how we detect, interpret, and visualize archaeological features across diverse contexts. Emerging techniques such as machine learning are enabling the recognition of subtle patterns in microtopographies and relief morphologies, revealing anthropogenic features that would otherwise remain hidden. Simulation models now allow for the dynamic reconstruction of material flows and diffusion processes, offering insights into the movement of resources, people, and ideas across ancient landscapes. Generative artificial intelligence is revolutionizing the virtual recreation of prehistoric environments, providing new ways to visualize and hypothesize about past landscapes with remarkable detail. More established tools, such as remote sensing technologies and UAVs (drones), are evolving through new applications, including the use of multispectral sensors for geochemical analysis of soil sediments, which can pinpoint ancient settlements and activity areas. Similarly, the integration of LiDAR data with advanced spatial analytics continues to refine our ability to detect and interpret hidden features in densely vegetated or rugged

areas. These methods, combined with GIS (Geographic Information Systems), support more precise predictive modeling, improving fieldwork planning while minimizing invasive interventions. We invite contributions that demonstrate the application of these experimental technologies, showcase innovative case studies, or address the methodological challenges they present. By fostering a discussion on the potential and limitations of these tools, the session seeks to inspire new approaches to archaeological analysis, promoting non-intrusive and sustainable practices that push the boundaries of spatial research.

CONTRIBUTION ABSTRACTS

68. GOING PUBLIC. EXPLORING THE RELIABILITY OF PUBLIC DATA FOR GEOSPATIAL ANALYSES IN THE BASSO VERBANO REGION (LAKE MAGGIORE - ITALY)

**Contribution format:** Oral  
**Contribution authors:** Amedeo De Lisi – Enrico Croce (University of Milan)

This paper aims to present the results of geospatial analyses conducted on settlement patterns over an extended period in the southern area of Lake Maggiore and the upper stretch of the Ticino River. When integrated with archival data, various public databases, including GNA, Copernicus, and the National Geoportal, can facilitate the development of an inductive predictive model aimed at understanding human-environment interactions from the Iron Age through the Medieval period. The study highlights the critical role of variable selection in predictive archaeology, demonstrating its utility both for descriptive purposes and for situating the study area within different historical periods. The results underscore the significance of proximity to watercourses and Lake Maggiore during the Iron Age for water supply, whereas, in the Roman period, this factor assumes primary importance, particularly in the context of trade. The model was further tested by comparing it with other similar regions in northern Italy, such as Lake Como and Lake Garda, to assess its predictive efficacy. The results indicate that the model's performance is not always optimal, possibly due to the incomplete nature of the initial database in certain aspects. The results also suggest that, despite apparent similarities in the natural and geographical characteristics of the regions, human settlement patterns may have been influenced by factors that are not yet fully understood or cannot be implemented in this type of analysis. Unfortunately, the nature of the evidence does not allow for the application of an ethnoarchaeological approach, which in other contexts has proved to be a way of overcoming some of the biases of a purely geostatistical approach.

658. THE SACRED MOUNTAIN FROM THE SKIES: DRONE AND LIDAR SURVEYING IN LA PEÑA DE LO. ENAMORADOS (ANTEQUERA, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Jose Ruiz Flores (Universidad de Sevilla) – David Wheatley (Southampton University) – Florian Cousseau (Durham University) – Raquel Montero Artús (Universidad de Sevilla) – Jose Antonio Lozano Rodriguez (Instituto Español Oceanografía (CSIC)) – Alexia Dorkel – Myriam Bensaïd (Université de Genève) – Jakub Niewisiewicz (Umea University) – Marie Besse (Université de Genève) – Leonardo García Sanjuan (Universidad de Sevilla)

La Peña de los Enamorados (Antequera, province of Málaga), is a limestone massif rising 886 m.a.s.l. Included in the UNESCO World Heritage List as part of the Antequera Dolmens Site since July 2016, La Peña stands out both as a remarkable landmark and as a multi-period archaeological complex. In February 2024, a survey campaign was carried out with the aim of synthesising the enormous archaeological record that La Peña de los Enamorados as a whole presents and to create its first preliminary detailed archaeological cartography. As part of the survey work, a high-resolution drone, with photogrammetric, LiDAR and thermal cameras was used, allowing us to obtain, for the first time, aerial reconnaissance images of this site. In this paper we will present the results of these flights, including the discovery of new megalithic tombs and settlement areas, not visible at ground level. These new discoveries add to the rich heritage of a high-profile World Heritage site. Legend, archaeology, landscape and now technology come together to give us new perspectives on a unique and yet poorly-understood archaeological site.

728. ELUSIVE LANDSCAPES: REMOTE SENSING IN ADVERSE LOCATIONS IN ATLANTIC IBERIA

**Contribution format:** Oral  
**Contribution authors:** Rodrigo González Camino – César Parceró-Oubiña – David González-Álvarez (Institute of Heritage Sciences (INCIPIT-CSIC))

Iron Age in the northwest of the Iberian Peninsula is characterised by the study of the castros (Hillforts). This type of settlement is the only one archaeologically recorded for the entire region, with a wide profusion throughout the territory. For this reason, Iron Age studies have tended to focus in the analysis of settlements, in the absence of other forms of evidence related to this period. This work proposes the use of different remote sensing tools,

in order to carry out off-site surveys of the castros. This methodology is systematically applied in three working areas selected in three northwestern provinces (Asturias, A Coruña and Ourense), where a significant amount of new archaeological sites are identified, as well as possible structures associated with the Iron Age out of the castros. In this way, new research lines on new forms of materiality are proposed, while at the same time providing experience in the application of this type of methodologies in the northwestern territory.

**749. ARCHAEOLOGICAL RECONNAISSANCE IN EASTERN KAZAKHSTAN USING SATELLITE IMAGERY: ON THE WAY TO THE USE OF NEURAL NETWORKS AND MACHINE LEARNING**

**Contribution format:** Oral  
**Contribution authors:** Andrey Pushkarev (East Kazakhstan Regional Museum of History and Local Lore)

East Kazakhstan is one of those unique territories, many parts of which are still ‘terra incognita’ for archaeologists. The inaccessibility of the mountainous areas and the low level of urbanization of the territory ensured the unique preservation of a large number of archaeological sites. At the same time, these conditions have made it significantly more difficult to investigate these sites using traditional archaeological surveys. As a result, a significant part of the objects remains unknown to researchers. To solve this problem, a program for searching archaeological sites using satellite imagery data was developed. Two sections of the territory of the Abay region of Eastern Kazakhstan were selected for the research, reflecting different landscape zones: Tarbagatai Ridge (mountains) and Saryarka (steppe and hills). At the preparatory stage, the previously identified archaeological sites were mapped. During the search stage, a continuous visual viewing of satellite images was carried out by grid cells. The area of 26,857 sq km was surveyed and 997 new objects with signs of archaeological sites were identified. At the conference, we would like to talk in detail about the work methodology, which turned out to be very effective for searching for archaeological sites using satellite imagery data. Its important feature is the use of free software and open map services, which makes it accessible to most researchers. The accumulated database of archaeological sites allows us to move on to the next step - the use of machine learning technology and neural networks to search for unknown archaeological sites throughout the whole territory of Eastern Kazakhstan. At this stage, we would like to discuss with experts how we can build further research. The research was carried out under the project BR24992916 ‘Comprehensive historical and archaeological research of the Abay region.’

**1133. SPATIAL TECHNOLOGIES USED TO RECONSTRUCT THE ECONOMIC BACKGROUND OF VILLAGES FROM THE LATE MIDDLE AGES TO THE PRESENT DAY**

**Contribution format:** Oral  
**Contribution authors:** Josef Petráš (Archaeological Institute of the Slovak Academy of Sciences)

The paper deals with the use of LiDAR and GIS (Geographic Information Systems) in combination with the study of archival written and cartographic sources to reconstruct the economic background of villages in the early modern and late medieval period. The study examines villages in the area of the former manor of Brtnice in the present-day Bohemian-Moravian Highlands in the Czech Republic and the manor of Krásna Hôrka in present-day Slovakia. Both areas are situated at an altitude of 450 - 600 metres above sea level. The settlement of these areas dates back to the 13th century, when the higher parts of both territories began to be populated with the so-called German colonisation. As these villages were established under German medieval law, the parcelling of the land remained virtually unchanged until the 1950s. In those years, Czechoslovak land was collectivised and individual plots were merged into larger units, destroying the original layout of the land. Aerial photographs taken before collectivisation can be used to reconstruct the original economic background of villages. Other important sources for such studies are cadastral maps from the second half of the 19th century and land registers from the 16th century, as well as LiDAR, which are available for both study areas. Once all this data has been converted into a GIS , it will be possible to create models of the landscape, identify the owners of individual farmsteads from the old land registers and the area of land they owned, and also, thanks to LiDAR, to discover structures that are now invisible. Another output will be the ability to trace the evolution of the landscape and its use over the last 200 years.

**766. BIRD’S-EYE VIEW: A PRELIMINARY APPLICATION OF GIS TOOLS AND MACHINE LEARNING MODELS TO CHALCOLITHIC/BRONZE AGE SELECTED SOUTHWESTERN IBERIAN AREAS**

**Contribution format:** Oral  
**Contribution authors:** António Diniz (Universidade de Évora, CHAIA, IN2PAST | Universidade de Évora, CIDEHUS) – Enrique Cuenca (Complutense University of Madrid) – Leonor Rocha – Inês Ribeiro (Universidade de Évora, CHAIA, IN2PAST) – Nelson Almeida (Universidade de Évora, CHAIA, IN2PAST | University of Lisbon, UNIARQ)

Research on the transition from the Chalcolithic to the Bronze Age in the Iberian Peninsula has seen successive updates and developments in recent decades. Several research projects address these issues, and many sites have

been added to the repertoire depicting these cultural, social, and demographic changes. However, only in recent years have new technologies been applied to these realities, as resources that allow us to see beyond materiality in its singularity and tools to allow us to perceive the whole, both at a local and regional level. This study aims to present preliminary data on these topics, using GIS tools and Machine Learning models to understand settlement patterns in the Guadiana River (Portuguese and Spanish territories) during the Chalcolithic/ Bronze Age transition. By combining information on the types of settlements, their topography, and resources in the area, we can start assembling a picture of how these communities occupied the landscape and adapted their lifestyle to the new contingencies that they faced between the 3rd and 2nd millennia BCE.

**1358. MSTĚNICE, THE CENTRAL SETTLEMENT AND ITS HINTERLAND. MODERN METHODS OF RECONSTRUCTING THE APPEARANCE OF THE SETTLEMENT AND THE CULTURAL-HISTORICAL LANDSCAPE**

**Contribution format:** Oral  
**Contribution authors:** Kamila Hanáková (Institute of Archaeology and Museology, Faculty of Art. Masaryk University)

The deserted medieval village of Mstěnice is located in the Czech Republic, in the Vysočina Region, within the Bohemian-Moravian Highlands, at an elevation of approximately 350 meters above sea level. The main focus of this thesis is a comprehensive analysis of the landscape and settlement, with an emphasis on the deserted medieval village of Mstěnice and its cultural-historical context. The development of this area has been traced primarily during the transition to late medieval settlement and from the village’s abandonment in 1468 to the present day. The core of the thesis is focused on the development of settlement and its role within the structure of the manor, political and administrative evolution, transformation of the landscape in the High and Late Middle Ages, and the consolidation of the normative village and its surroundings. A combination of traditional historical records and modern non-destructive methods has been used for the systematic analysis of this development. These non-destructive methods include: LiDAR, DTM, field surveys, metal detecting, surface collections, 3D photogrammetry, and GIS modeling of the surroundings.

**1452. POINT PATTERN ANALYSIS FOR THE STUDY OF NURAGIC LANDSCAPE: A QUANTITATIVE INVESTIGATION IN THE GULF OF CAGLIARI**

**Contribution format:** Oral  
**Contribution authors:** Matteo Alessi (“Sapienza” Università di Roma) – Davide Schirru (Musei Archeologici di Cagliari) – Alessandro Vanzetti (“Sapienza” Università di Roma)

The study of the Bronze Age Sardinian territory is undergoing a phase of profound transformation thanks to the adoption of new analytical methodologies that integrate traditional archaeology with statistical-quantitative approaches. During this period, Sardinia underwent a structured transformation of its landscape, marked by the construction of megalithic monuments, such as nuraghi and collective tombs known as “Giants’ Tombs”. The earliest nuraghi, referred to as “archaic,” exhibit more rudimentary forms compared to the later tholos-type nuraghi, which became widespread after the 16th century BCE. These building efforts gave rise to complex and dynamic landscapes, the evolution and organization of which remain somewhat elusive. The main objective of this research is to apply a range of spatial formal methodologies to investigate those archaeological phenomena along the southeastern part of the Gulf of Cagliari from a quantitative perspective, employing open-source software such as QGIS and R. In particular, Point Pattern Analysis represents a fundamental method for formalizing and quantifying spatial relationships between sites, the environmental context, and other elements of the dataset through functions such as Ripley’s K and Pair Correlation Function (PCF), which allows us to determine whether the distribution of points follows specific patterns or occurs randomly. The effectiveness of such analyses partly depends on the accuracy of the data, refined over the years through various survey and excavation campaigns at Nuraghe Antigori and Sa Domu e S’Orku, which have revealed, among other things, significant connections with the eastern Mediterranean. This approach provides an analytical perspective on the settlement dynamics of the Nuragic civilization during Middle and Late Bronze Age (ca. 1700 BCE - 1200 BCE). In this context, the adoption of a quantitative approach makes it possible to overcome some of the limitations and biases of traditional analyses, while also providing a solid framework for fruitful academic discussion.

**1682. MULTISPECTRAL UAS FOR ARCHAEOLOGICAL PROSPECTION: INVESTIGATING THE HINTERLAND OF IRON AGE HILLFORTS IN THE NORTH-WEST OF THE IBERIAN PENINSULA**

**Contribution format:** Oral  
**Contribution authors:** Juan Torrejón-Valdelomar – Carlos Otero-Vilarino – Marta Crespo-Fernández – Pastor Fábrega-Álvarez – Lucía Pereira-Pardo – César Parcero-Oubiña – David González-Álvarez (Institute of Heritage Sciences (incipit-csic))

The application of UAS (Unmanned Aircraft Systems) in archaeology has revolutionised how heritage sites are

explored, documented and preserved. Among the most advanced technologies used in this field, multispectral UAS stand out for their ability to capture information beyond the visible spectrum. Multispectral imaging allows to record data in different wavelengths, which facilitates the detection of changes in vegetation that indicate anomalies such as archaeological remains. These capabilities make multispectral UAS essential non-invasive tools, optimising future interventions, e.g. geophysical prospections and excavations. The implementation of these data in GIS, integrated with three-dimensional models, improves the documentation and analysis of the sites, allowing the detection of unearthed archaeological features. Within the framework of the projects ‘The Museum of the Invisible - Spectral Imaging Techniques for the Digital Recovery of Cultural Heritage’ and ‘HINTERLAND - Recognising human activity outside the Iron Age forts in the North-west of the Iberian Peninsula using non-invasive methodologies’ (INCIPIT-CSIC), an analysis of the hinterland of Late Iron Age hillforts, with special emphasis on Montes Claros (A Laracha, Spain), is being carried out through the application of different non-invasive techniques: UAS multispectral imaging, UAS LiDAR, and geophysical prospection. This talk aims to answer the question of whether multispectral UAS technology (including red, green, blue, red-edge and near-infrared bands) may be useful as a first step to investigate archaeological sites and their hinterland. Preliminary results showed that features observed in the multispectral UAS images are confirmed by geophysical prospection methods, suggesting that this approach would allow to efficiently evaluate the areas of interest, prior to more in-depth targeted interventions. Through a seasonal monitoring of the case study areas, we aim to identify the best conditions in the application of multispectral UAS techniques for the investigation of archaeological sites and their hinterland in the North-west of the Iberian Peninsula.

1706. A SPATIAL INTERACTION MODEL OF THE LATE HELLADIC MESSENIA, GREECE

**Contribution format:** Oral  
**Contribution authors:** Areti Michalopoulou (University of Cologne)

This study applies spatial interaction models to investigate how interactions among settlements in Late Helladic Messenia (ca. 1600–1050 BCE) may have shaped the region’s socio-political dynamics during this pivotal phase in Mycenaean civilization. Focusing on the emergence of the Palace of Nestor at Ano Englianos as the dominant center, the research examines how interactions among settlements shaped the region’s political landscape. Recent findings from Iklaina challenge traditional views of centralized control, prompting a reevaluation of Messenia’s political structure. GIS mapping tools and gravity-based spatial interaction models which implemented in R, were used to analyze settlement interactions across the region. A dataset of known settlement locations was used, supplemented by a small number of predicted “missing” sites to address potential survey bias. By leveraging simple data such as site coordinates and inter-site distances, the study seeks to shed light on the evolution of settlement hierarchies and Messenia’s broader socio-political landscape. Conducted as part of a master’s thesis, this research represents one of the few applications of spatial interaction models in Greek archaeology. It aims to highlight both the advantages and challenges of using computational tools to investigate ancient political networks. Ultimately, the findings will contribute to debates on Mycenaean state formation and help establish a framework for future archaeological studies exploring complex political structures.

2384. REMOTE SENSING FOR CULTURAL HERITAGE MANAGEMENT: HYPERSPECTRAL AND INSAR APPLICATIONS IN ARCHAEOLOGICAL AND ARCHITECTURAL HERITAGE

**Contribution format:** Oral  
**Contribution authors:** David Villalon-Torres (Instituto Andaluz del Patrimonio Histórico (IAPH)) – Carmen Cuenca-García (Universitat de València) – Raquel Montorio-Llovería (Universidad de Zaragoza) – Esteban García-Viñas (Instituto Andaluz del Patrimonio Histórico (IAPH)) – Clara Toscano-Pérez (Universidad de Huelva) – Antonio Ruiz-Armenteros (Universidad de Jaén) – Yolanda González-Campos (Instituto Andaluz del Patrimonio Histórico (IAPH)) – Juan Díaz-Quidiello (Consejería de Cultura y Deporte. Junta de Andalucía) – Eloísa Bernáldez-Sánchez – Milagros Alzaga-García (Instituto Andaluz del Patrimonio Histórico (IAPH))

Remote sensing technologies are reshaping both archaeological research and heritage conservation practices. This study presents the IAPH’s experience through two complementary approaches that leverage hyperspectral satellite imagery and Interferometric Synthetic Aperture Radar (InSAR) to support heritage stewardship and enhance management in various contexts. In the ARQUEOMEMES project, hyperspectral data from the PRISMA satellite are combined with on-site chemical analyses (ICP-OES) to accurately detect and delimit the Tejada la Vieja archaeological site (Escacena del Campo, Spain). By identifying chemical variations in soils altered by human activity and correlating them with their spectral signatures, this non-invasive method improves delineation precision and strengthens administrative decision-making for heritage protection. Meanwhile, the VESTIGIUM project applies Sentinel-1-based InSAR to monitor structural instabilities in watchtowers and castles along the Cádiz coast (Spain). This technique reveals ground subsidence and micro-displacements that may indicate emerging structural risks.

Moreover, the high temporal resolution of the data allows for long-term trend detection, reinforcing conservation strategies by prioritizing interventions and planning preventive measures. Despite their distinct objectives, both methods offer complementary perspectives and converge on a shared goal: advancing cultural heritage management through remote sensing. By integrating hyperspectral and InSAR data with on-site validation, these projects demonstrate the potential of a comprehensive, interdisciplinary approach to heritage management. This presentation provides an overview of the methodologies, preliminary results, and key insights obtained from ongoing research. We advocate a broader application of these tools to safeguard cultural assets under increasing threats and pressures, thus fostering a more sustainable and resilient future for our shared heritage.

1171. GIS- BASED ANALYSIS ON PROTOHISTORIC VILLAGES IN CENTRAL SARDINIA- ITALY (WESTERN MEDITERRANEAN SEA)

**Contribution format:** Oral  
**Contribution authors:** Ilaria M. F. Pitzalis (University of Cagliari)

The island of Sardinia, located in the western Mediterranean Sea, is the second largest island in the Mediterranean and has a predominantly mountainous and hilly territory. During the 2nd millennium BC, the island saw the development of the Nuragic civilization, characterized by a complex settlement system and a peculiar material culture. The contribution proceeds to analyze the distribution and settlement characteristics of the Nuragic settlements in the central-eastern region of the island, in order to reconstruct the strategies of territorial organization and the socio-economic dynamics of the communities of the time. The study examines a large region of the central-eastern region, with a focus on villages characterized by the presence of multiform hut structures. The investigation starts from the analysis of altimetric, geomorphological, hydrographic and chronological factors, in order to understand the settlement dynamics and interactions with the surrounding environment. Particular emphasis has been placed to a peculiar architectural manifestation: the sanctuary villages, manifestation of a close correlation between living spaces and cult functions. A series of visual-perceptive analyses conducted in a GIS environment were then carried out in order to evaluate the relationship with the territory and resources of the sites analyzed. The results suggest that the distribution of settlements was not random, but responded to specific territorial and economic logics, linked to the control of resources and communication routes. The contribution allows for a better understanding of the settlement dynamics of Nuragic Sardinia and of the relationship between man and the environment in a complex protohistoric context, especially with regard to the role of villages in relation to that of the most studied nuraghi.

2438. BUT THE BYZANTINES DID NOT HAVE GIS! OPTIMIZING GIS PREDICTIVE MODELS IN ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Predrag Đerkovic (Faculty of Philosophy, University of Belgrade)

Predictive models in archaeology have seen particularly widespread use with the introduction of GIS software, making it possible to identify potential locations of undocumented sites. However, the quality, and therefore reliability of the model, depends largely on the resolution of the data used to create it, which is especially problematic when dealing with insufficiently researched territories. Such is the case with early Byzantine hillforts in southern Serbia. While many newly built fortifications in 6th century A.D. have been mentioned in written records, only a small number of them have actually been registered - unlike in other regions in close proximity to Nišava valley. Using the example of ancient Remesiana and its surroundings, this work is based on reevaluating the theoretical and methodological approach when dealing with predictive models in poorly researched areas. Key factors, including proximity to rivers, roads, natural resources, altitude, geomorphology, and visibility potential, are critically evaluated to determine their relative importance in identifying suitable locations for early Byzantine fortifications in the region. The approach used here is based on experimental calibration of these factors in GIS, using the data from better researched territories in close proximity to the ancient Remesiana region. Only in that way can a precise and predictive model be made, and eventually checked using other methods of archaeological survey.

67. FINDING THE RIGHT WAY. NEW APPROACHES TO COST ANALYSES TO SHED LIGHT ON THE COURSE OF THE MEDIOLANUM-VERBANNUS

**Contribution format:** Poster  
**Contribution authors:** Amedeo De Lisi – Emanuele Intagliata (University of Milan)

Cost analyses conducted in GIS platforms have often been used to predict and reconstruct the course of ancient road networks in antiquity. However, such geospatial approaches present several limits; last but not least, the distortion caused by modern infrastructural works such as highways and airports. In addition, they often do not take into consideration natural features that may facilitate or create an obstacle between two geographic points. The scope of this poster is to overcome these limitations of these traditional geospatial analyses by realaborating

the geographical dataset (incl. DEM data) to reconstruct the past environment as exactly as possible. In addition, it will make use of specific plugins (r.walk in GRASS, among others) to factor other elements in predictive modelling, such as fatigue. It will take the ancient Mediolanum-Verbannus, a Roman road that connected Milan with Angera and the lower Lake Maggiore region, as a case study. While a few sections of this important regional artery have been fully excavated (incl. at Somma Lombardo) most of the course of this road remains unknown.

**701. BROADENING HORIZONS. APPLICATION OF NON-INVASIVE ARCHAEOLOGICAL METHODS IN THE ARCHAEOLOGICAL AREA OF CERRO DE LOS ALMADENES (OTERO DE HERREROS, SPAIN)**

**Contribution format:** Poster  
**Contribution authors:** Juan Álvarez García (Sociedad Española de Historia de la Arqueología) – Carlos Morato Marqués (Asociación para la Difusión de la Arqueología y la Minería Antigua) – Mariano Ayarzagüena Sanz – Santiago Valiente Cánovas (Sociedad Española de Historia de la Arqueología) – Gonzal. Lozano Otero (Instituto Geológico y Minero de España - Consejo Superior de Investigaciones Científicas)

Cerro de los Almadenes (Otero de Herreros, Spain) has become a key site for understanding mining and metallurgical production on the Iberian Peninsula in ancient times. Since 2009 and up to the present day, two well-differentiated areas have been identified. On the one hand, we have found the production area on the north-eastern slope of the hill. On the other, we identified the area of control and administration of all these activities on the upper platform. However, together with these two areas, which have been the focus of practically all the archaeological excavations, there are other areas where we could find other structures of importance to the study of the archaeological site, just like pitheads, living spaces and road remains. In order to understand the relationship between all these structures, excavated or not, we have carried out geophysical and aerial LiDAR surveys. Thanks to these two instruments, it has been possible to identify: mining and mineral processing areas, living spaces, roads and access routes to the settlement, among other infrastructures. The aim of this presentation is, therefore, to show how these two non-invasive archaeological methodologies have been used to broaden the horizons of knowledge about the mining-metallurgical settlement of Cerro de los Almadenes.

**803. SENSING VALENCIAN IBERIANSCAPES: A MULTI-SCALAR AND MINIMALLY INVASIVE APPROACH TO STUDY THE IBERIAN IRON AGE**

**Contribution format:** Poster  
**Contribution authors:** Carmen Cuenca-García (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València | Department of Archaeology and Cultural History, Norwegian University of Science & Technology (NTNU)) – Maria Lucrècia Centelles-Fullana – Valeria Martín-Sidro (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València)

SENSING IBERIANSCAPES (CIDEXG/2022/55) is a research project focused on the minimally invasive investigation of the Iberian Iron Age in eastern Spain. The project explores the ad-hoc integration of remote and proximal sensing, near-surface geophysics, and soils analysis to identify hidden features and conduct territorial analysis. Iberian culture is represented by a diverse range of archaeological sites, including fortified settlements, funerary places, and production sites associated with metalworking and agriculture. By examining these sites and their surrounding landscape, we aim to gain a multi-scalar perspective that allows a more nuanced interpretation of how these protohistoric societies were organised. This poster presents the progress of our research in 2024 and 2025, highlighting the results of geophysical surveys using magnetometry and ground-penetrating radar (GPR), as well as the analysis and monitoring of multispectral satellite imagery. Additionally, we assess the potential of photogrammetry and LiDAR at several of our case study sites. By integrating these methods, we seek to enhance detection success and the depth in proxy interpretation, ultimately providing new insights into ancient land use and spatial organisation. This project is funded by the PLAN GENT CIDEAGENT 2022 of the Generalitat Valenciana. Conselleria de Educación, Universidades y Empleo.

**1129. RIVERS AS SHAPERS OF PREHISTORIC ENVIRONMENT: THE ROLE OF WATERCOURSES IN THE PRIGORJE REGION DURING THE BRONZE AND IRON AGES**

**Contribution format:** Poster  
**Contribution authors:** Laura Šejic – Franka Ovčarić – Luka Drahotusky-Bruketa – Janja Mavrović Mokos (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

Watercourses have long influenced human habitation, serving as both facilitators of exchange and obstacles to movement. This study investigates the influence of rivers on settlement formation during the Bronze and Iron

Ages in the Prigorje region through an interdisciplinary approach that synthesizes archaeological, historical, and palaeoenvironmental data. By integrating geoarchaeological evidence, hydrological reconstructions, and archaeological sites pattern analysis, this research examines how rivers functioned as trade routes, boundaries, and sources of sustenance. Historical hydrology provides insights into past water levels and flood dynamics, while archaeological data reveal direct and indirect traces of human interaction with fluvial landscapes. The positioning of settlements, shifts in habitation patterns, and the material culture associated with riverine environments reflect both opportunities and constraints imposed by these watercourses. This study also considers how different cultural, and environmental contexts shaped social interactions along waterways. Rivers acted as unifying corridors facilitating movement and exchange, while in other cases, they reinforced divisions, particularly in frontier regions. Advances in remote sensing, GIS modeling, and LiDAR analyses enhance the investigation of settlement dynamics, allowing for a micro-regional approach to understanding human adaptation to changing fluvial conditions. In floodplains, LiDAR-derived digital elevation models (DEMs) can be converted into relative elevation models (REMs) to better visualize river features that are difficult to discern using aerial imagery or lower-resolution DEMs. REMs are particularly useful in identifying past river channel migrations, vividly displaying features such as meander scars, terraces, and oxbow lakes. Such information is invaluable for studying channel migration, flood history, and broader environmental, cultural, and engineering assessments. This research examines the interaction between human activities and natural processes, providing a deeper understanding of how rivers have influenced past human landscapes. The findings enhance broader discussions about the long-term relationship between societies and their water environments, emphasizing the resilience and adaptability of prehistoric communities.

**1360. MSTĚNICE: THE CREATION OF THE FIRST “CADASTRE” BEFORE THE TRANSFORMATION INTO A HIGH MEDIEVAL VILLAGE?**

**Contribution format:** Poster  
**Contribution authors:** Kamila Hanáková (Institute of Archaeology and Museology, Faculty of Art. Masaryk University)

The deserted medieval village of Mstěnice is located in the Czech Republic, in the Vysočina Region, within the Bohemian-Moravian Highlands, at an elevation of approximately 350 meters above sea level. The main focus of this thesis is a comprehensive analysis of the landscape and settlement, with an emphasis on the abandoned medieval village of Mstěnice and its cultural-historical context. The development of this area has been traced primarily during the transition to late medieval settlement and from the village’s abandonment in 1468 to the present day. The core of the thesis is focused on the development of settlement and its role within the structure of the manor, political and administrative evolution, transformation of the landscape in the High and Late Middle Ages, and the consolidation of the normative village and its surroundings. A combination of traditional historical records and modern non-destructive methods has been used for the systematic analysis of this development. These non-destructive methods include: LiDAR, DTM, field surveys, metal detecting, surface collections, 3D photogrammetry, and GIS modeling of the surroundings.

**1440. VISUAL DOMINANCE AND SPATIAL ORGANIZATION IN MENORCA’S PREHISTORIC ROCK-CUT TOMB NECROPOLISES**

**Contribution format:** Poster  
**Contribution authors:** Sonia Carbonell Pastor (Grup de Recerca en Arqueologia Protohistòrica (GRAP) | University of Barcelona (UB))

The application of Geographic Information Systems (GIS) in the study of ancient landscapes has significantly evolved in recent years. In the context of funerary landscapes, these tools have opened new avenues of research, shedding light on the factors influencing the location of necropolises and the internal organization of these spaces. This poster presents a case study on intervisibility analysis applied to one of Menorca’s artificial cave necropolises, primarily used during the first millennium BCE. These funerary sites are characterized by clusters of rock-cut chamber tombs, typically located on the vertical slopes of ravines and cliffs overlooking the sea, as well as on rocky outcrops that provided optimal conditions for their excavation. In sites such as the Calescoves necropolis (Alaior), a variety of tomb types have been documented, ranging from natural caves and rock shelters with Cyclopean-style entrance walls, dated to the Late Bronze Age, to more elaborate artificial caves, which form the core of this study. These rock-cut tombs span a broad chronological framework covering the entire first millennium BCE. The continuous funerary use of the same location over centuries suggests a strong symbolic and emotional connection between the communities that inhabited this region and their burial spaces. The primary objective of this study is to determine whether spatial patterns exist in the visibility of the funerary units within the Calescoves necropolis. We aim to analyze the relationship between visibility indices and the architectural characteristics of different tomb types, from the earliest natural caves and rock shelters with Cyclopean walls to the more complex artificial caves.

64 STORYTELLING TEETH: INSIGHTS INTO DIET, HEALTH, AND LIFESTYLES THROUGH DENTAL ANTHROPOLOGY

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Regular session  
Session keywords: Teeth, Dental anthropology, Oral pathologies, Dietary reconstruction, Morphology, Multiproxy  
Session organisers: Raquel Hernando (Centro Nacional de Investigación sobre la Evolución Humana (CENIEH)) – Miguel Ángel Moreno-Ibáñez (School of History, Classics and Archaeology, University of Edinburgh) – Dulce Neves – John Willman (Centro de Investigaç o em Antropologia e Sa de (CIAS))

SESSION ABSTRACT

Human teeth are highly informative biological structures that offer invaluable insights into many aspects of human life in the past—from dietary practices and oral pathologies to non-masticatory activities. This session seeks to highlight the significant potential of dental anthropology for understanding past lifeways, particularly when combined with complementary methodologies. By integrating different proxies—e.g. dental micro and macro wear, oral pathologies, morphological analysis, isotopic analyses, and dental calculus—we can achieve a deeper understanding of how past human groups interacted with their environments, developed subsistence strategies, and experienced health and stress. The combination of multiple approaches allows for a more comprehensive view of the intricate relationships between diet, health, and lifestyles in different periods and regions. We encourage researchers to submit proposals that explore these themes through case studies from various chronologies and geographical contexts. Contributions that combine dental evidence with other archaeological and anthropological methods will help foster a richer dialogue on the lifeways of past populations. This session aims to provide a platform for exchanging ideas across different areas of dental anthropology, showcasing innovative methodologies, and promoting discussions that bridge the gaps between researchers’ specializations. By bringing together diverse perspectives, we hope to establish a summary of the current state of the art in dental anthropology and related research, offering inspiration and collaboration opportunities for all participants.

CONTRIBUTION ABSTRACTS

272. UNVEILING LATE PREHISTORIC PRACTICES OF THE NORTHEASTERN IBERIAN PENINSULA: A COMPLEMENTARY APPROACH TO DENTAL MICROWEAR ANALYSIS

Contribution format: Oral  
Contribution authors: Aristeidis Strimenopoulos (Institut Catal  de Paleoecologia Humana i Evoluci  Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’ Hist ria i Hist ria de l’ Art) – Jos  Espejo (Atics, Gestio i difusio del patrimoni arqueol gic i hist ric, Matar  | Seminari d’ Estudis i Recerques Prehist riques (SERP), Universitat de Barcelona) – Esther Medina – Sergi Segura – Francesc Florensa (Atics, Gestio i difusio del patrimoni arqueol gic i hist ric, Matar ) – Josep Maria Verg s –  ngel Rubio Salvador – Marina Lozano (Institut Catal  de Paleoecologia Humana i Evoluci  Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’ Hist ria i Hist ria de l’ Art)

The conduction of dental microwear analysis has proven to provide insights into past human practices and lifestyles. The specific analysis is laid in the examination of dental features, which imply the adoption of specific dietary habits or/and the use of teeth as tools, thus indicating the behavioral level of the studied individuals. In this context, the Bronze Age of the Iberian Peninsula provides a fruitful ground for the understanding of the subsistence strategies and cognitive patterns of the populations through the study of dental wear due to its diversity, which the archaeological record has exhibited concerning this temporal point. The specific study is laid in the examination of the wear patterns on the dental remains of 4 sites, which are located in the Catalonia, Northeastern Iberian Peninsula. The specific sites are placed chronologically in the Early and Middle Bronze Age, while are attributed to both deciduous and permanent dentition and both sexes, providing a very good opportunity for the obtainment of a comprehensive approach on the diets and behaviors of the specific populations. Furthermore, the adopted methodological framework consists of the use of 2 different pieces of microscopic equipment (Optical and Digital microscopes), aiming to examine different aspects of the dental features and to understand the level of complementation among the two microscopes for the finest archaeological interpretation. In this framework, our results demonstrate insights into the dietary and the behavioral patterns of the studied populations, while underlining the need for the adoption of complementary methodological approaches for the in-depth examination of the dental features during the conduction of dental microwear analysis.

217. DIETARY PRACTICES IN LATE PREHISTORY OF NORTHEASTERN IBERIA: THE CASE OF ROC DE LES ORENETES AND COVA DEL GEGANT

Contribution format: Oral  
Contribution authors: Raquel Hernando (Centro Nacional de Investigaci n sobre la Evoluci n Humana (CENIEH) | Institut Catal  de Paleoecologia Humana i Evoluci  Social (IPHES-CERCA)) – Miguel  ngel Moreno-Ib  ez (School of History, Classics and Archaeology, University of Edinburgh) – Celia D ez-Canseco – Iv n Ram rez-Pedraza (Institut Catal  de Paleoecologia Humana i Evoluci  Social (IPHES-CERCA) | Departament d’Hist ria i Hist ria de l’Art, Universitat Rovira i Virgili (URV)) – Carlos Tornero (Department of Prehistory, Autonomous University of Barcelona (UAB) | Institut Catal  de Paleoecologia Humana i Evoluci  Social (IPHES-CERCA)) – Joan Daura – Montserrat Sanz (Grup de Recerca del Quaternari (GRQ-SERP), Universitat de Barcelona) – Marina Lozano (Institut Catal  de Paleoecologia Humana i Evoluci  Social (IPHES-CERCA) | Departament d’Hist ria i Hist ria de l’Art, Universitat Rovira i Virgili (URV))

The Late Prehistory of the Iberian Peninsula was a period of significant cultural dynamism and complexity, characterized by a series of socio-cultural, technological, and demographic transformations with different regional expressions and rhythms. This study focuses on understanding the dietary practices during the Late Prehistory of the northeastern Iberian Peninsula, focusing on two groups: Cova del Gegant and Roc de les Orenetes, which span from the Late Chalcolithic to the Middle Bronze Age. Teeth were examined using the dental microwear technique with an optical microscope (OM), focusing on the buccal surfaces. Buccal dental microwear patterns revealed significant differences between the groups, suggesting distinct dietary strategies influenced by diverse factors. By integrating these results with other proxies, including oral pathology and isotopic analyses, we identified two dietary patterns reflecting varying degrees of abrasiveness. High-altitude sites like Roc de les Orenetes suggest pastoral economies heavily reliant on animal products, while coastal sites such as Cova del Gegant reflect mixed diets influenced by the inclusion of extrinsic particles. These findings show the intricate interplay between environmental settings, resource choices, and subsistence strategies. This research highlights the potential of combining dental microwear with other available proxies to gain deeper insights into past lifestyles and cultural adaptations. By situating these dietary patterns within the broader Iberian context, this study sheds light on the dynamic interactions between human populations and their environments during Late Prehistory, contributing to a deeper understanding of their lifeways.

500. CULTURAL INFLUENCES ON DIET: INSIGHTS FROM MEDIEVAL ISLAMIC AND CHRISTIAN POPULATIONS IN SILVES (SOUTHERN PORTUGAL)

Contribution format: Oral  
Contribution authors: Ana Gonzalez-Ru z – Ana Santos (University of Coimbra, Centro de Investiga o em Antropologia e Sa de (CIAS)) – Maria Gon alves (Museu Municipal de Arqueologia de Silves)

This study explores dietary patterns in two medieval populations—Islamic (9th–13th centuries) and Christian (13th–15th centuries)—from Silves (Portugal), posing the hypothesis. Since both groups occupied the same location, then any observed dietary differences would be primarily driven by cultural rather than environmental factors. To test this hypothesis, the prevalence of caries (recorded as present/absent) and antemortem tooth loss (AMTL) in permanent dentition (individuals >11y.o.) were analyzed. The prevalence of caries was higher among the Islamic population (61.1%, 22/36) compared to the Christian (36.9%, 22/58). After applying the ‘caries correction factor’ proposed by Lukacs (1995). to account for AMTL, the adjusted prevalence was respectively 19.6% and 12.3%. Statistical analysis confirmed a significant difference between the two populations, both at the individual level (p = 0.028) and after correction (p < 0.05). The prevalence of AMTL was 55.6% (20/36) in the Islamic population and 55.2% (32/58) in the Christian. A comparison of AMTL loci showed similar trend (12.7% vs. 10.4%), with no significant differences in either case. These results suggest a different intake of cariogenic foods, and/or differences in food preparation techniques. Poor skeletal preservation hindered sex estimation for many individuals, preventing the analysis of potential sex-based differences. Published isotopic data suggest the Islamic community could have relied more on C<sub>3</sub> plants, while the Christian diet was slightly more diverse, consistent with higher fish and/or terrestrial animal protein intake. However, 12th–13th century faunal remains suggest an alternative scenario, indicating consumption of domestic animals (sheep, goats, chickens) and wild species (rabbits, hares, red deer, wild boar or domestic pigs, partridge, geese (potentially domesticated), fish, and molluscs. These findings highlight the cultural influence on diet and the need for complementary methods to better understand past lifeways and cultural dynamics.

1202. LIFESTYLE AND OCCUPATIONAL ACTIVITIES AT THE IRON AGE SITE OF PONTECAGNANO (CAMPANIA, ITALY, 7TH-6TH CENTURY BCE)

**Contribution format:** Oral  
**Contribution authors:** Roberto Germano (Department of Environmental Biology, Sapienza University of Rome) – Alessia Galbusera (Department of Odontostomatological and Maxillo Facial Sciences, Sapienza University of Rome) – Dulce Neves (Research Centre for Anthropology and Health, University of Coimbra | Department of History, Anthropology, Religions, and Performing Arts, Sapienza University of Rome) – Carmine Pellegrino (Department of Cultural Heritage Sciences, University of Salerno) – Alessandra Sperduti (Bioarchaeology Service, Museum of Civilizations, Rome | Asia Africa and Mediterranean Department, University “L’Orientale” of Naples) – Luca Bondioli (Institute of Geological Sciences, Polish Academy of Sciences, Kraków) – Giorgio Manzi (Department of Environmental Biology, Sapienza University of Rome) – Alessia Nava – Emanuela Cristiani (Department of Odontostomatological and Maxillo Facial Sciences, Sapienza University of Rome)

Dental calculus analysis provides a window into the dietary habits and daily activities of ancient populations. The present research focuses on the analysis of dental calculus of five individuals from the Iron Age necropolis of Pontecagnano (Campania, Italy, 7th-6th century BCE), selected for their well-preserved and extensive calculus deposits. Our aim is to reconstruct aspects of adult diet and possible occupational activities through the micro-scopic analysis of micro-debris embedded in the dental calculus. We carried out a meticulous extraction and analysis of dental calculus following established protocols. Micro-debris were identified by light microscopy and compared with modern reference collections and existing literature. Our results show the presence of starch granules, plant fibres and fungal spores. Starch granules, identified in three individuals, belong to the Poaceae family (Triticeae tribe: wheat and barley) and the Fabaceae family (lentils, fava, and peas). The damage observed on some granules suggests possible cooking or processing techniques. In addition, numerous *Saccharomyces* fungal spores were identified in three individuals, likely suggesting the consumption of fermented foods and/or beverages. The presence of plant fibres in all individuals analysed suggests extra-masticatory use of teeth or hygiene practices. The presence of cereals, legumes, and evidence of fermentation processes, along with plant fibres, highlights the complex interplay between diet, culture, and environment in Iron Age Pontecagnano and their inhabitants. Furthermore, we integrate optical analysis of dental calculus with other lines of bioarchaeological evidence, which will provide valuable insights into food preparation techniques and broader cultural practices in this ancient population.

1401. DENTAL MICROWEAR ANALYSIS AT CASTILLEJO DEL BONETE SITE (TERRINCHES, CASTILLA LA MANCHA, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Alba Navarro-Pérez (Laboratorio de Evolución Humana, Universidad de Burgos) – Domingo Salazar-García (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València | Department of Geological Sciences, University of Cape Town,) – Luis Benítez De Lugo-Enrich (Departamento de Prehistoria, Historia Antigua y Arqueología, Universidad Complutense de Madrid) – Rebeca García-González (Laboratorio de Evolución Humana, Universidad de Burgos)

Castillejo del Bonete (CB) is a sacred site in Castilla-La Mancha, built within a natural cave and used as a burial place during the transition from the 3rd to the 2nd millennium cal BC. A minimum of 80 individuals were interred at the site. This burial period at CB coincides with an increase in social complexity. Since dental microwear analysis is a well-established method for characterizing subsistence strategies, cultural behaviors, and social organization, it can be used to evaluate this process of increasing social complexity. The main objective of this study is to establish the dental microwear pattern in molars from CB. To achieve this, we analyzed the occlusal and buccal surfaces of 8 upper first molars, 22 lower first molars, 20 upper second molars, and 22 lower second molars. For buccal microwear analysis, digitized micrographs were taken at 100× magnification, measuring the number, length, and angles of all scratches. For occlusal microwear analysis, facet 9 was imaged at 500× magnification, counting pits and scratches. Our preliminary results suggest an abrasive diet, along with some interindividual differences. This study is expected to provide valuable insights into the relationship between dental microwear, diet, and food processing techniques, contributing to a better understanding of these late prehistoric populations.

1657. THE DIETARY CHOICES OF NEOLITHIC COMMUNITIES IN THE SOUTHERN CARPATHIAN BASIN (~6250-4500 CAL. BC)

**Contribution format:** Oral  
**Contribution authors:** Jelena Jovanovic (BioSense Institute, University of Novi Sad) – Jelena Marković (Department of Archaeology, Faculty of Philosophy, University of Belgrade) – Tamara Blagojević – Maja Kokanović – Nejra Omerović (BioSense Institute, University of Novi Sad) – Alejandro Romero (Department for Biotechnology, Faculty of Science, University of Alicante) – Camille De Becdelièvre (Associate Member, Aix Marseille Univ, CNRS, Minist Culture, LAMPEA, Aix-en-Provence)

The Neolithic period represents an important stage that shaped the development of mankind and transformed the trajectory of our species. In the late 7th millennium BC, farmers from the Near East spread into Europe via the Balkans and Carpathian Basin, introducing new economic and social practices. The Southern Carpathian Basin represents one of the key regions for examining the nature and dynamics of the farming expansion and the adaptations of different parts of the “Neolithic package” into new natural environments. An important aspect in studying the processes of Neolithization and consolidation of Neolithic practices is the question of dietary strategies through space and time. To investigate how newly arrived Neolithic communities (~6250–4500 cal. BC) adapted to the local environmental conditions and food resources and how their diet changed throughout their lifetime, we observed several parameters on human teeth from this region (dental caries, calculus deposits, antemortem tooth loss), and performed stable isotopes ( $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$ ,  $\delta^{34}\text{S}$ ) and buccal microwear analysis. The results showed that the diet of Neolithic communities was based mostly on terrestrial resources, with a high input of carbohydrate-rich foods, and that only a few consumed aquatic resources in moderate amounts. They had a mixed diet of plant and meat foods, and there is a trend toward greater meat consumption among men. Differences seen among some Neolithic individuals from different sites might reflect communities’ adaptation to local environments and food sources. Our ongoing study of sequential analysis of tooth dentine will deepen our knowledge of individual early life histories and the diversity of food consumed and identify possible mobility from childhood to adulthood. This research was supported by the Science Fund of the Republic of Serbia, GRANT No. 7498, Moving across the plain: reconstructing the lifetime movements of farming pioneers and their successors during the Neolithic in the Southern Carpathian Basin-MOVE.

2191. DIET AND SUBSISTENCE STRATEGIES OF CATACOMB CULTURE POPULATION NEAR RIVER LUHAN`

**Contribution format:** Oral  
**Contribution authors:** Claudia Sharapova (Taras Shevchenko National University of Kyiv)

Pastoralism, which constituted the basis of the Bronze Age population’s livelihood, is characterised by a specific set of food products. The pastoralist lifestyle of the Catacomb community is traditionally associated with diet rich in animal proteins. However, the actual adaptation strategies could potentially be much more complex. Detailed description of the diet based on dental pathologies has the capacity to confirm or refute the hypothesis of intergroup specialisation of households within local groups of catacomb cultures. To identify signs of dental pathologies, a sample of individuals from the kurgans near the city of Oleksandrivsk, located in the Luga River basin, was created. The excavations were carried out by the Siversko-Donetsk expedition in the 1970s by S. Bratchenko. Selected individuals belong to the Catacomb cultures. The following dental pathologies were recorded: periodontal disease, apical processes, calculus, caries, ante-mortem tooth loss, interproximal grooves, enamel chipping, hypercementosis, tooth wear, and secondary dentin. Signs of pathologies that provide a general indication of the health status of the subjects in the sample were also incorporated to the study. They include linear enamel hypoplasia as a marker of stress episodes and localised pitting enamel hypoplasia, which is associated with osteopenia. The obtained information reflects the relationship between the success of particular survival strategy and prevailing living conditions of the population. The high prevalence of calculus, low frequency of caries and its complication, as well as distributions of the other markers, suggest the predominance of protein-rich diet in the catacomb culture populations. Intergroup fluctuations in frequency of the stress indicators reflect the local or temporal variants of adaptation level.

920. ORAL PATHOLOGIES FROM ROC DE LES ORENETES: HEALTH AND LIFESTYLE OF AN EARLY BRONZE AGE POPULATION IN THE EASTERN PYRENEES

**Contribution format:** Oral  
**Contribution authors:** Miguel Ángel Moreno-Ibáñez (School of History, Classics and Archaeology, University of Edinburgh) – Raquel Hernando (Centro Nacional de Investigación sobre la Evolución Humana (CENIEH) | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) – Palmira Saladié (Institut Català de Paleoecologia Humana i Evolució Social

(IPHES-CERCA) | Departament d’Història i Història de l’Art, Universitat Rovira i Virgili (URV) | Department of Paleobiology, Unit associated to CSIC, Museo Nacional de Ciencias Naturales) – Rosa Soler (Institut Català d’Arqueologia Clàssica (ICAC-CERCA) | Departament d’Història i Història de l’Art, Universitat Rovira i Virgili (URV)) – Celia Díez-Canseco (AASPE UMR 7209 CNRS, Muséum National d’Histoire Naturelle | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) – Carlos Tornero (Department of Prehistory, Autonomous University of Barcelona | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA))

Teeth are a fundamental part of the skeleton for studying different aspects of the health and lifestyle of past populations, especially if they are studied from different approaches. In this study, we examine the oral pathologies documented in the prehistoric collective burial of Roc de les Orenetes (Queralbs, Girona, Spain). It is a burial cave with a minimum of 51 individuals, located in a high mountain environment. Caries, periodontal disease, dental enamel hypoplasia, dental calculus, and antemortem tooth loss have been found in the remains of Roc de les Orenetes. Caries have been documented in 16 adult teeth (1.8%), in most cases molars, interproximal, and with an intermediate severity. Periodontal disease has been observed in nine mandibles and six skulls, belonging to adult individuals of different ages, representing 18.3% of the skulls and mandibles recovered at the site. Severe enamel hypoplasia has been found in eleven dental remains (1.2%), mostly canines. Dental calculus is highly prevalent (16%), found in 143 teeth, especially in the mandibular dentition. Finally, two crania and two mandibles present cases of antemortem tooth loss, in one case with the loss and resorption of all molars and premolars. From the paleopathological point of view, the low number of caries and the high proportion of periodontitis can be related to a diet rich in animal protein intake. The results observed from dental microwear studies provide complementary information, indicating a diet based on highly processed or soft foods, such as meat or secondary products. Further skeletal pathologies may support this interpretation, as several cases of cribra orbitalia, porotic hyperostosis, periosteal new bone formation, and hypervascularity have been found. Taken together, this evidence suggests important metabolic deficiencies, such as anemia, rickets, or scurvy, indicating a lifestyle adapted to high mountains, with a shortage of some foods and high physiological stress.

**1282. INTER-ISLAND VARIATION IN ORAL HEALTH, DENTAL SIZE, AND ENAMEL HYPOPLASIAS IN THE AMAZIGH POPULATION OF THE CANARY ISLANDS (1ST–15TH CE)**

**Contribution format:** Oral  
**Contribution authors:** Aarón Morquecho Izquier – Jonathan Santana (Universidad de Las Palmas de Gran Canaria | IG. I. Tarha. Department of Historical Sciences) – Rebeca García González (Universidad de Burgos | Laboratory of Human Evolution, Department of History, Geography and Comunicación | Faculty of Humanities and Comunicación)

This study examines oral conditions, dental size, and linear enamel hypoplasias (LEHs) in 61. adult individuals from the Amazigh population of the Canary Islands (1st–15th cal CE). The oral conditions analyzed include dental macrowear, calculus, periodontal disease, and antemortem tooth loss (AMTL). Mesiodistal (MD) and buccolingual (BL) diameters, as well as the geometric mean of permanent teeth (I1–M2), were measured for all islands except Lanzarote. LEH prevalence, age at first occurrence, and stress episodes were assessed macroscopically in the same sample. Two distinct patterns emerged: the Gran Canaria population exhibited the largest teeth, the highest overall prevalence of dental conditions, and the highest prevalence of LEHs. In contrast, the populations of El Hierro and La Palma generally showed the smallest teeth, the highest prevalence of severe macrowear, and the lowest LEH prevalence. The remaining populations (La Gomera, Tenerife, and Fuerteventura) presented a mixed pattern, with no clear trend toward either extreme. No consistent pattern in sex differences was found regarding the prevalence of caries, periodontal disease, AMTL, calculus, and hypoplasias across the islands. In some cases, one sex shows higher prevalence on certain islands, while on others the opposite trend—or no significant difference—is observed. Additionally, age at death appears to be a key factor influencing the prevalence of all oral conditions examined. Overall, the findings suggest that inter-island differences in oral health, dental size, and LEH prevalence were shaped by a complex interplay of environmental, behavioral, and possibly genetic factors, rather than following a uniform trend across the archipelago.

**1680. RECONSTRUCTION OF DIETARY HABITS AND DENTAL HEALTH IN MEDIEVAL AND EARLY MODERN URBAN AND RURAL COMMUNITIES FROM CONTINENTAL CROATIA**

**Contribution format:** Oral  
**Contribution authors:** Željka Bedic (Institute for Anthropological Research) – Maja Bunčić (Archaeological Museum in Zagreb) – Ivana Hirschler Marić – Andrej Janeš (Croatian Conservation Institute)

Diet has an important role in the organisation and evolution of human cultures. Information about the type of diet

and dietary habits of ancient populations may be obtained from historical sources, by studying the animal and plant remains excavated at archaeological sites, by analyses of teeth and stable isotopes of human osteological material. In this study we focused to obtain this information through analysing three dento-alveolar pathologies: caries, ante-mortem tooth loss, and alveolar abscesses, as well as carbon and nitrogen stable isotope analysis from bulk collagen. The study included three archaeological sites in continental Croatia from the Middle Ages and Early Modern Period. Two of them are of rural character – Stenjevec and Bijela, while Gorjani were one of the largest settlements in Medieval Slavonia. The cemetery around the church of the Assumption of the Blessed Virgin Mary in Zagreb – Stenjevec exhibit around 170 excavated graves, cemetery inside the church of the Benedictine monastery of St Margaret situated in Bijela near Daruvar around 50, and inside two churches (one older and one younger) in Gorjani near Đakovo around 200 graves. Previous data obtained during the analysis of part of the dental material from Gorjani and Bijela show similar frequencies of caries (13.6 vs. 11.0%) and alveolar diseases (15.4% in both samples) with significantly worse oral health in females. The aim of this study is to discover, in a larger sample, what effect living in a rural or urban area had on dental health, whether they practiced a different subsistence strategy, and ate different foodstuffs due to the development of trade, agriculture, oral hygiene, etc. depending on the environment in which they lived.

**2057. DENTAL INSIGHTS INTO SUBSISTENCE, HEALTH, AND INEQUALITY IN MEGALITHIC BURIALS OF THE MIDDLE DOURO VALLEY (CENTRAL IBERIA)**

**Contribution format:** Oral  
**Contribution authors:** Ana Lorenzo Barrio – Teresa Fernández Crespo (University of Valladolid) – Rebeca García González (University of Burgos) – Cristina Tejedor Rodríguez (University of Valladolid)

Anthropological approaches to megalithic tombs are constrained by the palimpsest-like mortuary record they usually include, where cumulative funerary use often plays an important role. Those disarticulated, commingled, fragmented and generally poorly preserved skeletal assemblages make both individualization and osteobiographic reconstructions very difficult tasks. Within this complex scenario, teeth stand as key elements to trace life-histories because they hold meaningful incremental physiological and dietary information during their formation and far beyond. Within the framework of the AGENDER project (Politics of death and diachrony of inequality in the megalithic tombs of the Douro Valley during the 4th millennium BC), this contribution is a diachronic study of subsistence strategies and experienced health and stress episodes. These aspects of megalithic populations are revealed by combining dental macro and microwear, oral pathologies, non-specific stress markers (such as linear enamel hypoplasia) and both bone and dentine collagen carbon and nitrogen isotope analysis. To obtain more nuanced life-histories, these dietary and health insights are linked to biological profiles based on sex determinations from peptides in tooth enamel and age estimations from tooth development in non-adults. The integration of these methodologies not only promotes a more comprehensive and fine-grained dietary approach at both an individual and a group level but also allows for a better understanding of the lifeways, social dynamics and funerary practices of those communities burying their dead in megalithic tombs of the middle Douro region during the 4th millennium BC.

**2300. EXPLORING THE IMPACT OF MULTIPLE SOCIO-POLITICAL TRANSITIONS ON HUMAN HEALTH AND LIFESTYLE IN ANCIENT AMPHIPOLIS, USING TEETH AS MULTI-PROXY TOOLS**

**Contribution format:** Oral  
**Contribution authors:** Dimitra Michael (School of History and Archaeology, Aristotle University of Thessaloniki) – Christophe Snoeck (Archaeology, Environmental Changes and Geo-Chemistry, Vrije Universiteit Brussel) – Panagiotis Tselekas – Ilias Sverkos (School of History and Archaeology, Aristotle University of Thessaloniki) – Dimitra Malamidou (Ephorate of Antiquities of Serres) – Sevi Triantaphyllou (School of History and Archaeology, Aristotle University of Thessaloniki)

Amphipolis in northern Greece, experienced many different political models from the Archaic until the Roman times (6th c. BCE-2nd c. CE), including colonization, political autonomy, consolidation and imperialization. The BIOSOCIOPOLIS project, funded under a Marie Skłodowska-Curie frame, aims to develop a new interpretive model to reveal the extent to which multiple and consecutive socio-political transitions, affect human lifeways and deathways diachronically, from the less privileged individuals to the most favored “elite” groups. A well-contextualized sample from the inhumation burials of the diachronic cemeteries of Amphipolis has been selected on the basis of representation for the time period as well as for the diverse mortuary evidence linked to “elaborate” and “modest” burial features. To test whether the stated status-quo transitions were marked by specific impacts on health, diet and mobility, we implemented a multi-proxy approach combining macroscopic evidence with isotope analysis. Results on oral health (dental caries and calculus), physiological stress (enamel hypoplasia), diet (dentine carbon and nitrogen isotopes) and mobility (dental non-metric traits, tooth enamel oxygen and strontium isotopes) will be presented in conjunction with historical information and archaeological data. Dental results

based on macroscopic and isotope analyses will also be compared with cranial and post-cranial data. According to current results, health seems to have been negatively affected during the Roman transition, while a possible shift in subsistence strategies might have been present during the Classical transition, as suggested by calculus rates. The possible existence of socio-economic inequalities will also be investigated by analyzing results of lived reality in relation to mortuary criteria, such as the type of tomb, type of materials and number of artifacts. This approach, which is completely novel for historical populations of the broader region of northern Greece, is expected to induce significant progress, both on a methodological level, as well as for humanities in general.

**1704. ADDRESSING ACCIDENTAL INHALATION OF AIR POLLUTANTS THROUGH ANCIENT DENTAL CALCULUS: A CASE-STUDY FROM LATE NEOLITHIC COVA DAS LAPAS (PORTUGAL)**

**Contribution format:** Oral  
**Contribution authors:** Dulce Neves (Research Centre for Anthropology and Health (CIAS), University of Coimbra | Department of History, Anthropology, Religions, and Performing Arts, Sapienza University of Rome) – Emanuela Cristiani (DANTE - Diet and ANcient TEchnology Laboratory, Sapienza University of Rome) – António Carvalho (Centro de Estudos de Arqueologia, Artes e Ciências do Património (CEAACP), University of Algarve | Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, University of Algarve) – Ana Maria Silva (Research Centre for Anthropology and Health (CIAS), University of Coimbra | UNIARQ – University of Lisbon | Centre for Functional Ecology (CFE), University of Coimbra)

The World Health Organization defines air pollution as the “contamination of the indoor or outdoor environment by any agents that modify the natural characteristics of the atmosphere”. Despite being a current concern among modern human populations, studying the presence of such agents and their impact on ancient populations is challenging. Dental calculus research focuses on analysing particles entrapped in mineralized dental plaque. It has the potential to identify accidentally inhaled airborne particles, providing information on air quality and health-related environmental contaminants. This work aims to identify and interpret the environmental particles identified in the dental calculus collected from Cova das Lapas natural cave (Alcobaça, Portugal), dated to the second half of the 4th millennium BCE. Furthermore, we explore the health impact of the identified particles on the studied population. Dental calculus was sampled and analysed using optical light microscopy, applying well-established methods. The remains were identified based on reference comparative collections and published literature. A total of 67 samples were studied (56 from permanent teeth and 11 from deciduous teeth). Among the 1846 microdebris found in the 67 samples, several types can be considered airborne agents, including charcoal (80.6%; 54/67) and mineral particles (19.4%; 13/67), fungal remains (62.7%; 42/67), as well as wood (34.3%; 23/67) and fibre fragments (60.7%; 34/56). The identification of environmental particles in calculus from deciduous and permanent suggests chronic exposure to respiratory irritants, which have been related to poor respiratory health in modern populations. This work allowed the identification of ecological agents known to affect air quality. Such particulates could have impacted the respiratory health of the people buried in Cova das Lapas. Despite the challenge of identifying the remains and their entrapment pathways, these findings show the potential of dental calculus in addressing environmental and health-related questions that are not accessible through skeletal analysis.

**1861. TEETH IN TRANSITION: ODONTOMETRIC ANALYSIS OF MESOLITHIC HUNTER-GATHERERS AND NEOLITHIC AGRICULTURAL COMMUNITIES IN THE DANUBE GORGES (9500-5500 CAL. BC)**

**Contribution format:** Oral  
**Contribution authors:** Nina Dragicevic – Sofija Stojkov – Jelena Marković – Mina Amzirkov – Sofija Stefanović (Department of Archaeology, Faculty of Philosophy, University of Belgrade)

The Mesolithic-Neolithic transition is one of the most significant processes in human history, profoundly impacting human biology, health, and dietary choices. During this transformative period, communities shifted from hunting and gathering to a sedentary, agricultural lifestyle, further influencing human development. In many regions, the transition to food production was accompanied by a reduction in craniofacial and dental dimensions. In this study, we investigate whether the Neolithic transition affected tooth dimensions in the Central Balkans, a key area for examining Neolithisation due to its strategic position at the crossroads of the Near East and Europe. To assess this, an odontometric study was conducted on the teeth of Mesolithic hunter-gatherers and the newly arrived Neolithic population in the Danube Gorges (9500–5500 cal. BC). To investigate potential differences in odontometric parameters between these two groups, we measured the mesiodistal and buccolingual diameters of permanent maxillary and mandibular molars using an optical digitizing device. Our sample includes individuals from Padina, Vlasac, Lepenski Vir, and Hajdučka Vodenica, for whom absolute dates and aDNA genotyping data are available. Previous studies enabled us to genetically determine whether individuals belonged to the hunter-gatherer or agricultural population. By comparing tooth size between these groups, we aim to reconstruct how

the mixing of populations, lifestyle shifts, and dietary changes affected teeth dimensions in the Danube Gorges.

**1655. EXPLORING HORMONAL DEFICIENCY DETECTION IN DENTAL TISSUES THROUGH BIOGEO-CHEMICAL ANALYSIS**

**Contribution format:** Oral  
**Contribution authors:** Jessica Bergamini (Department of Sciences of Antiquity, Sapienza University of Rome) – Alessia Galbusera (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome) – Martina Trocchi (Institute of Complex Systems, Rome | Department of Earth Sciences, Sapienza University of Rome) – Szymon Mianowski (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome | Institute of Geological Sciences, Polish Academy of Sciences) – Federico Lugli (Institut für Geowissenschaften, Goethe-Universität | Department of Chemical and Geological Science, University of Modena and Reggio Emilia) – Robert Anckziewicz (Institute of Geological Sciences, Polish Academy of Sciences) – Wolfgang Müller (Institut für Geowissenschaften Goethe-Universität | Frankfurt Isotope and Element Research Centre (FIERCE), Goethe University Frankfurt) – Luca Bondioli (Institute of Geological Sciences, Polish Academy of Sciences) – Alessia Nava (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome)

The relationship between health status and variations of trace element concentrations in mineralized dental tissues represents an innovative research field yet to be extensively explored through the lens of bioarchaeology. Coupled with biogeochemical studies, the study of microstructural and micromorphological features of dental tissues enables retrieving many biological variables associated with individuals’ life histories. A deeper understanding of the development and function of the endocrine system in past individuals is instrumental in elucidating the evolution of hormonal disorders, such as hypothyroidism. This study investigates the potential correlation between variations in trace element (TE) concentration in mineralized dental tissues and hormonal fluctuations using histology coupled with laser-based mass spectrometry (LA-ICPMS). To this end, five teeth from three contemporary individuals with known medical and nutritional histories were analysed, each with different forms of hypothyroidism and treatment histories: (a) congenital hypothyroidism treated with levothyroxine (L-T4) since birth; (b) untreated Hashimoto’s thyroiditis diagnosed in adulthood; and (c) untreated hypothyroidism discovered in childhood. These were compared with fifteen healthy modern individuals. TE variations were then measured in ten archaeological specimens. Results indicate significant differences in TE patterns between individuals with and without endocrine pathology and between treated and untreated cases. In non-pathological individuals, enamel’s Mg/Ca ratio decreases progressively from prenatal to postnatal periods. Treated hypothyroid individuals exhibit postnatal Mg/Ca concentrations comparable to healthy subjects, while untreated individuals show stable magnesium concentrations in pre-and postnatal enamel, without the expected decrease. Similarly, archaeological specimens exhibit consistent Mg/Ca concentrations between prenatal and postnatal enamel, lacking the anticipated decline. Conversely, Zn/Ca patterns reveal ambiguous trends. In healthy individuals, Zn/Ca remains uniform along the enamel-dentine junction (EDJ), whereas in pathological subjects, it fluctuates, suggesting disturbances during enamel mineralization. This study offers insights into disentangling past individuals’ life histories, offering a method to identify endocrine dysfunction in the past.

**1665. UNCOVERING THE LINK BETWEEN BREASTMILK CONSUMPTION AND VITAMIN D DEFICIENCY THROUGH HISTOMORPHOLOGICAL, ELEMENTAL AND STABLE ISOTOPE ANALYSIS**

**Contribution format:** Oral  
**Contribution authors:** Panagiota Bantavanou – Elissavet Ganiatsou – Christina Papageorgopoulou (Laboratory of Physical Anthropology, Democritus University of Thrace)

Dental Enamel Hypoplasia (DEH) and Interglobular Dentin (IDG) are pathological markers that result from insufficient secretion of mineral and organic substances and indicate physiological and metabolic stress during infancy. DEH has been correlated with infections and malnutrition, while IDG has been associated with Vitamin D deficiency. Despite extensive research, the causation of these conditions is not fully understood yet. In this project, we test the role of breastmilk consumption and weaning duration in the formation of DEH and IDG as critical factors of infant growth and development. For this, 26 individuals from ancient Thessaloniki, mostly dated to the Roman period (168 BC–324 AD) were analysed. Histological sections of the permanent canines were prepared and the severity and the exact age-at-formation of DEH and IDG was recorded microscopically. Stable isotope analysis of nitrogen and carbon coupled with Bayesian mixing modelling was performed on first permanent molars of the same individuals to estimate the duration of weaning and breastmilk proportions, respectively. XRF analysis performed to explore the elemental levels of calcium and phosphorus as crucial substances for the development of dentition and basic components of vitamin D. The preliminary combined results of our analyses show that

individuals consuming less than 50% of breast milk during weaning, developed multiple DEH and IDG defects (mean age 2.59 and 2.24 respectively), mostly formed close to the age of weaning or later (mean age at weaning 2 years of age) indicating that low breastmilk intake and early weaning correlate with the appearance of DEH and IDG. XRF results indicate a decrease of calcium and phosphorus levels when the pathologies occurred. Our assay provides fundamental understanding on infant health on aspects previously poorly understood. Funding: This research is part of the ERC-Consolidator Grant entitled CityLife (Project: 101126337).

**1837. HEALTH AND MORTALITY PROFILE IN THE NEOLITHIC: HISTOMORPHOMETRIC ANALYSIS OF DENTAL ENAMEL AND CEMENTUM FROM CERNICA (ROMANIA, 5240–4995 BCE)**

**Contribution format:** Oral  
**Contribution authors:** Beatrice Peripoli (Department of Environmental Biology, Sapienza University of Rome) – Raluca Kogălniceanu (1 Decembrie 1918 University of Alba Iulia) – Angela Simalcsik (“Olga Necrasov” Centre for Anthropological Research, Iași Branch of the Romanian Academy) – Emanuela Cristiani (Department of Oral and Maxillo-facial Sciences, Sapienza University of Rome) – Giorgio Manzi – Dušan Borić (Department of Environmental Biology, Sapienza University of Rome)

The Neolithic site of Cernica (Romania, 5240–4995 BCE) is situated in the Lower Danube Basin, a key region in European prehistory that served as a bridge between the Middle East and continental Europe. The Neolithic transition is one of the most fascinating periods in human history, marked by a profound shift in the relationship between humans and their environment. With the advent of agriculture, the health and mortality profiles of past communities underwent significant changes. Human teeth provide invaluable information for investigating these changes, as they permanently record physiological events during their formation. This allows researchers to examine the stress events occurred during dental formation and to estimate the age at death. In our contribution, we present the preliminary results of histomorphometric analysis of both dental enamel and cementum from the dental sample of the Neolithic cemetery of Cernica. The sample includes 30 permanent teeth from 12 individuals (4 incisors, 9 canines, 12 first molars). The main aim of this research is to outline the mortality profile by determining the age at death through the histomorphometric of dental cementum (Tooth Cementum Annulation – TCA). Additionally, we investigate health status during early infancy by analyzing enamel microstructures in order to identify incremental stress markers within the Crown Formation Time. For each tooth, a thin section was prepared along its mid-longitudinal plane. The sections were observed and analyzed under a transmitted light microscope under polarized light with different magnifications (5x, 10x, and 20x). The sample shows no significant diagenetic alteration, and the cementum is well-preserved in most cases, allowing for age-at-death estimation in 8 out of the 12 individuals. Histomorphometric analysis of the enamel reveals several stress episodes during early infancy, likely related to metabolic disturbance associated with several childhood morbidities (e.g. malnutrition, childhood illnesses, infections, and undernourishment during weaning).

**553. RECONSTRUCTING MEDICAL AND DIETARY PRACTICES IN ANTIQUITY: BIOARCHAEOLOGICAL EVIDENCE FROM CENTRAL ITALY (1ST-6TH CENTURY AD)**

**Contribution format:** Oral  
**Contribution authors:** Viola Cecconi (DANTE-Diet and Ancient Technology Lab, Sapienza University of Rome | Freelance anthropologist at the Bioarcheology Service, Museum of Civilizations, Rome) – Ilenia Gentile – Arianna Giordano – Elena Fiorin (DANTE-Diet and Ancient Technology Lab, Sapienza University of Rome) – Alexandra Dimitrova (FT-LAB Forensic Toxicology Laboratory, Department of Health Science, University of Florence) – Artnora Ndokaj (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome) – Alessandra Sperduti (Bioarcheology Service, Museum of Civilizations, Rome | Department of Asia, Africa and the Mediterranean, University of Naples “L’Orientale”) – Livia Ottolenghi (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome) – Fabio Vaiano (FT-LAB Forensic Toxicology Laboratory, Department of Health Science, University of Florence) – Emanuela Cristiani (DANTE-Diet and Ancient Technology Lab, Sapienza University of Rome)

Interdisciplinary research methods, including osteological and paleopathological analysis combined with molecular and biochemical studies, allow us to reconstruct ancient human biographies, providing insights into past populations’ lifestyles, activities, and health conditions, including diet and therapeutic practices. Among these methods, dental calculus analysis has become a crucial tool for investigating both human and environmental contexts. This mineralised matrix preserves bacterial communities, food residues, and therapeutic substances in a unique way, which would otherwise remain undetectable. While often considered independently, this study integrates its findings with broader osteobiographical data to investigate ancient medicinal knowledge and the

boundary between diet and healing. Our research examines 100 individuals with chronic diseases from archaeological sites in central and southern Italy (Isola Sacra, Velia and Amiternum), dating from the 1st to the 6th century AD. A multidisciplinary approach was employed, combining macroscopic assessment of skeletal lesions with advanced imaging techniques (MICRO-CT, 3D photogrammetry) and the study of oral health, including caries, abscesses, and ante mortem tooth loss. Microscopic analysis of calculus-embedded debris provides insights into dietary habits and possible occupational activities. To detect dietary and medicinal residues, optical and polarized microscopy was combined with biochemical and forensic analyses using gas chromatography-mass spectrometry (GC-MS) and liquid chromatography-tandem mass spectrometry (LC-MS/MS). These techniques shed light on ancient health strategies, offering new perspectives on dietary and phytotherapeutic practices.

**141. INSIGHTS INTO LIFESTYLES: THE PRODUCTION OF THREADS IN POPULATIONS FROM GRANADA (SPAIN) DURING LATE PREHISTORY**

**Contribution format:** Oral  
**Contribution authors:** Marina Lozano – Aristeidis Strimenopoulos (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’Història i Història de l’Art) – Sylvia Jiménez-Brobreil (Facultad de Medicina. Universidad de Granada) – Ángel Rubio-Salvador (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’Història i Història de l’Art)

Evidence of the use of teeth as tools appear early in our evolution. The activities performed with teeth vary through time. From the Neolithic period onwards, specialized tasks have been documented. This specialization affects not only the activities, but also the people in charge of them because only some of the individuals of a population carried out those tasks. One of the most outstanding dental wear features associated with non-masticatory activities are grooves on occlusal, mesial and distal surfaces. To characterize the morphology of the grooves is recommended to perform microscopic analyses. Here, we explore the suitability of a combination of different types of microscopy (scanning electron, digital and confocal) to describe and characterize grooves located on dental crowns. Our samples come from nine sites of the Granada province (Spain). Six out of the nine sites belong to El Argar culture dated to 1900-1450 cal BC and the other three sites, dated to Copper and Bronze Age, are not associated with El Argar culture. The results show that only some individuals of both groups present this type of grooves, moreover there are some differences in the grooves’ location on the dental crowns and the affected teeth among the samples. Methodologically, the combination of three different microscopic techniques allows a more in-depth analysis and improves precision of characterization of the grooves through the high-resolution images and measurements obtained. On the other hand, the specific methodological framework allows the extraction of information about the biological profile of the individuals such as sexual division of tasks, the age of the engagement on them, and for how long. All these pieces of evidence suggest that some individuals, especially women, were devoted to preparation of threads during Late Prehistory as a well-established task in the Argaric and non-Argaric societies.

**1714. BEHAVIORAL INFERENCES FROM DENTAL MICROWEAR STRIATIONS ON THE NEANDERTAL TEETH FROM PAYRE, FRANCE**

**Contribution format:** Oral  
**Contribution authors:** John Willman (Universidade de Coimbra) – Raquel Hernando (Centro Nacional de Investigación sobre la Evolución Humana (CENIEH)) – Marie-Hélène Moncel (UMR 7194 CNRS/MNHN-Département Homme Environnement, Musée de l’Homme)

Dental remains recovered from the site of Payre in the Rhône Valley of southeastern France have contributed significant information on lifeways of Neandertals in the region dating to between 250,000 and 125,000 years before present (MIS 8 to MIS 6/5). This study contributes data on labial and buccal dental microwear striations that relate to dietary and non-dietary behaviors (i.e., the use of teeth as tools). Gigapixel-like images (photomosaics) of enamel surfaces were taken with optical microscopy and one or more areas of interest were viewed at 50x to 100x magnification. Striation length and orientation were measured for each sampled area and a subsample of representative striation widths were measured. Average anterior tooth striation widths (mean: 26.63 µm, std: 21.00 µm, range: 4.83–95.68 µm) are considerably larger than striation widths on the posterior teeth (mean: 14.81 µm, std: 9.16 µm, range 4.05–77.33 µm), albeit there is overlap in the range of variation. There are no significant differences in the orientation of striations between anterior and posterior teeth and vertical striations are predominant. Enamel chipping is present on 2 of 4 anterior and 3 of 4 posterior teeth with complete crowns. Striation widths are particularly interesting as they are rarely observed using the same methodology for anterior and posterior teeth. The considerably wider widths on anterior teeth compared to posterior teeth indicate differences in tooth-use related to ingestive and non-dietary uses of the anterior teeth compared to the masticatory function of the posterior teeth. However, the presence of relatively wide striations on the posterior teeth encourage caution in

attributing all wide striations on the anterior teeth to non-dietary tooth-use behaviors.

2194. WHAT HAVE YOU BEEN DOING WITH YOUR TEETH? ATYPICAL DENTAL ALTERATIONS IN NEOLITHIC SAMPLE FROM HIPOGEU OF SÃO PAULO II

**Contribution format:** Oral  
**Contribution authors:** Ana Maria Silva (CIAS - Department of Life Sciences, University of Coimbra | CEF - University of Coimbra | UNIARQ - University of Lisbon) – John Willman (CIAS - Department of Life Sciences, University of Coimbra)

Dental remains are a valuable record of past activity patterns, including diet and occupational activities. Certain sets of behaviours or activities can produce particular and unintentional patterns of dental wear or alterations, and thus, reflecting non-masticatory and/or masticatory habits of the individuals. In order to illustrate the potential of dental studies to shed light on dietary habits and task-related activities of past populations, the dental remains exhumed from the rock-cut cave of São Paulo II are here examined. This tomb was used as a collective burial place since in the Late Neolithic/Chalcolithic, according to radiocarbon dating of human bones. The recovered human remains belong to a minimum number of 254 individuals, including 132 adults (> 15 years). Dental wear, including atypical one, and oral lesions (chipping, notching, grooves, LSAMAT and polish enamel surfaces) of the teeth of this collection were examined to assess information about non-masticatory behavior and oral pathology of these individuals, and thus insights of past activities that involved teeth.

1620. ORAL HEALTH OF THE POPULATION OF ORICUM (ALBANIA) DURING THE MIDDLE AGES

**Contribution format:** Oral  
**Contribution authors:** Ulsi Tota (Institute of Archaeology of Tirana, Albania)

The aim of this presentation is to present the state of oral health of the mediaeval population of Oricum (modern Orikum, Albania). The ancient city of Oricum is located in the southern part of Albania, in the coastal area, in the zone were the Adriatic sea join the Ionian sea. The sample analysed consist of the dental remains of 66 adult individuals (34 men and 13 women) excavated from the mediaeval cemetery (9 - 14th century AD) around the church in the acropolis of the ancient city of Oricos. In total were examined 627 teeth. To carry out this study, we took into consideration three pathologies most frequently encountered in our observations and which are dental caries, ante-mortem tooth loss and presence of dental calculus. Based in the observation we can say that with a frequency of caries which is around 13% and a presence of calculus around 34%, the percentages show an absence of dental hygiene and the consumption of soft foods, such as porridges rich in carbohydrates. The results for the food are also confirmed by isotopic analyses There are no big differences between the two sexes, although this conclusion should be taken with reservations due to the differences in the sample.

458. DENTAL DISEASE AS AN INDICATOR OF DIET AND HEALTH IN NON-ADULTS FROM URBAN AND NON-URBAN SITES IN LATE ANTIQUE SERBIA

**Contribution format:** Poster  
**Contribution authors:** Dragana Vulovic – Nataša Miladinović-Radmilović (Institute of Archaeology, Belgrade)

Children represent an important segment of the community and have an important role in reconstructing the health status of ancient populations. Dental diseases (i.e. caries and calculus) in childhood give us data about food availability, social status, and feeding practices, in addition to contributing to a child’s overall health status. Dental disease also causes infections and pain, which can later cause children to have problems with eating certain foods and, thus, directly affect their health and immunity. Caries analysis provides significant data on the cultural eating habits in children, especially if we do not have more precise data from historical sources on the type of food or drink consumed by children. The presence of caries in non-adults indicates the amount of intake of carbohydrates that have a cariogenic effect. Populations whose diet is rich in protein, such as meat and fish, present a lower frequency of caries. The high incidence of caries could indicate that high-quality food was less available to children and that a diet rich in carbohydrates prevailed. In this poster presentation, the results of a dental analysis of non-adult skeletal remains from two late antique necropolises from today’s Serbia will be presented. The dental analysis itself included frequencies of caries and calculus both on erupted permanent and deciduous teeth. We will compare the results of the dental analysis from two different late antique sites, one urban (Naissus, today’s Niš) and one non-urban (Begov Most – Staničenje, nearby Pirot) to see how different living conditions affect the dental health of children individuals.

1121. LYING THROUGH THEIR TEETH? A UNIQUE CASE OF BILATERAL TOOTH ROTATION FROM LBA KEFALONIA AND THE HALF-TRUTHS OF BIOARCHAEOLOGICAL STORYTELLING

**Contribution format:** Poster  
**Contribution authors:** Vicky Papagianni (National and Kapodistrian University of Athens) – Efrossini Vika (American School of Classical Studies at Athens) – Eleni Papafloratu – Grigoris Grigorakakis (Ephorate of Antiquities Kefalonia and Ithaca)

The concept of storytelling has in recent years gained momentum in archaeology, facilitating the powerful creation of a more relatable, emotive, and therefore understandable past. But how different is an account of events from a story? And is storytelling an inclusive, nuanced method of interpretation, especially when the protagonists are human bones? Arguably, osteoarchaeology in Greece has been given a lot more attention than its sister discipline, dental anthropology, a fact that in itself amplifies the importance of peculiar finds. Here, we present for the first time a unique case of bilateral mandibular premolar rotation, presenting together with dental non-metric traits. We discuss the etiology and bioarchaeological frame of this find by implementing a ‘story within the story’ approach: firstly, we reconstruct the context, investigating the significance of this characteristic within a living population. Then, we analyse the explanatory potential of the ‘unique find’ in bioarchaeological narratives and the ambiguity of its predictive importance, exploring how scientific analyses significantly amplify the performance of storytelling by providing an important element of critique.

1273. PALEOPATHOLOGY AND ORAL HEALTH FOR A HALLSTATT POPULATION IN SOUTHWEST GERMANY

**Contribution format:** Poster  
**Contribution authors:** Rocio Herrera Reyes (Independent) – Marta Díaz-Zorita Bonilla (Eberhard Karls Universität Tübingen)

This case study analyses a sample of 24 individuals from the site of Gewann Rebhuhn, located in Tauberbischofsheim-Impfingen, Germany, from the Hallstatt period (1200-450 BCE). This project aimed to firstly revise the conditions of the osseous material in present times, secondly to re-evaluate biological profiles, and thirdly to estimate the state of health and diseases focusing on dental health. Therefore, detailed information for every type of lesion was processed and used to get a more solid base to start further studies with quantitative and qualitative data. This set of individuals presents a variety of oral paleopathology. This includes lesions or defects on maxilla and mandible bones; inflammatory responses on the alveolar bone area, and dental diseases (e.g. developmental issues, dental traumas, and infectious illnesses). In addition to the paleopathology, the same individuals were examined with the ASUDAS method to obtain a perspective of the type of non-metric traits found in this population. Even though it is a small sample compared to the population recovered from this site; it is quite representative of many more individuals that were examined under another project, for the type of lesions that were seen. In other words, it shows the most prevalent dental paleopathology of this population for the Hallstatt period.

1327. RECONSTRUCTING PERINATAL MORTALITY IN THE PAST: A BIOARCHAEOLOGICAL CASE STUDY FROM 17TH CENTURY TRANSYLVANIA

**Contribution format:** Poster  
**Contribution authors:** August Stone (Florida Atlantic University Department of Anthropology) – Jonathan Bethard (University of South Florida Department of Anthropology) – Zsolt Nyárádi (Haáz Rezső Múzeum Department of Archaeology)

In recent years, bioarchaeologists have expanded their work to include fetuses and perinates. These studies have explored diverse geographic and temporal contexts around the world and investigated numerous questions ranging from those focused on maternal health to others which explore personhood and identity. Additionally, bioarchaeologists have recognized that work focused on fetuses and perinates might also inform contemporary questions about infant mortality. For example, current medical research has identified a pattern in neonatal infant mortality rates that differs between males and females. Male infants worldwide have an approximately 20% higher mortality rate than females in the perinatal period (up to 44 weeks gestational age). The cause for this difference is unknown. While males’ survival disadvantage is well documented in modern research, there is very little data on differential perinatal mortality rates in historic or archaeological contexts. This is largely due to the difficulty in estimating biological sex in skeletal remains prior to puberty; however, this study utilizes enamel peptides from tooth enamel to generate sex estimates from perinatal tooth crowns. Proteomic sex estimation utilizes the presence of the AMELY peptide in human dental enamel to identify the presence of a Y chromosome, signaling that the individual is genetically male. A sample of 49 perinatal individuals excavated from the Telekfalva Reform Church in the Székelyföld region of Eastern Transylvania is utilized to reconstruct male and female perinatal mortality patterns from a 17th century Transylvanian mortuary context. Results are compared to patterns seen in modern medical research to estimate similarities between past and present differential perinatal mortality rates.

1491. DENTAL WEAR ASSESSMENT ON ARCHAEOLOGICAL HUMAN SKELETONS OF EARLY BRONZE AGE (YAMNAYA CULTURE) DISCOVERED IN REPUBLIC OF MOLDOVA–A PRELIMINARY STUDY

**Contribution format:** Poster  
**Contribution authors:** Ozana-Maria Giorpac-Petraru (Faculty of Biology, “Alexandru Ioan Cuza” University of Iași) – Sergiu Popovici (National Agency for Archaeology, Chișinău, Republic of Moldova) – Mariana Popovici – Vasilica-Monica Groza (Romanian Academy, Iași Branch, “Olga Necrasov” Center of Anthropological Research) – Luminita Bejenaru (Faculty of Biology, “Alexandru Ioan Cuza” University of Iași | Romanian Academy, Iași Branch, “Olga Necrasov” Center of Anthropological Research)

Teeth are particularly important in the research of past human populations. The loss of dental tissues in archaeological context can be correlated with the physical properties of consumed food, preparation techniques, being also influenced by the environment through the ingestion of grit, and some activities using the teeth as “a third hand”. Even though there are many studies addressing dental wear characterization, the knowledge on dental macrowear in prehistoric human populations is still limited, especially in Republic of Moldova. This preliminary study focuses on the dental wear in 20 skeletons, belonging to adolescents and adults, and discovered during preventive archaeological excavations from the Republic of Moldova, in 2022-2024. The human skeletons subjected to this study come from five tumuli, being attributed to the Early Bronze Age, Yamnaya culture (3100-2400 BC). The degree of dental wear was assessed for all preserved teeth by the semiquantitative scoring system, and only the second molars (M2) were subjected to quantitative assessment based on dentine exposure (image analysis). The antemortem and postmortem tooth loss, antemortem fractures, calculus, and extreme dental wear were recorded. The results of scoring system indicate that the analysed teeth show all three wear grades (i.e., small, moderately advanced, and advanced). Chipping was identified in several individuals, in both anterior and posterior teeth. An anomalous dental wear probably related to non-masticatory uses of teeth has been described. The persistence of mandibular deciduous second molars was reported as anomaly in an adult male skeleton. The results of this study will be included in an overall survey regarding the dental macrowear in the human populations belonging to Yamnaya culture. These findings will also enhance a deeper understanding of how diet, daily activities, and environmental factors influenced dental wear.

1624. PECULIARITIES OF THE DENTITION IN HUMAN SKELETON SAMPLES FROM IRON AGE SITES I. SOUTHEAST ROMANIA

**Contribution format:** Poster  
**Contribution authors:** Vasilica-Monica Groza (Romanian Academy, Iași Branch, “Olga Necrasov” Center of Anthropological Research | Romanian Academy, Iași Branch, Institute of Archaeology) – Mariana Popovici (Romanian Academy, Iași Branch, “Olga Necrasov” Center of Anthropological Research) – Alexandru Berzovan – Lavinia Grumeza (Romanian Academy, Iași Branch, Institute of Archaeology) – Luminița Bejenaru (Romanian Academy, Iași Branch, “Olga Necrasov” Center of Anthropological Research | Faculty of Biology “Alexandru Ioan Cuza” University of Iași)

The human skeletal remains discovered in sites of both Early and Late Iron Age, on the territory of Romania, are relatively few, due to the widespread practice of incineration, which led to the damage of the bone material and poor preservation. A such situation creates gaps in the knowledge on archaeological human populations in terms of biological characteristics and evolution in this region. This study aims to reevaluate human skeletal remains, which date to Iron Age, discovered in Southeast Romania, with a particular emphasis on the dental analysis. By investigating morphological dental patterns, and pathologies, this work contribute to better understanding of the genetic diversity and health status of the Iron Age people in the specified region. The dental material analyzed here belongs to adult skeletons recovered from bi-ritual necropolises: Enisala, Histria, and Isaccea. The examination of morphological dental patterns focused on the occurrence and expression degree of non-metric traits, on the surface of the teeth. Specific features were identified in the development and expression of the metacone and hypocone cusps on the upper molars, the presence of accessory tubercles on canines, the Carabelli trait, as well as the angular torsion of the mandible. Dental pathologies such as hypoplasia, granuloma, and tooth loss suggest possible dietary deficiencies. Another significant aspect is represented by the presence of caries and the absence of dental calculus, which could indicate a predominant consumption of foods producing oral acidity. The results of this study provide clues to understand how these human groups adapted to environmental conditions, diet, and lifestyle, highlighting aspects of both biological evolution and cultural practices that influenced their oral health. This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS–UEFISCDI, Funerary landscapes in the Carpatho-Dniestrian area at the beginning of the Late Iron Age, PN-IV-P2-2.1-TE-2023-0015.

2049. THE ALMOST EMPTY GRAVES. RECORDING OF POORLY PRESERVED SKELETONS ON SITE

**Contribution format:** Poster  
**Contribution authors:** Vicki Rytøft Kristensen (Unit of Anthropology (ADBOU), University of Southern Denmark) – Kirsten Nielsen (Museum Silkeborg, Denmark)

The topography of medieval cemeteries is not arbitrary, and the distribution of interred individuals not random. Skeletal remains exhibit preservation biases with age, both the very young and the elderly, diseases and dating as factors. Consequently, it is important to recover as much data as possible from each grave. Often, one of the most enduring components of the skeleton is dental enamel, though it is difficult to detect in the ground, and very fragile. If carefully excavated, it is possible to assess and register tooth eruption patterns and dental wear on site, even if the teeth cannot be fully recovered intact. The information provides more accurate age estimates, and when combined with peptide analysis of enamel, can also yield sex determinations. Using the fully excavated medieval cemetery at Virklund, Denmark, as a case study, it demonstrates the additional insights that can be gained from such analyses. In this cemetery 15% of the graves contained only teeth while 25% contained teeth along with poorly preserved bone fragments. Only 21% of the graves contained well-preserved skeletons. Peptide analyses of 91 juvenile remains has allowed for the determination of sex, enhancing the materials suitability for demographic analysis. The sex determination of juvenile remains has never before been done for a completely excavated medieval cemetery in Denmark. While it is rare for graves to be completely derived for skeletal material these partial remains provide valuable information. The registration sheet used for this on-site registration will be shared, and suggestions for further improvements are welcomed.

65 EARLY NOMADS OF IRON AGE AROUND THE BLACK SEA: NETWORKS OF EXCHANGE AND INTERACTION

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Scythians, Cimmerians, Black Sea, Caucasus, early nomads, Iron Age  
**Session organisers:** Denis Topal (National Museum of History of Moldova | Institute for Cultural Heritage) – Roberto Dan – Andrea Cesaretti (ISMEO – The International Association for Mediterranean and Oriental Studies)

SESSION ABSTRACT

The first millennium BC marked the spread of iron, the rise of nomadism, and a revolutionary shift toward cavalry. This era also witnessed the emergence of new social and cultural norms, through which the nomadic world shaped Eurasia’s historical landscape for the next two millennia. A distinct cultural space began to form, which may be described as the “Eurasian steppe cultural continuum of the Iron Age”. With the advent of the Iron Age, Eurasia’s steppe belt functioned as a cultural highway, linking distant regions from the Danube to the Huanghe River. Key research areas within this vast area include Southern Siberia for Asia and the Black Sea region for Europe, but future studies could also explore the cultural interconnections and influences that extended further westward. Hallmarks of early nomadic culture — such as weaponry, horse harnesses, funerary architecture, sculpture, and jewellery — highlight distinctive ways of life and social structure across these areas. However, the effects of this continuum were not limited to the Black Sea region alone. Other areas, such as the Balkans, Carpathians, and the Great Hungarian Plain, also experienced significant influences tied to these steppe cultures. Expanding the scope of research to include these regions offers a more comprehensive view of how nomadic groups shaped the broader Eurasian landscape. The main question is how nomadism influenced changes in lifestyle and social organization. To address this, this session presents new interdisciplinary approaches to examining the ecological, social, cultural, and economic transformations occurring between the Northern Black Sea region, Caucasus, Balkans, and Carpathians during the Iron Age. Acknowledging the diverse and multi-faceted nature of these cultural regions, and broadening the geographical scope, we can better capture the complexity and interconnectedness of these transformations.

CONTRIBUTION ABSTRACTS

1757. SCYTHIAN ARCHAEOLOGICAL CULTURE: PROBLEM OF DEFINITION

**Contribution format:** Oral  
**Contribution authors:** Oksana Lifantii (National Museum of the History of Ukraine)

The first Scythian complex was excavated in the North Black Sea region more than 260 years ago, and since then, a massive amount of literature has been devoted to Scythian culture. However, the difference in understanding the fundamental questions of Scythology is more significant than ever. At first, the researchers’ question of meaning arrived when they understood that the Forest-Steppe population in Scythia could not be ethnic Scythians. Thus, the term Scythian culture was not fair to them. Then, the question of Early Scythian monuments, the Asian monuments in the Altai mountains, etc., arose. Many researchers used the terms “early Scythian culture”, “Scythian animal style”, and the like without referring to the actual Scythian ethnicity. So, in essence, the scholars recognised the lack of alternatives to this term. As some have already noted, no quotation marks near the word “Scythian” and no additional reservations about the need to distinguish between “ethnic” Scythians and “archaeological” Scythians will save neither authors nor readers from unintentional confusion in understanding these concepts. Archaeological cultures named after people known from written sources, willingly or unwillingly, carry the corresponding ethnic “colouring”. Some specialists in the eastern territories of the Eurasian steppe use the term “Scythian-Saka time”, but even such a more neutral formulation is not gaining popularity. It is especially noticeable in articles on STEM research. Thus, in the obligatory historical reference at the beginning of such works, the authors may indicate (but not always) that they understand the ethnic heterogeneity of the analysed cultures, but still, “for simplicity”, use the term Scythians about all nomads of Eurasia of the Iron Age. The titles and conclusions of such articles are very loud, but this loudness is mainly the result of the simplification of terms and not the uniqueness of the knowledge obtained.

351. GOLD, FIRE AND SCYTHIAN “ROYAL” TOMBS IN THE WESTERN PART OF THE PONTIC STEPPE

**Contribution format:** Oral  
**Contribution authors:** Denis Topal (National Museum of History of Moldova | Institute for Cultural Heritage) – Roberto Dan – Andrea Cesaretti (The International Association for Mediterranean and Oriental Studies)

The most original feature of the funeral rite of the Scythian communities in the western part of the Eurasian steppe is the burned wooden tombs under the barrows. Most of them are connected to the Dniester River, such as the Dubăsari burial ground. Based on the available data, burned wooden tombs appeared among the Scythians of the northwestern Pontic region during the Middle Scythian period. This practice continued until the end of the Classical period, but there is a notable chronological gap between these two phases. Most of the early burned tombs date back to around the mid-6th century BC. Later burned tombs among the Scythians of the northwestern Black Sea region do not appear until the late 5th century BC, with the majority dating to the second quarter of the 4th century BC. Based on satellite imaging data, another presumed Scythian mound with a diameter of more than 100 m has been identified. Satellite images clearly show three artificially created circles in a field adjacent to the northeastern outskirts of the village of Lărguța, in the Cantemir district of the Republic of Moldova. If our assumptions are at least partially confirmed, the mound near Lărguța could become one of the first excavated mounds of the Scythian high nobility west of the Southern Bug, in an area traditionally considered to be on the periphery of Scythian culture. In addition, as experience shows, the most significant cultural interactions occur at borderlands, so the potential “royal” mound situated at the intersection of the Scythian and Thracian worlds could represent a unique discovery in the entire history of Scythian archaeology.

2201. THE MALYI VYSTOROP HILLFORT: ON THE QUESTION OF THE ROLE AND FUNCTION OF CERTAIN FORTIFICATIONS OF THE SCYTHIAN PERIOD

**Contribution format:** Oral  
**Contribution authors:** Oleh Bilynskyi (National University of Kyiv-Mohyla Academy)

The hillfort near the village of Malyi Vystorop (Sumy region, Ukraine) has been actively researched over the past two years. During this time, the internal layout system has been traced, and a number of structures and artifacts have been discovered. Based on Greek amphorae, the site is dated to the transition between the 6th and 5th centuries BC. The most intriguing structure is a building that was likely used for production purposes. Inside and around it, materials have been found that indicate the development of metallurgy at the site and possibly jewelry-making. The hillfort is sparsely populated but features a powerful fortification system. The available materials suggest a relatively high standard of living for its inhabitants. These factors, combined with a high level of production, may indicate that the site functioned as a fortified workshop. Such settlements with a clear specialization are characteristic of early urbanism, raising the question of the existence of similar sites in Forest-Steppe Scythia.

1988. SCYTHIAN PERIOD PINS OF THE SEYM REGION

**Contribution format:** Oral  
**Contribution authors:** Yuliia Khodukina (National University of Kyiv-Mohyla Academy)

The Seym Region, located at the northern border of Forest-Steppe Scythia, extends further north into the territories of forest cultures, earning it the designation of a “borderland zone.” This region is characterized not only

by its proximity to forest cultures but also by a narrow chronology of sites, minimal influence from nomads, and the absence of burial sites. The source base for this research comprises 52 metal pins, exclusively originating from published settlement sites dated to the Scythian period. The study utilizes the typology developed by V.G. Petrenko, based on three primary characteristics (head shape, shaft cross-section, and neck shape) and additional features (material and ornamentation). The research identified 11 types of metal pins from the Seym Region and three unique forms that have no parallels within Scythia. Among these are a shield-shaped pin, a stylus-shaped pin with twisted ornamentation, and a pin with a bifurcated shaft. This study aims to expand knowledge about the material culture of the Seym Region by emphasizing the unique characteristics of these artifacts, their manufacturing technologies, and the influences of neighbouring cultures. At the same time, it highlights the need to move beyond typological classifications and recognize ornaments as works of art, reflecting the imagination and experimentation of their creators. The proximity to forest cultures, as previously mentioned, may have inspired some artisans to imitate or incorporate creative elements into their designs.

674. GREEK ARMOUR IN THE SCYTHIAN CULTURE: ORIGIN, SYMBOLIC MEANING AND PRACTICAL USAGE

**Contribution format:** Oral  
**Contribution authors:** Oleksandr Shelekhan (Institute of Archaeology, National Academy of Sciences of Ukraine)

Starting from the 7th c. BC, Eastern Europe became an area of mobile horse riders known as the Scythians. At the same time, the northern shores of the Black Sea appeared to be the northernmost area of Greek colonisation. Tracing the exchange of military technology shows examples of cross-cultural interaction while Greek armour is considered to be evidence of changes in the non-Greek communities. In total, 69 Scythian sites with Greek helmets and greaves are known. Two helmets were chance finds, while the rest of the artefacts were grave goods. The main area of their dissemination lay near the Lower Dnieper course, where the main kurgans of the Royal Scythians were erected. For sure, the foreign weapons had additional value after appeared in the hands of the Scythians. But the bright evidence of everyday use and numerous modifications testify to quite a pragmatic attitude. The Scythians didn’t elaborate their own type of quasi-Antique armour or parade derivatives of it like Thracians and Maeotians did. As a rule, they just used products available to them, sometimes making them lighter for horse riding. The earliest finds belong to the 5th c. BC. But the majority of them were gained in the 4th c. BC, during the Spartocid’s expansion when nomads stood as allies or mercenaries. Therefore, they can be considered not as spoils of war, but as diplomatic gifts received during successful campaigns. It was the period when panoply in the Mediterranean also became lighter, together with an increasing part played by mercenaries in the armies. So while providing armour to the Scythians, the Bosporan Greeks achieved two goals: to enlist the support of an ally and at the same time get rid of outdated armour, the need for which gradually decreased.

2259. THE CAUCASUS AT THE CROSSROADS OF EURASIAN HORSE RIDERS

**Contribution format:** Oral  
**Contribution authors:** Sabine Reinhold (Eurasia-Department German Archaeological Institute)

The first millennium BCE in the Eurasian steppe is considered to be the millennium of the first mobile horse nomads. Based on Ancient Oriental, Greek and Roman historiography, for the first time names of certain tribes appear on its western edge; an early history of the steppe peoples seems within reach. However, the ethno-historical interpretation of archaeological materials in the orbit of ancient literate cultures has created numerous problems. This becomes particularly evident when looking at the Caucasus. The role of the interaction between Caucasian groups and mobile Eurasian ones is pivotal and objects, like cultural practices, were circulating in the regions north of the Caucasus, the Crimea and the Black Sea region from the 9th century BCE onwards at the latest – but maybe everything started much earlier? Recent bioarchaeological evidence suggests a sporadic presence of individuals with Central Asian connections at the start of the first millennium BCE. Among them is an individual who consumed horse milk and dates to the early 9th millennium cal. BCE from a site in the North Caucasian foothills (Scott et al. 2022). In this talk, I will critically review the interaction between local Caucasian populations and mobile groups, considering the latest bioarchaeological research. These new indications challenge paradigms, but also offer an opportunity to re-evaluate the significance of the mutual interaction.

810. PRE-SCYTHIAN HORSE HARNESSES IN THE KOBAN NECROPOLIS

**Contribution format:** Oral  
**Contribution authors:** Sergey Makhortykh (Institute of Archaeology Ukrainian Academy of Sciences) – Nadiia Kotova (Institute of Archaeology Ukrainian Academy of Science)

Horse equipment is one of the most important and vivid categories of the material culture in the 9th-7th centuries BC. It is essential for chronological reconstructions and the study of cultural contacts between different regions in antiquity. The aim of the present paper is to provide a general overview followed by a discussion of

the metal and bone horse harnesses found in the Koban cemetery (North Ossetia), one of the most prominent and largest burial sites of the Koban culture. It should be noted that among all the necropolises excavated in the mountainous Central Caucasus, it is only the Koban burial ground is characterized by a numerous and diverse composition of various pre-Scythian types of bridle accessories (for example, at least five distinct types of both bits and cheekpieces are presented here). This testifies in favour of a long-term and productive interrelation of the Koban community with the early nomads (Cimmerians). The rise of nomadism in the early 1st millennium BC brought about a revolution in communications. The horse could be used to explore new territories, in raiding and trade. A mobile life-style helped to create a new set of cultural and social patterns of behavior. On the basis of Caucasian material, it can be argued that these changes affected social structures (the development of elite groups of horsemen who benefited from long-distance exchanges), the economy (changes in the structure of animal breeding) and warfare (the effective use of cavalry in warfare, which required well-trained horses and riders), as well as religious practices (the appearance of the inhumation graves with horse gear).

850. IRONWORKING AND SCYTHIANS IN COLCHIAN PLAIN: AN OVERVIEW

**Contribution format:** Oral  
**Contribution authors:** Andrea Cesaretti (ISMEO - The International Association for Mediterranean and Oriental Studies)

The Colchian Plain represents one of the most distinctive environmental settings in the South Caucasus. It is a vast coastal area traversed by numerous rivers, the most significant of which is the Rioni River. Despite being one of the primary maritime outlets of the region, large portions of the plain are characterised by wetlands and marshes. These environmental conditions significantly influenced the settlement strategies of local communities, leading to distinct settlement pattern and land use. Despite the relative scarcity of raw materials in the lowlands, Colchis quickly became a key centre of metallurgy in the South Caucasus, a characteristic emerged during the Bronze Age and became particularly prominent in the Late Bronze Age and Iron Age. Sites such as Vani and Ureki have yielded substantial evidence of metalworking, underscoring the region’s pivotal role in production and exchange networks. A particularly significant aspect of the Iron Age in Colchis is the presence of Scythian-related material culture, dated between the 8th and 6th centuries BCE. Among the most notable finds are numerous akinakes-type swords, trilobate arrowheads, gold plaques with zoomorphic decorations, and bronze mirrors, recovered primarily from funerary contexts or as isolated deposits (e.g., Ureki, Vani). While ancient sources often depict Scythian-Colchian interactions in terms of conflict and raids, archaeological evidence suggests a more complex reality, involving both cultural exchange and trade. The metallurgical expertise of Colchis may have facilitated economic interactions with steppe populations north of the Greater Caucasus, indicating that these relationships were not solely based on violence and invasion. This paper aims to provide an overview of the Scythian-related materials found in Colchis, exploring the dynamics of interaction between the region’s inhabitants and the nomadic groups of the Eurasian steppe, with particular attention to the role of metallurgy in shaping networks of contact and exchange.

927. RETHINKING “SCYTHOID” OBJECTS IN IRON AGE BURIALS OF THE SOUTH CAUCASUS

**Contribution format:** Oral  
**Contribution authors:** Ruben Davtyan (State Office for Heritage Protection and Archaeology)

The presence of archaeological material linked to the Cimmerian and Scythian invasions in the South Caucasus has long been a subject of research and debate. The central question is whether objects with a “Northern” repertoire can be assumed to indicate the cultural belonging of nomadic groups, or whether they might have been produced and used by local populations. This presentation examines Iron Age tombs from Lori Berd in Northern Armenia, where only a small number of so-called “Scythoid” objects were found within an otherwise extensive archaeological assemblage. Through contextual analysis of these artefacts and comparisons with similar finds from the region, it is argued that while Eurasian nomads left a significant imprint on local material culture in rhe South Caucasus, hardly any burials from the 7th–6th centuries BCE there can be definitively attributed to Scythians or Cimmerians. Nevertheless, my aim is to showcase the material groups in which “Scythoid” objects were most frequently found Furthermore, evidence from Lori Berd suggests that in some cases, Scythoid artefacts were deliberately placed separately – perhaps to distinguish them from Urartian objects – indicating their potential role as war booty rather than markers of nomadic identity.

1735. “SCYTHIAN” ARROWHEADS IN WESTERN ASIA – NEW INSIGHTS INTO A LONG-STANDING DEBATE?

**Contribution format:** Oral  
**Contribution authors:** Anja Hellmuth Kramberger (Univerza Alma Mater Europaea)

Assyrian cuneiform texts from the 8th and 7th centuries BC describe the first encounters with mounted warrior

tribes attacking the neighboring kingdom of Urartu. These texts distinguish between two groups, the Gimirraia and the Ischkuzaia, which some scholars equate with the Cimmerians and Scythians based on Herodotus’ accounts in his fourth book. However, Herodotus also notes the diversity of tribes inhabiting the Northern Black Sea and steppe regions, making strict ethnic classifications highly problematic. To address this issue, scholars often use more neutral terms, such as “Eurasian nomadic,” when referring to the material culture of these groups. A particularly long-standing debate concerns the distribution of so-called “Cimmerian” and especially “Scythian” arrowheads beyond the core region of mounted nomadic culture in the Northern Black Sea area. Can the presence of these arrowheads in Western Asia be interpreted as evidence of invasions by mounted warrior groups? How do these artifacts relate to other weapons and the written historical record? This contribution will examine the occurrence of “Scythian” arrowheads in 8th–6th century BC contexts in Western Asia, exploring their significance within the broader framework of military campaigns, historical events and cultural interactions.

992. SCYTHIANS AND THE FALL OF URARTU: A PERSPECTIVE FROM KARMIR-BLUR AND ITS ROLE IN THE ADMINISTRATION OF THE URARTIAN STATE

**Contribution format:** Oral  
**Contribution authors:** Roberto Dan (ISMEO) – Nzhdeh Yeranyan (History Museum of Armenia)

The site of Karmir-Blur, located near Yerevan, is crucial for studying Urartian culture and the dynamics that led to the dissolution of Urartian power, marking the transition to the Orontid/Achaemenid period. Founded in the first half of the 7th century BCE by Rusa II, the site was excavated for decades under the direction of Boris Piotrovsky on behalf of the Hermitage Museum in St. Petersburg. Research has uncovered well-preserved architectural structures and a vast number of Urartian and non-Urartian artefacts, often in excellent condition, including many inscribed objects. These discoveries have provided essential insights into Urartian culture and the site’s final moments before its destruction. Recent studies on the materials unearthed have led to a reassessment of Karmir-Blur’s role during the final stages of Urartu. Contrary to previous assumptions, the site was not simply abandoned but was reoccupied during the Orontid/Achaemenid period. This presentation will provide an overview of the site, which is unique among Urartian fortified and administrative centres, and will examine interactions with the steppe world, particularly the Scythians. The reassessment of artefacts preserved in the History Museum of Armenia has revealed a rich and complex picture that remains largely unexplored. Despite more than a century of Urartian studies, significant gaps persist, particularly regarding the lesser-documented phases of its history and the cultural and military interactions with both nomadic and non-nomadic groups, such as the Phrygians and Scythians in the 7th century BCE. These aspects remain central to a deeper understanding of the transformations of the period.

594. BRIDGING VALLEYS: AGENTS OF MOBILITY AND THE RISE OF THE VENETIC EQUESTRIAN TRADITION

**Contribution format:** Oral  
**Contribution authors:** Ronak Alburz (University of Melbourne)

While a notable cultural division persisted between Central Europe and the Mediterranean world until the Roman era, similarities in Iron Age horse-burial practices across the southeastern Pannonian Plain, the southeastern Alpine region, and Veneto suggest sustained interregional contacts. Crucially, affinities between Venetic and Carpathian horse breeds further reinforce this connection. Despite various hypotheses regarding the trade or exchange of horses, the mechanisms of interaction and the actors involved remain obscure—as do the origins of Venetic equestrian traditions, which stand apart from those of contemporary northern Italy and Central Europe. Against this backdrop, this paper examines the emergence of Venetic equestrian culture and its possible connection to the contemporaneous reintroduction of inhumation rites in the Veneto during its formative phase (9th–7th centuries BCE). Through a focused case study, it identifies key agents of change and explores the intertwined trajectories of human and animal mobility to assess whether shared traits in horse-related traditions arose independently or reflect the influence of Pannonian horse culture.

1641. THE WANDERING TORQUES: THRACIAN-SCYTHIAN-GREEK INTERCONNECTIVITY AND CULTURAL APPROPRIATION

**Contribution format:** Oral  
**Contribution authors:** Maria-Magdalena Stefan (National History Museum of Romania)

The presentation will explore the cultural and functional significance of the Bunești-Averești diadem, a gold artifact traditionally associated with the North-Thracian milieu east of the Carpathians. Recognized early on as the product of a Greek workshop and dated to the 3rd century BC, the object was reportedly discovered in a pit within a fortified local settlement. Reassessing its function as a torques rather than a diadem invites comparisons with the North Pontic steppe, where spiralic torques with feline finials are well-attested in the rich female burials of Scythian nobility from the second half of the 4th century BC. As a variant of a widely recognized

status symbol, such torqs played a key role in elite representation and identity. Unlike its funerary counterparts in the North Pontic region, however, the Bunești-Averești piece appears to have been appropriated and ritually deposited, likely in a local sanctuary. This practice foreshadows a ritual model that would become emblematic for Pre-Roman Dacia in the following centuries—namely, the burial of hoards containing elements of ceremonial female attire. By examining the artifact’s production features, its possible trajectory to the region east of the Carpathians, and its subsequent conversion in function and meaning, this analysis seeks to illuminate broader patterns of exchange and interaction along the northwestern fringes of the Black Sea. It argues for the role of the North-Thracian space as an intermediary between nomadic and classical worlds, facilitating the movement of objects, styles, and ritual practices between the Greek, Scythian, and Thracian spheres during the late 4th and early 3rd centuries BC.

354. OLBIO UNDER SARMATIAN RULE IN THE LATE 1ST CENTURY AD

**Contribution format:** Oral  
**Contribution authors:** Oleksandr Symonenko (Institute of Archaeology of NAS of Ukraine)

Having come to the North Pontic steppes, the Sarmatian society was on the early class stage. Under this system the political power was concentrated in the hands of the most lucky and able military leaders – the chiefs of tribes or hordes. There is no doubt that Sarmatian society was organized by some way. In addition to the general historical logics, this is proved also by the terms ‘king’, ‘ruler’ etc. used in the written sources with regard to Sarmatians. The higher nobility burials of the second half of the 1st – early 2nd centuries AD are concentrated in the Middle Dnister basin, then south, in the Southern Bug basin and in the Middle Dnipro region. It can be argued that these aristocratic necropolises points to the centers of tribal groups. In 1984 the Sarmatian “royal” burial has been discovered in the barrow near Porohy village in Western Ukraine. In this grave the most reach and sacral items (ritual silver cup, golden torque, sets of ceremonial belts, and sword scabbard) have a tamga-signs similar to the signs on the Olbian coins of kings with Sarmatian names Inismeos and Farzoios. The spectacular Oriental coloration of the grave goods from Porohy, especially status belts, torque and bracelet, the Oriental bow with the arrowhead of Xiongnu type are characteristic for the subculture of Alanic nobility. Obviously, kings Farzoios and his son (?) Inismeos made the alliance with Olbian state. Most probably, it was a political union with a nominal Sarmatian leadership, as was often in use among nomads. In such case Sarmatians usually visited the city, which is justified by the finds of numerous tamga-signs and Sarmatian items on the whole territory of Olbian state as well as by Sarmatian burials along the state borders.

1676. LIFE AND DEATH IN THE EAST CARPATHIAN REGIONS AT THE BEGINNING OF THE LATE IRON AGE (5TH-3RD CENTURIES BC)

**Contribution format:** Poster  
**Contribution authors:** Lavinia Grumeza – Alexandru Berzovan (Romanian Academy, Iași Branch, Institute of Archaeology)

The period between the 5th–3rd centuries BC was a particularly dynamic time in the Carpatho-Dniester region, an area located at the crossroads between the North Thracian and Scythian worlds. This is evidenced by approximately 130 hillforts, a series of hoards, and a large number of funerary discoveries, highly diverse typologically, ultimately bearing witness to a complex ethno-cultural picture. Through this presentation, we aim to briefly present the main funerary discoveries in the area, focusing on specific elements that connect the region of interest to the Balkan world, Central Europe, and the Eastern Steppes. Challenging older historiographical views that imposed rigid boundaries between ‘Thracians’ and ‘Scythians’, our analysis aims to provide a much more nuanced understanding of the local communities that lived and thrived in this territory two and a half millennia ago. This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS-UEFISCDI, Funerary landscapes in the Carpatho-Dniestrian area at the beginning of the Late Iron Age, PN-IV-P2-2.1-TE-2023-0015.

68 EDUCATING FOR TOMORROW: PEDAGOGY AND CULTURAL HERITAGE DIALOGUES

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Discussion session  
**Session keywords:** cultural heritage education, future professionals, reskilling and upskilling, teaching methodologies, pedagogical strategies  
**Session organisers:** Federica Di Biase (University of Cyprus) – Francesca Porta (University of Bologna)– Francesca Romana Fiano (University of Ferrara)

SESSION ABSTRACT

The intersection between education and cultural heritage involves three main aspects: teaching future professionals, educating diverse publics, and reskilling and upskilling current practitioners. While UNESCO’s position in safeguarding cultural heritage through preservation and education highlights the mutual benefits of integrating these two disciplines, cultural heritage education faces widespread challenges, including funding cuts, reduced teaching resources in universities, and policy reforms that threaten the teaching of history and art in schools. This session is intended as a space for archaeologists and cultural heritage professionals to share theoretical insights and practical experiences from their roles as educators and/or learners within specialized training programs. We welcome contributions that critically discuss courses design, hands-on teaching and learning in laboratory settings, the integration of digital tools for remote instruction, and other innovative methodologies. Special focus will be placed on the challenges encountered, strategies for enhancing learners’ engagement, and effective methods for conveying complex cultural heritage issues. Recognizing education as a powerful tool for addressing social changes, this session aims to promote the integration of insights from both pedagogy and cultural heritage disciplines. By presenting our research, we seek to foster dialogue on best practices and future directions in cultural heritage education, ensuring that education remains central to the sustainable management, preservation, and promotion of cultural heritage.

CONTRIBUTION ABSTRACTS

1412. THE ROLE OF EDUCATION IN EQUIPPING CULTURAL HERITAGE PROFESSIONALS FOR THE DIGITAL ERA

**Contribution format:** Oral  
**Contribution authors:** Federica Di Biase (University of Cyprus)

In 2021, following the evaluation of the previous recommendation on the online accessibility of cultural material and digital preservation (EU 2011), the European Commission emphasized the urgent need to accelerate the digitization of cultural heritage. This initiative aims to ensure that Member States actively contribute to the objectives of the Digital Decade. While many cultural heritage institutions have embraced various digital technologies to expand their offerings, enhance collection promotion, and enrich visitor experiences, others continue to struggle with formulating a coherent digital strategy. For these institutions, digitization remains more of an abstract concept than a concrete reality. Giving insights from the MEDISHARE project, this presentation examines the current state of digitization in cultural heritage institutions on small Mediterranean islands, with a particular focus on Cyprus, as well as islands in Italy, Croatia, and Greece. Assessing the level of digitization serves as a foundation for establishing a dialogue with institutions to identify their needs and those of cultural heritage professionals, ultimately supporting them in advancing the digitization process. Addressing digital disparities among institutions and professionals is crucial to enabling small and remote museums to keep fulfilling their role as agents of social change and education. Employing a mixed-methods approach that combines traditional research—such as a literature review—with social science methodologies, including questionnaires and interviews, this study highlights the need for tailored open educational resources and targeted training workshops. By fostering digital inclusion, the project seeks to empower cultural heritage institutions to navigate the digital transformation more effectively.

1390. LEARNING BY DOING: GIS AND DIGITAL ARCHAEOLOGY IN HIGHER EDUCATION

**Contribution format:** Oral  
**Contribution authors:** Margherita Bottoni (Roma Tre University) – Federico Fasson – Elisa Giunta (Roma Tre University) – Angela Paolini (Ministero della Cultura - Soprintendenza Speciale per il PNRR) – Matteo Rossi – Emeri Farinetti (Roma Tre University)

Within the framework of GIS and digital archaeology education, which has significantly reshaped both research methodologies and teaching practices, this paper explores the Landscape and Digital Archaeology Laboratory at Roma Tre University as a case study of an innovative learning environment. The course combines archaeological methodologies with digital tools, providing students with hands-on experience to explore the complex relationship between humans and their environment while developing transferable skills. The course structure includes a theoretical section, hands-on exercises, field activities, and topic-based sessions, with a strong emphasis on GIS and digital technologies applied to archaeology. A key feature of the laboratory is the customization of learning paths, designed to accommodate the interests and academic backgrounds of students from various fields, including archaeology, history, and geography, at both undergraduate and graduate levels. This diversity is also reflected in the teaching staff, which includes archaeologists, architects, geologists, and geophysicists at various career stages, fostering dynamic student-tutor interactions that bridge generational gaps and enhance experiential learning. Interdisciplinarity is central to the program, with collaborations involving institutions

dedicated to environmental protection, research, and preservation of cultural heritage. This wide network enables students to engage in diverse perspectives on landscape analysis and heritage management. Students also have the opportunity to work with real research data, making them active participants in the research process and providing strong motivation for their learning. Collaborative platforms for sharing archaeological landscape data encourage discussions on open science, data sharing, and reuse, fostering a participatory approach to archaeological research. Structured evaluation and assessment tools are used to analyse student perceptions of key topics and implement effective engagement strategies, promoting active student participation throughout the learning process. Reflexive practices ensure the continuous improvement of educational experience, enabling iterative adjustments and the ongoing refinement of teaching methodologies and content.

132. FROM CLASSROOM TO HERITAGE: BRIDGING PEDAGOGY AND CULTURAL HERITAGE PRESERVATION

**Contribution format:** Oral  
**Contribution authors:** Nikola Babucic – Martina Seifert (University of Hamburg)

This paper discusses a mentoring approach developed through interdisciplinary training programs at the Archaeological Park of Xanten (Colonia Ulpia Traiana). Since 2013, the Institute of Classical Archaeology at the University of Hamburg has been setting up annual field schools focused on non-destructive archaeological methods, which aim to integrate theory and practice to train future professionals in both archaeological and cultural heritage preservation disciplines. The program’s structure divides into two parts: a theoretical seminar introducing the archaeological site and its historical significance, followed by a practical field module where students apply geophysical methods, such as magnetic surveys, ground-penetrating radar (GPR), electrical resistivity tomography (ERT), and geodesy (Total Station/DGPS). Our goal is to equip students at an early stage of their studies with the technical skills required to generate and interpret subsurface data while fostering a deeper understanding of cultural heritage preservation in a sustainable manner. This paper explores the pedagogical strategies used in our training programs, emphasizing hands-on learning and the integration of digital tools for remote and in-field instruction. We aim to discuss how these methods not only prepare students for the future of archaeology but also enhance their ability to contribute to the sustainable management and preservation of cultural heritage. In line with the session’s theme, we will reflect on the challenges faced in cultural heritage education, such as limited resources, changing curricula, and the evolving demands of heritage professionals. We will also highlight the broader international and interdisciplinary context in which our field schools operate, fostering dialogue on best practices and strategies for enhancing student engagement and knowledge transfer. By sharing our experiences, we hope to inspire further discussion on the integration of pedagogy and cultural heritage in education, ensuring that education remains at the core of cultural heritage preservation efforts.

1280. MODELLING INTERDISCIPLINARY COOPERATION IN AN EDUCATIONAL ENVIRONMENT THROUGH THE CASE STUDY OF MATRICA

**Contribution format:** Oral  
**Contribution authors:** Katalin Wollak (Independent heritage expert) – Zoran Vukoszávlyev (Budapest University of Technology and Economics)

The preservation of cultural heritage keeps facing new challenges in the 21st century. While advances in scientific methods contribute to a deeper understanding of various subjects, putting the new findings to use is significantly hampered by a lack of interdisciplinary dialogue. In Hungary, separate university trainings are available for future professionals specialised in archaeological, architectural and cultural heritage. It is essential to bring these highly specific fields closer together, as the transmission of cultural values can only succeed through a cooperation of numerous actors. In addition to developing a holistic vision of different disciplines, work must be done to reinvigorate the links between the professions involved in cultural transmission. We conduct a methodological experiment to respond to this systemic challenge. Our post-graduate training is unique in the Hungarian education system, as it is open to architects, civil engineers, archaeologists, restorers, historians, art historians and heritage managers alike, and explicitly aims to co-train professionals from different fields jointly. In addition to facilitating knowledge transfer in heritage management, we are also modelling a project that aims to explore the mindsets typical of the various collaborating disciplines. With students from different backgrounds, we examine the possibilities of development at an archaeological heritage site through exploring the hidden values of the site with the help of experts, studying interests in consultation with local government and community stakeholders, and considering the social impact of the planned development. This joint endeavour helps students to learn about focus areas in the internal operational framework of other disciplines. Understanding and accepting priorities and working collaboratively promotes good practice across disciplines, preparing the students for real-world co-operations. In our presentation, we outline the stages of this interdisciplinary cooperative work through a case study on the heritage values of the Roman camp of Matrica in Pannonia.

2167. HERIT-AWARE: AN INTERDISCIPLINARY GAME ABOUT HERITAGE

**Contribution format:** Oral  
**Contribution authors:** Alexandra Anders (Institute of Archaeological Sciences, Eötvös Loránd University) – Marta Arzarello (Ferrara University) – Antony Borel (Muséum national d’histoire naturelle, France | Eötvös Loránd University) – Hugo Gomes (Instituto Politecnico Tomar) – Aldi Lasso (Satya Wacana Christian University, Indonesia) – Carlos Merino (Universitat Rovira i Virgili) – David Pleurdeau (Muséum national d’histoire naturelle, France) – Marco Beaumont (Holy Moka Games) – François Semah (Muséum national d’histoire naturelle, France | Satya Wacana Christian University, Indonesia)

Many students from various disciplines say they are attracted to heritage issues, without fully understanding all of its dimensions. To address this gap, we launched a project, called ‘HERIT-AWARE: AWAREness and management of natural and cultural HERITage challenges: a skill acquired during university studies’ funded by Erasmus+. The project’s main coordinator is the National Museum of Natural History of Paris (France), in partnership with universities from Hungary, Italy, Portugal, and Spain and the Holy Moka studio. The primary objective is to raise awareness among university students about the many facets of natural and cultural heritage issues, emphasizing their importance for the future of our societies and the diverse professional opportunities they offer. The tool we have chosen is a playful, scientifically validated open-access training platform. We are developing an online video game for international / multidisciplinary students teams whose studies include at least one course related to heritage, regardless of their country of origin. The game allows them to explore diverse contexts, tackle real-life challenges, and develop integrated management plans, while also building skills useful for both their academic and professional careers. During the game, the players create a management plan of a region facing two heritage issues: natural and cultural. The game relies on several key mechanics that guide players in exploration, information gathering, and solving heritage challenges. Players are tasked with discovering the vast Geographical Areas, which consist of Zones and Interzones. We are organize summer schools for test game phases. Since 2024, we have developed two Zones, ‘Indonesia’ and ‘Hortobágy’ (Hungary). In this presentation, we will introduce these two zones, the challenges we faced, and the results of the first half of the project. The project is funded by Erasmus+ (2023-1-FR01-KA220-HED-000153092 KA220-HED).

1425. LANDSCAPE EDUCATION AND CULTURAL HERITAGE: AN ACTIVE AND PARTICIPATORY APPROACH TO LEARNING ON THE ALMONE STREAM

**Contribution format:** Oral  
**Contribution authors:** Elisa Giunta (Roma Tre University)

Integrating cultural heritage into education fosters environmental awareness and responsible citizenship. Landscape, as both a cultural and natural asset, offers a lens through which students explore territorial transformations and human impact over time. This project, developed in a public primary school near the Caffarella Valley in Rome, Italy, adopts an active and participatory approach to landscape education, aligning with the European Landscape Convention and sustainability policies. As part of the Cultural Heritage Active Innovation for Sustainable Society (CHANGES) Partnership, fostered by the Italian Ministry of Education and Research, this research contributes to protecting cultural heritage against climate change and environmental risks. The Almone stream, which flows through the Caffarella Valley, was revered as sacred by the Romans and serves as a case study of historical landscape transformations. Over the centuries, it played a crucial economic role, serving both agricultural purposes and as a source of hydraulic energy for mills, fulling vats, and paper factories. Its diachronic value as a natural and cultural landmark highlights the intertwined relationship between water, heritage, and human activity. Students engaged in soil permeability experiments, historical map tracing, and site explorations to examine hydrological changes and former water infrastructures. Their work culminated in a community map and a picture book, capturing their reflections on the evolving human-river relationship. By combining heritage studies with experiential learning, this initiative demonstrates how landscape education engages younger generations in cultural heritage preservation and sustainable management. At a time when heritage education faces funding cuts and school reforms, fostering active engagement with the landscape helps develop awareness, critical thinking, and a deeper connection to local history. This presentation will explore the methodologies employed, their impact on students’ perception of cultural heritage, and broader implications for integrating landscape education into school curricula.

1699. JOURNEY THROUGH THE WAYSTATION: A STUDENT’S EXPERIENCE IN CULTURAL HERITAGE EDUCATION

**Contribution format:** Oral  
**Contribution authors:** Katrina Kuxhausen-Derose (University of California Los Angeles)

In 2023, the University of California Los Angeles (UCLA) launched the Waystation Initiative in order to meet the

needs of community stakeholders and students seeking specialized training in provenance research, restitution, and other cultural heritage career skills. Unlike traditional museums, the Waystation is designed to temporarily steward archaeological and ethnological objects, focusing on their ethical return to the nation or community of origin. The Waystation’s certificate program addresses key challenges in cultural heritage education by blending community-focused learning with object-oriented research. Students are assigned 3-4 objects to investigate throughout the program. Coursework includes a seminar on the history of collecting, ethics, community engagement, and cultural heritage law. This course tasks them to perform provenance research and work with foreign consulates, ministries of culture, and descendant communities. The second course includes laboratory training, materials analysis, sampling, and testing. This makes students conversant on what methodologies can answer questions about dating, authenticity, origin, use, and treatment history. The final course requires students to complete capstone projects that convey their results through the creation of digital story maps (object biographies), database records, and profiles of art dealers and other stakeholders involved in an object’s provenance. As a student of this educational model, my perspective as a learner can highlight the challenges and opportunities in cultural heritage training. Through illustrative examples from my own object research, my presentation will critically reflect on my practical experiences with navigating the complexities of cultural heritage management and learner engagement. Challenges concerning intake protocols, determinations regarding the nation or community of origin, invasive testing and sampling, and the ethics of publication foster productive dialogues and collective solutions regarding best practices. As a trailblazer in cultural heritage education, the Waystation Initiative offers a fresh approach to reskilling and upskilling future professionals while promoting greater awareness of cultural heritage issues.

747. FROM RUINS TO PANELS: COMICS AS A TOOL FOR ARCHAEOLOGICAL STORYTELLING

**Contribution format:** Oral  
**Contribution authors:** Francesca Porta (University of Bologna) – Agostino Sotgia (University of Groningen)

In an era where storytelling shapes our understanding of both past and present, “narrating” has paradoxically become more complex. For archaeology, this challenge is even more pressing: how can we effectively communicate the discipline while remaining engaging, especially in a digital landscape where only viral content seems to capture attention? Among the many tools available, this paper explores an unconventional yet powerful medium: comics. Traditionally perceived as entertainment for younger audiences, comics possess a unique visual and narrative language that makes them a compelling tool, not only for education but also for cultural heritage dissemination and public archaeology. Their combination of imagery and text enhances accessibility, allowing for nuanced storytelling that can bridge the gap between experts and the broader public. Moreover, embracing a multilingual and multimodal approach can further amplify the reach and impact of archaeological narratives. By integrating comics into archaeological communication, we can foster a more inclusive and engaging way to share knowledge, ensuring that diverse audiences –regardless of age, language, or background – can connect with the past in meaningful ways.

1284. LEARNING TO COMMUNICATE HERITAGE THROUGH SOCIAL MEDIA: REFLECTIONS ON INFORMAL UPSKILLING

**Contribution format:** Oral  
**Contribution authors:** Giulia Albertazzi – Francesca Meneghetti (University of Cyprus) – Andrea Villani (University of the Balearic Islands)

Outreach is an often-overlooked yet essential aspect of Archaeology. Engaging non-specialists is key to preserving cultural heritage. However, archaeologists and cultural heritage professionals frequently struggle to communicate their work and its significance beyond academic environments. Our project, Once Upon a Time Lefkosia, funded by a Culture Moves Europe mobility grant, aims to move beyond traditional research practices and enhance our ability to convey archaeological insights to a broader audience, thereby fostering public interest in cultural heritage. Beginning with a 21-day field and archival research period in Nicosia (Cyprus), we adopted a learning-by-doing approach to explore the city’s evolving urban landscape and collective memory. Our methodology combined archival research with direct engagement in contemporary spaces, using photography and sketches to document historical and modern transformations of Nicosia’s cultural landscape. The Centre for Visual Art and Research (CVAR) provided access to historical photographs and documentary resources, offering a comparative lens through which to examine these changes. Over nine months, we developed a public outreach social media page, releasing weekly content collected during our three-week fieldwork period. Rather than positioning ourselves as experts, we sought to understand the challenges of effective communication with non-specialist audiences and to recognise our own limitations. Through social media and informal storytelling, we experimented with narratives that resonated beyond the academic realm. Funding limitations, time constraints, and the need for specific outreach skills further underscored areas where our formal archaeological training required upskilling. This paper reflects on the project’s ambitions, the learning process, and the gaps we identified in our

communicative abilities. By analysing our experience, we aim to contribute to a broader conversation on how archaeologists and cultural heritage professionals can improve engagement strategies and foster a more inclusive and direct dialogue around cultural heritage.

2451. KARLŮV HRÁDEK: EDUCATIONAL CENTRE IN SOUTH BOHEMIA

**Contribution format:** Poster  
**Contribution authors:** Martin Pták (Univerzity of South Bohemia)

Charles’s Castle at Purkarec is a castle ruin in southern Bohemia, which was formerly considered to be a building of Charles IV from the middle of the 14th century. In 2018, the management of the University of South Bohemia signed an agreement with the town of Hluboká nad Vltavou on cooperation in scientific research, conservation, restoration and presentation of this important cultural monument. AU FF JU is currently preparing a broad research and presentation project called “Karlův hrádek - Research and Educational Centre of Archaeology of the University of South Bohemia in České Budějovice”. In addition to other university activities (field teaching, research methodology of prospecting and documentation, application of specialized material and spatial analyses), archaeological research in the form of student internships takes place at the site. The material obtained is then processed in the Institute’s laboratories as part of the teaching process and students are assigned graduate thesis topics related to the site. In the 2019 season, a testing excavation was carried out on the site to determine the strength and quality of the medieval stratigraphy and to identify extinct structures. A major finding was that the area was intensively used as early as the 13th century. It therefore appears that the site had been built at least half a century earlier as the centre of the royal states in the area. In 2021, a survey was carried out in the palace, which confirmed that it had been heavily damaged by fire and had probably not been restored. In the 2024 season, a survey of the castle chapel was carried out, during which it was shown that the chapel had also been lost in the 13th century and the question remains as to whether it has been fully completed.

69 WAYFARING AND PLACE-MAKING IN THE MEDITERRANEAN SEA

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Round table  
**Session keywords:** Way-faring, Place-making, Seasonality, Climate change, Resilience, Mediterranean  
**Session organisers:** Linda Hulin (University of Oxford) – Helen Dawson (University of Tübingen)  
**Session speakers:** Linda Hulin – Max MacDonald – Karl Smith (University of Oxford) – Assaf Yasur-Landau – David Gal (University of Haifa) – Helen Dawson (University of Tübingen) – Angela Falezza (University of Oxford) – Athena Trakadas (University of Copenhagen) – Manuel Calvo Trias (University of Balearic Islands)

SESSION ABSTRACT

The shores of the Mediterranean witnessed repeated phases of exploration, settlement and abandonment from the Neolithic to the Classical period. While much of the discourse is focussed on the technology of maritime travel and the search for resources, this roundtable will explore the questions of how new routes were discovered, how they came to be established, and why they were abandoned. Points to consider are. (i) Are some shores and some islands so placed that they will inevitably be encountered. (ii) Do similar current regimes, wind patterns and resource availability lead to similar decision-making. (iii) What is the impact of seasonality and climate change on sea-faring and settlement resilience, particularly on small islands. (iv) Do technical advances in maritime technology encourage new route-making or impact upon older routes. (v) How are resources discovered and how is information about them transmitted to other populations. (vi) What other environmental and cultural factors contributed to the establishment of persistent routes and places in and around the Mediterranean?

70 PREHISTORIC OBJECTS IN TRANSITION: CULTURAL TRANSFORMATION IN MATERIAL RECORD

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** cultural transformation, prehistory, artifacts, cultural transmission, technology  
**Session organisers:** Jasna Vukovic (Faculty of Philosophy, Department of Archaeology, University of Belgrade) – Ina Miloglav (Faculty of Humanities and Social Sciences, Department of Archaeology, University of Zagreb)

SESSION ABSTRACT

Transitional periods usually are very intriguing issues in archaeology. In traditional research, archaeological “cultures” are seen as distinct entities, manifested primarily by differences in material culture, and are distinguished mainly by using various typologies. However, this approach blurs the transitional and contact periods, which are still poorly understood. This session aims at exploring how transitional periods in prehistory can be detected and explained in material record, i.e. among artifacts made of various materials (ceramics, bone and antler, metal, stone). Some of the topics this session is addressing at are:

- Technological changes and innovation, and their relations to social organization
- Methods of assessing variability in archaeological material in contrast to reduced variability generated by traditional approaches based on typology
- Hybridization of technological and stylistic traits
- Cultural transmission mechanisms and the processes of knowledge transfer
- “Mixed” assemblages – assemblages containing features that can be related to different cultures or traditions
- Changes in lifestyle reflected by different artifact types
- Coexistence of two or more cultures/traditions.

Speakers are invited to present some of the following issues:

- Case studies with a wide range of materials belonging to transitional prehistoric periods
- Archaeometric analyses aimed at revealing technological change.
- Theoretical considerations about transition and cultural transformation periods
- Methodology procedures and techniques for detecting cultural transition.

CONTRIBUTION ABSTRACTS

1220. VARIOUS ASPECTS OF TRANSITION, ASSESSED ON THE BASIS OF EXAMPLES OF CHANGING MEANINGS AND USE OF OCHRE

**Contribution format:** Oral

**Contribution authors:** Julia Kosciuk-Zalupka (Jagiellonian University)

Ochre has been identified in a variety of archaeological contexts worldwide, suggesting its utilisation across diverse cultural and temporal contexts. Its application encompasses a range of purposes, including its use in burial contexts as grave goods, in the decoration of artefacts (such as e.g. pottery) and in the processing of hides. Therefore, it could be argued that it is a significant cultural factor. It is noteworthy that the patterns of ochre use and its application are subject to change over time, thus facilitating the analysis of cultural behaviours. For the purposes of this presentation, the terrains of the Central and Eastern Balkans and part of the Carpathian Basin during the Mesolithic and Early Neolithic have been selected to illustrate these transitions. Under juxtaposition would be patterns observed at: nine Mesolithic sites, five sites presenting both Mesolithic and Neolithic layers, and 17 of the Starčevo-Körös-Criş cultural horizon. It is interesting to note that during the SCK horizon, the artifact form of the painted pebble with a hollow, which was previously observed to be quite popular at earlier sites, disappears. Furthermore, it appears that the significance of ochre as a grave good increases over time. Furthermore, it is possible to deliberate on the issues of general perception of ochre, its cultural enhanced value and attached meanings based on the observed changes.

2033. FROM SOCIETY TO ROCKS: CHANGES IN THE LITHIC TRADITIONS OF THE LATE NEOLITHIC TO CHALCOLITHIC IN NORTHEAST IBERIA

**Contribution format:** Oral

**Contribution authors:** Cynthia González-Olivares (SERP - Universitat de Barcelona | Institut of Archaeology - Universitat de Barcelona | Palarq Foundation)

The Middle Neolithic tradition in the northeast of the Iberian Peninsula has been the subject of numerous studies due to its key role in the network of trade routes for prestigious materials in Western Europe. During the 4th millennium BC, this territory was a center of intense interaction, where objects of high symbolic value were exchanged on a large scale. These exchanges connected the northeast of Iberia with regions such as the south of France, the northwestern Mediterranean, and the Italian peninsula (e.g. Chassey-Lagozza-Cortailod traditions), promoting fluid communication and a constant flow of goods and knowledge. However, with the arrival of the third millennium BC, this classical tradition underwent some significant changes. In this period, we observe a series of changes in the socio-economic and cultural structures of Neolithic communities. The economy, based on the exchange of prestige materials, facilitated the implementation of new ideologies of power, forms of social organization, and new objects of prestige. Likewise, funeral practices began to reflect external influences, incorporating new foreign elements into their rituals and grave goods. These changes not only affected the symbolic

and funerary sphere but also the organization of daily life and the configuration of domestic space. The present study focuses on the detailed analysis of lithic materials from some sixty sites located in the northeast of the Iberian Peninsula. Using a techno-typological approach, the main characteristics of these industries in transition will be examined, identifying the raw materials used and their distribution in both domestic and funerary contexts. This analysis will shed light on the processes of change that marked the transition from the Neolithic to the Chalcolithic, providing a comprehensive view of the transformations that defined the end of an era and the beginning of new social and economic dynamics.

589. MARKING LANDSCAPES, SHAPING IDENTITY: SHELL BEADS PRODUCTION AND SYMBOLISM ADAPTATION AT ARANGAS CAVE, NORTHERN SPAIN

**Contribution format:** Oral

**Contribution authors:** Claudia Finocchiaro (University of Cantabria | IIIPC)

The climatic changes marking the transition from the Pleistocene to the Holocene forced late hunter-fisher-gatherers to modify their dwelling patterns and subsistence strategies. Within these dynamics, marine resources, which had already been occasionally exploited during the Upper Palaeolithic, gained increasing importance, becoming a crucial source of sustenance for groups inhabiting the Atlantic coasts. The diversification of food resources was a response to environmental shifts that inevitably influenced other aspects of daily life, including mobility, the perception of the surrounding world, and self-identity—elements expressed by these communities through symbolism and rituals. The sea became a recurrent theme, reflected in artistic expression and funerary practices across the Atlantic coasts of Iberia and France. From this perspective, the study of shells through malacological analyses is fundamental. It not only provides insights into the climatic and environmental conditions in which they developed and their exploitation by these communities, but it may also suggest a symbolic dimension related to mobility and landscape marking. The transport of shells collected in marine environments to different sites, including inland locations, indicates the construction of networks connecting various places, contributing to the definition of spaces with ritual significance. The selection of specific species reflects aesthetic criteria—such as color, size, and workability—guiding their choice. Shell beads symbolized a connection to the sea, which, as a primary source of sustenance, was further celebrated in funerary contexts, where marine resources adorned the deceased. The site of Arangas, located in the Cantabrian region, with its multi-layered stratigraphy, has allowed for the examination of the evolution of shell beads use and production from the Late Upper Palaeolithic to the Bronze Age. This study provides valuable insights into how these communities responded to climatic and environmental changes by adapting their aesthetic preferences and ritual practices to the use of marine resources.

1397. CULTURAL TRANSFORMATION AND ADAPTATION IN WESTERN SERBIA DURING 5TH MILLENIUM

**Contribution format:** Oral

**Contribution authors:** Boban Tripkovic (Faculty of Philosophy, Department of Archaeology, University of Belgrade)

This paper examines the processes of cultural change, social transformation, and environmental adaptation during the 5th millennium in the central Balkans. That is the time of the disappearance of the Vinča cultural style and the emergence of the cultural traditions of Bubanj-Sălcuța, Tiszapolgár, Bodrogkeresztúr, Lengyel, and Lasinja cultures. Cultural changes have most often been explained by migration processes, the collapse of large settlements at the end of the Neolithic, the development of metallurgy, and changing economic practices. Other critical considerations point to internal cultural and technological development, the coexistence of Late Neolithic and Early Eneolithic cultures, the hybridization of cultural traits, and lifestyles that cannot be strictly labeled as Late Neolithic or Early Eneolithic. However, the central Balkans region has a diverse geography that requires contextualizing cultural tradition and transformation into different ecological niches. To what extent did the environment stimulate or constrain the process of cultural transformation and interaction? Based on the selected sites of western Serbia, the context of cultural change will be examined, with a special focus on the role of the wet environment in regional settlement dynamics and material culture development.

865. TRANSITION FROM THE LATE NEOLITHIC TO EARLY CHALCOLITHIC IN SOUTHEASTERN BULGARIA: THE CASE HADZHIDIMITROVO, YAMBOL REGION

**Contribution format:** Oral

**Contribution authors:** Viktoria Petrova (National Archaeological Institute and Museum, Bulgarian Academy of Science)

The studies of the transition from the Late Neolithic to the Early Chalcolithic in Southeastern Bulgaria are few. They are related to the study of pottery from an archaeological site or summarizing data for a specific region or microregion. A new contribution to these studies is the results of the study of the pit site Hadzhidimitrovo, located 13 km northwest of Yambol (Bulgaria). The characteristics of its material culture illustrate a gradual

development over at least 500–600 years (5350/5300–4750/4730 cal. BC), which covers the entire Late Neolithic period Karanovo IV, and the transition to the Early Chalcolithic. Along with the smooth development, the transition from the Late Neolithic to the Early Chalcolithic in Hadzhdimitrovo also presents some changes related to the location and shaping of the pits. The characteristics of the pottery outline three main accents, which determine its transitional character: simultaneous coexistence of Late Neolithic and Early Chalcolithic traits in the pottery assemblage; combination of Late Neolithic and Early Chalcolithic traits on one pottery vessel, as well as technological and stylistic changes in the ornamentation. The results of the study of the transitional stage to the Early Chalcolithic in Hadzhdimitrovo are also supported by a series of radiocarbon dates. They outline the time interval 4850/4800 – 4750/4730 cal BC, which refines the chronological position of this still poorly known period in the context of prehistoric phenomena in Southeastern Bulgaria and neighboring regions.

**820. INSIDE OUT: MONTE DA PONTE AND THE LARGER CENTRAL ALENTEJO REGION (SOUTHERN PORTUGAL) DURING THE 3RD MILLENNIUM BCE**

**Contribution format:** Oral  
**Contribution authors:** Inês Ribeiro (Universidade de Évora, CHAIA, IN2PAST) – António Diniz (Universidade de Évora, CHAIA, IN2PAST | Universidade de Évora, CIDHEUS) – Fábio Jaulino – Catarina Guinot (Universidade de Évora) – João Rocha (TerraWave Innovations, Lda) – Nuno Pereira (TerraWave Innovations, Lda | Instituto Politécnico de Beja) – Leonor Rocha (Universidade de Évora, CHAIA, IN2PAST) – Nelson Almeida (Universidade de Évora, CHAIA, IN2PAST | Universidade de Lisboa, UNIARQ)

The 3rd millennium BCE socio-cultural, ideological and environmental dynamics in Southwestern Iberian Peninsula have been a research hot topic for several decades. During the last years, with the identification of many new ditched enclosures, the debate as resurfaced by looking comparatively at ditched and walled enclosures. Different questions regarding chronology and associated material records and other dynamics of these societies have regained impetus with the analysis of the material record still remaining among the best ways of cross-referencing information between these different types of architectures. Monte da Ponte is one of the few known enclosures for this large area that combines positive and negative features. Hence, it has been considered paradigmatic to the analysis of SW Iberia Chalcolithic. The site is located in the Évora district, in the inland Alentejo region (Southern Portugal), and while it has been subjected to archaeological research during the 90's it had a large interregnum period with a new research program only starting recently. Some information from these studies, including geophysics and archaeological excavations has been obtained. In this paper, we present the current data of the site focusing on the material record recovered. We aim to discuss how this enclosure contributes to ongoing questions on changes and transitions during the 3rd millennium BCE in SW Iberia, especially considering the strong socio-cultural, economic and social transformations that these communities faced. Our objective is to reflect upon the reality that we have on the site of Monte da Ponte by comparing it with other assemblages that compose the broader picture of the Chalcolithic on the surrounding Central Alentejo territory.

**1039. CULTURAL TRANSFORMATION IN SOUTH AND WEST BOHEMIA DURING THE BRONZE AGE**

**Contribution format:** Oral  
**Contribution authors:** Ondrej Chvojka (University of South Bohemia, Faculty of Arts) – Markéta Augustýnová (University of West Bohemia, Faculty of Arts) – Daniel Hlášek (Institute of Archaeology of CAS Prague)

South and West Bohemia are the regions with a specific position in prehistoric times, given by their geographical location between the Danube regions in the south and central Bohemia in the north. The material culture and character of settlement in both these regions changed according to the nature and intensity of external influences from both directions, which is clearly evident in the Bronze Age. How are these cultural influences reflected in the archaeological record? How did the system of the cultural transmission and social organisation work and how it changed? Are we able to see cultural changes in the typology and also in the technological properties of the preserved artefacts? In our presentation, we will focus on selected artefacts from the periods of cultural transformations, specifically on different types of copper ingots from the transition of the Early and Middle Bronze Age, when the Early Bronze cultural groups gradually transformed into Tumuli cultures, or on casting cakes and ceramic vessels decorated with incised carving from the end of the Middle and beginning of the Late Bronze Age, when the Tumuli cultures changed to Urnfields. The orientation of both Czech regions towards the Danube area continues throughout the Late Bronze Age, but at the beginning of the Final Bronze Age there is a change: while Western Bohemia remains culturally strongly linked to today's South German area, the inhabitants of South Bohemia bring their material culture closer to the Central Bohemian Štítary culture. However, some manifestations in the material record continue to be preserved, such as specific trench-like features, which are known from flat settlements only in southern Germany, western and southern Bohemia.

**507. A NEW PIECE OF THE PUZZLE: TECHNOLOGICAL INNOVATION IN METALMAKING AT FINAL BRONZE AGE BOZSHAKOL, C. 1200-1100 BC (NORTH KAZAKHSTAN)**

**Contribution format:** Oral  
**Contribution authors:** Ilaria Calgaro – Miljana Radivojević (UCL Institute of Archaeology) – Yekaterina Dubyagina – Antonina Yermolayeva (A.Kh. Margulan Institute of Archaeology)

The Final Bronze Age of the Eurasian Steppe, corresponding to the end of the 2nd millennium BC, was marked by significant economic, social, and cultural transformations, including the intensification of husbandry, the expansion of settlements, and increasing craft specialisation. This period witnessed the emergence of the first proto-centres of the steppes and a surge in long-distance exchange networks of finished metal artefacts. While the movement of copper alloys across the Eurasian Steppe is well documented, the evolution of primary metal production at specific workshops, as well as their role in broader metal production and consumption networks, remain less explored. This study investigates metallurgical production at Bozshakol, a settlement and workshop site located in the Pavlodar Irtysh region (North Kazakhstan), directly associated with a major copper mining field. Bozshakol experienced long-term occupation primarily focused on exploiting the nearby ore deposit and functioned as a zone of transit and cultural contact of people, technologies, and raw materials. This is evidenced by the numerous ceramic materials unearthed, spanning the Final Bronze Age (c. 1200-1100 BC) and transitioning into the Early Iron Age. Ceramics appears linked to multiple cultural groups, including Sargary-Alekseevka, Begazy-Dandybai, Fedorovo, as well as imitations of Central Asian types from the Bactria-Margiana Archaeological Complex. In this context, questions arise regarding the transmission of metallurgical knowledge and the extent of shared technological traditions among the communities of the steppes, and beyond. We present new data on archaeometallurgical remains related to primary metal production from the workshops of Bozshakol, including ores, slags, and technical ceramics, to investigate innovation in metalmaking technology, its adaptation, and its transmission at this site. Our results contribute to a deeper understanding of the evolution of metal production and of the the interconnectedness between metal producers and consumer communities within the broader framework of the Bronze Age Eurasian Steppe.

**1428. EXPLORING DIVERSITY WITHIN TRADITION: INDIVIDUAL EXPRESSION AND INNOVATION IN NEOLITHIC GREECE**

**Contribution format:** Oral  
**Contribution authors:** Lily Bonga (Institute for Aegean Prehistory, Study Center for East Crete)

One of the striking aspects of the Greek Neolithic is the highly identifiable ceramic assemblage, both decorated and undecorated pottery. Ceramic change, the traditional pillar of relative chronologies in prehistory, is based on the premise of stylistic and technological change, which have traditionally been assumed to define cultural periods. This viewpoint does not, however, consider the role of individuals within their community and their choice to reinforce, experiment, or break with the orthodox cannon. Furthermore, Greek Neolithic pottery technology did not follow a linear path from simple to complex, as shown by the abandonment of a more technologically demanding painted pottery to that of simpler undecorated wares over time. Such a trajectory suggests that cultural and social pressures affected the choices potters employed in selecting materials and firing methods, rather than technological ignorance. Experimentation, innovation, and change are attested in the diversity of within ceramic assemblages, even within an identifiable tradition. The Early Neolithic site of Mavropigi-Fillotsairi in Western Macedonia, Greece provides a case study for assessing ceramic variability in relation to cultural transmission mechanisms and the processes of the transfer of knowledge at a generational level. The co-existence of several traditions and a hybridization of technological and stylistic traits is documented. This “mixed” assemblage is a good starting place for a discussion on how to approach cultural material from at site geographic crossroads during a pivotal transitional period.

**1263. THE NETWORK OF TECHNOLOGICAL KNOWLEDGE TRANSMISSION IN THE EARLY AND MIDDLE COPPER AGE CARPATHIAN BASIN**

**Contribution format:** Oral  
**Contribution authors:** Eszter Solnay (MTA-ELTE Lendület “Momentum” Innovation Research Group, Eötvös Loránd University | Doctoral School of Archaeology, Paris 1 Panthéon-Sorbonne University | UMR 8215 Trajectoires) – Zoltán Kovács (MTA-ELTE Lendület “Momentum” Innovation Research Group, Eötvös Loránd University | Department of Biological Physics, Eötvös Loránd University) – Péter Hornok (Vas County Government Office Department of Construction and Heritage Protection) – Péter Kiss (Savaria Museum) – Nikolett Kovács (Herman Ottó Museum) – Dávid Kraus – Zsuzsanna M. Virág (Budapest History Museum) – Attila Németh (Herman Ottó Museum) – Gábor Szilas (Budapest

The traditional cultural-historical approach outlines archaeological cultures and regional units based on the typological classification of the material culture. However, this methodology has always faced the difficulty of classifying certain, especially pottery assemblages within a particular archaeological culture. This was also the case for the Early and Middle Copper Age in the Carpathian Basin (4500–3650 cal BC), where several cultures were defined based on pottery typology, although many assemblages could not be unequivocally assigned to one culture or another. This approach focused on the cultural differences and diverse supraregional connections between the eastern and western parts of the Carpathian Basin (i.e. Great Hungarian Plain and Transdanubia) and highlighted the cultural difference between the Early and Middle Copper Age without the explicit consideration of the social relations and personal interactions beyond these differences and changes. Our analysis focuses on the technology of pottery making that explores the strong relationship between several vessel fabrication steps and the social link(s) of the potters. Pottery forming, and to some extent, the surface treatment reflects the continuous transmission of technical traditions between individuals in strong social relations. These steps of the pottery making were analysed with a macroscopic approach on seventee. Early and Middle Copper Age sites in three adjacent regions of the Carpathian Basin: the Great Hungarian Plain, the Transdanubia, and the Budapest region. The identified techniques are then studied using social network analysis, which enables us to reconstruct the spatial and temporal distribution and change of technological knowledge. Therefore, the spread of pottery technical traditions over space and time reveals a previously fully unknown network of social relations based on close personal contact of potters from different communities in the Carpathian Basin.

1266. THE TRANSITION BETWEEN THE 3RD AND THE 2ND MILLENNIUM BC: CASE STUDY OF GALABOVO POTTERY

**Contribution format:** Oral  
**Contribution authors:** Denitsa Ilieva (Sofia University “St. Kliment Ohridski”)

Several issues engage the minds of scholars studying the transition between the end of the 3rd and the beginning of the 2nd millennium B.C. They include chronological questions, such as where to place the boundary between the end of the EBA and the beginning of the MBA; shifts in settlement patterns; the origin of wheel-thrown vessels from this period – whether they were imported or locally produced; and the trade routes between Anatolia and the Balkans used for economic and cultural interactions. Tell Galabovo is central to these issues in Eastern Upper Thrace. So far, it is the only tell in Bulgaria that provides evidence highlighting the transition between both prehistoric periods. During the transition between the EBA and MBA, continuity in pottery production is observed, reflected in the gradual development of both vessel shapes and decoration, but there are also some specific changes within the ceramic repertoire. This study examines both the general relationships between decoration such as techniques, motifs, and vessel composition during the two reviewed periods and the specific characteristics distinctive to each, including techniques, modified elements, and changes in shape, method, and location of certain motifs. Tracking distinct vessel types and their decorations in relation to the stratigraphic layers of the sites where they were found provides grounds for distinguishing several stages of ceramic production in Southeastern Bulgaria during the second half of the 3rd and the beginning of the 2nd millennium B.C. The presence of ornamental compositions with modified elements, along with innovations in shaping certain vessel parts could be considered reliable and recognizable chronological indicators characteristic of the transition between EBA III and MBA.

99. CHANGES IN POTTERY PRODUCTION AS INDICATORS OF SOCIOECONOMIC DEVELOPMENT: A CASE STUDY FROM EASTERN BOHEMIA

**Contribution format:** Oral  
**Contribution authors:** Jan Volf (Department of Archaeology, Faculty of Arts, Charles University | Institute of Archaeology of the Czech Academy of Sciences, Prague) – Karel Slavíček – Kristýna Trnová (Department of Geological Sciences, Faculty of Science, Masaryk University)

During the first century BC, settlement in Central Europe underwent a significant transformation. This change is attributed to a crisis and the collapse of the society of the late La Tène period (LT D1) and the arrival of a new population at the onset of the Roman period (LT D2). In Bohemia, the settlement development of the La Tène period peaked in the phase LT D1a (130/100–80/70 BC). However, during the phase LT D1b (80/70–50/40 BC), a decline began, culminating in the phase LT D2 (50/40–10/5 BC) with the dissolution of the La Tène settlement network, the disruption of craft production, and substantial changes in material culture, including pottery. Nonetheless, research on the discontinuity of pottery production has predominantly focused on stylistic analysis of shapes and decorations, and the disappearance of specific ceramic types. To obtain additional insights into the transitional period, this case study examines pottery from the late La Tène and early Roman periods

from Slepotice in Eastern Bohemia through macroscopic observation, X-ray fluorescence analysis, and thin-section analysis to explore materials used and manufacturing processes. The results indicate significant changes in sources of materials used at the beginning of the Roman period, accompanied by a reduction in their diversity. Simultaneously, certain pottery-making techniques were abandoned, but the overall manufacturing process persisted. The transformation of pottery production and distribution could have been driven by various factors, including the disintegration of the La Tène socioeconomic network and the loss of specialised potters. However, it likely did not involve a complete end of settlement and total population replacement. This suggests that changes observed during the first century BC were primarily caused by internal factors rather than external influences.

1958. DISSECTING CENTRAL AMERICA’S LATE FORMATIVE CERAMIC SPHERE. NORTHEASTERN HONDURAS’ CONNECTIONS TO SOUTHERN MESOAMERICA AND THE ISTHMO-COLOMBIAN AREA

**Contribution format:** Oral  
**Contribution authors:** Adrien Martinet (German Archaeological Institute, KAAK | University of Leiden) – Jeannine Langmann (German Archaeological Institute, KAAK)

Central America has long been considered as the borderland between Mesoamerica and the Isthmo-Colombian Area: a patchwork of loosely connected communities with isolated centers displaying fledgling markers of social complexity. However, recent investigation results from Late Formative sites (400 BCE to 300 CE) challenge this view: the distribution of Usulután-style ceramics – characterized by hard-fired, fine-pasted, service-oriented vessels with linear negative-painted decorations – shows that the Central American communities of the Late Formative period were well connected. Communities far away from larger settlements had access to these elite-associated types of ceramics. Compositional analyses revealed that these prestige goods – previously thought to be imports – were produced locally in multiple regions of Central America, implying strong interregional ties for the transmission of specialized technological knowledge. Honduras’ northeastern coast sits at a nexus where Mesoamerica, the Isthmo-Colombian Area, and the Caribbean converge. This coalescence of influences created a distinct material record for the Late Formative period, which significantly differs from later assemblages of the Classic period (300 CE to 1000 CE). Despite recent advances in Central American archaeology, the internal organization of this supra-regional interaction network remains unclear. This paper aims to present the preliminary results of our research at the site of Betulia, in northeastern Honduras, where the region’s first stratified Late Formative context is currently being excavated. Through an analysis of the site’s ceramic assemblage, we highlight socio-cultural ties to both nearby and distant settlements. Rather than merely serving as a corridor for people and goods to move between the larger neighboring cultural areas, northern Honduras actively engaged with them and shaped these interactions.

2069. CULTURAL HYBRIDIZATION IN THE LATE BRONZE AGE: THE EVOLUTION OF THE HAJDÚBAGOS–CEHĂLUȚ POTTERY STYLE

**Contribution format:** Oral  
**Contribution authors:** Orsolya Gyurka (Móra Ferenc Museum, Szeged | Babeş-Bolyai University, Cluj-Napoca)

This presentation explores a crucial phase of cultural transformation in the Late Bronze Age Carpathian Basin, focusing on the hybridization of pottery traditions. The Hajdúbagosa–Cehăluț pottery style stands at the center of this transition, blending elements of the Otomani–Fűzesabony Cultural Complex with influences from the Tumulus culture. This stylistic fusion is evident in north-eastern Hungarian regions, as well as north-western Romania, marking a key period from approximately 1600 to 1200/1150 BC. Rather than a simple technological transfer, the adoption of Tumulus elements by the Otomani–Fűzesabony communities during the Koszider period reflects a complex cultural process. These communities reinterpreted and integrated new features, leading to a hybridized pottery tradition that retained Middle Bronze Age forms while incorporating new motifs such as amphora shapes and spiral designs. This phenomenon also exemplifies glocalization, wherein external influences were absorbed and reshaped to fit local traditions. The Upper Tisza region played a pivotal role in these cultural dynamics, being well integrated into the trade networks of the Tumulus culture and bridging connections between Western Europe and the eastern regions of the Carpathian Basin. The widespread distribution of common ceramic elements across the Great Hungarian Plain highlights the considerable extent of interaction among various cultural groups. This study underscores the importance of pottery as a medium for understanding cultural transition, illustrating how tradition and innovation intertwined to shape evolving identities and artistic expressions in the Late Bronze Age.

1103. TRANSITIONING TO A COLLECTIVE ETHOS: THE CRETAN SARCOPHAGUS AS ILLUSTRATIVE OF A SOCIO-POLITICAL SHIFT FROM A HETERARCHY TO HIERARCHY

**Contribution format:** Oral  
**Contribution authors:** Laura Nerling (Columbia College)

This paper explores two different transitional moments on Crete during the Bronze Age, as illustrated by the continuation, discontinuation, or reintroduction of the Cretan larnax (sarcophagus). Transitions of socio-political complexity are often poorly understood in prehistoric cultures due to a lack of written evidence; however, material culture can impart subtle cues about lifestyle shifts that reflect broader ideological transitions. In particular, funerary objects and assemblages can provide a window into ideological transformations due to their long-duration and continued use regardless of shifting environments. This paper asserts that the Cretan larnax reflects such a social-political transition from a microregional and heterarchically-based organizational structure in Pre- and Protopalatial Crete (Early to Middle Bronze Age) to a hierarchical, homogenous culture that ideologically demonstrates an island-wide identity consistent with a cohesive macroregional culture during the Post-Palatial period (Late Bronze Age). This argument contributes to the larger debate concerning the idea of a Cretan or Minoan “Collective Ethos.” While there is little evidence to support a collective ethos during the Early Bronze Age on Crete, the reintroduction of the larnax in LM III suggests an intentional re-adoption of past funerary practices. This adoption of a material object associated with both the death and the afterlife (from the EM III and on) is then co-opted in the LM III period as a form of active manipulation. Thus, the Early Bronze Age funerary object becomes a tool used to solidify the transition from small regional centers into the collective ethos of a hierarchical Cretan society.

**940. IRON AGE RITUAL VESSELS AS TRANSFORMATIVE MASKS: A NEW INTERPRETATION OF MENORCAN RITUAL CUPS DURING THE POST-TALAYOTIC PERIOD (550-123 B.C.E.)**

**Contribution format:** Oral  
**Contribution authors:** Evelyn Patterson – Alexander Smith (SUNY Brockport) – Amalia Pérez-Juez (Boston University)

The Balearic Island of Menorca was home to a distinctive prehistoric culture that in the Late Iron Age, or Post-Talayotic period (c. 550-123 BCE), saw a peak of prehistoric populations that built massive megalithic homes, modified ceramic traditions, and innovated new ritual practices, all while interacting with the increasingly powerful Carthaginian, Roman, and Greek worlds. As part of the ceramic assemblages from this era, archaeologists have long studied the high-bottomed cup (vaso de fondo alto) and the truncated cup (vaso troncoconico), which are unique to Post-Talayotic Menorca, and serve as ritual consumptive vessels. Their overall shape has been likened to a taumorphic design, possibly referencing a bull deity that appears elsewhere in ritual contexts on the island from both the Post-Talayotic and previous periods (Ferrer 2021). Several hundred examples of these cups have been found at sites around the island, including one truncated cup at the site of Torre d'en Galmés that was excavated by the Menorca Archaeological Project (MAP) in 2021. After a close analysis of MAP’s truncated vessel in 2023, it became clear that when used to consume liquid, the cups’ unique shape may lend itself to a type of animal mask. As a result, this paper proposes a new interpretation of Menorca’s ritual vessels, where the cups function as both drinking vessels and as transformative masking devices in ritual spaces. To understand this new interpretation, this paper considers the likelihood of cultural transmission from previous prehistoric groups on the island through the continuous use of ritual contexts and traditional ceramic production techniques. Nevertheless, we also consider the potential of hybridization of the vessels’ form and function based on external influences of Phoenician-Punic masking rituals and elements of Greek drinking culture.

**364. THE 5TH MILLENNIUM BC IN THESSALY. RETHINKING THE TRANSITION FROM THE NEOLITHIC TO THE CHALCOLITHIC PERIOD**

**Contribution format:** Poster  
**Contribution authors:** Lea Hüntemann (Freie Universität Berlin)

This poster aims to present the current findings from my research project on the Late Neolithic and Early Chalcolithic Period in Thessaly, Greece, which is concerned with the examination of material culture and the clarification of both periods and the transitional period in between. There has been extensive research, especially on the pottery from this region, leading to many insights over the decades which were discussed and adjusted by many scholars before me. This has led to the clarification of countless research questions but also to a situation in which gaps caused by the shifting of pottery sequences have not been filled as of yet. Similarly, many excavations remain unpublished and are not available for further research. Through the systematic examination of material from Late Neolithic/Chalcolithic sites in Thessaly (such as Agia Sophia magoula), this project is focused on redefining and specifying the way the pottery has changed (and in some ways remained the same) in between these two periods. The thorough analysis of pottery and the connection of relative chronological and absolute chronological findings allows for a clearer definition of what is currently called the “Rachmani Period” as well as the transition from Late Neolithic to Chalcolithic.

**430. PREHISTORIC BRONZE OBJECTS IN TRANSITION: CULTURAL TRANSFORMATION IN MATERIAL RECORD AT IRON AGE CENTRE PODZEMELJ, SOUTHEAST SLOVENIA**

**Contribution format:** Poster  
**Contribution authors:** Lucija Grahek (Institute of Archaeology ZRC SAZU, Ljubljana) – Nataša Nemeček (National Museum of Slovenia) – Marijan Nečemer – Katarina Vogel Mikuš (Jožef Stefan Institute (IJS), Ljubljana)

The study of transitional periods in prehistory is crucial for understanding cultural dynamics. Traditional archaeological research often delineates cultures based on typological distinctions in material culture, which can obscure the nuances of contact and transition periods. We are presenting an investigation of copper-based artefacts from the Iron Age site of Podzemelj in Southeastern Slovenia, focusing on their chemical composition and corrosion mechanisms. The study examines artefacts from two distinct cultural circles: the Dolenjska Hallstatt and the Late Iron Age Vinica community. Through advanced archaeometric techniques, including X-ray fluorescence (XRF), micro-XRF (μXRF), and X-ray diffraction (XRD), the research explores technological variations, material transformations, and cultural interactions reflected in the metal objects. Findings indicate that while both cultural groups utilized similar alloy compositions (bronzes and leaded bronzes), differences in corrosion patterns suggest distinct environmental influences. One key observation is the varying degrees of copper depletion and tin enrichment (i.e., decuprification) in artefacts from different cultural contexts, implying the role of burial environments in shaping the preservation state of objects and emphasizing the need for context-specific conservation strategies. The absence of chlorides in corrosion layers is particularly significant, as it reduces the risk of bronze disease, allowing for more flexible preservation approaches. By integrating material analyses with archaeological context, this research contributes to a broader understanding of cultural transitions, artifact hybridization, and technological exchange in prehistoric Europe. The findings underscore the necessity of interdisciplinary methodologies in detecting and interpreting shifts in material culture, shedding light on the complexity of prehistoric interactions and transformations.

**1195. WOOD OR SOIL? SOLUTION OF THE GOUGE USE: EXPERIMENTAL AND USE WEAR APPROACH**

**Contribution format:** Poster  
**Contribution authors:** Katarína Kapustka (Institute of Archaeology of the CAS Prague) – Malgorzata Winiarska Kabacińska (Archaeological Museum in Poznań)

The use of gouges in Early Khartoum has been frequently discussed, particularly in relation to this specific cultural context. However, much of the understanding surrounding their function has remained speculative, with limited solid evidence to support these claims. This article addresses this gap by comparing experimentally produced tools with archaeological specimens from the region. The experimental tools were crafted by a skilled knapper using the same raw material—red rhyolite—that prehistoric communities in the Sabaloka region are known to have used. These experimental pieces were utilized for practical tasks, specifically for soil and wood-working activities. The wear patterns and functional traces resulting from these uses were carefully documented and compared with those found on archaeological artifacts from the Fox Hill and Kadero sites. By conducting this comparative analysis, the study aims to provide a clearer understanding of the specific activities for which these gouges were employed during the Neolithic period in central Sudan. This research not only contributes to a more refined interpretation of tool function in this ancient context but also enhances our broader understanding of Neolithic technological practices in the region.

**71 BEYOND CONQUEST: ENVIRONMENTAL AND CULTURAL IMPACTS OF ROMAN EXPANSIONISM**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Roman conquest, Bioarchaeology, Environmental Archaeology, Roman Archaeology, Landscape Archaeology  
**Session organisers:** Antonio Merola (University of Bari) – Valentina Colagrossi (University of Bari / ISPC-CNR) – Francesco Solinas (University of Lecce) – Roberto Ragno (University of Bari) – Frijda Schmidt (University of Cambridge)  
**Session discussant:** Nicola Terrenato (University of Michigan)

SESSION ABSTRACT

This session aims to establish a methodological framework that facilitates collaboration between scholars engaged in studying environmental change and those focusing on the processes of Roman Empire in the Mediterranean region. The study of conquest of Rome has long relied on topographical and historiographical methods and material culture to trace the profound changes that occurred over time in the territories affected by the Roman conquest. On the other hand, a growing number of researchers have increasingly focused on human-environment interactions, and the integration of paleoenvironmental approaches to read historical-archaeological processes has opened new frameworks for investigating how Roman impact transformed local ecosystems. This session will broaden traditional approaches by incorporating environmental archaeological perspectives. By combining paleoenvironmental analysis with well-established methodologies, we aim to prompt new lines of questioning that will lead to enhanced and innovative approaches, thereby advancing our understanding of the Roman world. The objective is to identify, through case studies, the consequences of Roman conquest on evolving local environments. This will involve exploring whether the exploitation of the environment was more intense under the Roman settlement and investigating the possible links between the Roman conquest and the ecological footprint on landscapes. Roman explotation significantly impacted water management practices, mining, agriculture, productive assets and, more generally, the wider economic exploitation of natural resources. We invite scholars to consider these changes in a broader temporal perspective, from the pre-Roman period to late-Roman o. early middle ages, following the environmental dynamics associated with the Roman conquest. We welcome contributions on archaeobotanical, zooarchaeological and other bioarchaeological case studies from Romanised regions, as well as computational approaches and/or studies on the productive, agricultural and mining sectors, all within the framework of the environmental dynamics associated with the Roman conquest.

CONTRIBUTION ABSTRACTS

557. INTRODUCTION

**Contribution format:** Oral  
**Contribution authors:** Antonio Merola (University of Bari)

This session aims to create a methodological space that brings together scientific disciplines analyzing environmental changes with scholars of Romanization around the Mediterranean. The objective is to identify, through case studies, the biochemical and faunal traces of ecosystems during the Roman conquest. The session seeks to examine whether Romanization led not only to intensive environmental exploitation but also to assess possible correlations between conquest and ecological footprints on landscapes. For the first time, this session brings together researchers engaged in the complex issue of Romanization with the findings of environmental sciences, which have significantly advanced research in other fields of archaeology. It is time to analyze environmental changes during the Roman conquest, considering the effects of water, mining, agricultural, faunal, and floral exploitation introduced by Roman technologies and production methods. The central theme is the environmental impact of Roman conquest, particularly in relation to the exploitation of natural resources and the economic transformations of conquered areas. This analysis goes beyond resource extraction, exploring how these practices reshaped production systems essential for integrating newly Romanized regions into the pan-Mediterranean context. The session welcomes contributions on archaeobotany, zooarchaeology, and bioarchaeology in Romanization contexts, as well as studies on productive, agricultural, and mining sectors in relation to the environmental dynamics of the Roman conquest.

1688. ASSESSING THE IMPACT OF ROMANIZATION ON THE MANAGEMENT OF ANIMAL RESOURCES IN THE LUSITANIA (SW IBERIAN PENINSULA)

**Contribution format:** Oral  
**Contribution authors:** Patrícia Aleixo – Ana Beatriz Santos – Cleia Detry (School of Arts and Humanities. University of Lisbon | UNIARQ - Centre for Archaeology)

The expansion of the Roman Empire resulted in significant changes in the conquered territories, not only from an economic, social and cultural perspective but also environmental changes, namely in animal resources management and exploitation. It has been assumed the Phoenicians initiated a deep transformation in managing animal resources, namely through the circulation of animals across the Mediterranean. Indeed, the introduction of chicken and donkey in the Iberian Peninsula seems to be related to the presence of that seafaring people, as well as new varieties of cattle in different parts of the Mediterranean. Notwithstanding, during the Roman period, these movements of circulation and exchange were intensified and the introduction of several new species for consumption in feasts, hunting activities, and pest control, among others, had a huge impact on local ecosystems, while the establishment of new management methodologies has also been attested. The artificial selection of animals is also clearly dominated in this period with the appearance of small morphotypes in dogs

and eventually in equids. In Lusitania (corresponding approximately to the current Portuguese territory south of the Douro and most of the Spanish Extremadura) this information has been observed through the analysis of zooarchaeological data. Cattle improvement was also noted in Lusitania, especially in cities of roman foundation and in some villae. This paper aims to synthesize all the zooarchaeological data from archaeological sites of Lusitania and provide a first analysis on the changes and continuities caused by the Romans in this territory.

1942. HUMAN-ENVIRONMENT INTERACTION IN THE CENTURIATED LANDSCAPE OF THE PONTINE PLAIN: PLANT REMAINS FROM CANALS AND DITCHES

**Contribution format:** Oral  
**Contribution authors:** Mans Schepers – Tymon De Haas (University of Groningen) – Tirsia Komrij (University of Groningen | RAAP Archeologisch Adviesbureau) – Michael Bakker (University of Groningen)

The Pontine Plain, located approximately 70 km south of Rome, is a former marshland area impacted by humans from prehistory onwards, but transformed profoundly in the Republican period as part of Roman expansion. The Via Appia runs straight through the landscape and forms the most prominent feature of these transformations. Visually less imposing are the many traces of intensive agricultural exploitation in the surrounding polder landscape. While the present parceling of the landscape is mainly the result of large-scale reclamation activities in the early 20th century, remnants of a much older Roman centuriation are present in the soil. Intensive field surveys, analyses of historical aerial photography, and geophysical prospection from 2011 onwards revealed a large number of archaeological sites as well as the presence of an extensive network of canals and ditches. These could be assigned to roman Republican times through both their association with archaeological material on the present surface and radiocarbon dates on plant remains from their infills. Over the past five years, we have sampled canals and ditches in various parts of the plain for the analysis of pollen and plant macro remains. These allowed us to elevate our understanding of Roman land use in, and environmental impact on the area, but we also ran into a number of methodological and taphonomical issues. We will share the findings so far, discuss further plans, and reflect upon the potential of our project for work carried out in other regions.

696. MORPHOLOGY, DEPOSITION AND ROLES OF DOGS IN LATER PREHISTORIC, ROMAN AND EARLY MEDIEVAL SOUTHEAST EUROPE

**Contribution format:** Oral  
**Contribution authors:** Sarah Everett (BioArCh, Department of Archaeology, University of York)

Among the environmental and cultural impacts of the Roman occupation were widespread changes in animal morphology, with the emergence of larger livestock and particularly small dogs evident in many provinces. Dogs played a wide variety of roles in past societies — utilised for hunting, herding and guarding, for pest control, and kept as pets — and were additionally associated with chthonic deities, healing, and other aspects of ritual activity. While distinct dog breeds only emerged within the last few centuries, human-induced changes in dog size and shape as a result of selection for particular traits have a much longer history. Analysis of spatiotemporal variation in dog morphology provides important insights into the emergence of different morphotypes or varieties of dogs, the roles of dogs within human societies, and the impact of key political changes such as the Roman expansion on animals living within human communities. Via the meta-analysis of published metrical data from archaeological sites across southeast Europe, with a temporal scope from later prehistory to the early medieval period, this paper aims to evaluate morphological change under Rome within the context of longer-term patterns, in order to understand the relative impact of the Roman conquest on the range and relative abundance of different dog morphotypes. The paper explores patterns in morphology across site types, aiming to ascertain the extent of variation between the types of dogs deposited within domestic contexts, on the one hand, and the types of dogs selected for deposition within religious or ritual contexts, on the other. The study encompasses three regions — (a) the Balkan provinces, under long-term Roman occupation, (b) Dacia, a Roman province from 106-271/275 CE, and (c) regions to the north that remained beyond the Empire.

695. VISCERAL COMMODITIES: FISH SAUCE PRODUCTION AND CONSUMPTION IN ROMAN BRITAIN

**Contribution format:** Oral  
**Contribution authors:** Avner Goldstein (Boston College)

Fish sauce, commonly referred to by one of its Latin names garum, reaches many of our classical literary texts, including recipe compilations and cookbooks, as well as treatises on agriculture, and was one of the most essential components of Roman cuisines. Before the Roman period, Iron Age Britain had no strong maritime culture, and fish were rarely exploited or eaten. By the end of the Roman period, however, Britain had developed a robust infrastructure for the exploitation, processing, trade, and consumption of fish and other marine products, in part for the large-scale importation and later production of fish sauce. This paper draws on both zooarchaeological

and artefactual analyses to highlight the transformation of Britain’s marine environments across five centuries through the exploitation of local fish for the fish sauce industry, which reflected a provincial interpretation of a classic Roman staple. Through this process, we document the destructive impact this industry had on specific fish species and the habitats they lived in, as well as how these environments responded to the collapse of Roman systems in the late fourth and fifth centuries. Finally, the industry illustrates the complex interplay between human societies and the marine world in antiquity, showing how widespread cultural practices and social hierarchies shaped and were shaped by environmental interactions.

**1951. THE MACEDONIAN WARS IN PELAGONIA PALEOENVIRONMENTAL RESEARCH CONTRIBUTIONS TO THE UNDERSTANDING OF THE EARLY ROMAN CONQUEST OF THE MACEDONIAN KINGDOM**

**Contribution format:** Oral  
**Contribution authors:** Nick Angeloff (Cal Poly Humboldt | Chronicle Heritage) – Ljuben Tevdovsky (Goce Delchev University Shtip) – Byron Smith (76907) – Rebekka Kniernan (Swca) – Jessica Bedell (Cal Poly Humboldt)

The archaeological site of Crnobuki in the Pelagonian Valley was traditionally associated with the historically famous battles of the Macedonian phalanxes with Rome. Yet, our archaeological research and known necropolis in the vicinity of the site suggested that it was not just a military outpost of the last Macedonian kings, but an important urban center of the archaic, classical and Hellenistic periods. The abundance of ancient written sources and archaeological material related to this region contributed towards ignoring the important dynamics of development of this pre-Roman and Roman settlement in relation to the exploitation of its landscape and surrounding natural resources. This paper presents important new findings, hypotheses and interpretations of the symptoms of change related to the Roman conquest, which are results of the two seasons of field surveys, excavations and laboratory analyses of the international American-Macedonian team, focused on computational and paleoenvironmental approaches. The LIDAR data produced in the last two years, led towards a more precise modeling of topographic and geographical features of the site, which combined with archaeobotanical analyses, alphanumerical and geo-referenced cartographical reports and flood analysis with a focus on the flood zone between 570–600 m above sea level, revealed the complexity of the dynamics of the settlement in the pre-Roman and Roman times. Analyzing the environmental changes caused by the modern landscape cultivation (huge drainage system), led towards an entirely new orientation of the site towards the mountain slopes to the north, instead of the ancient flood zone to the south-east. More importantly, the significant reduction of agricultural and export activities of this urban center in Roman times, can no longer be associated exclusively with the early Roman suppressive policies, but also with new patterns of developing settlements within the critical zone predisposed to floods and Roman mining of minerals.

**1874. WINE PRODUCTION IN TAGUS VALLEY (CENTRAL LUSITANIA) DURING THE ROMAN PERIOD, CHANGING LANDSCAPES. VILLA CARDÍLIO AS A CASE STUDY**

**Contribution format:** Poster  
**Contribution authors:** Victor Filipe (UNIARQ- Centre for Archaeology, School of Arts and Humanities, University of Lisbon | Torres Novas City Council) – Catarina Viegas – Carlos Fabião (UNIARQ- Centre for Archaeology, School of Arts and Humanities, University of Lisbon)

It is an established fact that the Roman presence in Westernmost Hispania, from Late Republic to the end of the Empire, caused profound transformations compared to the previous period, both culturally, socially, politically, and economically, as well as in terms of urban and rural landscapes. In this context, one of the most impactful actions on the rural landscape was the exploitation of natural resources, particularly mineral resources, which was one of Rome’s main interests in Hispania, but also the agricultural potential of the soils, with natural emphasis on the most fertile ones located in the valleys of the main rivers. Indeed, thanks to a differentiated technological apparatus and an orientation towards large-scale production, Roman occupation enhanced agricultural production, reaching levels far superior to those of the previous period. With this study, we aim to highlight the importance of viticultural exploitation in the economy of the Tagus Valley during the Roman period and its marked difference from previous eras, while also assessing the changes that this activity may have caused in the landscape from the end of the Iron Age to Late Antiquity. To achieve this, we will use archaeological evidence, particularly structures and materials associated with the production, transport and consumption of wine, comparing these data with recent archaeobotanical studies conducted in this region. The Roman villa of Cardílio (Torres Novas, Portugal), located near the banks of the Almonda River, a navigable tributary of the Tagus River, and approximately 100 km from its mouth, represents a highly interesting case study for this topic. This is due to the recent identification of the production of wine amphorae intended to transport the wine produced on the villa’s fundus.

**72 FACING COMPLEXITY OF THE URBAN STRATIGRAPHY**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Discussion session  
**Session keywords:** Urban archaeology, organization of space, site biographies, geoarchaeology, archaeobiology, urban Dark Earth  
**Session organisers:** Christine Pümpin (University of Basel) – Mónica Alonso-Eguiluz (Vrije Universiteit Brussel) – David Brönnimann (University of Basel) – Meihui Li – Yannick Devos (Vrije Universiteit Brussel)

**SESSION ABSTRACT**

Urban archaeology is at the core of some of the big issues that archaeology seeks to address, such as the emergence of complex societies, the co-existence of communities, the economic activities, human impact on the environment and societal collapse. To address these questions urban archaeologists need to face complexity. Part of this complexity is inevitably linked to variability in scope and size of the archaeological interventions, ranging from small-scale follow-up during construction works to large-scale excavations. The key challenge in urban archaeology, however, is the complexity of the urban stratigraphy often involving urban deposits reaching several meters in thickness, resulting from many phases of human occupation within a restricted space. This complexity is particularly challenging when dealing with the so-called urban Dark Earth, ubiquitous in urban areas throughout Europe. In order to tackle these issues, multiscale approaches have been developed, ranging from the geomorphological study of the town and its surroundings, over detailed field observations, geochemical and archaeobiological analyses to the micromorphological study of individual stratigraphic units. These studies have not only permitted to come to a better understanding of the sedimentary matrix, but also of the processes involved in the build-up of the urban fabric, thus opening perspectives for both an in-depth analysis of the individual strata and their content, and the reconstruction of the site biography. Present session invites contributions dealing with the understanding of the complex urban stratigraphies, including the urban Dark Earth, through different approaches and at different scales. Furthermore, we invite contributions aiming to discuss how a better understanding of the urban soils and sediments can contribute to address a series of current issues in urban archaeology, including the use and organization of urban space; ancient soil pollution in towns; reconstructions of the physical (geomorphological) environment and the interactions of towns within their wider regions.

**CONTRIBUTION ABSTRACTS**

**1838. BUILDING WITH DEMOLITION DEBRIS: URBAN WASTE MANAGEMENT AT THE PUNGRT HILL-FORT (CENTRAL SLOVENIA)**

**Contribution format:** Oral  
**Contribution authors:** Agni Prijatelj (Centre for Soil and Environmental Research, University of Ljubljana | Centre for the Interdisciplinary Research in Archaeology (CIRA), University of Ljubljana) – Helena Grčman (Centre for Soil and Environmental Research, University of Ljubljana) – Matej Dolenec (Department of Geology, University of Ljubljana) – Luka Gruškovnjak (Centre for the Interdisciplinary Research in Archaeology (CIRA), University of Ljubljana) – Petra Vojaković (Centre for the Interdisciplinary Research in Archaeology (CIRA), University of Ljubljana | Arhej Ltd.) – Matija Črešnar (Centre for the Interdisciplinary Research in Archaeology (CIRA), University of Ljubljana)

The fortified urban settlement of Pungrt (Central Slovenia) was occupied from the Early Iron Age (8th/7th century BC) to the Early Roman Period (2nd century AD). Its interior was divided into a series of man-made terraces, densely built-up with houses arranged in parallel rows. Amongst a group of 50 excavated buildings, 14 were unearthed on the lowest terrace, adjacent to a 2m-wide gravel road running along the inner face of the monumental stone rampart. In this area, where the deepest and best-preserved deposits were found, the floor sequences of timber-framed buildings consisted of alternating preparation substrates and constructed floors. While often overlooked in archaeological research, such preparation substrates serve as a rich archive of data on urban waste and its management. At Pungrt, micromorphological and geochemical analyses revealed that these deposits comprised a mixture of loose occupational debris, remnants of old floors, plasters, finishing coats, and other construction materials, all chaotically distributed within the layers. Some of the most significant materials identified included fragments of dung, metalworking slag and types of lime plaster absent from other sections of the urban stratigraphic sequence. The composition of these deposits suggests they were a mixture of indoor and outdoor, occupational and demolition debris employed as a levelling prior to the construction of a new building. Characterised by a plethora of anthropogenic inclusions embedded in an organic- and phosphate-rich matrix with significant bioturbation, these deposits bear similarities to urban Dark Earths, and, like them, pose challenges

in reconstructing complex, multi-layered (pre-)depositional histories. Nevertheless, they also provide distinct evidence of urban waste management, recycling, and circular economy practices, which must be considered in any reconstruction of urban biographies of sites, where such deposits are present.

**783. INTERPRETING THE URBAN STRATIFICATION PROCESSES: AN INTEGRATED GEOARCHAEOLOGICAL STUDY OF DARK EARTH IN THE HISTORICAL CENTER OF OUDENAARDE (BELGIUM)**

**Contribution format:** Oral  
**Contribution authors:** Meihui Li – Mónica Alonso-Eguiluz (Vrije Universiteit Brussel) – Christine Pümpin – David Brönnimann – Sarah Lo Russo – Simon Kübler (University of Basel) – Wouter De Maeyer (SOLVA) – Kristin Ismail-Meyer (University of Basel) – Yannick Devos (Vrije Universiteit Brussel)

The growing archaeological investigation of urban deposits dating back to the Medieval period has been crucial in disclosing different stages of European urbanisation. However, the seemingly unstratified deposit known as Dark Earth, commonly found at urban sites, presents a major challenge to archaeologists. Its macroscopic homogeneity makes it difficult to identify and interpret its internal complexity without integrated geoarchaeological investigation. Due to its thick, dark-coloured, and homogeneous characteristics, Dark Earth has often been discarded or interpreted as the result of a singular natural or anthropogenic event. Over the last decades, Belgium, as one of the most densely urbanised regions since medieval times, has been one of the major focal points for European Dark Earth research. During the excavation of the Broodstraat site in the historical centre of Oudenaarde, at the margins of the Scheldt River, a late medieval Dark Earth was excavated. A micromorphological study has been realized to detail the site stratigraphy and to examine the site formation processes including the taphonomical changes involved in the formation of the Dark Earth. Additionally, all data collected for this research is digitized into the two-pillar database systems I-GEOARCHrec and I-GEOARCHive. The present study intends to discuss how the micromorphological study of this Dark Earth can contribute to our understanding of the organisation of space and human-environment interactions, including waste management.

**2061. STRATIGRAPHIC AND TAPHONMIC CONSIDERATIONS IN AN OPEN-AIR FUMIER SEQUENCE, CÁRTAMA, MÁLAGA, SPAIN**

**Contribution format:** Oral  
**Contribution authors:** Rowena Banerjea (University of Reading) – Mónica Alonso Eguiluz (Vrije Universiteit Brussels) – Marcos García García (Universidad de Granada) – Lionello Morandi (Università di Pisa | Eberhard-Karls-Universität Tübingen) – Jérôme Ros (Institut des Sciences de l’Evolution - ISEM (UMR 5554), University of Montpellier) – Luc Vrydaghs – Yannick Devos (Vrije Universiteit Brussels) – Francisco Melero García (Colección Museográfica de Cártama) – Aleks Pluskowski (University of Reading) – Irene Bertelli (Università di Pisa | Sapienza Università di Roma)

Fumier is a French word that translates to "dung" or "manure". It refers to animal waste, such as excrements from stables and barnyards. In archaeology, fumier sequences play a primary role in the study of livestock management and the use of space in prehistoric pastoralist societies. They are formed when dung that accumulated in sheepfold caves and rock shelters is burnt with other plant remains, resulting in an overlapping of burnt and unburnt sedimentary layers. The high-resolution analysis of these sedimentary layers (deposits) informs us about livestock’s diet, the use of vegetal resources in animal husbandry, and explores practices relating to seasonality. According to the literature, only one open-air fumier is known (outside of the usual rock shelter setting) and is not published, which makes the identification of one in an urban, medieval (Almohad) context at Cártama so interesting. The key features of a fumier sequence are:

- Alternating burnt and unburnt sub-horizontal layers, that grouped in sequences ("layer cake") representing stabling episodes.
- Clearly observable in profile, very difficult to excavate in plan due to variability in the burning across the floor.
- Presence of dung.
- Presence of bedding and other plant material (maybe the remains of the corral’s fence) that has been set alight to burn the dung.

The first two of the above bullet points were observable during excavation and sampling at Cártama. The presence of dung, bedding and other plant materials and evidence for burning are all documented here as a result of multi-proxy bio- and micro-archaeological analyses owing to exceptional preservation conditions at the site, which are examined in this paper. **1568. URBAN GEOARCHAEOLOGY, ANTHROPOGENIC STRATIGRAPHY AND “DARK EARTHS”: NEW WORLD PERSPECTIVES FROM MANHATTAN ISLAND, U.S.A**

**Contribution format:** Oral  
**Contribution authors:** Joseph Schuldenrein (Geoarcheology Research Associates)

The formal concept of “Dark Earths” is not widely utilized in North America. In part, this is due to geographically based epistemological perspectives. These include the more recent time-depth of the cities in the Americas, the reach of the urban imprint on broader, sparsely settled New World landscapes, and limited spatial overlap of discrete urban cultures and their material culture footprints. Arguably, discrete palimpsests, above non-anthropogenic landform segments, render the reading of New World “Dark Earth” sediment matrices somewhat more facile. This presentation illustrates both contrasting and comparable Old and New World urban sequences. We use Manhattan Island and New York City the signature example of the latter. We track modeling of urban sequence stratigraphy using methodologies developed over the past three decades. We stress that “Dark Earths” in the Americas are similar in matrix composition to those in Europe and the Old World, but their antiquity ranges on the order of centenary rather than millennial antiquity. Site formation processes are largely similar and stratigraphic and facies variability require similar analytic techniques. Formal legal guidelines mandate that the concept of “site integrity” must be reframed as urbanization activities advance at accelerated rates. In this connection we need to consider “landfills” as the dominant archaeo-stratigraphic unit of the late 20th and 21st century Anthropocene. “Landfills” are not monolithic disturbance units world-wide. Instead advancing analytical technologies show us how to sort out what were once dismissed as “jumbled” site residues. We are on the cusp of developing refined fine-scale sequences with high resolution analyses, GIS mapping and AI strategies.

**1362. EXPLORING THE URBAN STRATIGRAPHY OF THE PARISH CORE: THE CASE OF SIBIU (RO)**

**Contribution format:** Oral  
**Contribution authors:** Daniela Veronica Marcu Istrate (Romanian Academy, „Vasile Pârvan” Institute of Archaeology | Cultural Association „Hieronymus”)

Urban archaeology rarely faces extensive research in parish sites, which usually are still in use, have disappeared, or are occupied by different buildings. However, sometimes fortunate situations also occur, as in the case of Sibiu (Transylvania, RO), a site that has recently undergone major archaeological surveys during construction works. The settlement was established in the mid-12th century by immigrants from Central Europe (Saxons) to quickly obtain urban status, and in 1191, it was mentioned as the see of the Saxon Provostship. The religious core (fortified wall, main church, cemetery, and chapels) was established as early as the 12th century, evolving sinuously over the following centuries. Gradually, the fortified enclosure and the chapels disappeared, and the cemetery was closed in the mid-16th century. Meanwhile, the parish church was expanded and modified, with parts demolished and parts added, reaching the form it retains to this day by the mid-16th century. The interior of the church was converted into a cemetery, probably in the 14th century. However, the graves dug into the ground were sooner or later replaced by vaults and funerary monuments, which subsequently multiplied, overlapped, and replaced each other. These activities soon ended in a filling mixed with building materials, human remains, and artifacts. Finally, the situation was once again changed in the 19th century, when the inner cemetery was removed, and the empty hole was filled with garbage and rubble. This paper will explore the challenges faced by this excavation, following several main questions: - How does the stratigraphy of the outer cemetery reflect the constructive works? How did the latter affect the cemetery and our understanding of the urban site? - What were the challenges encountered during the excavation of the inner cemetery? What was the impact of destroying the vaults and replacing them with rubbish and debris?

**291. FROM MICROSCOPE TO MAGNETIC; NEW METHODS FOR INTEGRATING MAGNETIC ANALYSIS WITH GEOARCHAEOLOGY USING MICROMORPHOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Ada Dinckal (Archaeological Micromorphology and Biomarkers (AMBI Lab), Universidad de La Laguna | Laboratorio de Paleomagnetismo, Universidad de Burgos) – Joshua Feinberg (Institute for Rock Magnetism, University of Minnesota) – Angel Carrancho (Laboratorio de Prehistoria, Universidad de Burgos | Laboratorio de Paleomagnetismo, Universidad de Burgos) – Carolina Mallol (Archaeological Micromorphology and Biomarkers (AMBI Lab), Universidad de La Laguna)

Geoarchaeological research has long utilized multi-proxy approaches to develop robust interpretations of human behaviour, site formation processes, and environmental and climatic contexts. In recent years, this has increasingly focused on single-sample analysis, where micromorphology serves as a means of integrating multiple lines

of analysis into a coherent, succinct, and robust way. However, within these research parameters, magnetic data—both archaeomagnetic and rock magnetic—has often been overlooked due to challenges in integrating it directly into single-sample analyses alongside micromorphology. In this presentation, we introduce new methodological advancements that integrate archaeomagnetic, and rock magnetic data with micromorphology. At the core of this methodological improvement is the use of a quantum diamond microscope (QDM), which can analyse magnetic fields directly on thin sections. We introduce the QDM and outline methodological frameworks for its application, demonstrating how it can be utilized to integrate rock magnetic data with micromorphological thin sections. We highlight this initial application through the case study of a combustion feature before discussing how these methodological improvements yield more robust interpretations of both anthropogenic and environmental data at the microscale, and how this can be utilized within multi-scalar approaches to exploring urban sites and landscapes.

431. READING THE URBAN STRATIGRAPHY: EXAMPLES FROM THE HISTORICAL CENTER OF BRUSSELS (BELGIUM)

Contribution format: Oral  
Contribution authors: Yannick Devos – Luc Vrydaghs (Vrije Universiteit Brussel)

Reading the stratigraphy in Brussels is – like in many other towns – a difficult exercise. The main reason behind this is the fact that there are many different occupation phases succeeding each other in a very restricted space, resulting in very deep and complex stratigraphical sequences. In order to read the stratigraphy, a multiscale geoarchaeological approach has been adopted, including field and microscopic observations (Devos et al., 2020). Such an approach has shown to be very rewarding to decipher the processes involved in the formation of the stratigraphical sequences (Devos, 2024). Present contribution intends to discuss how the systematic application of this multiscale approach – both on small and large-scale interventions, on macro- and microscopic levels – contributes to our understanding of the formation of the urban soils and sediments in Brussels, and how it provides us with new insights in a series of long-standing debates, such as the early formation of the medieval town, the importance of agricultural and horticultural activities, and the evolution of the organization of space.

1805. MICROMORPHOLOGY AND PHYTOLITH ANALYSES OF THE AGRICULTURAL FIELDS IN THE URBAN DARK EARTHS OF GENT NEDERPOLDER 1, BELGIUM

Contribution format: Oral  
Contribution authors: Mónica Alonso-Eguiluz (Archaeology, Environmental Changes and Geo-Chemistry (AMGC)-Vrije Universiteit Brussles) – Jari Mikkelsen (Raakvlak, Archaeology, Monuments and Landscapes of Bruges and Hinterland) – Tomas Bradt (Monument Vandekerckhove) – Karin Nys – Yannick Devos (Archaeology, Environmental Changes and Geo-Chemistry (AMGC)-Vrije Universiteit Brussles)

Urban Dark Earths are an ubiquitous phenomenon in European urban archaeology. Despite their common appearance during archaeological excavations in many historical town centers, the study of these homogeneous deposits has long been neglected. However, the application of new techniques and especially micromorphology have shown their potential for studying the evolution of the urban fabric. Present contribution intends to present the integration of soil micromorphology with the study of phytoliths in thin sections applied to the Dark Earth of the archaeological site of Ghent Nederpolder 1, Belgium, dated ca. 5th-8th century AD. The micromorphological study indicates, besides evidence for cultivation of the soil, the episodic input of windblown sands, testifying of the open landscape character. In order to identify the plants that have been cultivated on the medieval fields of the Nederpolder site a phytolith analysis on soil thin sections was performed. The results show indeed the presence of grasses of the pooideae subfamily, to which the most important crops belong to (i.e., wheat, barley, rye). However, only few remains of the typical phytoliths related to the inflorescences of crops (ELONGATE DENDRITIC) have been observed.

73 HOUSES AND MATERIAL CULTURE IN THE MEDIEVAL MEDITERRANEAN AND BEYOND: DOMESTIC SPACES AND SOCIAL IDENTITY IN MULTICULTURAL CONTEXTS

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: Domestic architecture, Medieval Mediterranean, Spatial organization, Cultural dynamics, Social structure  
Session organisers: Guillem Alcolea (Universitat Autònoma de Barcelona) – Susan. Gómez (Universidade de

Évora) – Maria Isabel Molina (Universitat Autònoma de Barcelona) – Cristina Martínez-Álvarez (Archeologii i Etnologii Polskiej Akademii Nauk) – Helena Kirchner (Universitat Autònoma de Barcelona)

SESSION ABSTRACT

Domestic architecture is a fundamental source for understanding how societies shape and structure their living environments. It reflects not only the material conditions, but also the social structures, values, and cultural dynamics of each historical context. The study of dwellings presents multiple analytical dimensions: on the one hand, the organisation of space allows us to understand how functions were distributed within the household and how social organisation was reflected in it. On the other hand, building materials provide information about available resources and construction techniques. Adaptations to urban or rural environments reveal how dwellings responded to the specific needs of the environment. The material culture associated with these spaces—such as ceramics, tools, and decorative elements— offers valuable information about daily practices, production conditions, social interactions, and access to markets or distribution networks. Through architectural analysis and material culture, we can also study the processes of transformation within these communities. The medieval Mediterranean, encompassing Iberia and extending to North Africa, Southern Europe, and the Near East, presents a rich framework for exploring these dynamics. This region’s multicultural contexts—marked by interactions between Jewish, Islamic, and Christian traditions— allow for comparative approaches that highlight both shared practices and cultural divergences. This session seeks to explore and compare domestic spaces across the medieval Mediterranean and beyond and between the 8th and 15th centuries. Contributions are invited on topics including the structuring of domestic living spaces, the interplay between architectural and social change, the integration of housing within urban and rural landscapes, and the role of domestic architecture in shaping and reflecting multicultural identities. This expanded geographical and cultural perspective aims to facilitate a deeper understanding of the intersections between material culture, domestic life, and social organisation in the medieval world.

CONTRIBUTION ABSTRACTS

193. DOMESTIC SPACES AS A REFLECTION OF SOCIAL ORGANISATION AND IDENTITIES IN THE 8TH CENTURY: THE SOUTHERN RABAD OF SHAQUNDA (CORDOBA)

Contribution format: Oral  
Contribution authors: Maria Teresa Garcia (Prehistoric and Archaeology Department. University Autónoma of Madrid)

In this paper present the study of the houses discovered in the southern rabad of Shaqunda (Cordoba- Madinat Qurtuba), built and inhabited between the 8th and first quarter 9th centuries. In its analysis we have defined the organisation of the different spaces in the houses, in order to understand how the functions were distributed within the household and how the social organisation was reflected in it. We also pay attention to the particular building materials, reused decorative materials and their construction techniques, complemented by the analysis of the material culture documented in the spaces (ceramics, glass, ect..). This study has made it possible to define the first medieval andalusi models of domestic housing in Córdoba and to characterise the population that inhabited them. It constitutes a paradigmatic example of domestic spaces in the medieval world of the 8th century. The analysis of the distribution of the domestic area in the overall layout of the suburb has allowed us to understand the organisation and distribution of functionalities in this suburb. On the other hand, has made it possible to integrate the houses into the urban landscape of the emiral Umayyad capital of al-Andalus, as a precedent to the Caliphate houses.

1709. HOUSEHOLDS AND DOMESTIC MATERIAL CULTURE IN THE KŪRA OF ILBĪRA: RURAL-URBAN PERSPECTIVES FROM TÓZAR AND MADĪNAT ILBĪRA

Contribution format: Oral  
Contribution authors: Luca Mattei (University of Granada) – Cristina Martínez-Álvarez (Archeologii i Etnologii Polskiej Akademii Nauk) – Yaiza Hernández Casas – Teresa Koffler Urbano (University of Granada) – María González Castañón (Museo Nacional de Arqueología Subacuática) – Marian Rebkowski (Archeologii i Etnologii Polskiej Akademii Nauk) – Guillermo García-Contreras Ruiz (University of Granada)

Domestic spaces and the material culture associated with them serve as key indicators in the archaeological record, helping us to understand the way of life of past societies. Their spatial organisation and material remains provide insight into daily practices, the use of natural resources, the orientation of productive strategies, and possible areas of cultural and trade networks. In response to this need, within the framework of the ERC SyG

“MedGreenRev”, the Cátedra Gómez-Moreno and the “DICRAN” project, we propose a comparative analysis of two distinct contexts of the Kūra of Ilbira (south-east of the Iberian Peninsula): one of an eminently urban character and another fully rural. We aim to highlight the differences between Madīnat Ilbira, the capital of Kura, an urban centre where a predominantly Islamic social component coexisted with a Christian community, and the rural site of Tózar, where a Christian Dhimmī peasant community resided. This study is based on the analysis of domestic architecture as well as the ceramic and metallic material remains found in these contexts. Our objective is to determine whether, beyond religious differences, social distinctions existed, how the dwellings were laid out, and what types of resources were utilised and what daily life practices in these two contexts.

**462. HOUSES AND MATERIAL CULTURE: A RECENTLY EXCAVATED HOUSE IN MADÎNA BALAGHÎ (BALAGUER, CATALONIA, SPAIN)**

**Contribution format:** Oral  
**Contribution authors:** Guillem Alcolea – María Isabel Molina Campuzan. – Andrea Collado Padilla – Helena Kirchner (Universitat Autònoma de Barcelona)

This proposal focuses on the study of domestic spaces and the material culture recovered from the Islamic archaeological site of Pla d’Almatà, located in the north-east of the Iberian Peninsula (Balaguer, Spain). It is an exceptional context corresponding to the deserted city of Madīna Balaghī, situated on the Upper Frontier of al-Andalus. The city was occupied from the early 8th century until its conquest by Count Ermengol VI of Urgell in 1105. Only the area beside the River Segre was reoccupied by Christian settlers, while Pla d’Almatà remained abandoned. The preservation of its urban layout and architecture makes it a key reference for the study of Andalusī domestic architecture. The primary objective is to examine the domestic assemblages of the dwellings at Pla d’Almatà. To this end, House 15 will be presented as a case study, as its excavation began in 2023 and is currently ongoing within the framework of the European project “MEDGREENREV (ERC–SyG–101071726)”. Firstly, the characteristics and spatial organisation of the house will be analysed. Secondly, the most significant recovered materials and their locations will be discussed, including storage ceramics (jars, pitchers), cooking ceramics (pots, casseroles), and a notable concentration of metal objects found in situ (nails of various sizes and hinges), which provide valuable insights into the context of the house’s abandonment. Additionally, proposed analyses of the material culture will be outlined. In the case of pottery, the sampling protocol for organic residue analysis will be introduced, aiming to clarify aspects related to its functionality and daily practices. By integrating architectural analysis with material culture studies, this research contributes to broader discussions on the structuring of domestic spaces. It explores the relationship between urban form and household organization, as well as the impact of historical processes on daily life in the city.

**1069. THE MEDIEVAL ALQUERÍA AT TORRE D’EN GALMÉS: DOMESTIC SPACES, TEMPORAL ENTANGLEMENTS, AND DAILY LIFE ON ISLAMIC MENORCA**

**Contribution format:** Oral  
**Contribution authors:** Alexander Smith (SUNY Brockport) – Amalia Pérez-Juez (Boston University) – Kathleen Forste (Brown University) – Helena Kirchner – Guillem Alcolea (Universitat Autònoma de Barcelona)

The Menorca Archaeological Project (MAP) has been investigating the remains of a medieval, Islamic alquería at the Iron Age site of Torre d’en Galmés since 2021. Building on years of work by the team from Boston University, MAP has documented dozens of house structures between and on top of Iron Age houses in varying states of preservation, carrying out intensive excavations on four domestics compounds thus far. This paper will discuss the results of MAP’s most recent excavations of Spatial Unit (SPU) 7, located in the center of Torre d’en Galmés. Exhibiting a sprawling ground plan, multiple subsidiary rooms, evidence of plastered walls, abundant material culture, and preserved working spaces, SPU 7 is an ideal example of a medieval house compound and an excellent starting point to discuss Islamic domestic spaces during the 11th-13th centuries C.E. This paper will discuss MAP’s recent findings, which have dramatically expanded our understandings of medieval Islamic settlement and domestic practices on the island, and have ramifications well-beyond the shores of Menorca.

**1055. BETWEEN LAND AND SEA: AN OVERVIEW OF MALACOLOGICAL RESEARCH IN CACELA-A-VELHA**

**Contribution format:** Oral  
**Contribution authors:** Daniela Cabral (University of Algarve, Faculty of Human and Social Sciences | Laboratory of Forensic Anthropology, Centre for Functional Ecology, University of Coimbra) – Beatriz Pinto (University of Algarve, Faculty of Human and Social Sciences | ICaREHB – Interdisciplinary center of archaeology and the evaluation of human behavior) – Maria Valente (University of Algarve, Faculty of Human and Social Sciences | CEAACP

– Centre for Studies in Archaeology, Arts and Heritage Sciences) – Cristina Garcia (CCDR Algarve – Regional Coordination and Development Commission of Algarve, I.P.)

Cacela-a-Velha, in Vila Real de Santo António, Algarve, is a fortified settlement within the Ria Formosa, a productive lagoon system known for its biodiversity and bivalve harvesting. This study analyzes malacological remains from archaeological excavations (2001–2022) at Poço Antigo, in the extra-mural area. The findings relate to the Almohad quarter and its abandonment between the 12th and 13th centuries. Over 30,000 mollusc remains were identified, exceeding 50 kg and representing more than 50 species. Bivalves dominate the assemblage, with fewer gastropods and other classes (thecostraca, scaphopods, cephalopods) occurring in low numbers. The collection reflects the availability of aquatic resources in the Ria Formosa, with several species still consumed today. Most invertebrates were likely used for food, including *Donax trunculus* (wedge clam), *Ruditapes decussatus* (good clam), *Cerastoderma edule* (cockle), and *Ostrea edulis* (European flat oyster). Some species, such as *Glycymeris* spp. (dog cockles) and *Pecten maximus* (great scallop), were likely collected for their shells, with *Glycymeris* possibly used as fishing weights due to perforations, while *P. maximus* may have served as containers or ornaments. Gastropods suggest dietary and decorative uses, as well as intrusive occurrences. Some marine species, such as *Aporrhais pespelecani* (common pelican’s foot) and *Charonia lampas* (triton), were likely adornments. Consumed species include *Bolinus brandaris* (purple dye murex), *Hexaplex trunculus* (banded murex), and the terrestrial *Theba pisana* (Mediterranean snail). In contrast, *Cornu aspersum* (garden snail) and *Xeroplexa intersecta* (wrinkled snail) are likely intrusive, while *Otala lactea* (Moorish snail) could have been eaten, though no direct evidence confirms this. The remains show moderate preservation, significant fragmentation, and few signs of carbonization, suggesting rapid food processing, likely raw or lightly cooked. These findings confirm the role of molluscs in the medieval diet and their potential non-food reuse in Gharb al-Andalus.

**2048. WHO’S IN THERE? NEW PERSPECTIVES ON THE INTERSECTIONS OF GENDER, RELIGION AND DOMESTIC LIFE IN MEDIEVAL IBERIA**

**Contribution format:** Oral  
**Contribution authors:** Marcos Garcia (University of Granada)

One of the defining characteristics of the Middle Ages in the Iberian Peninsula is the coexistence of diverse religious cultures. Given the central role of religion not only as an ideological construct but also as a socio-cultural phenomenon shaping social relations, understanding the processes through which religious (and ethnic) identities were created, recreated and transformed is essential for analysing the historical dynamics of this period. In this regard, the social practices developed within the domestic sphere—recognised as the primary site of socialisation and enculturation—are of particular significance. Moreover, as this paper aims to demonstrate, any attempt to comprehend social dynamics within and through the domestic sphere that fails to integrate gender as an analytical category will necessarily remain incomplete. This presentation outlines the theoretical, analytical, and methodological framework of an ongoing research that examines the intersection of religion, gender, and everyday life in medieval and early modern Iberia, with a specific focus on the sphere of food practices. To this end, a series of theoretical reflections is presented to justify the chosen perspective, providing an innovative interpretative framework for the analysis of archaeological data derived from various contexts across the Iberian Peninsula.

**365. HOUSES AND MATERIAL CULTURE IN MEDIEVAL CÓRDOBA: IDENTIFYING THE USE OF DOMESTIC SPACES AND SOCIETAL TRANSFORMATIONS THROUGH THE CERAMICS**

**Contribution format:** Poster  
**Contribution authors:** Elena Salinas (Escuela de Estudios Árabes, CSIC) – Cristina Camacho Cruz (Universidad de Granada) – Marina González Virseda (Universidad de Almería)

The Islamic period of the present-day city of Córdoba (Spain) lasted from 711 to 1236 CE. During these centuries, a succession of political dynasties of different origins (Umayyads, Taifa Kingdom, Almoravids, Almohads, etc.) coexisted firstly with the local Visigothic and later Andalusī substrate. In this multicultural and multi-religious environment, the domestic ceramic ware was produced and consumed locally, changing according to factors as diverse as identity, social differentiation, purchasing power, culinary customs and fashion. The spaces of the houses of Córdoba and their uses have been interpreted on numerous occasions thanks to the material culture associated with them, and especially the ceramic household. The aim of this work is to show comparative examples of urban houses and the elements that have remained throughout the entire Andalusī period and others that are characteristic of a specific period of time, as well as the reason(s) why they were adopted in the daily life of Madīnat Qurtuba.

1048. EVIDENCE OF GOOSE-HATCHING AND USAGE OF WILLOW HEN COVER AT A 13TH CENTURY RURAL SETTLEMENT IN THE SOUTHERN HUNGARIAN PLAIN

Contribution format: Poster  
Contribution authors: Dénes Szabó (Government Office of Csongrád-Csanád County)

Several interpretations have already arisen regarding the possible functions of various internal pits in semi-subterranean buildings of the Árpád period settlements (11-13th century), as these features can indicate separate spaces for activities inside houses and might provide clues to the spatial patterns of everyday life. A find at the settlement excavated at the Csanádpalota, Juhász T.-tanya site (SE Hungary) can be interpreted as an in-building hatching nest: goose eggs discovered in situ in the inner pit of the half-buried building and the charred plant remains along its edge indicate that the pit was used for hatching geese. The burned willow pieces reflect the usage of a woven willow cover over the brooding goose or hen. Various ethnographical and historical parallels indicate that the hatching of the three eggs might have happened at either late spring or early summer, this was also the timeframe when the building got burned down, preserving the remains of the nest. Likely evidence for pre-emptive sterilization of the building via fumigation was also found. What might the find tell us about the purpose of in-house pits, and human-animal interactions in household units?

2187. HOUSES AND MATERIAL CULTURE IN THE MEDIEVAL STARÁ BOLESLAV

Contribution format: Poster  
Contribution authors: Katerina Levá – Ivana Boháčová – Ivana Hrušková (AU - Institute of Archaeology of the Academy of Sciences of the Czech Republic)

Stará Boleslav is an Early Medieval stronghold established around the year 900 in the lowlands along the Elbe River. It belonged to the Přemyslids and, before the middle of the 11th century, became a capitular seat. This stronghold is one of the most frequently mentioned Czech Early Medieval sites in written records from the Middle Ages. The main reason for this is the murder of Prince Wenceslas (a member of the ruling Přemyslid family) by his brother Boleslav. This place played an important role in the early development of the Přemyslid state, although its significance declined in the later Middle Ages. Archaeological material uncovered during long-term rescue excavations at the site has made it possible to reconstruct a reasonably convincing picture of the form of the Early Medieval Přemyslid stronghold, its transformations, and various aspects of the lives of its inhabitants. We will primarily focus on two phases of settlement, represented, as we assume, by examples of residences of elite members – first, by log cabins from the 10th century (some of the earliest evidence of this type of building in Central Europe), and second, by their later stone successors from the 12th century, located at different parts of the stronghold. This stone building, which may have been the residence of the provost, is characterized by an exclusive material culture (e.g., glass, temple rings, and two denars). In this paper, we would like to compare these buildings with similar structures from Prague Castle.

74 ANTIQUARIAN SOCIETIES, QUO VADIS?

Session theme: 4. De nobis fabula narratur: archaeological practice and a profession in flux  
Session format: Regular session  
Session keywords: antiquary, antiquarian, society, future, heritage, development  
Session organisers: Simon Gilmour (Society of Antiquaries of Scotland) – Meriel Mcclatchie (University College Dublin)

SESSION ABSTRACT

Antiquarian learned societies emerged over the last few centuries across Europe in a variety of forms particular to the country and time in which they were formed. A recurring feature of these organisations is that they tended to play a central role in the development of archaeology as a discipline and the creation of the heritage sector, focused mainly around the protection of sites and monuments and also the development of museums and the accumulation and curation of material culture. In many cases they led archaeological thinking that came to set the parameters of how we interpret the past. In this session we want to explore the role for antiquarian societies in the 21st century. These societies are constituted in many different ways, some are entirely voluntary while others have paid staff. Key to their identity is membership. Do their values still hold? Does their approach, and membership, reflect what is needed in society today? How do they balance the needs of a modern, often charitable, organisation with the concept of an ancient learned society? Are their long histories a foundation or a prison, a point of pride or cause of shame? Most importantly: can they be relevant?

CONTRIBUTION ABSTRACTS

1228. AN ANTIQUARIAN SOCIETY IN IRELAND: CONFINED TO THE PAST OR LOOKING TO THE FUTURE?

Contribution format: Oral  
Contribution authors: Meriel Mcclatchie – Kelly Fitzgerald (University College Dublin) – Aideen Ireland (Royal Society of Antiquaries of Ireland)

The Royal Society of Antiquaries of Ireland (RSAI) was established in 1849, a time before Ireland was to gain its independence from Britain. It began as a local society (the Kilkenny Archaeological Society) and grew to become a national organisation, taking the name of the RSAI in 1890. Its inception was thanks to a small group of men who enjoyed privileged positions in society: three clergy, a newspaper editor and a political activist. Its ethos was more inclusive, however - it was established to be non-sectarian and non-political, and its membership was intended to be socially inclusive. The aim of the society was to ‘preserve, examine all ancient monuments and memorials of the arts, manners and customs of the past, as connected with the antiquities, language, literature and history of Ireland’. Nowadays, the RSAI is led by a woman, and the statutory protection of monuments in Ireland means that its focus is on supporting learning, scholarship and debate, as well as outreach activities for schools and the general public. Certain aspects have remained the same, however - even though Ireland has been a republic for almost a century, the RSAI retains the term ‘Royal’ within its title. This paper will critically examine how an institution with an unusually long history (within an Irish context) can maintain the integrity of its original mission, whilst actively engaging in the 21st century.

1771. PAST, PRESENT & FUTURE: THE EVOLVING ROLE OF THE SOCIÉTÉ JERSIAISE IN RESEARCH, HERITAGE, AND COMMUNITY ENGAGEMENT

Contribution format: Oral  
Contribution authors: Hervé Duval-Gatignol (Société Jersiaise, Field Archaeologist | UMR 6566, CReAAH, Université de Rennes, Research associate) – Agatha Medina Ruiz (Aix-Marseille Université, Archaeology Graduate Student) – Nicolette Le Quesne Westwood (Société Jersiaise, Chair of History Section)

Founded in 1873, the Société Jersiaise is a registered charity based in Jersey (Channel Islands). Since its establishment, its mission has been to conduct and promote research while sharing knowledge as widely as possible for the benefit of Jersey’s island community. To achieve this, it relies on the efforts of its Sections and Departments, as well as its extensive collections and resources. These objectives are pursued through events, conferences, publications, and collaborations with local partners and international institutions, to promote history, culture, language and environmen. In 2023, we celebrated our 150th anniversary - an important milestone that provided an opportunity to reflect on our achievements, particularly in archaeology, where the research conducted by our founding members played a fundamental role in shaping the Société Jersiaise. Today, with over a thousand members and around a hundred active volunteers, our organisation faces the need to renew itself to generate the same level of engagement as in the past. This responsibility falls to our decision-making members within the Executive Committee, our President and Vice-President, as well as our staff, including our Chief Executive Officer. There are many challenges ahead, and we are committed to an ongoing process of transformation while staying true to our roots. This paper aims to highlight the roles of the Société Jersiaise, some of its key contributions - particularly through the example of archaeology - and how important it is to remain relevant. In a world where learned societies often no longer have the same impact as before, our actions only hold meaning if they are understood by and for others. Now more than ever, it is through the engagement of our members, “the heart of our organisation and the focus of the work we do”, that we can shape a future where we make a real difference.

1024. HIDDEN VOICES: FEMALE SCOTTISH ANTIQUARIANS

Contribution format: Oral  
Contribution authors: Doug Rocks-Macqueen (Open Past) – Joana Valdez-Tullett (Wessex Archaeology) – Rebecca Jones (National Museums Scotland) – Elliot Knell (Society of Antiquaries of Scotland) – Lucia Michielin (University of Edinburgh) – Jeff Sanders (Society of Antiquaries of Scotland)

Women have been allowed to be ‘Fellows’ of the Society of Antiquaries of Scotland since 1901 (over 75 years after the men); prior to this, they were ‘Lady Associates’. This was over three decades since the ‘Edinburgh Seven’ ([https://en.wikipedia.org/wiki/Edinburgh\\_Seven](https://en.wikipedia.org/wiki/Edinburgh_Seven)) broke down academic barriers as the first undergraduate female students at any British University. Many female Scottish antiquarians of the 19th and 20th centuries have made a significant contribution to Scottish archaeology, although often not given due credit for their work. This paper will report on the Hidden Voices project, where a few current Fellows are collaborating to raise the profile

of these women, increasing visibility of their work and contributions for archaeology. This work group has regular meetings which involve creating and updating Wikipedia pages, with further plans for podcasts, posters and papers. This is one way in which the current Society can recognise some of its past Fellows, and consider their contemporary relevance.

**1890. ‘THE PAST IS ANOTHER COUNTRY’?: NEXT STEPS FOR THE SOCIETY OF ANTIQUARIES OF LONDON**

**Contribution format:** Oral  
**Contribution authors:** Natasha Mcenroe (Society of Antiquaries of London)

2024 was a milestone year for the Society of Antiquaries of London because it saw the purchase of our historic premises in Burlington House, Piccadilly - premises which had been designed and built specifically for the Society and its extensive collections. This purchase was preceded by a period of uncertainty for the Society, during which long-term investment had not been possible as lengthy negotiations with the British government continued. The Society of Antiquaries of London’s identity and values can be traced back to its foundation in the early 18th century; the Society and its Fellows, Trustees and staff have always been fascinated by the material past. An enthusiasm for history when planning for the future can be an advantage, providing a much-needed sense of perspective. But a reverence for the past when examining the relevance of our work today risks hindering progression of the Society’s charitable aims. Now, as the new owners of the 150-year-old building, we are examining the role of the antiquarian learned society in the 21st century, and exploring how our activities and the use of our building can help us continue our mission in the modern era. Natasha McEnroe was appointed General Secretary of the Society of Antiquaries in April 2024. Prior to this, she was Keeper of Medicine at the Science Museum, where she oversaw the delivery of the new £4 million Medicine Galleries project, joint winner of the Art Fund Museum of the Year 2020. Before the Science Museum, she was Director of the Florence Nightingale Museum and her other roles have included the Grant Museum of Zoology at UCL and Dr Johnson’s House, where she remains a Trustee.

**582. THE ROLE OF THE ANTIQUARIAN SOCIETIES IN GREECE IN THE 21ST CENTURY**

**Contribution format:** Oral  
**Contribution authors:** Kleanthi Pateraki (Independent)

The antiquarian societies in Greece have been founded since the establishment of the Greek state (1830). Most of them are mixed although male dominated, while a few others are female. Their purposes vary, however their common goal is the study, preservation and publication of Greek antiquities and generally the protection, preservation and dissemination of the Greek cultural heritage. Some antiquarian societies have a Pan-Hellenic reach and others are more limited, concerning a prefecture or a geographical district of Greece. Some rely on volunteers, others on subscription membership, and others on hired staff. However, all of them have a board of directors and consist of scientists (archaeologists, historians, philologists, etc.), artists, writers, even university professors. Since their foundation to the 21st century, there have clearly been changes in the character of Greek antiquarian societies, related to the changes in the conditions of Greek society as a result of historical, political and economic events. The aim of this oral presentation is to examine all the aforementioned issues. In addition, the role of the Greek antiquarian societies in the cultural heritage management of Greece in the 21st century will be discussed in detail. Finally, it will be demonstrated to which extent they keep up with current events, developments and the needs of our times.

**2075. THE ANTIQUARIAN SOCIETY OF CUMBERLAND AND WESTMORLAND, WHICH MAY GOD PROSPER**

**Contribution format:** Oral  
**Contribution authors:** Gill Hey (Cumberland and Westmorland Antiquarian and Archaeological Society)

Thus concluded the Reverend James Simpson, Vicar of Kirkby Stephen and first President of the Society, at its inauguration in 1866. Since that time, despite the presence of internationally-important archaeological sites like the Neolithic stone axe factories in Langdale, Hadrian’s Wall on the Roman limes and important Cistercian Abbeys such as Furness, the Society at first struggled to survive. Today, however, it has around 800 members, a lively programme of events and funds to provide grants for research and publication. The absence of a university archaeology department in the vicinity has been a curse but also a blessing, for the Society provides a hub for researchers from elsewhere but, importantly, for the community groups that are very active in the county. Rev Simpson outlined a research programme for the county in 1866 and the present society has just issued its current research framework. A comparison enables interesting reflection on change over 160 years. But what next?

**1944. THE FUTURE OF THE SOCIETY OF ANTIQUARIES OF SCOTLAND: FACING MODERN CHALLENGES**

**Contribution format:** Oral  
**Contribution authors:** Simon Gilmour – Helen Spencer – Jeff Sanders (Society of Antiquaries of Scotland)

The Society of Antiquaries of Scotland stands at a crucial juncture as it navigates the 21st century. With over two centuries of dedication to preserving and promoting Scotland’s archaeological and historical heritage, the Society must now adapt to rapidly changing societal and technological landscapes. This paper explores the future trajectory of the Society, emphasizing its commitment to inclusivity, interdisciplinary research, and public engagement. Economic instability threatens Scotland’s heritage, putting historical sites and artifacts at risk due to reduced funding. Moreover, the digital revolution presents both opportunities and challenges; while digital archives and virtual tour. can democratize access to history, they also require substantial investment and expertise. The Society must also address the evolving interests and demographics of its membership. Engaging younger generations and diverse communities is essential for the Society’s sustainability. This involves the evolution of its vision and values, reconsidering what Fellowship means in the 21st century, while also rethinking traditional methods of outreach and education, embracing new, innovative ways to make Scotland’s rich heritage relevant to all. The future of the Society of Antiquaries of Scotland centres on its ability to confront these challenges head-on. By fostering a culture of resilience, adaptability, and inclusivity, the Society can continue to protect and celebrate Scotland’s unique historical legacy for generations to come. This paper will briefly outline some of the ways the Society is looking to adapt and engage with these challenges.

**854. AN INTERNATIONAL PERSPECTIVE OF THE SOCIETY OF ANTIQUARIES OF SCOTLAND THROUGH SOME MUNRO’S UNPUBLISHED DOCUMENTS**

**Contribution format:** Poster  
**Contribution authors:** Angelica Gabrielli (University of Verona)

Robert Munro was the secretary of The Society of Antiquaries of Scotland from 1886 to 1899. Precisely at that period belong some autograph documents conserved in the De Stefani’s Private Archive, in the Verona’s State Archive. Specifically, they consisted of two letters, a postcard, and two attachments - concerning the program of Rhind Lectures - sent from Munro to De Stefani between 1888 and 1890. The documents, which seem to be unprecedented, are primarily related to the publication of the author’s most important contribution, “The Lake-Dwelling in Europe”, published in 1890. Notably, Munro requested information, illustrations, and permission to reproduce materials regarding certain excavations conducted by De Stefani, who served as the inspector of ministerial excavations in the Verona area during the latter half of the 19th century. These excavations pertained, of course, to the Bronze Age wet settlement considered in the project. Also, he asked to be an intermediary for other Italian scholars and their respective findings, such as Cordenons. This research is focused on a preliminary analysis of the correspondence between Munro and De Stefani, involving a detailed examination and transcription of the archival documents. The first section of the study quantitatively assesses these documents, while the second contextualizes them within the broader scientific milieu of the time, particularly the relationships between key figures in historical archaeology and their impact on major archaeological investigations. Finally, the poster partially explores the influence of European antiquary societies, such as the Scottish one, and their international connections through De Stefani’s study case. However, the years under analysis fit within the fundamental decades in which the disciplines developed, confirming the present relevance of this type of organisations in the History of archaeological studies.

**1986. ARCHAEOLOGY AND THE PUBLIC IN 19TH CENTURY LEICESTER**

**Contribution format:** Poster  
**Contribution authors:** Molly Pye (University of Leicester)

James Francis Hollings (1806-1862) and James Thompson (1817-1877) were newspaper editors/proprietors and archaeological pioneers from Leicester who were heavily involved in learned organisations. Analysis of the Leicestershire Mercury and Leicester Chronicle found unexpected evidence that public value was considered a distinguishing feature of archaeology, perhaps more than its objects of study, and was used to distance the discipline from antiquarianism. Thompson and Hollings shared a strong belief in the importance of archaeology to society, their involvement entangled with political activism. The perceived needs of the public drove their choices and archaeology’s public value motivated them to widen participation and gain support for the discipline. Archaeology was deemed especially beneficial to the working class whose experiences were elucidated along with the role of hidden figures such as PC Hart. Current conditions require archaeology to improve its relationship with the public. Research into the history of archaeology is essential; understanding the role of public value in the recursive development of archaeology and its relationship with the public will foster reflexivity and act as both a source of inspiration and means for engaging the public and ensuring public value.

2403. THE LISBON GEOGRAPHICAL SOCIETY AS AN ANTIQUARIAN SOCIETY: A 150-YEAR-OLD CHALLENGE

Contribution format: Poster  
Contribution authors: Ana Cristina Martins (IHC-Universidade de Évora / IN2PAST | Lisbon Geografical Society)

Founded in 1875 to defend Portugal’s interests in the territories of Angola and Mozambique, the Lisbon Geographical Society (SGL) quickly began to fill various gaps in the country’s academic milieu, although the active Association of Portuguese Archaeologists had existed in the same city (Lisbon) since 1863. Nothing, however, prevented the SGL from contemplating archaeological research, along with practically all areas of 19th-century knowledge, from an understanding of total geography, interweaving human and physical geography. This history is obvious today when it is made up of 35 commissions and study sections, comprising most of Portuguese (mostly male) senior university professors and researchers, with the particularity of having one of the best libraries in the country and a museum with thousands of artifacts of different origins and types. However, given the countless challenges currently facing institutions of this nature, we intend to reflect on the place of the SGL in an increasingly multivocal, multicultural, and demanding society wrapped in post-colonial discourse. Added to this is the urgency of evaluating the extent to which it can and needs to respond to a new way of being and doing things for generations that are little or no match for the model that still prevails within it. In other words, it’s important to understand how to make it survive and with it 150 years of the country’s history.

75 ARCHAEOLOGICAL ADVENTURES: THE BENEFITS AND CHALLENGES ASSOCIATED WITH WORKING IN MULTIPLE COUNTRIES AND/OR SYSTEMS

Session theme: 4. De nobis fabula narratur: archaeological practice and a profession in flux  
Session format: Regular session  
Session keywords: Transnational, Mobility, Foreign, Travel  
Session organisers: Ros O Maolduin (Rubicon Heritage | IAI - Institute of Archaeologists of Ireland | INFRA Europe - Archaeology for Infrastructure) – Franziska Lehmann (DArV - Deutscher Archäologen Verband) – Marcella Giorgio (ANA - Associazione Nazionale Archeologi) – Holger Schweiter (Transnet | CIfA - Institute for Archaeologists) – Brigitte Buss (Jacobs | CIfA - Institute for Archaeologists)

SESSION ABSTRACT

Archaeologists have always travelled; the adventure of travel is what lures many to become archaeologists in the first place. In the past, this typically involved groups of archaeologists from richer nations travelling to conduct projects in those less well off, sometimes with a colonial mindset. While the legacy of this arguably survives, times have changed. Today, most international projects are collaborative affairs, many individual archaeologists migrate from country to country seeking work, and commercial companies compete to win projects internationally. There are potential challenges and benefits associated with this. Philosophical and practical approaches to archaeology vary and it can be difficult to adapt; however, the experience of working in multiple systems allows one to compare, contrast and ultimately evaluate. We welcome papers from institutions, commercial companies, and/or individuals who have experience of working in or collaborating with people from different counties and can speak to this. We intend to publish the session as a monograph and ask that speakers prepare their submissions with this in mind.

CONTRIBUTION ABSTRACTS

289. ETHICS, STANDARDS AND GUIDANCE — FRAMEWORKS FOR INTERNATIONAL COLLABORATION

Contribution format: Oral  
Contribution authors: Paul Belford (Heritage Innovation)

The professionalisation of archaeology and cultural heritage work has increased during the last 50 years, alongside the emergence of international frameworks seeking to manage the various (and sometimes contradictory) strands of ‘sustainable development’. Many of these do not directly stem from, or relate to, heritage; however they have had an impact on the way that archaeology and cultural heritage is considered, protected and managed. International treaties, international financial standards, and procurement practices by international bodies (such as the EU and UN), have been influential in improving practical approaches to archaeological heritage management, by setting standards and guidance for large-scale projects. The work of professional associations such as CIfA and RPA has also begun to help create ethical frameworks for heritage management. However, whilst

large-scale internationally-funded infrastructure projects generally work to international standards, the picture is much more complex at national and regional levels. There are challenges in implementation where heritage management structures are not well established, or are vulnerable to political and other pressures. This paper will draw on recent experience in the Balkans to explore some of the issues and tensions around the implementation of professional standards and guidance, particularly where independent regulation is weak and ethical challenges are strong.

1232. EXPLORING THE ALIGNMENT OF PROFESSIONAL STANDARDS AND GUIDANCE TO SUPPORT UNIVERSAL ARCHAEOLOGICAL PRACTICE: CHALLENGES, OPPORTUNITIES....AND ADVENTURES

Contribution format: Oral  
Contribution authors: Jen Parker Wooding (Chartered Institute for Archaeologists)

The outcomes of archaeology are universal - the wealth of knowledge extracted from archaeological activities and research the world over has provided (and continues to do so) a vast history of the world we inhabit and of the civilisations that preceded us. However, the actual practice of archaeology is not universal; legislative frameworks, policy and approaches differ across jurisdictions, and for a profession operating internationally that can pose challenges, as well as opportunities for knowledge exchange and collaboration. This presentation explores the challenges and opportunities associated with aligning jurisdiction-specific guidance with universal professional standards to support consistency in practice wherever archaeologists are working. A collaborative project commissioned by the Department for Communities, Historic Environment Division is presented. This project reviewed the applicability of professional standard and guidance documentation (produced by the Chartered Institute for Archaeologists (CIfA) and the Institute of Archaeologists of Ireland) to archaeological guidance in Northern Ireland addressing recommendations published in Archaeology 2030. A Strategic Approach for Northern Ireland. The aim being to support the archaeological profession in Northern Ireland to consistently deliver archaeological activities to recognised professional standards. This project provided a valuable opportunity to explore one approach to guidance alignment that could potentially be adopted elsewhere. CIfA is the leading professional body for archaeologists in the UK and overseas, with members based across the world routinely working on international projects. CIfA has developed a range of Regulations, Standards and guidance to ensure that CIfA members work to high ethical and professional standards. This documentation collectively provides a regulatory framework which the Institute is currently updating for wider universal application. Providing professional standards and guidance that are applicable wherever archaeologists work is a key strategic objective for the Institute to maximise the benefits that archaeologists bring to society.

534. FROM THE ALPS TO THE PELOPONNESE, FROM UNIVERSITIES TO PRIVATE CONTRACTORS: A RANGE OF ARCHAEOLOGICAL OPPORTUNITIES

Contribution format: Oral  
Contribution authors: Veronica Testolini (Independent | Associazione Nazionale Archeologi (ANA)) – Regina Klöckl-Zorić – Elisabeth Trinkl (University of Graz)

This paper presents a Greek-Austrian collaboration, showcasing how an academic project can be successfully implemented through cooperation across multiple systems, including academia, private contractors, and public and private institutions from different countries. The project 6,500 Years of Solitude? Investigating Pottery from Pheneos, is led by the University of Graz and funded by the Austrian Science Funds (FWF), exemplifying how national funding schemes can foster international and interdisciplinary collaborations. Similar organisations, such as The British Academy, the Deutsche Forschungsgemeinschaft, and El Consejo Superior de Investigaciones Científicas, also play pivotal roles in supporting global archaeological research. While these institutions primarily advance their national research and innovation agendas, they also provide opportunities to develop archaeological research that extends beyond borders and colonial practices. The implementation of this project was based on a close collaboration between the University of Graz, Austria, and the Greek Ephoreia at Corinth. British, Austrian, Greek, and Italian private contractors, as well as public institutions, were also involved. Greek legislation strictly regulates the movement of archaeological artefacts outside of Greece. Consequently, the study of the Pheneos ceramic assemblage took place at both the excavation site and the museum depot in the Peloponnese, as well as in Athens at the INN Demokritos. Travel to Greece was essential, fostering productive exchanges but also presenting challenges, particularly in organisational terms. Mobility and effective planning of fieldwork was crucial to maximise efficiency, minimise disruption and optimise the limited time on-site. This paper examines the value of involving specialised collaborators in such projects, emphasising the advantages of working with private contractors. Additionally, it highlights the benefits of transnational synergies and addresses the challenges of working outside national borders. We will discuss how collaboration between nationalities enriched the research, while also reflecting on the impact of the project on the nearby local communities.

919. BEYOND LIMITS: WHAT HAPPENS WHEN ARCHAEOLOGY TRANSCENDS BORDERS? – REMARKS ON THE IMPACT OF INTERNATIONAL COLLABORATION IN ARCHAEOLOGY

Contribution format: Oral  
Contribution authors: Martyna Pacek (University of Wrocław)

International collaboration is critical in archaeology, encouraging various viewpoints and ground-breaking discoveries. Since the very beginning, archaeological research has been intrinsically international, with contributions from countries all over the world. The presentation highlights the importance of archaeologists collaborating beyond national borders, advocating for teamwork with a diverse array of researchers and organizations. The speaker has almost a decade of experience in working internationally, having written dissertations on diverse European cultures and collaborated with scholars from Europe and the United States. Author’s academic history includes a still ongoing work on PhD dissertation focused on the Mediterranean area and work on another PhD thesis that examines global artifact repatriation, highlighting the advantages of scholarly collaboration across borders. Archaeologists, as intermediaries conveying messages from the past, must remain open-minded and flexible – almost like generalists in the world of very narrow specialists – to accurately capture the long-lost worlds. The type of collaboration discussed necessitates a thorough reassessment of current methodologies and foundational questions within the discipline. The interdisciplinary aspect of archaeology, which includes academic, public, private, and voluntary sectors, provides distinct opportunities for partnership. Nevertheless, engaging in cross-national and cross-cultural projects introduces distinct challenges. Archaeologists are required to maneuver through varying regulatory frameworks, ethical considerations, and logistical obstacles, all of which can influence the execution and results of their work. Communication and collaboration may be hindered by language barriers and cultural disparities, potentially resulting in misunderstandings. Furthermore, the blend of diverse research methods and approaches necessitates a high degree of adaptability among team members. The need to reconcile the interests of local communities with scientific goals adds another layer of complexity since archaeologists should aim at honoring and integrating indigenous knowledge and perspectives into their work.

1162. FROM SMALL REGIONAL COMPANY TO TRANS-REGIONAL PARTNER – THE OPPORTUNITIES AND CHALLENGES OF INTERNATIONAL COOPERATION AT INFRA EUROPE JV

Contribution format: Oral  
Contribution authors: Sarah Wolff (ADW Archäologische Dienstleistungen Wolff | infra europe jv)

Germany’s commercial archaeology is characterised by many small companies that divide up individual regions or districts among themselves. Due to the different excavation guidelines of the federal states, they usually do not go beyond the borders of their federal state. Large-scale linear infrastructure projects, such as those currently underway in Germany, push this mosaic system to its limits – and illustrate the need for collaboration on a larger scale. Infra europe jv has brought together five companies of different sizes and from different countries to take on this challenge. International experience in large infrastructure projects and an internationally diverse team met with regional excavation companies, of which ADW is the smallest. This lecture highlights from the perspective of the smallest partner in the jv how work changes when you go from being a small regional company to a partner in a large-scale project. And how archaeologists from all over the world join forces to achieve great things together and thereby become freidns.

145. EXPLORING THE WORLD THROUGH ARCHAEOLOGY: NAVIGATING MOBILITY, IDENTITY, AND PASSION

Contribution format: Oral  
Contribution authors: Ivana Mirkovic (IMT School for Advanced Studies)

Becoming an archaeologist often begins with a profound curiosity about the human past and a passion for uncovering stories of ancient civilisations. However, the path to this profession is rarely easy, particularly in the context of international work. It demands constant adaptability to new institutions, methodologies, and cultures. Drawing on my experiences studying at nine universities across six countries, I explore how constant mobility has shaped my understanding of archaeology and my professional identity. This journey prompts reflection on key questions: Why do archaeologists travel? What are the benefits of international collaboration, and what challenges arise along the way. By sharing insights from my studies and collaborations in Bosnia and Herzegovina, Serbia, Italy, Portugal, France, Spain, and the Netherlands, I illustrate how international engagement enriches not only our knowledge of the past but also our ability to bridge various subfields of archaeology, ensuring its continuity in a world of constant transformation. This paper explores the broader implications of mobility in archaeology: the personal and professional growth it fosters, the obstacles it presents, and the ways it prepares archaeologists to contribute meaningfully to social and technological phenomena.

1550. ARCHAEOLOGICAL ADVENTURES AND ADMINISTRATIVE ADVERSITY: A CASE STUDY OF IRELAND’S IMMIGRATION SYSTEM AND INTERNATIONAL ARCHAEOLOGICAL EDUCATION

Contribution format: Oral  
Contribution authors: Brigid Melloy (Institute of Archaeologists of Ireland | Archaeological Management Solutions)

The globalisation of archaeological education and practice presents both opportunities and challenges for emerging professionals. This paper examines the complex intersection of international archaeological education and immigration policy through the lens of Ireland’s higher education system and archaeological sector. While Ireland actively recruits international students, seeing a 15% increase in non-EU enrolments in 2024, significant barriers prevent these graduates from contributing their expertise to Irish archaeology post-graduation. Despite the growing demands of Ireland’s archaeological sector and the country’s stated aims to become a global leader in education and innovation, the current immigration framework creates substantial obstacles for international graduates seeking to work in Irish archaeology. Drawing on personal experience as an American archaeologist navigating the Irish education and immigration systems, this paper explores the disconnect between Ireland’s desire to attract international students and its restrictive work permit policies. The research highlights how current immigration policies may perpetuate historical inequalities in archaeological practice, albeit in new forms - while students from wealthy nations can afford expensive international tuition fees, post-graduation barriers often prevent them from fully participating in the field they studied. This case study provides insights into the broader challenges of archaeological mobility in the 21st century and raises important questions about access, equity, and the future of transnational archaeological practice. The presentation will contribute to wider discussions about the benefits and challenges of archaeological work across different systems, examining how immigration policies shape opportunities for international collaboration and knowledge exchange in contemporary archaeology.

1218. WHAT DOES “WORKING ABROAD” MEAN TO YOU?

Contribution format: Oral  
Contribution authors: Brigitte Buss (Jacobs | CIfA)

To work in another country as a professional archaeologist in the commercial sector, a relevant degree or similar qualification is usually the first step to landing a job, a good understanding of the prevailing culture(s) and language(s) is generally useful, sometimes mandatory. Some employers may require membership level of an accredited professional institute and, depending on the job in question, mobilizing for fieldwork may also mean passing additional stipulations by regulating authorities. Few would question that professional qualifications are important to ensure that cultural heritage is protected or taken care of responsibly and to the highest professional standards. These may differ from country to country, as may well the type of archaeology encountered. Within Europe, the need to link to qualifications with specific geographic territories is, perhaps, predominantly administrative and legal in accordance with geopolitical divisions. Beyond this, regulatory requirements reflect a specific understanding of what good archaeological practice looks like within that realm. The link of geographies with requirements and its juxtaposition with an applicant’s professional qualifications and cultural identity can, however, reach near absurd levels. In federalist Germany, for example, regulations are applied at the federal state (Bundesland) level. Therefore “working abroad” may simply mean up the road across an otherwise invisible border, and a need to prove your qualifications beyond it, even within one nation. Working abroad is generally understood to mean outside your country of origin/residence, but in our multicultural and mobile world constellations are more complex. So, what does “working abroad” mean to you? This paper is intended a think piece with the aim to stimulate a discussion about modern professional identities and mobility.

2092. CAN WE TALK ABOUT INTERNATIONALIZATION IN ARCHAEOLOGY?

Contribution format: Oral  
Contribution authors: Marcella Giorgio (Associazione Nazionale Archeologi)

In economic terms, internationalization is the adaptation of an element (a commodity, a company) for potential use outside the market or environment in which the element operates, i.e. in other markets or nations. Applying this concept to archaeology, we can think of a company or a professional who operates in different countries not sporadically (e.g. one research excavation campaign per year) but as a normal professional practice, that is, having different partnerships and collaborations as a daily work area. This requires a knowledge of foreign regulations that allows one to apply one’s professional activity indifferently in different contexts. In a European system where there are no real borders and there is a tendency towards an increasingly shared economic and professional mobility system, the question therefore arises spontaneously: can we talk about internationalization in archaeology? Are professional archaeologists and archaeological companies ready to build professional networks in these terms? Does university and post-university training allow one to be ready to operate in a system

of this kind? Do the particularities and differences of the legislations of the various States represent a difficulty in the transactional mobility of archaeologists? Is the working methodology applied by European archaeologists a common basis for a shared dialogue or an element of dissimilarity? The intervention aims to try to answer the above questions and identify the critical and positive aspects inherent in the development of internationalization in archaeology.

76 UNTANGLING HEALTH AND DISEASE STATUS FROM A MULTIDISCIPLINARY BIOARCHAEOLOGICAL PERSPECTIVE IN EUROPEAN MEGALITHIC POPULATIONS (4TH-3RD MILLENNIA BC)

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Regular session  
Session keywords: Megalithism, Late European Prehistory, Macro and micronarratives, Pathologies, Human health  
Session organisers: Miriam Vílchez Suárez (Universidad de Granada) – Ramón López-Gijón (Universidade de Évora) – Sonia Díaz Navarro (Universidad de Burgos) – Marta Díaz-Zorita Bonilla (University of Tübingen)

SESSION ABSTRACT

Megalithism is one of the most important cultural phenomena in human history. This phenomenon, present on a worldwide scale, is characterised by the diversity and complexity of the monuments and the funerary practices. Despite the advances in the study of megalithic populations, information on their health and disease status remains poorly understood due to the limitations of these collective contexts where human remains are found commingled and deficiently preserved. Megalithic communities offer valuable insights into the health of ancient populations. Aspects such as diet, environmental changes, social structure, and diseases, played significant roles in shaping the health of these populations. It is expected that these individuals would have experienced specific health conditions reflective of their agrarian lifestyle, such as malnutrition, dietary deficiencies, degenerative joint diseases, oral pathologies or those associated with animal domestication. Furthermore, the physical demands of constructing large megalithic structures likely contributed to musculoskeletal stress markers and trauma. A detailed bioarchaeological analysis can reveal patterns of life, physiological stress related to poor and deficient diets, pathologies acquired during life, interpersonal violence, deficient hygiene levels and even medical (surgery) and care practices. In addition, stable isotopes or paleogenomics analyses complement osteological studies by linking health indicators to the geographical origin, dietary and mobility patterns, kinship, endogamy and pathogens. Untangling health status from a bioarchaeological perspective is essential for reconstructing their living conditions and understanding how these factors impacted their quality of life. The goal of this session is to bring together researchers for an update on their latest findings of health and disease of European megalithic populations (4th-3rd millennia BC) utilizing multidisciplinary approaches from bioarchaeology (e.g., palaeopathology, paleoparasitology, dental health, paleogenetic, isotope analysis, etc.). We encourage the presentation of general and case studies as well as new methodologies and strategies to establish guidelines for their identification and interpretation.

CONTRIBUTION ABSTRACTS

1365. GUIDELINES FOR PALEOPARASITOLOGICAL SAMPLING IN MULTIPLE BURIAL CONTEXTS

Contribution format: Oral  
Contribution authors: Ramón Gijón (Universidade de Évora | Universidad de Granada) – Miriam Suárez (Universidad de Granada)

The finding of parasites from archaeological contexts (discipline known as Paleoparasitology) allows us a bioarchaeological approach to the study of past populations. In particular, by finding parasite dispersal phases, we can learn about the socio-economic and hygienic-sanitary conditions of the human hosts. Although parasites can be studied in any material susceptible to preserve human fecal remains (cesspools, latrines, sewage pipes, etc.), the study of parasites present in sediment associated with human skeletal remains allows us a more accurate approach to their living conditions. Based on this type of studies, we can individualize parasitosis in order to approach the prevalence according to age and sex ranges, as well as perform multidisciplinary studies in which the presence of parasites is compared with bone pathologies and diets, among others. However, given the lack of soft tissue in these archaeological contexts, sampling is essential to be able to demonstrate the presence of parasites, thus avoiding false negatives. In the present contribution, we propose a methodology focused on the collection of paleoparasitological samples in sediment from human skeletal remains in multiple burials,

addressing the different cases that we can find and how to proceed in each of them.

2420. NEW APPROACHES TO NUTRITION, HEALTH AND INEQUALITY IN MEGALITHIC TOMBS OF DUERO BASIN (CENTRAL IBERIA) DURING THE 4TH MILLENNIUM BC

Contribution format: Oral  
Contribution authors: Cristina Tejedor Rodriguez – Ana Lorenzo-Barrio (University of Valladolid) – Sonia Díaz-Navarro – Rebeca García-González (University of Burgos) – Teresa Fernández-Crespo (University of Valladolid)

Megalithic tombs, especially the most monumental ones, have been and still are usually interpreted as ‘ancestors houses’, symbols of social cohesion, where all the members of the group would share the same burial space, losing their individuality and becoming part of the ‘social body’. However, several evidences have led these ideas to be called into question, such as the presence of a low number of individuals that does not fit well with what would be expected from the long-term funerary use of these sites, or the identification of the unnatural sex and age imbalances, generally favouring male adults. As a result, these megalithic tombs have been reinterpreted as ‘tombs of selected people’. Within this context, it is timely to re-evaluate megalithic collective burials, through new research questions and innovative perspectives. The Duero basin (central Iberia) stands as a key area of study for these new approaches, since this region has a well-defined geographical framework and a high density and diversity of megalithic monuments, including well preserved ossuaries. This oral communication, which is framed within the AGENDER project (‘Politics of death and diachrony of inequality in the megalithic tombs of the Douro Valley during the 4th millennium BC’), aims to reconstruct the dietary patterns of the individuals buried in megalithic tombs of the region as a means to approach health and disease experiences and social relationships of these populations. For this purpose, different complementary methodologies are applied, the combination of which represents an innovative strategy that not only offers a more accurate understanding of diet, but also of health, care and survival strategies. This work contributes to a better understanding of the living conditions, inequality, and diachronic variability of the communities burying their dead in megalithic tombs of the Duero basin during the 4th millennium BC.

1793. BIOARCHAEOLOGICAL ANALYSIS OF A LATE NEOLITHIC STONE CIST FROM DENMARK: HEALTH, DIET, AND SOCIAL STRUCTURE

Contribution format: Oral  
Contribution authors: Rikke Petersen (ADBOU: Unit of Anthropology Department of Forensic Medicine, University of Southern Denmark)

In 2019, a remarkable stone cist (hellekiste) was excavated on the island of Langeland, Denmark, dated to the Late Neolithic period (2400-1800 BC). As part of a master’s thesis project, osteological analysis was conducted on the remains of nine individuals buried in this late Neolithic grave. Despite the fragmented and commingled nature of the remains, the individuals represent a diverse demographic, including both sexes and various age groups, offering rare insights into the health conditions of megalithic populations in Europe. The paleopathological analysis revealed signs of nutritional stress, dental disease, and healed fractures, pointing to the physical strain of an agrarian lifestyle and potential interpersonal violence or accidents. These health indicators, found in both children and adults, suggest shared environmental and social stressors within the community. Evidence of healed injuries implies the existence of care practices, reflecting social responsibility and community cohesion. This research, employing bioarchaeological methodologies, provides valuable insights into the lived experiences of those buried in the hellekiste. It further illuminates how health, social roles, and identities were shaped by environmental and social factors. Isotopic analysis has further enriched the understanding of the diet for the buried individuals. While the exact span of usage for the hellekiste remains a subject of debate, with C14-dating still pending, the study still contributes to understanding the health challenges faced by megalithic populations during the 4th–3rd millennia BC and the interplay between health, social structure, and burial practices in Neolithic societies.

1880. ISLAND LIVES IN THE BONES: HEALTH AND ACTIVITY PATTERNS AMONG DOLMENIC COMMUNITIES FROM THE BALEARIC ISLANDS (3RD-2ND MILLENNIA BC)

Contribution format: Oral  
Contribution authors: Ángela Orosa-Queijo (Institute of Heritage Sciences (INCIPIT-CSIC)) – Edgard Camarós (University of Santiago de Compostela) – Pau Sureda (Institute of Heritage Sciences (INCIPIT-CSIC))

The megalithic phenomenon has been identified in the Balearic Islands from the end phase of the 3rd millennium BC and along the 2nd millennium BC through a wide variety of monuments and funerary practices. In this context, dolmens are the oldest and most representative structures of this phenomenon on the archipelago, being also linked to the first stable settlers of the islands. How does this first settlement affected prehistoric communities in

their biological anthropology? According to several authors, early island settlement is a harsh process with physiological costs reflecting life conditions evidenced among the skeletal assemblages through stress markers and a high frequency of skeletal pathologies. In this paper, we evaluate the health and lifestyle of the individuals buried in the Balearic dolmens with the aim of exploring the costs, influence and adaptations of living in an island. To do so, we analyse human skeletal remains macroscopically from key Balearic sites, in search of pathologies and skeletal markers of stress and adaptative processes. Additionally, taphonomic modifications are isolated within poor preserved and fragmented assemblages aiming to overcome pseudo-pathologies (ie., post-depositional changes affecting our identification of pathologies). Preliminary results of our research indicate physiological stress and specific skeletal markers as a potential response to island adaptation. Observation of a high incidence of enthesal changes, particularly present on the phalanges and femurs, and other stress markers may provide insights into daily activities. In addition, oral pathologies such as dental infection, extreme dental wear, and antemortem tooth loss, and degenerative diseases (eg. Osteoarthritis) provide further evidence of the health status of these prehistoric populations to an island context.

**142. HUMAN MOBILITY AND SUBSISTENCE PATTERNS FROM THE CHALCOLITHIC TO THE IRON AGE IN BEJA (SOUTHERN PORTUGAL)**

**Contribution format:** Oral  
**Contribution authors:** Linda Melo (Research Center in Anthropology and Health (CIAS). University of Coimbra | Center of Archaeology (UNIARQ). School of Arts and Humanities. University of Lisbon) – Marta Díaz-Zorita Bonilla (Institut für Ur und Frühgeschichte und Archäologie des Mittelalters. Universität Tübingen)

Isotopic analyses of human hard tissues (bones/teeth) are well established in Anthropology and Archaeology as a reliable way of reconstructing and interpreting both subsistence and mobility patterns of past communities. This study was based on an interdisciplinary methodological approach that combines anthropological, archaeological and biochemical data on human individuals from the Chalcolithic period to the 1st Iron Age from the Beja region (southern of Portugal).. A total of 14 archaeological sites were analysed from which 300 individuals were studied in detail. Regarding isotopic analysis, 156 samples were collected: 72 samples of human bone and 10 of fauna to investigate diet ( $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ), and 72 samples of tooth enamel and 2 of fauna to explore mobility ( $^{87}\text{Sr}/^{86}\text{Sr}$ ,  $\delta^{18}\text{O}$ ). The study aimed to document funerary practices in detail and to identify differentiation within the burial space arrangements, to characterise the diet of individuals and to understand differentiated access to food, but also to explore mobility patterns of these human communities. This diachronic approach allowed us to contribute to the characterisation of the life and death of these human populations that lived in a specific geographical area over a period of approximately 2500 years.

**1395. NEW APPROACHES TO THE ANALYSIS OF INFECTIOUS PROCESSES. CT AND SEM IN A MAXILLA FROM THE DOLMEN OF EL PENDÓN**

**Contribution format:** Poster  
**Contribution authors:** Sonia Díaz-Navarro – Nico Ciotto (Laboratorio de Evolución Humana, Universidad de Burgos) – Cristina Tejedor-Rodríguez – Manuel Rojo Guerra (Universidad de Valladolid) – Rebeca García-González (Laboratorio de Evolución Humana, Universidad de Burgos)

This paper presents a case study focused on an individual recovered from El Pendón site (Burgos, NW Spain), a megalithic monument used as a burial place for a hundred individuals during the 4th millennium BC. Specifically, a maxilla (EP-4551) belonging to a middle-aged male individual has been analysed. It exhibits severe oblique dental wear with chipping of the enamel, as well as calculus deposits in the labial and interproximal region of the posterior teeth. The most relevant aspect is the presence of a large abscess due to a periapical cyst on the upper left second molar (10.1 mm long by 7.2 mm wide). The lesion shows rounded edges without macroscopic traces of bone resorption and inside the alveolus there is a rounded orifice of 4.73 mm in diameter that connects with the maxillary sinus. The methodology consisted of multi-slice CT and bone remodelling maps with SEM from high resolution replicas. The CT scan clearly showed the external opening of a drainage channel because of a fistulation process and direct communication of the abscess with the maxillary sinus, causing sinusitis. SEM mapping allowed the detection of resorption in the affected area, suggesting that bone remodelling is acting to repair the damage of the infection. The use of this non-destructive methodology has made it possible to safely diagnose the pathology, analyse the extent of the infectious process, reconstruct how the destruction of the bone tissue occurred and determine whether the individual survived, as well as the estimated healing time.

**2183. MOBILITY AND HEALTH STATUS IN MEGALITHIC COMMUNITIES: A CASE STUDY FROM THE NECROPOLIS OF PANORIA**

**Contribution format:** Poster  
**Contribution authors:** Paula Becerra Fuelle (Department of Prehistory and Archaeology, University of Granada) – Javier Lescure Rodríguez (Dpto. de Biodiversidad, Ecología y Evolución, Universidad Complutense de Madrid) – Gonzalo Aranda Jiménez – Miriam Vilchez Suárez (Department of Prehistory and Archaeology, University of Granada) – Marta Díaz-Zorita Bonilla – Dobereiner Chala-Aldana (Tübingen University) – Marcos Marrero Santana (University of Granada)

This poster is part of the MigrAnt project at the University of Granada: Migrations in Social and Physical Anthropology in the Iberian Peninsula. The project aims to assess how mobility affects migrants today while also exploring parallels with prehistoric populations. Beyond the economic, personal, or social benefits that migration processes may have had for the migrant, the consequences often include stressful situations such as loss of identity, inequality, discrimination, xenophobia, or exile. Additionally, physiological stress can manifest through exposure to new pathogens, childhood health problems, or enthesal changes caused by long-distance walking. Moreover, migration leaves a direct isotopic imprint on the human skeleton through the consumption of local water and food, reflected in strontium isotopic values, among other isotopes. The Late Neolithic and Chalcolithic periods were characterized by the arrival of new populations, highly mobile societies, and strong exchange networks. As part of this study, we assess the proportion of migrant (non-local) individuals through isotopic analyses and examine their health status in relation to their potential exogenous origins. Preliminary data suggest that the proportion of non-local individuals in southeastern Iberia is relatively small. However, there is some observed association between individuals with non-local Strontium (Sr) isotope values and specific pathological conditions, particularly cranial pathologies. Through this poster, we analyze the relationship between non-local individuals and their health status during the 4th and 3rd millennium BC in the megalithic cemetery of Panoria (Granada, Spain).

**2284. HEALTH TRENDS THROUGH PHYSIOLOGICAL STRESS INDICATORS IN PORTUGUESE LATE NEOLITHIC MEGALITHIC POPULATIONS**

**Contribution format:** Poster  
**Contribution authors:** Dulce Neves (Research Centre for Anthropology and Health (CIAS), University of Coimbra | Department of History, Anthropology, Religions, and Performing Arts, Sapienza University of Rome) – Álvaro Calleja – Francisco Curate (Research Centre for Anthropology and Health (CIAS), University of Coimbra) – Ana Maria Silva (Research Centre for Anthropology and Health (CIAS), University of Coimbra | UNIARQ – University of Lisbon | Centre for Functional Ecology (CFE), University of Coimbra)

In Portugal, human remains from Late Neolithic Megalithic tombs are commonly unearthed. These populations are mainly found in collective burials, where intense manipulations of the human skeletons result in a mass of highly fragmented commingled bones, with little or no absence of anatomic connections. Henceforth, disarticulation, poor preservation, and incompleteness pose major challenges to the study of these collections. Despite these limitations, the meticulous analysis of these assemblages can contribute to the knowledge of the health and lifestyles of these individuals. To get insights and document long-term health trends of these communities, two physiological stress indicators, cribra orbitalia (CO) and linear enamel hypoplasia (LEH) were collected for Cova das Lapas (Alcobaça) and Dolmen de Ansião (Coimbra). LEH were scored in very low frequency in both collections. CO was found in 36.4% (4/11) of the non-adults and 21.0% of the adults (5/24) of Cova das Lapas, with major severity in the former group. Among the adults, all observed lesions were remodeled with one exception. CO was not detected in the Dolmen de Ansião sample. Further, possible co-occurrence with endocranial signs of infections were explored and investigated, prompted by the high frequency of this latter pathology in Cova das Lapas.

**2416. HEALTH AND LIFESTYLE IN PREHISTORIC CENTRE-NORTHERN AND NORTHERN PORTUGAL: THE ANCNORTH PROJECT**

**Contribution format:** Poster  
**Contribution authors:** Ana Bettencourt (Landscape, Heritage and Territory Laboratory (Lab2PT), Department of History, University of Braga | Research and Innovation in Heritage, Arts, Sustainability and Territory (In2Past)) – Ana Silva (Research Centre for Anthropology and Health, Department of Life Sciences, 2University of Coimbra | UNIARQ – University of Lisbon. Centre for Functional Ecology, Department of Life Sciences, University of Coimbra) – Aurora Grandal D’Anlade (Instituto Universitario de Xeoloxía, University of A Coruña)

– Pedro Fernandes (Centre of Molecular and Environmental Biology (CBMA), School of Sciences, University of Minho | Institute of Science and Innovation for Bio-Sustainability (IB-S), University of Minho) – Pedro Soares (Centre of Molecular and Environmental Biology (CBMA), School of Sciences, University of Minho | Institute of Science and Innovation for Bio-Sustainability (IB-S), University of Minho)

In the centre-northern and northern of Portugal, unlike in other parts of the country, human remains dating from the Late Prehistory are rare and highly fragmented due to the acidity of the soil. It was in this scope that the “Fine-scale study of ancestry, mobility and diet in the Copper Age-Bronze Age transition in northern Portugal”, FCT project (Ref. PTDC/HAR-ARQ/3286/2021) was proposed, involving geneticists, archaeologists, anthropologists and paleontologists from different universities, research units and countries. Through an interdisciplinary approach, this team intend to document data on the demography, pathology, ancestry, mobility and diet of the few human remains recovered in this region, from the Neolithic to the Bronze Age. These results will be compared with similar ones obtained for populations in the centre and south of the Iberian Peninsula. Here we present the first palaeopathological data, cross-referenced with isotopic and ancient DNA results, which have provided information on the health and lifestyle of the populations under study.

77 FROM FIRE TO COMPLEXITY: KILN INNOVATIONS AND SOCIOECONOMIC DYNAMICS IN POTTERY PRODUCTION

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: kilns, pottery production, technological innovation, craft specialization, pottery firing, social complexity  
Session organisers: Andreea Terna (Kiel University) – Felix-Adrian Tencariu (Al. I. Cuza University of Iasi) – Núria Miró Alaix (Museu d’Història de Barcelona) – Zsolt Vágner (PPKE, Hungary) – Anna Bach Gomez (Universitat Autònoma Barcelona)

SESSION ABSTRACT

The adoption and development of ceramic production technologies, particularly the use of kilns, have profoundly shaped prehistoric and historical societies. The introduction of kilns marked a transformative technological innovation, enabling better control over the firing process, improved pottery quality, and increased production efficiency. This innovation fostered craft specialization, economic interconnectivity, and new approaches to resource management. Despite these advantages, kiln technology adoption varied, with some communities retaining traditional open or pit firing methods. This session explores the dynamics of ceramic production areas in archaeological contexts, emphasizing technological, socio-economic, and environmental factors driving these changes. By examining kiln structures, workshop layouts, raw material procurement, and waste disposal patterns, as well as regional and chronological variations across Eurasia, the Mediterranean, and Europe, we aim to uncover patterns in the development of pottery production. Key questions include: What factors influenced the adoption of kiln technology in some societies while others maintained traditional methods? How did kiln innovations impact product quality, output, and trade networks? What role did technological and environmental constraints play in shaping production practices? We also investigate how ceramic production sites reflect broader societal dynamics, including urbanization, trade, and political shifts, with localized adaptations highlighting responses to resource availability and labour dynamics. Through interdisciplinary approaches—including geochemical analysis, spatial analysis, ethnographic comparison, and experimental archaeology—we seek to provide a comprehensive understanding of the interplay between technology, society, and craft knowledge in ceramic production from prehistory to present.

CONTRIBUTION ABSTRACTS

1614. EXPLORING TECHNOLOGICAL DIVERSITY IN HALAF CERAMICS DURING THE 7TH-6TH MILLENNIUM SHIFT IN UPPER MESOPOTAMIA

Contribution format: Oral  
Contribution authors: Anna Bach Gómez – Ana Sanmiguel De La Fuente – Lara Marín González – Eric Knibb (Universitat Autònoma de Barcelona)

The Halaf culture (c. 6100–5300 BCE) is renowned for its sophisticated ceramic production, which exhibits remarkable technological diversity across different regions of northern Mesopotamia. The sites along the Middle Euphrates, Khabur, and Tigris provide valuable insights into variations in raw material selection, manufacturing

techniques, and firing processes, reflecting both localized adaptations and broader cultural interactions. Although there is little evidence of production areas, it can be inferred from indirect evidence. In this context two hypotheses have been predominant. On the one hand, considering female domestic work in a household production, and the presence of specialized workshops suggests a centralized production system, possibly linked to long-distance trade networks. This contribution will work on demonstrate that Halaf ceramic production was not monolithic but rather adapted to regional conditions while maintaining a cohesive cultural identity. The technological diversity observed in these three regions underscores the complexity of Neolithic communities in Mesopotamia and their ability to innovate and interact within broader exchange networks. Understanding these variations provides critical insights into the economic and social organization of the Halaf culture.

204. LEARNING FIRE: SENSORY PERCEPTIONS AND PYROTECHNICAL CHOICES IN CHALCOLITHIC POTTERY PRODUCTION OF SOUTHWESTERN ASIA

Contribution format: Oral  
Contribution authors: Claire Padovani – Johnny Baldi (CNRS Archéorient)

In Southwestern Asia, the first kilns are adopted during the second half of the 7th – beginning of the 6th millennium BCE in different socio-economic, chrono-cultural and environmental contexts. The kiln is a particularly designed firing structure characterised by the separation of the combustion chamber, where heat is generated, from the firing chamber, where this heat is transferred to the clay material to be fired. In the archaeological literature, kilns are often – and wrongly – considered as more efficient firing structures due to their ability to reach higher temperatures, create and maintain a consistent atmosphere. Despite their supposed technical superiority, other types of firing structures continue to be used alongside them. It suggests that the use of the kiln is motivated predominantly by traditions, personal beliefs, social structures and cultural exchanges, rather than by a pursuit of performance. Operating a specific design requires a long apprenticeship of a specific set of gestures associated with that design, which is not easily transferable to other designs. Firing techniques are learned empirically, through demonstration and sensory signals, rather than through strict theoretical instructions. During firing, sensory signals directly influence the decisions taken by the potter to manage the firing in order to obtain a particular ceramic result. Over the long term, these signals form a frame of reference which guides the technical choices that shape the development of pyrotechnology. This paper investigates the adoption of kilns in Southwest Asia by comparing the socio-economic and environmental contexts of kiln-using societies, alongside the technical and cognitive distinctions involved in managing fire within kilns compared to other firing structures. How is the fire perceived in each type of structure? And what differences does this imply for learning the technique and managing the firing process?

1957. KILN INNOVATIONS AND SOCIETAL CHANGE IN THE NORTH PONTIC REGION DURING THE 4TH MILLENNIUM BCE

Contribution format: Oral  
Contribution authors: Andreea Terna (Kiel University) – Felix-Adrian Tencariu (Al. I. Cuza University of Iasi)

At the turn of the 4th millennium BCE, the North Pontic forest-steppe region underwent profound societal transformations, leading to the emergence of large, highly structured settlements, considered by many, examples of early urbanism. Despite varying in size from 15 ha in the western area to 300 ha in the eastern area, the settlements follow a consistent planning concept, featuring concentric rings of houses arranged around a central open space. This period saw significant advancements in technology and subsistence strategies, including the development of animal traction and the widespread use of manuring to support agricultural productivity. It is in this context that the widespread adoption of pottery kilns occurred. Excavations in recent years have revealed a dominant kiln type—a dual-chamber design with channels—spread across this vast region and showing relatively low morphological variation. Additionally, there is evidence of experimentation with new kiln designs, which would later evolve into the grate-type kiln, a characteristic type of the second half of the 4th millennium BCE. By using excavation data and experimental archaeology, our paper discusses the efficiency of particular technological choices in the building and use of the two pottery kiln designs and their consequences for the production scale and resource and labor organization.

2301. CERAMICS AND THE CITY: THE EVOLUTION OF THE BARCELONA WORKSHOPS

Contribution format: Oral  
Contribution authors: Núria Miró Alaix – Emili Revilla Cubero (Museu d’Història de Barcelona)

The archaeological interventions carried out in the last 20 years in the city of Barcelona (Catalonia, Spain), have made it possible to document kilns and dumps from various pottery centres in the city. These actions have allowed the recovery of a large volume of material that has been the subject of study and research, from the Museum of History of Barcelona, through various projects. In addition to morphometric and characterization analyses,

archaeometric-based analytical studies have been carried out, both on objects used for consumption and on waste material from the exhumed kilns. The identification of the different workshops was based on the location of the kiln itself, as well as the production areas of the workshop. These results have made it possible to characterize local production in Barcelona from Roman times to the 19th century. This particularity allows us to study both the technological development and the production and consumption patterns taking place in the city over more than 2000 years of history. Today, the names of the trades are still preserved in the toponymy of the streets of Ciutat Vella, such as Tallers and Escudellers, recalling the ancient location of the areas of the production centres.

93. TECHNOLOGIES, TRADITIONS, AND PROVENANCE OF CHALCOLITHIC POTTERY: A CASE STUDY OF CUCUTENI CERAMICS IN EASTERN ROMANIA

**Contribution format:** Oral  
**Contribution authors:** Ana Drob – Viorica Vasilache – Andrei Asăndulesei – Felix Tencariu (“Alexandru Ioan Cuza” University of Iasi)

In this study is presented a model of interdisciplinary ceramic analysis and laboratory experiments that provides new data about Chalcolithic pottery. The analyzed ceramic fragments come from several quasi-contemporary Chalcolithic (Cucuteni B1 phase, cca. 3800-3500 B.C.) settlements in Eastern Romania (Iași County), like the eponymous site of Cucuteni culture, Stroești-Pietrărie, and Dumbrăvița-Tarlaua Iezer. For the pottery, interdisciplinary methods are used to obtain more information about raw materials and production technology, inclusions, finishes, firing temperatures, and functionality. In this regard, the research also focuses on the raw material, like different clay deposits nearby the settlements that could serve as possible sources for the chalcolithic communities. These samples are subjected to experimental testing and chemical investigations for a comparative study at an intra- and extra-site level. The methods used in the analysis are macroscopy (shape, color, wall thickness, firing type, and inclusions type, distribution, form, and sorting), optical microscopy (texture of the paste, surfaces, and inclusions details), SEM-EDX (elemental composition), and μFT-IR (chemical compounds). Through this study, we want to contribute to highlighting the role of interdisciplinary results that led to the identification of technological features and specific ceramic traditions in the Chalcolithic period in Eastern Romania for a cluster of settlements. Thus, the proposed research ultimately provides a comprehensive overview of the ceramic technologies employed by Cucuteni communities through a broader spectrum of approaches and investigative methods.

716. PXRF INVESTIGATIONS INTO THE PROCESS OF CHALCOLITHIC CUCUTENIAN POTTERY PRODUCTION. A CASE STUDY

**Contribution format:** Oral  
**Contribution authors:** George Bodi (The Institute of Interdisciplinary Research, “Alexandru Ioan Cuza” University of Iași | Institute of Archaeology, Romanian Academy, Iași Branch) – Radu Pîrnău (Center for Geographical Research, Romanian Academy, Iași Branch | The Institute of Interdisciplinary Research, “Alexandru Ioan Cuza” University of Iași)

Hoisești – La Pod is a chalcolithic settlement situated in NE Romania, in the floodplain of the Bahlui River, and it belongs to the phase A of Cucuteni Culture. The unusual positioning has made it the object of interdisciplinary investigations, which advanced pottery production as the main possible site function. The hypothesis was further strengthened by the multi-analytical characterization of nine pottery shards and four possible raw materials samples from the area – clays from the riverbed, from different stratigraphic positions. Our presentation is focused on two main research questions: it seeks to verify the current working hypothesis and to also assess the utility of pXRF investigations into Cucutenian pottery. To this end, 34 pottery samples were analysed using a Bruker Tracer S1 Titan 800 pXRF spectrometer. The chemical composition data were statistically processed using R software to identify potential grouping and variances. The results indicated the presence of two distinct clusters based on elemental composition, suggesting homogeneity of the raw materials but different preparation techniques of the clay. This study demonstrates the potential of pXRF for Cucutenian ceramic analyses and it sets the stage for future research, based on larger sample sets, and aimed at inter-site comparisons to build a comprehensive framework for understanding the Cucuteni ceramic production. This work was supported by a grant of the Ministry of Research, Innovation, and Digitization, CNCS-UEFISCDI, project number PN-IV-P1-PCE-2023-0040.

1962. FIRE ON HIGH. ARCHAEOMETRICAL APPROACHES TO QUALITY CONTROL AND FIRING EFFICIENCY IN THE PRODUCTION OF THE CUCUTENI POTTERY

**Contribution format:** Oral  
**Contribution authors:** Florica Matau (Arheoinvest Center, Alexandru Ioan Cuza University of Iasi)

The Cucuteni-Trypillia culture represents a key reference point for understanding the technological advancements of Old European civilisation. Spanning a long period, approximately 4525/4500-3350 cal BC, and covering a large area of over 350,000 km² in present-day Romania, Ukraine, and the Republic of Moldova, this culture provides a

wealth of ceramic material, such as painted pottery and female figurines. These artefacts allow us to appreciate the technological capabilities of Chalcolithic artisans. Each phase of the pottery chaîne opératoire offers valuable evidence of their technical skills and innovative potential. The development of advanced pyrotechnological techniques among Cucuteni artisans was notably marked by the introduction of complex up-draught kilns, among the first of their kind in temperate Europe. Several factors influence the pottery firing process, including maximum temperature, heating rate, soaking time, duration, and thermal homogeneity. Despite a historically limited presence in Cucuteni-Trypillia settlements, recent advancements in large-scale geophysical prospection and subsequent excavations have uncovered several dual-chambered, up-draught kiln structures. One particularly noteworthy firing installation was recently identified at the eponymous site of the Cucuteni culture (Tencariu et al., 2022). The existence of pottery firing kilns within a settlement not only indicates local production but also offers valuable insights into the quality control measures employed by the potters. This study aims to evaluate the firing parameters of a representative dataset of pottery samples collected from the recent excavations at the Cucuteni-Cetățuie site, using these findings as a proxy to determine firing efficiency. To gain a deeper understanding of the firing conditions, we will employ thin-section petrography and X-ray diffraction analysis. The results will be further used to explore the degree of standardization and variability in the output of a pottery workshop within a Cucuteni settlement. Acknowledgements: This work was supported by a grant from the Romanian Ministry of Education, CNCS-UEFISCDI, project number PN-IV-P1-PCE2023-0040.

1747. THE CERAMICS FROM THE A-B SETTLEMENT OF CUCUTENI - DÂMBUL MORII (IASI COUNTY, ROMANIA)

**Contribution format:** Oral  
**Contribution authors:** Radu Balaur („Alexandru Ioan Cuza” University of Iasi, Arheoinvest Center)

The adoption of specific ceramic firing techniques, painting techniques, and raw materials and a high standardization of forms and decorations reflect not only advanced technological knowledge but also a degree of craft specialization within Eneolithic communities. . In this study, we will analyze the ceramics discovered in the Cucuteni A-B settlement at Dâmbul Morii. The analysis will be carried out both at the macroscopic level (color, painting, applied surfaces and treatments, shape/type of vessel, type of firing, etc.) and microscopically (optical microscopy, SEM-EDX).The study allowed detailed analysis of the multitude of aspects specific to the technological process of Cucuteni pottery production, starting with a deep insight into the characteristics of the raw materials, identification of the minerals present in the ceramic bodies, the analysis of the pigments used for painting the pots, as well as a thorough analysis of the factors involved in the high quality of the ceramics. . At the social level, we do not exclude the possibility that a master potter, who possessed all the knowledge necessary for the production of ceramics, would have divided certain tasks in the production process at the community level. As an argument, in addition to standard vessels with standard shapes and decorations, other vessels have been discovered that differ from the typical precision to which the bearers of the Cucuteni culture have accustomed us, the so-called „school vessels”. . . We want to compare the situation at this site with other phase A-B settlements to have a more concrete picture of the ceramic production. Finally, we would like to answer some questions related to the production of ceramics. Was there a local production of ceramics at the settlement of Dâmbul Morii? Were there specialized craftsmen and apprentices?

107. REFINING THE POTTERY CRAFT IN THE EAST EUROPEAN ENEOLITHIC (CUCUTENI-TRYPILLIA CULTURE): ARCHAEOLOGICAL EVIDENCE, SOCIO-ECONOMIC IMPLICATIONS, AND EXPERIMENTAL TESTING

**Contribution format:** Poster  
**Contribution authors:** Maria-Cristina Ciobanu – Adina Amărieuței – Analisa Ariton – Elena-Camelia Pintilie (Alexandru Ioan Cuza Iași University)

The East European Chalcolithic civilization of Cucuteni-Trypillia, renowned for its sophisticated painted pottery, exemplifies the correlation between socio-economic and demographic transformations and technological innovations. This relationship is evident with the onset of the final phase, Cucuteni B (ca. 3800-3500 BCE). The introduction and improvement of bicameral kilns, along with advanced pottery modeling techniques, including rotating supports, marked significant transitions in craft production. These innovations, together with the standardization of ceramic vessels, reflect the need to streamline production in response to population growth. The rapid adoption of these innovations indicates efficient inter-community exchange networks. This paper connects archaeological discoveries with recent experiments. Discoveries in Romania, Moldova, and Ukraine, correlated with our experiments, reveal new perspectives on pottery techniques. The usefulness of a rotating device in modeling large vessels has been demonstrated. Experiments on painting techniques validated recipes for the preparation of mineral pigments and slip, clarifying the role of polishing. Furthermore, experimental constructions of pottery kilns highlighted their evolution and improvement. Their use has demonstrated the efficiency of bicameral kilns and the relevance of technological innovations. The concern of prehistoric potters for innovation and

efficiency, quality and aesthetics demonstrates a deep understanding of materials and a constant desire to improve techniques, reflecting a complex society in which pottery played an essential role. These innovations reflect a dynamic society undergoing rapid expansion. Continuously refined, the craft of pottery responded to the needs of the community, contributing to its cultural identity.

79    WORLDS OF SENSATION: THE HUMAN BODY, THE SENSES AND NEUROSCIENCE

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Sensory Archaeology, Cognitive Archaeology, Material Culture, Landscape, Human body, Performance  
**Session organisers:** Susanna Harris (University of Glasgow) – Karina Groemer (Natural History Museum Vienna) – Sonia Machause López (University of Valencia)

SESSION ABSTRACT

The aim of this session is to bring together researchers from the humanities and hard sciences to present current research on approaches to sensation and perception of the human body in understanding the past. From a humanities perspective, sensory archaeology came to attention in the 1990s notably through Chris Tilley’s ‘Phenomenology of Landscape’ (1994) and Costance Classen’s ‘Worlds of Sense in history and across cultures’ (1993). Today archaeologists, historians and museum professionals use the sensorium as a tool for the analysis, presentation and interpretation of a plethora of actions/performances, things (stone, metals, textiles, houses, musical instruments), animals, plants, landscapes, spaces, monuments and periods in time (e.g. Gosden et al 2006, Howes 2006, Skeates 2010, Hamilakis 2013, Day 2013, Skeates and Day 2020; Landeschi and Betts 2023). From a hard science perspective, the senses are focused on the brain and nervous system as neural network, perceiving and responding to sensation. Developing out of Colin Renfrew’s cognitive archaeology of the 1990s, neuroarchaeology is used to apply to approaches for understanding the past through human cognition (Stout 2015). This includes the role of the mind as an organ processing human experience, and had been applied to making tools, complex decisions, language and understanding the evolution of humanity (e.g. Malafouris & Koukouti 2022, Malafouris 2019). Archaeologists have debated the tension between these approaches as treating the past (and present) body as a universal, with biological capacities that enable and restrict sensations, and the human as the centre of culturally ordered experiences, where biological capacities are interpreted according to ways of knowing. We invite archaeologists to present innovative methods and datasets exploring sensation from across the spectrum of humanities and hard sciences to address the question: what is the significance of human sensation for understanding the past, and present, of humanity?

CONTRIBUTION ABSTRACTS

407. SENSATION, PERCEPTION AND THE APPEAL OF LINEN TEXTILES IN THE DEEP PAST

**Contribution format:** Oral  
**Contribution authors:** Susanna Harris (University of Glasgow)

Research indicates that woven textiles are innovative materials of Neolithic and Bronze Age assemblages. The earliest preserved textiles are made of plant fibre, often flax, *Linum usitatissimum*. These were first present in Southwest Asia around 10,000 BCE, later adopted across the North Mediterranean, central and northern Europe. Given that textiles woven from flax (linen) were introduced into already existing cloth assemblages, how may this fabric have been perceived? Did they offer a unique and appealing range of sensations? On this basis, why may these textiles have become so widely adopted? This paper addresses these questions through results of a handling experiment. In the experiment participants were asked to respond to sensory questions about an assemblage of replica cloth-type materials including furs, leather, twining and knotless netting that are characteristic of some late hunter-gatherers, and a linen textile. The questions included aspects of visual appearance, odour, touch sensations and sound. Questions about preferences and dislikes revealed modern ideas of how sensation and perception relates to attitudes towards the materials, concepts of usefulness, ethics and cultural learning. By focusing on the linen textile, these results are used to address what may have been appealing and enduring about this type of cloth in the past.

1145. ATTENTION IS A ‘ZERO-SUM GAME’: ON THE EVOLUTION OF VISUAL PATTERNS OF ATTENTION IN PREHISTORIC CENTRAL GERMANY

**Contribution format:** Oral  
**Contribution authors:** Bruno Vindrola-Padrós – Lizzie Scholtus (Institute of Pre- and Protohistoric Archaeology, Kiel University | XScape: Material Minds (ERC 951631))

The study provides a different approach to explaining stylistic variation, i.e. from a visual cognition perspective, by focusing on the effects stylistic attributes (i.e. visual properties) of vessels have on human patterns of attention. In other words, our study focuses on what prehistoric pottery styles ‘do’ to their viewers. With the aim of determining the diachronic changes in visual patterns of attention towards pottery in prehistoric central Germany, a free-viewing experiment was conducted at the State Museum of Prehistory in Halle (Saxony-Anhalt, Germany) using 41 pottery vessels that span from the year 5500 to 1 BC, i.e. from the start of the Neolithic to the Late Iron Age. We used eye-tracking to analyse fixation locations and durations, along with pupillometry to assess cognitive load, while participants viewed these vessels. We found that participants primarily focused on decorative patterns, with pottery from the Early Neolithic period receiving the most visual attention. The results indicate that in general pottery styles become decreasingly captivating or attention-grabbing during the last five thousand years of prehistory, which we argue was linked to the increase in standardisation of pottery, the shift of the household and part-time specialisation of craftsmanship towards other materials that functioned as new media of symbolic expression (e.g. metals and glass), and the increasing diversification of different social spheres (e.g. economic, ritual, socio-political). As a consequence, we argue, a feedback mechanism was created between the loss of interest in pottery as the main medium of symbolic expression and its visual cognitive effects, leading to a shift in attention towards other crafts and specific social spheres. Our study, thus, shows how material culture played a role in perpetuating, but more importantly transforming patterns of visual attention in relation to changes in social institutions.

946. RATTLING JEWELLERY AND SOFT CLOTH - SENSORY ASPECTS OF HALLSTATT PERIOD CLOTHING

**Contribution format:** Oral  
**Contribution authors:** Karina Groemer (Natural History Museum Vienna)

This paper aims in presenting case studies from the Early Iron Age in Central Europe, about the sensory aspects of textiles and dress, about look, touch, feel and sound: a grave with large brooches with rattling pendants from Hallstatt and ornaments with rattling pendants and bobbles from the Býčí skála Cave – both markers of the social elite. Visual signals sent for example with clothing, jewellery or headgear, together with body language (gestures, posture, and stance), are unconsciously read by the receivers who then decode and understand them. This aspects of visibility relate to a direct, non-verbal communication and such interaction between people. Studies in semiotics also work with visual codes such as colours, brightness, design, pattern and others – those are traditional aspects to be analysed e.g. on metal artefacts such as jewellery and dress accessoires. For our understanding of Iron Age garments, also thoughts about touch and feel, soft wool vs. hard metal elements are to be discussed as well as the impact of sound. In Hallstatt Culture, brooches with rattling pendants as well as jingles, bells and other sounding items have been used as personal ornaments and were attached to garments, especially of rich women. In an interdisciplinary approach this can be studied in music-archaeological, acoustic and psychoacoustic research. The sounds of the objects create acoustic fields, influence the acoustic environment of the people and thus their listening habits. Such, a visual and acoustic code of clothing of Iron Age ladies of the upper social strata is created, including specifics of haptics.

2157. THE SENSORY EXPERIENCE OF FUNERARY TEXTILES IN ETRURIA

**Contribution format:** Oral  
**Contribution authors:** Audrey Gouy (University of Lille)

The sensory dimension of textiles in Antiquity has been highlighted several times (Harris 2019, Harris 2022, Grömer et al. 2024). Indeed, fabrics stimulated and engaged the senses. They affected through their appearance, their weight, their smell, their texture, their sound. And as such, they provoked emotions. Textiles were particularly used in funerary rituals. They contributed to create a ritual and consecrated space. They defined a suspended moment in everyday life. And they assisted both the living and the dead in a crucial moment of social, psychological and symbolical transition. This paper aims to investigate the use of textiles in Etruscan funerary practices, and to focus on their sensory dimension. The cross-study of archaeological finds and iconography shows indeed an extensive use of textiles during funerals. They were manipulated as dress, furniture, and tents. The investigation and analysis of data show that specific textiles were appearing at different times and stages during the funerals, creating thus different sensory experiences all along the funerals, from the public exposure of the dead (prothesis), to the deposit of the corpse in the grave, and the closure of the tomb. Moreover, textiles appear to have been intensively manipulated during some specific funerary performances, which were held as close as

possible to the dead, such as dance, music, banquet, and wine consumption. Indeed, it appears that actors and performers were regularly changing dress, with the aim to control the emotions of the participants through textiles’ colours, forms, texture, motion, and sound. Furniture and tents were also highly engaged in funerals, by organizing performances around the dead, actively creating a space of intense emotions and mixed sensations, and highlighting the different stages of the funerals.

1888. HERITAGE WITHOUT HERITAGE: DEVELOPING A MULTISENSORY MUSEUM MODEL OF AN UNEARTHED ROMAN BATH

Contribution format: Oral  
Contribution authors: Mila Mitrovic (University of Belgrade – Faculty of Architecture)

In recent decades, there has been a growing focus on sensory aspects across various scientific disciplines, including museology. Traditionally dominated by an oculus-centered approach, contemporary museum practices increasingly integrate multisensory methods for object presentation and learning. This paper explores the potential of representing the heritage of Roman baths and bathing culture through a multisensory architectural approach, using the case of Niška Banja. Niška Banja, spa town of Niš, presents a unique site: as a thermal spring with a long history of use, it is known to have been used by the Romans and is linked to the nearby Mediana archaeological site. However, the remains of its Roman baths remain largely unexplored and undocumented. The first part of the research investigates sensory experiences in Roman baths, using the Caracalla Baths as a primary example, alongside a comparative analysis of other Roman baths in the Moesia Superior region. This analysis is further supported by the study of Vitruvius’ Ten Books on Architecture, which provides detailed descriptions of Roman bath structures and their architectural principles. The second part explores how these multisensory experiences can be interpreted through architectural design. The result is a design project for a museum that integrates multisensory architecture to offer insights into the heritage of Roman bathing culture. The proposed museum aims to bridge the gap between the known but unexplored heritage of Niška Banja and contemporary audiences, creating a space where history is experienced through the senses, rather than merely observed. This approach not only preserves the legacy of Roman baths but also redefines how visitors interact with archaeological narratives beyond traditional visual representation.

952. STRANGE SMELLS AND NOISY NEIGHBORS: SENSORY ENCOUNTERS BETWEEN HUNTER-GATHERERS AND EARLY FARMERS

Contribution format: Poster  
Contribution authors: Milica Mitrovic (Archaeological Collection, University of Belgrade)

Through the senses, individuals gather information about the external world, both consciously and unconsciously. Both biological predisposition and cultural influences shape the process of information processing before a stimulus is even perceived. When studying sensory perception, we assume similar abilities within the same human or animal species. In humans, the senses register stimuli at different distances. Vision detects distant stimuli, and smell and sound work at mid-range, while taste and touch require direct contact. These stimuli are categorized as familiar or unfamiliar. According to appraisal theory, a stimulus can be perceived as desirable (useful or pleasant), dangerous, or irrelevant. This perception triggers a reaction based on personal experience and cultural codes (such as taboos), leading to avoidance (flight), confrontation (elimination of the stimulus), or approach. Within this framework, I examine the Neolithization period from the perspective of Mesolithic communities. Early farming and herding populations brought new objects and behaviours into Europe, creating a challenging and unfamiliar sensory environment for local hunter-gatherers. So, were Neolithic newcomers perceived as “smelly and loud neighbours”? This study explores interactions between these communities—conflict, coexistence, and passive non-interference—through the lens of sensory perception. Dynamic models of understanding and evaluating the sensory world of “others” or “strangers” will be examined using ethnographic, anthropological, and sociological research on interethnic relations in contexts of colonization and globalization.

2267. PERFUMED LANGUAGE: THE USE OF SCENT-IMAGERY IN SAPPHO, CATULLUS, AND OVID

Contribution format: Poster  
Contribution authors: Seraphina Vasilodimitrakis-Hart (Aristotle University of Thessaloniki)

This poster examines the uses of scent-imagery in Catullus and Ovid and how these perfumed images reference the use of enargeia in Sappho’s poetry. Scent-imagery creates a scented atmosphere in which the action of the poem takes place, while also allowing the poet to make oblique references. This obliqueness suits the Neoteric poetry of Catullus, and Ovid’s referential style, while Sappho’s poetry makes use of scent-imagery to create atmosphere. In an essay on sparsiones and the role of smell and colour in the Roman circus, Jo Day writes that “The fragrant nature of the sparsiones meant that colour had smell, something that Romans would have been used to and maybe even expected, as many perfumes were dyed” (Day 2017: 186. This statement can also apply to poetic

descriptions. If the sparsiones of the circus and everyday perfumes were tinted, then they created an association of scent with colour, and this could be exploited to great effect in poetry. The poets make liberal use of headily scented herbs and flowers to describe colour. They can evoke a complex ‘smellscape’ while simultaneously describing a colour indirectly and poetically. This all fits into a larger poetic tradition, particularly in elegiac and lyric poetry, but the very clear influence Sappho had on Catullus, who in turn was a great influence on Ovid, suggests a more direct link between these three great poets. Though they follow her lead, the two Roman poets put their own spin on Sappho’s perfumed words: Catullus tends to add a dirty twist to his scent-imagery, combining low-brow vulgarity with high-brow poetry; while Ovid plays with the relationship between colour and scent. The implicit delicate and fleeting nature of florae and their scents, as well as their beauty, gives them a privileged role in love affairs and love poetry.

80 HUMAN REMAINS IN SETTLEMENTS: BURIALS, NON-BURIALS AND...WHAT ELSE?

Session theme: 3. Exploring methods in research, education and communication  
Session format: Regular session  
Session keywords: Settlement Burials, Archaeothanatology, Bioarchaeology, Funerary Practices,  
Session organisers: Penny Bickle (University of York) – Laura Waldvogel (Laboratoire d’archéologie préhistorique et anthropologie (LAP), Université de Genève) – Iseabail Wilks (University of York) – Sabina Cveček (Field Museum, Chicago | Austrian Academy of Sciences) – Sofija Stefanović (University of Belgrade)  
Session discussant: Kevin Kay (University of Leicester)

SESSION ABSTRACT

Archaeological research often documents the discovery of human remains in settlements, regardless of the period concerned. They are found in pits dug for this very purpose or in domestic pits reused after their original function (e.g. silos). Furthermore, those remains appear as either complete or incomplete skeletons – in the latter case, ranging from isolated or scattered bones to anatomical segments. These characteristics, which have sometimes been opposed to contemporary practices noticed in corresponding graveyards, have led researchers to put forward various hypotheses, such as the social exclusion of these individuals by the group (e.g. “deviant” or “atypical” burials). They are often viewed as low status in comparison to those receiving other burial rites and hence are often also devalued in our archaeological narratives of mortuary rituals. However, the ethnographic record demonstrates the complexity of practices and that we should not interpret these remains based on their context of discovery alone. Indeed, ethnographic records testify to various practices and gestures, (un)related to funerary customs, that may have resulted in the presence of bodies or the scattering of bones, either within the village space or the houses themselves (e.g. burial deprivation, cases of malemort, judicial decisions, ancestor worship, personhood). This session invites papers dealing with human bones found in settlements, with no geographical or temporal limits. Papers considering a broad range of themes are welcomed, including archaeothanatology, bioarchaeology, grave goods, kinship and social hierarchy, as well as funerary rites and depositional practices. Its aim is to encourage the interrogation of these types of human remains and discuss a variety of methodological approaches, including mixed methods. The aim of this session is to interpret the practices behind those deposits, mobilizing ethnographic data, wherever possible, to open up the field of interpretative possibilities.

CONTRIBUTION ABSTRACTS

535. INHABITING DEATH: EXPLORING THE ROLE OF SETTLEMENT BURIALS IN COPPER AGE ITALY

Contribution format: Oral  
Contribution authors: Annamaria Daniele – Giulia Recchia – Alberto Cazzella (Sapienza University of Rome, Department of Antiquity)

Human remains found in settlements during the Italian Copper Age (IV–III millennia BCE) offer valuable insights into the practices and social dynamics of prehistoric communities. These burials vary widely, from fully intact interments to scattered or incomplete skeletal remains, reflecting diverse choices in how the dead were treated and revealing the complex connections between the living and the deceased. This study focuses on the relationship between burials within settlements and those in formal cemeteries, asking whether these deposits reflect marginalization, ritual practices, or alternative forms of social representation. Central to the investigation is the question of access: why were certain individuals buried within settlements while others were interred in necropolises? Who were the people buried in these domestic contexts, and what factors—social, symbolic, or practical—shaped their place of burial. By analysing burial typologies, bioarchaeological data and associated

grave goods, this study seeks to reconstruct aspects of community life and explore the organization of Copper Age societies. The comparison of settlement burials with contemporary necropolises aims to identify patterns of inclusion and exclusion, providing a deeper understanding on the social and cultural dynamics that shaped burial practices within settlements during the Copper Age in Italy.

**669. BURIALS WITHIN SETTLEMENT FEATURES OF THE EARLY BRONZE AGE IN SOUTHEASTERN POLAND**

**Contribution format:** Oral  
**Contribution authors:** Anita Szczepanek (Institute of Archaeology an Ethnology Polish Academy of Sciences | Department of Anatomy Collegium Medicum Jagiellonian University) – Paweł Jarosz (Institute of Archaeology an Ethnology Polish Academy of Sciences)

In the Early Bronze Age of southeastern Poland, the tradition of burying human remains within settlement features is evident. These structures date to the period 2300–2000 BC and are associated with Early Mierzanowice culture communities. The burial pits were indistinguishable from typical settlement features and, in most cases, contained more than one individual. These burials predominantly included the remains of young individuals and females, with some representing partial interments. In contrast, male burials from this period were typically located in cemeteries and were accompanied by grave goods in accordance with established funerary customs. A notable aspect of the Mierzanowice culture is the scarcity of children’s graves within cemeteries. The arrangement of human remains found within settlement pits suggests that the deceased were not interred at the same time, resulting in their placement across different stratigraphic layers. Detailed examinations of the skeletal remains allowed for the reconstruction of the sequential use of these pits, which was further validated through radiocarbon dating. Additionally, stable carbon ( $\delta^{13}\text{C}$ ) and nitrogen ( $\delta^{15}\text{N}$ ) isotope analyses were conducted to reconstruct the diet of the buried individuals, while strontium isotope ( $^{87}\text{Sr}/^{86}\text{Sr}$ ) analyses provided insights into their mobility patterns. These integrated studies have significantly enhanced our understanding of burial practices and social dynamics in the Early Bronze Age of southeastern Poland. This research was funded by the National Science Centre, Poland (NCN), under project number 2020/39/B/HS3/00454.

**729. INTRA-SETTLEMENT BURIALS, KINSHIP, IDENTITY AND SOCIAL INCORPORATION (OR NOT)**

**Contribution format:** Oral  
**Contribution authors:** Stella Souvatzi (University of Thessaly)

However small in absolute numbers, the burying of the dead and generally the presence of human remains within the boundaries of the settlement still is a social and symbolic praxis that encodes distinct aspects of a community’s narratives, worldviews and social rules, not least because it apparently did not include the majority of the population. This is particularly true for contexts like Neolithic Greece and Turkey, and generally Southeast Europe and Southwest Asia, in which the vast majority of human remains comes from everyday, lived spaces. In fact, the scarcity of cemeteries or of separate mortuary sites in these regions is contrasted with the abundance of settlements, and the general lack of emphasis on the visibility of the dead underlines the focus on the realms of the living and the daily interaction at the household and the community level. Within this wider social and cultural framework, the noted diversity in intra-settlement mortuary rites deserves spatial attention. Using settlement data from Neolithic Greece and to a lesser extent from Turkey, this paper identifies particular patterns of the disposal of the deceased and the manipulation of human bones, depending, for example, on location, treatment, age and gender, and attempts to tie these to key social phenomena, including kinship, identity, memory and degrees of social incorporation (or exclusion).

**842. INVISIBLE DEATH RITES IN THE EARLY NEOLITHIC: RESULTS OF ARCHAEOETHANATOLOGICAL ANALYSIS OF LINEARBANDKERAMIK SETTLEMENT BURIALS**

**Contribution format:** Oral  
**Contribution authors:** Iseabail Wilks (Department of Archaeology, University of York) – Zuzana Hukeľová (Institute of Archaeology, Slovak Academy of Sciences) – Martin Furholt – Katharina Fuchs – Maria Wunderlich (Institute for Prehistory and Early History, Christian-Albrechts-University, Kiel) – Krisztián Oross (Institute of Archaeology, HUN-REN Research Centre for the Humanities) – Zdeněk Tvrdý (Anthropos Institute, Moravské zemské muzeum, Brno, Czechia) – Penny Bickle (Department of Archaeology, University of York)

The central European early Neolithic Linearbandkeramik culture (c. 5500-4900 cal. BC) is associated with an extensive burial record, comprising thousands of individuals recovered from both cemeteries and settlements, and treated in diverse ways. However, one form of practice is often cited as ‘regular’. This comprises the fresh body

deposited in a grave at a cemetery, flexed on its left side, and provisioned with grave goods. This narrow definition of normative practice results in burials from settlements, which show greater diversity in character and are less frequently furnished, being understudied or even explicitly dismissed as ‘deviant’. However, the application of fresh methodological and theoretical perspectives, such as those derived from archaeoethanatology, provide new material for the interpretation of mortuary practice within settlements. If the body is considered the central element of the burial and studied accordingly, new evidence for complexity, care and intimacy is highlighted within these diverse mortuary practices. This paper presents the results of retrospective archaeoethanatomical analysis conducted on settlement burials from the central European distribution of the Linearbandkeramik, and considers the potential contribution of a ‘body-first’ approach to the broader study of funerary material from settlements.

**1359. RECONSTRUCTING ENEOLITHIC FUNERARY PRACTICES AT FORNACE CAPPUCCINI (RAVENNA, ITALY): MULTI-DISCIPLINARY ANALYSIS OF PRIMARY AND SECONDARY BURIALS WITHIN AN ANNU-LAR DITCH**

**Contribution format:** Oral  
**Contribution authors:** Teresa Nicolosi – Sara Silvestrini – Sara Bernardini (University of Bologna) – Federico Lugli (University of Modena and Reggio Emilia) – Mary Anne Tafuri (Sapienza University of Rome) – Monica Miari (SABAP per la città metropolitana di Bologna e le province di Modena, Reggio Emilia e Ferrara) – Rita Sorrentino – Valentina Mariotti – Maria Giovanna Belcastro – Stefano Benazzi (University of Bologna)

The contribution examines a site which is a unicum among Italian Eneolithic funerary contexts, represented by Fornace Cappuccini (Ravenna, northern Italy). Starting from the Neolithic, the site was originally used for housing purposes and was characterised by the presence of an artificial annular ditch, alternatively interpreted as a defensive or hydraulic structure, a stockyard or the perimeter of a sacral area, although its original function remains unclear. In a subsequent phase, during the Eneolithic period, the ditch was re-used for funerary purposes hosting several human remains in both primary and secondary deposition, along with the remains of at least two canids and other faunal material. The present study aims at investigating the peculiar funerary ritual put into practice within the ditch and its possible implications. After calculating the minimum number of the individuals and assessing the representation of each skeletal element, we conducted a careful taphonomic analysis of both primary and secondary burials, highlighting the presence of some perimortem lesions likely related to defleshing and disarticulation. Different types of burials may suggest different phases of a funerary ritual likely intended to create secondary burials with a deliberate selection of specific bone elements, particularly crania. At the same time, different treatments of the individuals may suggest different social roles. Primary depositions of adults are mostly related to female individuals, thus we decided to run enamel peptide analysis of the protein amelogenin in order to determine the sex of the only child in primary deposition. Then, we performed C, N and Sr isotope analysis to explore the diet and the provenance of the individuals in order to highlight eventual differences among them. Together, these analyses offer new insights into the complexity of Eneolithic funerary practices at Fornace Cappuccini, shedding light on the ritual and social dimensions of this unique burial context.

**1839. ANCESTORS, ACCIDENTS, OR ODDKIN: WHO CAN SETTLEMENT REMAINS BE, AND WHAT CAN THEY DO?**

**Contribution format:** Oral  
**Contribution authors:** Marianne Hem Eriksen (University of Leicester | National Museum of Denmark) – Kevin Kay – Veronica Tamorri – Emma Tollefsen (University of Leicester)

In late prehistoric Scandinavia, human remains are frequent (and frequently overlooked) settlement finds. They present an interpretive dilemma: who are these people, why are they here, why aren’t they in cemeteries? Interpretations are generally made on an ad-hoc basis, with little synthesis or theoretical consideration. Cemeteries in the period are often characterised as ‘family plots’ or ancestor-commemoration, and sometimes settlement remains are interpreted in this rubric. Other remains sit in an uncomfortable space, sometimes interpreted as ‘votive offerings’ and other times as ‘accidental inclusions’. All three interpretations pivot around the idea of conscious depositional intent: can one ever unintentionally bury (e.g.) a human femur? Are all interactions with dead bodies textured by reverence for the person themselves? Can bodies be objects. We want to sit with this interpretive discomfort, considering how human bodies get worked into everyday spaces and social relations in ways that challenge modern notions of personhood and interpersonal ties. Presenting ongoing work on settlement remains from Iron and Viking Age Scandinavia as windows on prehistoric body-politics, we show how bodies part and whole texturised dwelling spaces and practices, without necessarily being humanised as ancestors or persons.

1902. EARLY PERMANENT SETTLEMENTS AND DOMESTIC BURIALS DURING THE DANUBE GORGES MESOLITHIC-NEOLITHIC TRANSFORMATIONS (VLASAC AND LEPENSKI VIR): DOMESTICATING THE OTHER?

**Contribution format:** Oral  
**Contribution authors:** Camille De Becdelievre (Associate member, AMU, CNRS, Minist Culture, UMR 7269 LAMPEA) – Sabina Cveček (Field Museum of Natural History, Chicago | Austrian Archaeological Institute, Vienna) – Tamara Blagojević – Aleksandra Žegarac – Jelena Jovanović (BioSense Institute, University of Novi Sad) – Sofija Stefanović (Laboratory For Bioarchaeology, Faculty of Philosophy, University Of Belgrade)

Between the Final Epipalaeolithic and Early Neolithic, new ways of occupying environments, along with the construction of durable settlements, triggered the impulse for domestication. As stabilizing structures, houses played a central role in shaping the emerging “domesticated” lifestyle by centralizing daily practices. Early on, the dead became part of the domestic sphere, integrated within built environments. The increasing proximity between the living and the dead may reflect a deeper link between symbolic rituals and the social or cognitive foundations of early village life. After millennia of adaptation in the Near East, the Neolithic package spread into Europe, encountering Mesolithic hunter-gatherers with markedly different ways of inhabiting the world. In the Danube Gorges (Central Balkans), exceptionally well-documented sites such as Vlasac and Lepenski Vir provide unique insights into this transition: Mesolithic constructions and burial practices, Mesolithic-Neolithic interactions and the emergence of a unique hybridized culture, as well as the adoption of domesticates. Using bioarchaeological proxies, this paper explores the cultural, social, and symbolic significance of in-house burials in early sedentary contexts and their transformation over the Mesolithic-Neolithic transition. Inferred biographies (sex, age-at-death, diet, origin, ancestry) of individuals associated with built structures are examined alongside aspects of the mortuary record. In the Gorges, particular social or biological identities are distinct in Mesolithic mortuary practices, especially in relation to built structures. During the Mesolithic-Neolithic contact period, architecturally refined houses may have served specific roles, including facilitating cultural and biological interactions between groups. In this context, in-house burials seem particularly linked to the fluids identities of those considered ‘New’ or ‘Transitional’ within the community—whether neonates, newcomers from agricultural back-grounds, or migratory non-human-animals. From a symbolic perspective, constructed buildings and in-house burials may have contributed to the domestication process, granting a social status to ‘the Other’ – hybridized, incorporated, and anchored into the domestic sphere.

1936. AT ODDS... YET THE CHORUS GROWS: A MULTIVARIATE PERSPECTIVE ON MORTUARY PRACTICES AND SOCIAL DYNAMICS AT PORTO TORRÃO (PORTUGAL)

**Contribution format:** Oral  
**Contribution authors:** Mónica Corga (UNIARQ - Centro de Arqueologia da Universidade de Lisboa | Morph / Octopetala, Lda. | FCT – Fundação para a Ciência e a Tecnologia)

The megasite of Porto Torrão is a large ditched enclosure in southwest Iberia occupied from the mid-4th to the late 3rd millennium BC. Since its first discovery, in the 1980s, preventive archaeology excavations yielded extensive data, revealing a complex mortuary landscape. Human remains, both within and beyond the enclosed area, are found in ditches, pits, or collective tombs - clustered or isolated -, as primary depositions or evidencing significant post-depositional manipulation. The deposition of bones or corpses in pits and ditches has traditionally been regarded as uncommon, challenging conventional mortuary models, within a cosmological framework thought to be dominated by collective graves. However, expanding datasets suggest that this ”non-normative” classification may stem from an interpretative bias shaped by research priorities and preconceived expectations. The combination of Geoarchaeology and Archaeothanatology field protocols and post-field spatial, stratigraphic, and archaeometric analysis, has allowed a multivariate approach to the attitudes towards death and the dead among the dwellers of Porto Torrão, both in a synchronic and diachronic perspective. This fine-grained reconstruction of the site’s mortuary system(s) allows the discussion of:

1. Situated mortuary contexts in place – analysing how mortuary practices were embedded in specific locations;
2. Variability in mortuary operational sequences – examining funerary rites and depositional practices over time, by grave and cluster, and at the broader scale of the site;
3. Interrelation of different mortuary contexts - exploring connections between mortuary practices, spatial distribution, and wider socio-cultural patterns.
4. Economic, social, and cosmological structures – investigating how mortuary practices reflect and inform broader aspects of economic organization, social hierarchy, belief systems.

Finally, we reassess concepts such as “deviant” or “non-normative”, questioning their applicability and interpretative challenges. The evidence from Porto Torrão suggests a more fluid approach to death, underscoring the need for renewed theoretical and methodological frameworks in prehistoric mortuary archaeology.

2238. THE RISE AND DECLINE OF ANCESTOR MANAGEMENT IN PREHISTORIC ITALY

**Contribution format:** Oral  
**Contribution authors:** Jess Thompson (National Museums Scotland) – John Robb (University of Cambridge)

People in all societies both interact with the dead as para-human beings in their own right, and use them as a resource in constructing relations with other people. In some ways, these roles define ancestors. However, there are many possible ways to do these things. The question, then, is not “were the dead ancestors or not?” but “what kind of ancestors were they?” We should expect to find shifting emphases in how people managed and related to the dead over time – “period” styles of ancestor. This talk explores this view by comparing how people related to their dead in prehistoric Italy, comparing three styles of ancestor management – a Neolithic style focusing upon very active ongoing, often intimate interaction with the dead as a generalised ancestral presence in the context of lived village space; a 4th-3rd millennia BCE style which distanced the dead from the living, personified them and invested them with cosmological powers, and a Bronze Age style in which the dead gradually lost their cosmological powers and instead assumed more specific personification with much more visible social distinctions.

1596. EXTENSIVE PERIOSTITIS IN A HUMAN SKELETON IDENTIFIED IN THE NECROPOLIS OF 15TH-19TH CENTURY AT “ST. ATHANASIOS” CHURCH OF NICULIȚEL (ROMANIA)

**Contribution format:** Poster  
**Contribution authors:** Paul Donciu (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology) – Vasilica Groza (Romanian Academy, Iasi Branch, Anthropological Research Centre “Olga Necrasov”) – Ozana Ciorpac-Petraru (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology) – Aurel Stănică (Eco-museum research institute “Gavrilă Simion”) – Eliza Crețu (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology) – Luminița Bejenaru (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology | Romanian Academy, Iasi Branch, Anthropological Research Centre “Olga Necrasov”)

This study focuses on the pathologies identified on the skeleton codified M114/S3, recovered during archaeological excavations conducted in a cemetery of 15th-19th centuries, located near the “St. Athanasios” Church in Niculițel (Tulcea County, Romania). The preventive archaeological research, conducted during 2022-2023 in this necropolis, documented 348 inhumation graves/funeral complexes. Sings of pathology have been identified on the skeleton codified M114/S3. This skeleton belonged to a male individual, with estimated age of approximately 50 years old. According to archaeological evaluation, the skeleton under study is date to 19th century. Macroscopic and stereomicroscopic analyses were followed by imaging analysis (i.e., radiography). Radiographs were performed using the KaVo OP 3D Pro medical radiological equipment, at 66.3 kV and 5 mA. At the level of the preserved long bones (i.e., ulna, femurs, tibias), new bone tissue formed was identified, indicating the presence of periostitis. Bone porosity also was observed on the extern surface of the occipital, the anterior surface of the sacrum, and on the hip bones, which could indicate a vitamin C deficiency associated with periostitis. The dentition showed wear, and calculus. Alveolar bone resorption, characteristic to periodontitis, was observed on the mandible. The skull also attracted attention due to the presence of a deposit on the endocranium, possible a trace of putrefaction fluid. Taphonomic and paleopathological analysis was limited by the poor state of preservation of the skeleton.

1689. POSSIBLE INTERPRETATION OF HUMAN REMAINS IN SETTLEMENT PITS. AN EARLY BRONZE AGE CASE STUDY FROM ULRICHSKIRCHEN (AUSTRIA)

**Contribution format:** Poster  
**Contribution authors:** Domnika Verdianu (Department of Prehistory and Historical Archaeology, University of Vienna | Austrian Archaeological Institute, Austrian Academy of Sciences)

Placing bodies in settlement pits is a well-documented and recurrent practice during the Early Bronze Age Únétice Culture. However, the reasons that led the society to bury some individuals in graves within a burial ground and to place others in settlement pits are rarely discussed. Why are these differences evident in the handling of human remains? To what extent can differences between the various deposition and burial activities be identified in an archaeological context? In order to answer these questions, both the depositions of human remains in settlement pits and the contemporaneous graves from the site in Ulrichskirchen (Austria) were archaeologically and osteologically analysed and compared. It is evident that the graves are very uniform, whereas the depositions in the settlement pits vary greatly in almost every respect, from the location and dimensions of the features, the orientation, position and number of the skeletons, to the finds recovered from the pits. No correlation has been established between biological characteristics, such as age at death, sex or the state of health of an individual and the depositional context. The interpretation of the depositions in the settlement pits cannot be generalised,

and each individual feature must be interpreted according to the available evidence. In addition to intentional burials, possible interpretations include the temporary storage of the bodies or their disposal. This study highlights the complexity of handling the dead during the Űnětice Culture.

2062. TRANSITIONS BETWEEN THE LATE BRONZE AND EARLY IRON AGE - INSIGHTS FROM A MULTIPLE BURIAL PIT AT HÓDMEZŐVÁSÁRHELY-KOPÁNC S XI

**Contribution format:** Poster  
**Contribution authors:** Anett Gémes (Department of Biological Anthropology, Eötvös Loránd University | Salisbury Zrt., Budapest) – Dániel Pópity (Móra Ferenc Museum, Szeged) – Gábor Szabó (Institute of Archeological Sciences, Eötvös Loránd University) – Tamás Szeniczey – Tamás Hajdu (Department of Biological Anthropology, Eötvös Loránd University)

The Gáva culture was a major archaeological complex in the Eastern Carpathian Basin between the 12th and 9th centuries BCE. It was characterized by a homogeneous ceramic style, large settlements and distinctive Hajdúböszörmény-type metalwork. Notably, cemeteries linked to the culture remain largely unknown, aside from a few uncertain burials. These changes in the 9th–8th centuries BCE with the appearance of the Mezőcsát culture in the Great Hungarian Plain, linked to the steppe and forest-steppe regions. Their inhumation burials are rare and concentrated at key transport hubs, while Gáva settlements likely persisted. Recent discoveries of mass graves (e.g., Pusztataskony, Tiszabó, Karcag, Gomolova) dating to the Early Iron Age (9th–8th centuries BCE) offer new insights. A radiocarbon date places them in the 8th century BCE, supported by associated artifacts. The interpretation of such multiple burials is aided by a newly discovered assemblage from a large-scale excavation (2016–2017) at Hódmezővásárhely-Kopáncs in the southern Great Hungarian Plain, prompted by sand mine expansion. A burial pit was uncovered with eleven individuals in various stages of decomposition and two pottery fragments, dated to the 9th–8th century BCE. The ceramic material from Kopáncs exhibits a strong connection to the contemporaneous Gornea-Kalakaca-Bosut complex of Vojvodina and Banat, which corresponds to the end of the Gáva culture and the Early Iron Age. However, residual Gáva elements are also identifiable within the assemblage. A key question regarding these mass graves is how they should be interpreted: do they reflect the consequences of an epidemic, a massacre, or a specific mortuary ritual? Project No. C2284509 has been implemented with the support of the Ministry of Culture and Innovation of Hungary, funded by the National Research, Development, and Innovation Fund under the KDP-2023 scheme and the Bolyai Scholarship of the Hungarian Academy of Sciences (Project id: BO-783-22-8).

2090. DISCOVERY OF SETTLEMENT FEATURE WITH HUMAN REMAINS FROM DOLNÉ KRŠKANY FROM THE EARLY MIDDLE AGES IN SLOVAKIA

**Contribution format:** Poster  
**Contribution authors:** Lucia Nezvalová – Klaudia Daňová – Monika Gabulová – Zuzana Hukelová – Mária Krošláková (Institute of Archaeology, Slovak Academy of Sciences)

In 2021, during excavations at Dolné Krškany, a settlement feature containing the remains of six individuals was discovered. This feature was located within the site where Bronze Age graves and settlement features spanning multiple periods were found. Radiocarbon dating of charcoal from this feature suggests that the bodies were deposited in the feature at the end of the 9th or during the 10th century CE. At this time, Slovakia was part of Great Moravia, which began to decline towards the end of the 9th century. These turbulent times were likely marked by violence, even affecting the rural populations. Settlement features containing skeletal remains from the Early Middle Ages in Slovakia are relatively common and have traditionally been interpreted in various ways. The 14C dating of the further remains could suggest that the human remains found in settlement features dated to the Early Middle Ages might have been the provisional graves of victims of violent encounters during the late 9th and 10th centuries. However, supplementary data is needed to substantiate this hypothesis.

81 CONNECTIVITY AND ITS IMPACT ON CULTURAL DYNAMICS DURING PREHISTORY

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Discussion session  
**Session keywords:** Network analysis, Methodology, , Epistemology, Prehistory  
**Session organisers:** Solange Rigaud (CNRS, University of Bordeaux) – Vincent Delvigne (CNRS, UMR TEMPS, Paris) – Sergio Lozano (University of Barcelona) – Alain Queffelec (CNRS, University of Bordeaux)

SESSION ABSTRACT

The establishment of networks of contacts and exchanges over time is widely described as a process that facilitates the diffusion, consolidation, and homogenization of technical, economic, and symbolic traits across varying geographical and chronological scales. Social network models have shown that fully connected populations are capable of preserving knowledge over time and space, but they generate insufficient variation to produce complex and diverse cultural traits. In contrast, populations with intermediate levels of fragmentation exhibit a balance between the loss of cultural traits and the increase in cultural diversity through innovation. Applied to the study of past populations, network analysis provides us with a relational perspective to the dynamics of societal transformations, the pace of innovation, and the modalities of knowledge and skill transmission and preservation that we aim to document. While this analysis is predominantly applied to historical periods, pre- and protohistoric periods remain less explored. This is likely due to 1) the quantity of reliable data available to question the structure of archaeological networks and 2) the chronological precision required for paleohistorical reconstructions. This session aims to identify the contributions and perspectives, as well as the biases and limitations, of network analysis when applied to Prehistory. Presentations will demonstrate, through case studies, the precautions that must be taken before modeling human groups for which only material remains are available, scattered across different sites that are not strictly contemporary. Beyond methodological limitations, we seek in this session to explore the means to document the role of past populations’ social networks on their transformations: What factors (intrinsic or extrinsic) may have facilitated or constrained the connectivity of groups over time (hence shaping their social networks’ structure)? And in this context, can we identify how networks served as a foundation for innovations and their preservation over time?

CONTRIBUTION ABSTRACTS

1567. TRACKING UPPER PALEOLITHIC CULTURAL IDENTITY & EXCHANGE NETWORKS WITH RED DEER (CERVUS ELAPHUS) MAXILLARY CANINE ORNAMENTS

**Contribution format:** Oral  
**Contribution authors:** Josh London (Eberhard Karls Universität Tübingen) – Marian Vanhaeren (CNRS, UMR PACEA, University of Bordeaux | Eberhard Karls Universität Tübingen) – Nicholas Conard – Sibylle Wolf (Eberhard Karls Universität Tübingen | Senckenberg Centre for Human Evolution and Palaeoenvironment)

Personal ornaments have been singled out as a key artifact class for discerning cultural diversity in the European Upper Paleolithic. Regionally standardized ivory bead forms demonstrate that personal ornaments played a key role in the formation and maintenance of group identities among early human communities in Europe. However, an abundance of less intensively modified and more widely geographically distributed bead forms, such as perforated shells and teeth, suggests that not all Paleolithic personal ornaments participated in processes of cultural boundary maintenance. This study investigates diachronic and synchronic trends in the provenance, production, and display of low-modification red deer (Cervus elaphus) maxillary canine ornaments from the Aurignacian, Gravettian and Magdalenian occupations of the Swabian Jura and Southwestern France. Red deer canines have highly distinctive morphologies that vary diagnostically by sex, age, side and source population, providing a rough determination of faunal provenance as well as insights into culturally valent craft traditions. Here, morphological and morphometric faunal analysis, experimental use-wear and traceology and multivariate statistics are used to identify regionally discrete techno-cultural units as well as their corresponding transregional exchange relationships through time. These transregional exchange dynamics are further scrutinized to infer the shifting proximate social functions performed by red deer canine ornaments in the European Upper Paleolithic. A special focus is placed on the probable role of red deer canines as long-distance exchange media linking geographically remote pioneer communities in both the Aurignacian and Magdalenian technocomplexes. Transregional connections fostered by the reciprocal exchange of symbolically laden red deer canine ornaments would have mitigated local ecological risks, expanded effective breeding populations and ensured the retention of novel social and technological innovations in the sparsely inhabited landscapes of late Pleistocene Europe.

1005. STUDY OF THE CIRCULATION OF KNOW-HOW IN THE PALEOLITHIC: THE CASE OF THE RAYSSIAN BLADELET PRODUCTIONS (32–28.2 KA CAL BP)

**Contribution format:** Oral  
**Contribution authors:** Morgane De Parthenay (Université Paris Nanterre, umr 8068 TEMPS) – Vincent Delvigne – Laurent Klaric (CNRS, umr 8068 TEMPS)

This presentation is based on ongoing doctoral research focused on the circulation of know-how in the Upper Paleolithic. This issue is explored through the lens of a lithic armature production method found in France between c. 32.000 and 28.200 years cal. BP during the Upper Paleolithic: the “Rayssse bladelet production”. From

a prehistoric archaeological perspective, this standardized production method has a limited temporal range, making the associated artifacts true chronological markers. Moreover, its spatiotemporal distribution and highly homogeneous nature make it a particularly suitable case study for examining spatial and temporal transmissions. As a “similar way of doing things across time and space,” this method fits the definition of a technical tradition as outlined by ethnologists. For around ten archaeological sites spread across France, and through the concept of the “operational sequence” (chaîne opératoire), we study the manufacturing process of these armatures, from raw material procurement to their final production. We aim to discuss not only the homogeneity of the Raysse technical tradition but also the role of certain sites in its maintenance and transmission. To achieve this, the sites are compared using network analysis techniques (similarity networks and proximal point analysis) based on technical and lithological criteria established during the study. In this presentation, we will detail the methodology employed—particularly how network analysis enables a dynamic understanding of prehistoric traditions—as well as the initial results of our analyses.

**2286. EXPLORING PREHISTORIC CONNECTIVITY THROUGH ROCK ART - THE NETWORKS OF IBERIA AND BEYOND**

**Contribution format:** Oral  
**Contribution authors:** Joana Valdez-Tullett (Durham University | Wessex Archaeology) – Sofia Figueiredo-Persson (CHAM - NOVA University Lisbon | Iconictheory Lda)

Digital and computational technologies have changed the biography of rock art research in the last few years. From documentation to analysis, we have never known so much about the topic and in so much detail. This applies to Atlantic Rock Art and Schematic Art, two well-established Neolithic traditions of carving and painting in Iberia (and beyond), respectively. Both traditions can be found distributed across large areas, the Atlantic rock art being also created in other parts of western Europe, and Schematic Art all the way through the Mediterranean to Italy. This paper will present an overview of recent research which applied integrated multiscalar and interdisciplinary methodologies to the study of these traditions. Combining digital recording technologies, archaeometry and computational methods, including network science. This formal method of analysis enabled the development of an effective relational approach to the various scales of analysis of two comprehensive datasets, by refining relational patterning in a complete similarity network. In both case studies we were able to identify differences and similarities, as well as clear regional patterns, and further explore prehistoric connectivity and the cultural transmission mechanisms which allowed for the wide distribution of the traditions to become well-established entities over at least 2 millennia.

**1753. ELEMENT NETWORK ANALYSIS: A METHOD FOR EXPLORING THE SYNTAX OF ABSTRACT DECORATION ON ARTEFACTS**

**Contribution format:** Oral  
**Contribution authors:** Rie Bloch – Niels Johannsen (Aarhus University)

Studying past, dynamic networks of human interaction presents a major challenge in archaeology, as we often lack data about the relational processes connecting the origins and destinations of artifacts (Sindbæk, 2013). Unlike sociologists, archaeologists rarely have independent information to validate their network models. To address this limitation, we propose a novel approach: applying network analysis to static networks within artifact decoration itself. Our method, termed Element Network Analysis (ENA), identifies basic relational structures in abstract decorative patterns, such as connections between elements, the centrality rank of individual components, and other relational structures hypothesized to be significant within a given cultural context. ENA shifts the focus from dynamic interactions of people and objects to the intrinsic syntax of artifact decoration. We apply ENA to pottery from the Neolithic Funnel Beaker (TRB) period in southern Scandinavia (4000–2600 BCE), known for its elaborate abstract designs. While prior research on ceramics has emphasized typology and chronology, ENA reveals the underlying structural principles of decoration, which may reflect broader aesthetic, ideological, and social values. This application of network analysis represents a significant departure from conventional archaeological uses of formal network theory, addressing static rather than dynamic networks. Through this case study, we demonstrate ENA’s utility in uncovering the syntax of decorative patterns and discuss its broader implications for material culture studies. By focusing on decoration as a network of elements, we show how network analysis can provide new insights into the cultural logic underlying abstract designs, offering a new perspective on the interplay between aesthetics, cognition, and social organization.

**2125. HUMAN-AVIAN RELATIONS WITHIN SOCIO-MATERIAL-ECOLOGICAL NETWORKS: THE CASE OF ÇATALHÖYÜK**

**Contribution format:** Poster  
**Contribution authors:** Camilla Mazzucato (University of Turin | University of Copenhagen) – Demarchi Beatrice (University of Turin) – Lisa Yeomans (University of Copenhagen | UCL)

“What if we imagined a human nature that shifted historically together with varied webs of interspecies dependence? Human nature is an interspecies relationship.” (Tsing 2012:144). The large multiphase Neolithic site of Catalhoyuk (7100-6000 BC) displayed a complex and dynamic relationship between humans and birds throughout its long occupation. Birds were both hunted for subsistence and occupied an important place in Catalhoyuk’s symbolic world. How can we best investigate the deeply interconnected, dynamic and complex relations between humans and birds? Here, we propose a network approach to the exploration of the complex web of human-avian interactions at the site of Çatalhöyük. For this study, socio-material-ecological networks are used to synthesize and integrate ecological and archaeological variables within a single analytical relational environment. Through the construction of microscale intra-site network systems, we wish to reconstruct the way human-avian dynamics developed through time alongside social and environmental changes at this large Neolithic site.

**82 JEWELRY AND GRAVE OFFERINGS AS INDICATORS OF RITUAL AND IDENTITY IN PREHISTORIC AND ANCIENT BALKAN FUNERARY PRACTICES**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Mortuary archaeology, Funerary adornments, Grave Goods, Human body, Social status, Balkan prehistory  
**Session organisers:** Aleksandra Wisniewska – Tomasz Gralak (Wrocław University) – Ana Cristina Hamat (Museum of National History and Archaeology Constanța)

**SESSION ABSTRACT**

The archaeology of the Balkans displays a unique variety of burial practices, spanning from the Neolithic through to the Roman times. Each period presents distinct graves with unique burial rites and various types of grave goods. This diversity offers a promising foundation for studying the complex relationship between material culture and the human body, both in life and after death. Our research focuses specifically on jewelry and other forms of personal adornment, which we propose were not only functional or decorative but also integral to forming human/non-human hybrids. From this point of view, material culture acts as an extension of the body itself, altering perceptions of social status and identity. In our session, we aim to explore a range of issues and questions. For instance, why would a corpse need jewelry or another personal equipment? Does cadaver possess needs, or is it just a reflection of living people’s needs? When a society lays one of its members to rest, what roles do material artifacts play in this farewell process? Furthermore, how do such objects express the emotions of the mourners, and what do they reveal about cultural attitudes toward death? We also seek to question the identities symbolized by opulently adorned graves: is the buried individual remembered as an ideal ancestor, a fetish, a relic, or something else entirely? How do jewelry and personal belongings speak to the deceased’s gender and social status, if at all? Does these artifacts really have a special power? These questions are still open. We welcome scholars to contribute their interpretations and insights into these issues, furthering the discourse on how material culture intersects with the body, identity, and memory in the burial practices of the ancient Balkans.

**CONTRIBUTION ABSTRACTS**

**1621. THIRD MILLENNIUM CALBC HAIR ORNAMENTS - SYMBOL OF IDENTITY AND SOCIAL STATUS**

**Contribution format:** Oral  
**Contribution authors:** Zheni Vasileva (National Archaeological Institute with Museum at the BAS)

Hair ornaments in the form of hair-rings appeared as early as the beginning of the 3rd millennium BC in the Balkans and soon became one of the most characteristic and distinctive types of metal jewellery. A new type of jewellery is often associated with a new custom that expresses a particular social identity. Over time, the local societies adopted and developed the fashion for gold and silver hair-rings. The aim of this study is to reconstruct Early Bronze Age hairstyles by examining the development and significance of metal hair rings. The creativity and originality of Balkans craftsmen is evident in the way they took ideas from local crafts or from other jewellery centres and adapted them to local needs. Jewellery is key to understanding the way prehistoric people saw themselves and constructed their identity. The emergence of new local types of metal hair ornaments may have

been a result of the creation of a new sense of identity among local elites. The way these pieces of jewellery were worn is important for interpreting their social and cultural significance, as the way they were worn could have different meanings from one community to another.

**306. SPINNERS, WOMEN, OR SOMETHING ELSE? - TEXTILE PRODUCTION TOOLS AS GRAVE OFFERINGS IN IRON AGE DONJA DOLINA**

**Contribution format:** Oral  
**Contribution authors:** Julia Fileš Kramberger (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology)

Prehistoric textile production tools were not just practical objects used in daily life—they also had symbolic value, attested by their presence in burials. In Central European Early Iron Age, particularly in the southeastern Hallstatt region and the southern Carpathian Basin, textile production was often reflected in funerary customs. The Iron Age site of Donja Dolina in northern Bosnia and Herzegovina is no exception, as spindle whorls and a single spool were found in about 25% of graves excavated in the early 20th century. Most of the spindle whorls are biconical or lenticular, with one unique star-shaped example. Some are plain, while others bear fine incised lines or, more commonly, concentric grooves on their surfaces. When looking more broadly at grave good assemblages at this site, spindle whorls mostly appear in burials without weapons but with plenty of metal elements of dress and jewellery typically associated with women. However, the number of spindle whorls in a grave doesn’t necessarily reflect the deceased person’s wealth or status—both the richest and simplest graves contained between one and six whorls. Additionally, many graves with traditional female dress and jewellery had no textile tools at all, which suggests these items were not a universal marker of female identity. Most likely, spindle whorls were included in the burials of individuals, predominantly women, who played a significant role in textile production during their lifetime. These women were maybe members of the elite, but they also possibly just managed weaving workshops, oversaw textile production, or were simply exceptionally skilled spinners and weavers recognized within their communities.

**449. RETHINKING THE PAST: THE ROLE OF GOLDEN FUNERAL MASKS IN BALKAN IRON AGE**

**Contribution format:** Oral  
**Contribution authors:** Aleksandra Wisniewska (University of Wrocław)

This presentation examine roles of funerary masks in the Iron Age, focusing on princely graves at archaeological sites in Trebenište, Ohrid “Gorna Porta” and Sindos in the Central Balkans. The study explores the diverse functions of these masks within burial traditions. A comparative method was used to identify shared and distinct elements in funeral customs and to analyze whether masks reflected the true appearance of the deceased. Findings suggest that funerary masks served as instruments of social elites, who leveraged mysticism and religious beliefs to maintain authority. Trade between Greece and the Eastern Hallstatt culture enabled elites to control the flow of goods, including votive offerings, which added layers of mysticism and transformed funerary rites into theatrical spectacles. In archaic Macedonia, masks were uniform in design, emphasizing ethnic identity over individuality. The standardized production suggests that craftsmen followed established traditions rather than aiming for personalized representation. Features such as prominent cheekbones or stylized facial elements were likely conventional artistic choices rather than realistic portraits. Overall, funerary masks played both symbolic and political roles, reinforcing elite status and cultural identity. Interpretations of these artifacts vary across modern archaeological perspectives, with some scholars emphasizing their role in social hierarchy, while others highlight their ritual significance. I aim to highlight the social and ideological significance of funerary masks.

**1036. OF GOLD AND GLASS. PERSONAL ADORNMENTS FROM WEST PONTIC NECROPOLEIS IN HELLENISTIC TIMES**

**Contribution format:** Oral  
**Contribution authors:** Mila Chacheva (National Archaeological Institute with Museum at the Bulgarian Academy of Sciences)

Thinking of personal adornments from the Hellenistic period inevitably leads to the picture of lavish jewellery sets found all over the Mediterranean. This period also witnessed a heyday in the production and distribution of glass beads and vessels throughout the ancient world. The investigations of the West Pontic Greek colonies and especially of their necropoleis indicate that they did not lag behind both these trends. Are the golden jewellery items merely adornments or is it possible to trace some other meaning beyond that? Then, are the strings of various glass beads and pendants bearing mainly protective functions? And what could be the possible interpretations when they occur together in the same context? Do these two materials – gold and glass – let us think of possible identities and political relations. The paper aims to illustrate some new and to revise some old evidence about the personal ornaments discovered in the necropoleis of three of the West Pontic Greek cities – Apollonia,

Mesambria and Odessos.

**542. MOTIVES OF THE DEAD AND THE MONEY OF THE LIVING. DEPOSITIONS OF WOMEN’S JEWELLERY IN THE ROMAN TOMBS FROM ROMANIA**

**Contribution format:** Oral  
**Contribution authors:** Hamat Cristina – Stefan Georgescu (Museum Of National History and Archaeology Constanta)

This paper will discuss several well-known female inventories, both national and internationally, dated to the Roman era and discovered on the territory of today’s Romania, in the necropolises of Tomis (Constanța), Callatis (Mangalia), Capidava (Capidava) and Drobeta (Drobeta Turnu Severin). By presenting the jewellery items, which are part of these inventories, we will try to clarify the motives behind these deposits, especially since we talk about special types of jewellery, in terms of artistic value and price. Also, we will present the motives and money that those left behind had, and the reasons that the deceased could have had for taking such pieces with him into the grave. The study of the inventories will also provide special association for items of jewellery with various objects belonging to the mundus muliebris. This cases, that we will use for this presentation, have been selected to provide a broader picture as possible for these different motifs, both for the living and the dead. As can be seen, we have civilian and military centres from the provinces of Moesia Inferior/Schythia Minor and Dacia, during the 1st-4th centuries AD., in order to discuss differences a special case in regard with the common motivation of the family left behind and those of the dead.

**395. LEUKAS-TYPE GOLDEN HAIR RING NORTH OF THE DANUBE, FROM A SALVAGE EXCAVATION ON THE ROUTE OF EXPRESSWAY DEX12 CRAIOVA-PITEȘTI (ROMANIA)**

**Contribution format:** Poster  
**Contribution authors:** Dragos Mandescu (Argeș County Museum, Pitești) – Alin Frînculeasa (Prahova County Museum of History and Archaeology, Ploiești) – Dragoș-Alexandru Mirea (“Horia Hulubei” National Institute for R&D in Physics and Nuclear Engineering, Măgurele | Bucharest Municipality Museum) – Monica Mărgărit (“Valahia” University, Târgoviște) – Mihai Constantinescu (“Francisc I. Rainer” Institute of Anthropology, Bucharest | Bucharest University) – Ioan-Andi Pițigoi (Argeș County Museum, Pitești) – Andrei Heroiu (SC Banat Archaeosave SRL, Timișoara) – Laurențiu Isăilă (Independent)

At the end of 2024, a Yamnaya burial mound was explored through a salvage excavation, at the eastern end of the Craiova-Pitești Expressway (DEX 12), near the village of Recea (Argeș County, at short distance south-east of Pitești city). The burial mound contained a single grave. The deceased (a subadult) had as grave goods a pair of hair rings, one of which (made of gold) belongs to the Leukas (Lefkada / Lefkas / Leucadia) type. The poster presents in detail both the in situ discovery and the results of the interdisciplinary approach on this special and not very common type of Early Bronze Age artefact north of the Danube, contributing to a better definition of aspects related to the formal, metallurgical, chronological correlations of this type of hair ring, and also to its distribution area. The excavation at Recea (including the subsequent interdisciplinary approach) is a valid example of good practices in salvage archaeology in Romania.

**595. MACEDONIAN BRONZES AS TOOLS USED TO CONSTRUCT A SOCIAL PERSON**

**Contribution format:** Poster  
**Contribution authors:** Tomasz Gralak (Institute of Archeology, University of Wrocław)

Macedonian bronzes mainly came from women’s graves dating to the Early Iron Age. The question arises: What role did they play during funeral ceremonies? Assuming they were similar to ancient Greek rituals, we can suspect the presence of similar events. The ceremony could last several days and begin with the public display of the body – prothesis. This type of ritual is performed in many cultures – members of a given community must see the deceased with their own eyes. In traditional societies, it is a kind of death certificate with all its legal consequences. After all, goods and interpersonal relations (social position) were inherited from the deceased. That is why it was essential to show who he was – including his status and spheres of activity. After being presented, the body of the deceased was transported to the burial place (ekphora) – often on a cart. Only the final part was the act of burial itself. . In general, the funeral ceremony was an elaborate spectacle aimed at strengthening the community (threatened by the loss of one of its members) by confirming the prevailing social hierarchy. Therefore, tools that had a substantial impact on emotions were used. The body of the deceased, constituting a kind of fetish equipped with shiny metal parts of the costume, had to be visible. Therefore, it was assumed that the Macedonian bronzes were props used to build a social figure. Individual artifacts showed the capabilities and functions of the person wearing them. These objects were material evidence of their owner’s life experience and

status. So, it was a kind of visual communication.

83 (NO) FEAR OF THE DARK, REFRACTED LIGHT, REFLECTIONS AND OBSTRUCTIONS. LOW-VISIBILITY CHALLENGES FOR 3D PHOTOGRAMMETRIC DOCUMENTATION IN ARCHAEOLOGY

Session theme: 3. Exploring methods in research, education and communication  
Session format: Regular session  
Session keywords: Photogrammetry, 3D documentation, Low-visibility, Underwater archaeology, Cave archaeology, Rescue archaeology  
Session organisers: Rault Estelle (Archéologie Alsace / umr 7044) – Kermeen Philippe (Heritage Consultant (Independent)) – Hostettler Marco (Institute of Archaeological Sciences, University of Bern)

SESSION ABSTRACT

Low-visibility conditions are a significant complication for archaeological recording in research and cultural management. In low-visibility conditions traditional documentation techniques often fail or encounter significant drawbacks. Photogrammetry can overcome these limitations by offering consistent and accurate results under adverse conditions, however it is not straight forward but may need adaption to individual context. Low-visibility environments can be differentiated into environments with challenging light-conditions and limited visibility caused by obstruction. Challenging light conditions include pitch-black environments, wet environments with a high degree of reflective surfaces and environments with light refractions, such as shallow underwater surfaces. Contexts with extreme light-shadow contrasts can also be counted as low-visibility environments for photogrammetric documentation. Limited visibility environments caused by obstruction include underwater contexts with high sediment and organic content in the water column, but also structures obscured by dense vegetation, obstacles which cannot be removed, such as scaffolding or telephone wires or contexts with limited visual range such as narrow architectural contexts or caves. All these environments call for different approaches to achieve better results. Although many projects have been realised under unfavourable conditions in recent years, there is a lack of knowledge transfer in the broader archaeological audience. This session aims at bringing together speakers with experience in the application of photogrammetric methods under unfavourable environmental conditions. We aim at presenting short project presentations focusing on the respective low-visibility environment, the challenges which were needed to overcome and the solutions applied. Discussion of time schedules and budgets are welcome, as are contributions maximising the use of Open-Source technology. We welcome contributions from research, rescue archaeology (commercial and public), and cultural heritage management. We envisage the publication of proceedings if interest and number of contributions allow for it.

CONTRIBUTION ABSTRACTS

396. LITTLE TO SEE: LOW VISIBILITY PHOTOGRAMMETRY OF A SUPERMARINE SPITFIRE WING IN DARWIN, AUSTRALIA

Contribution format: Oral  
Contribution authors: Philippe Kermeen (Cosmos Archaeology)

In late 2022 a Supermarine Spitfire wing was identified in East Arm, Darwin. The wing was discovered in a designated dredging area for the Darwin Shiplift Project (DSL). The low-visibility environment experienced by divers and the lack of visual comprehension of the structure poised a problem for overall information regarding potential extraction options. Using photogrammetry techniques in recording seafloor landscapes and three compact action cameras (Hero 8, 9, and 10), divers were able to record the entire structure with video. The recordings were rendered in Agisoft Metashape to reconstruct an image of the wing, facilitating an understanding of what sections were visible. Dredging of the wing to expose the furthest extent of debris was crucial for future extraction. The successful photogrammetry method had facilitated a continuous monitoring program to be implemented, able to observe the incremental changes in environment around the wing and to inspect any new structural components that had been exposed. The lack of published material on low-visibility photogrammetry prompted a review.

2170. SHALLOW WATER AND DIFFUSED LIGHT: PHOTOGRAMMETRY IN MARITIME ARCHAEOLOGICAL DOCUMENTATION

Contribution format: Oral  
Contribution authors: Savannah Bishop (Koç University | KUDAR Research Center)

From submerged coastlines to water-filled tanks to shadowy museum depots, maritime artifactual materials often reside in low-visibility environments. These conditions, especially when dealing with factors of light refraction and physical obstruction, can make photogrammetry modeling of these artifacts difficult. However, such challenging circumstances frequently necessitate creative approaches to documentation, where photogrammetry proves adaptable and effective. This presentation will address three maritime collections that illustrate how unfavorable environmental conditions impact the application of photogrammetry. These contexts include the documentation of the Yenikapı 23 ship timber as part of the Yenikapı Byzantine Shipwrecks Project, the maritime amphorae collection of the Minori Villa Romana e Antiquarium as part of the Maritime Survey of the Amalfi Coastline project, and the sunken remains of a potentially Hellenistic-era causeway as part of the “Alexander’s Causeway” project. Through this photogrammetric documentation of diverse cross-sections of maritime material unique contexts and challenges shape the way photogrammetry is applied. Each case presents unique obstacles ranging from waterlogged ship timbers and shallow-water sediment shifts to low-light museum storage spaces requiring tailored photogrammetric techniques. Examining these diverse maritime projects, we will discuss the strategies utilized to overcome these challenges, and how photogrammetry can be applied in response to specific environmental conditions.

400. STREAMLINED PHOTOGRAMMETRIC PROTOCOL FOR EFFICIENT DIGITIZATION OF LARGE ZOO-ARCHAEOLOGICA. COLLECTION

Contribution format: Oral  
Contribution authors: Brice Lebrun – Javier Sopesens Aixalà (Catalan Institute of Human Paleoecology and Social Evolution (IPHES-CERCA) | Area of Prehistory, Rovira i Virgili University) – Antonio Rodríguez Hidalgo (Unit Associated with CSIC, Department of Paleobiology, National Museum of Natural Sciences | Catalan Institute of Human Paleoecology and Social Evolution (IPHES-CERCA)) – Palmira Saladié Ballesté (Catalan Institute of Human Paleoecology and Social Evolution (IPHES-CERCA) | Area of Prehistory, Rovira i Virgili University | Spanish National Research Council, Institute of Archaeology-Mérida (CSIC-Junta de Extremadura))

This presentation introduces an innovative and streamlined photogrammetric protocol designed to rapidly digitize the large osteological reference collection of IPHES-CERCA laboratory under time-intensive constraints. Although not conducted in unfavourable low-visibility environmental conditions per se, the high volume of specimens—thousands of bones with diverse geometries, varying sizes, and complex morphologies—poses challenges analogous to adverse environments. Using cutting-edge frameworks like Apple’s RealityKit and custom-built Python scripts, The protocol optimizes 3D model generation by reducing computational time and minimizing manual parameter adjustments. Through the automation of repetitive tasks and the effective management of challenges associated with intricate bone geometries and reflective surfaces, the workflow efficiency is significantly improved, enabling the digitization of complex objects within minutes. Aligned with contemporary open-science principles, the protocol also includes open-access publication with standards-compliant associated metadata. In summary, this presentation outlines a practical approach to efficiently digitizing large osteological collections while emphasizing reproducibility and accessibility in 3D documentation.

1535. PLAYING WITH THE LIMITS IN PHOTOGRAMMETRY: DIGITIZING ARCHAEOLOGICAL GLASS IN 3D

Contribution format: Oral  
Contribution authors: Vanessa Espuelas (Universitat Autònoma de Barcelona)

The digitization of archaeological heritage has experienced significant momentum in recent decades, expanding the digital collections of museums, institutions, and scientific teams by incorporating increasingly a diverse array of materials. Nevertheless, a considerable proportion of these collections face the challenge of accurately documenting objects characterized by poor visibility, excessive transparency, or reflectivity. Even the best photographic study conditions cannot spare us from the whims of light reflections and refractions. This is especially true for the photogrammetric 3D capture of objects with particularly problematic surfaces, such as archaeological glass items. The optical properties of glass surfaces, characterized by their shiny and transparent nature, cause a multitude of phenomena, including partial reflections, anomalous light absorptions, and intricate alterations. The various redirections of light hitting the surfaces of these objects contribute to the distortion in the perception of the piece’s geometry in any of the current photogrammetry software. In this context, glass pieces represent one of the most challenging elements for photogrammetric capture. The presentation proposes a methodological approach to overcome these issues and generate realistic models of Roman glass tableware objects, based on extensive work in the acquisition, processing and publication of photogrammetric projects conducted over the past few years. The management of lighting during data capture is crucial. Additionally, tools to improve the accuracy in the subsequent photograph alignment will be explored. Moreover, photogrammetric processing steps will be discussed, along with their adaptation according to the distinctive lighting characteristics of each

type of glass to minimize geometric errors. Furthermore, we will not overlook post-processing work and texture reprojection to realistically emulate the transparencies and reflections of glass in digital environments. All of this will be presented alongside the results obtained on Roman glassware pieces.

316. ILLUMINATING THE SHADOWS: PHOTOGRAMMETRIC DOCUMENTATION OF PLEISTOCENE DEPOSITS IN TIBERIUS’ CAVE, ITALY

**Contribution format:** Oral  
**Contribution authors:** Francesco Bucci Casari – Francesco Lucchini – Caterina Fanucchi – Enza Spinapolice (Sapienza University of Rome) – Cristiana Ruggini (Direzione Regionale Musei Nazionali Lazio)

3D photogrammetry techniques offer an innovative and versatile solution for documenting archaeological contexts under low-visibility conditions, effectively addressing the limitations of traditional methodologies. Challenges such as the absence of natural light, visitor interference in tourist contexts, and the necessity of safeguarding vulnerable archaeological deposits are effectively tackled. The case study focuses on the Tiberius’ cave, located in Sperlonga along the Tyrrhenian coast of southern Latium, Italy. The site is renowned for its remains from the Roman imperial period but also presents evidence of an earlier Neanderthal occupation. It forms part of a broader system of caves attributed to the Pontinian facies, spanning from the Circeo promontory to Sperlonga and Gaeta. Within the Tiberius’ cave, residual Pleistocene deposits containing lithic industries and faunal remains represent a unique yet fragile heritage under threat from erosion and tourist activity. Here we present the solutions adopted to document these deposits accurately in a low-visibility environment, demonstrating how low-cost technologies can overcome complex operational challenges. The project underscores the critical importance of interdisciplinary approaches to preserving and enhancing archaeological evidence and highlights the pivotal role of 3D photogrammetry in the conservation and dissemination of endangered sites.

1829. SURVEYS IN APHOTIC ZONES : LASERGRAMMETRY AS A TOPOGRAPHIC AND PHOTOGRAMMETRIC SOLUTION FOR UNDERGROUND ENVIRONMENTS

**Contribution format:** Oral  
**Contribution authors:** Julien Quantin (Eveha - Etudes et valorisations archéologiques | UMR 5607 Ausonius - Université Bordeaux Montaigne)

The presentation will focus on the challenges of lasergrammetry for the study and analysis of archaeological sites/structures in an underground context. We will be highlighting the advantages of LiDAR systems for surveying underground structures that are subject to access and lighting difficulties, by proposing different methods illustrated by concrete cases and/or easily accessible tools. It will also be important to show the different ways in which these elements can be supported, and their specific uses: hand-held LiDAR, walking MMS, scanner on stands and UAS LiDAR. Most of these new methodologies have been developed as part of the TNT&MINES research program, in partnership with various engineering schools, and are the subject of recurrent tests on wells and mining sites. It will thus be interesting to compare the possibilities offered by these lasergrammetric methods with those of conventional photogrammetry, and to also indicate their contribution to the topographical study of a site in a confined environment.

87 INTERTWINED NARRATIVES: THEORY AND PRACTICE IN COMMUNICATING STORIES

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Regular session  
**Session keywords:** Narratives, Storytelling, imagination, Public communication, Voices  
**Session organisers:** Harold Mytum (University of Liverpool) – Samantha Reiter – Matthew Walsh (National Museum of Denmark) – Morgan Schelvis (University of Amsterdam)

SESSION ABSTRACT

As Shanks wrote on “the archaeological imagination”, archaeologists do not discover the past; we work with what remains. If we were to be factual about it, we would say that archaeologists synthesize incomplete data about the past into a meaningful and appropriate whole. If we were to tell a story, we would say that archaeologists bridge gaps in the past to give voice to its story, we use intertwined strands of evidence to create narratives that connect past and present, data and interpretation ... For an adventurous discipline whose raison d’être relies on the discovery of new remains or unknown information about the distant past, archaeology determinedly

produces communication which is often dry and boring (or, unfortunately both put together!); the majority of our communication efforts are self-oriented; that is to say, they are written for other archaeologists. Unfortunately, we too often leave outreach efforts in the hands of media professions who “interpret” our message for us and are removed from the enthusiasm for our subject and its relevance for today’s world with which we burn. We invite speakers to submit papers, readings or other examples of alternative forays into the relationship between archaeology, narrative, and the archaeological imagination. These could include reflexive accounts of science novels, illustrations of the utility of the archaeological imagination, critical studies of the portrayal of archaeology/archaeological research in the media, or something entirely other. We welcome all rigorous studies of alternative explorations of our shared past.

CONTRIBUTION ABSTRACTS

192. SCIENCE NOVEL AND ARCHAEOLOGY: A NEW DUO FOR PROMOTING RESEARCH

**Contribution format:** Oral  
**Contribution authors:** Christiane Angibous-Esnault – Jean-Olivier Gransard-Desmond (ArkéoTopia)

Combining literary fiction and archaeological reality, that’s the challenge of the science novel in archaeology. But what exactly is a science novel? Does it constitute a literary genre, or a practice developed by writers interested in archaeology? Authors and researchers have already been asking this question for a decade, such as the Fiction meets Science research group born in 2014. However, no definition has yet emerged. That’s why dictionaries and encyclopedias like Wikipedia remain silent on the subject. Despite their silence, there are unique characteristics that set apart a work of science novel. One is the requirement for extensive expertise in the specific field, whether it’s biology, physics, or any other. In the case of archaeology, an archaeological find must be chosen to guide the story. This constraint forces the author to review the literature and consult relevant experts before writing the fiction itself. More than in any other genre, a science novel often requires an advisor who is familiar with the field, as is the case with films. The author must integrate the story into the scientific process, while respecting its narrative codes. This means avoiding confusion between the subject and the object. A novel dealing with prehistory fails to qualify as a “science novel” if it ignores the scientific approach, instead focusing on the results of research into the prehistoric period. Through the experience of children’s author Christiane Angibous-Esnault and the adventures of her hero Augustin, born in 2008, we propose a definition of this literary genre, along with a list of distinguishing features. We’ll discuss its impact on the popularization of archaeology, and its need for dissemination, which will enable the voice of research to be better heard on such difficult subjects as research integrity, looting, the importance of sources, and so on.

985. BROOKE AND BRIDGEWATER – A CLASH OF WILLS

**Contribution format:** Oral  
**Contribution authors:** Harold Mytum (University of Liverpool)

Archaeologists tell stories based on the evidence they find and the assumptions and deductions they make about the past. The presentation investigates how, in a historical period, a range of sources can be utilised to form and support a narrative that provides an explanation of the archaeological evidence, set in interpersonal relationships and wider cultural expectations and aspirations. This is a first-person account related to the dispute between Sir Christopher Brooke of Norton Hall and the Duke of Bridgewater who wished to build his Bridgewater canal between Manchester and the mouth of the river Mersey over Sir Christopher’s land at Norton Hall, site of the medieval Norton Priory. The presentation is a first-person account, given from Sir Christopher’s perspective, but the Powerpoint slides behind the presenter will provide the ‘footnotes’ and evidence – documentary, cartographic and archaeological – that provides the scaffolding for the story being told (though alternative stories could be told by archaeologists interpreting our evidence differently, or those people at that time who held different views and perceptions). The paper encourages us to reflect on the ways in which entangled data of various kinds can be woven into a narrative with empirical fixed points joined by inferential threads.

1481. RECONSTRUCTING THE PAST: CHALLENGING OR REINFORCING STEREOTYPES. GENDERED NARRATIVES IN CZECH ARCHAEOLOGICAL EXHIBITIONS

**Contribution format:** Oral  
**Contribution authors:** Olga Lechyčová (Institute of Archaeology of The Czech Academy of Sciences, Brno) – Klára Matulová (Institute of Archaeology of The Czech Academy of Sciences, Brno)

Archaeological exhibitions are designed to communicate knowledge to the public; they serve as a bridge between the past and the present, offering insights not only into material culture and historical events but also into the social structures that formed them. From a gender perspective, numerous European studies show that many archaeological exhibitions present a skewed view of the past rather than an accurate reconstruction based on available

evidence. Through quantitative analysis, we explore something previously unexplored: Do Czech museum exhibitions—both old and new permanent prehistoric displays—perpetuate stereotypical narratives about the roles of men and women? Even though many artefacts were created by, associated with, or depict women, their roles and lives are frequently overlooked. By analysing both visual elements and accompanying texts, we examine how gender relations in the past are presented to the public and to what extent women are made visible in these exhibitions. At a time when gender discourse has become entangled in culture wars, we often encounter arguments based on stereotypes that ascribe rigid social roles to individuals—roles claimed to have accompanied humankind “since time immemorial”. Archaeology is particularly vulnerable when used to legitimise specific cultural models of social organisation in the present. Their advocates often equate “tradition” with the distant past, selectively shaping it through fragmented and stereotyped facts to prove the universal validity of such models. It is essential to continually highlight these fragile aspects of archaeology, keep reflecting on the persistence of stereotypical thinking, and challenge the projection of contemporary social patterns onto reconstructions of the past. Equally important is examining how exhibitions convey scientific knowledge and shape public perceptions of history. A museum should not only educate but also provoke reflection on the ambiguities of the past, fostering dialogue about the values we carry into the present.

1224. KANSALA KUMO: SINGING ARCHAEOLOGY IN GUINEA-BISSAU

**Contribution format:** Oral  
**Contribution authors:** Sirio Canós-Donnay (Universitat de València)

For hundreds of years, the jeli or griots have been the memory of Sudanese West Africa, singing historical epics and preserving them for future generations. In southern Senegambia, a key element of these epics is the fall of Kansala, last capital of the Kaabu Kingdom (13th-19th C), which features heavily in Senegambian collective imaginaries but until recently had never been archaeologically studied. In early 2024, we conducted the first excavations at the site (currently in Guinea-Bissau), which revealed a complex urban pattern and confirmed many of the local oral traditions. Given Kansala’s prominent place in local epic narratives we wanted to use this project to rethink the relationship between archaeologists and griots, from a uni-directional use of the latter as ‘sources’ to one of dialogue and knowledge co-creation, as well as exploring the potential it offers for public engagement and story-telling. We thus invited two families of griots (the Djabate and the Galissa) to visit the excavations, ask questions, and write songs about the archaeology and its connection with the griotic repertoire, including a sang version of the final excavation report. These were then played at various events in Guinea-Bissau, Senegal and the Gambia, as well as shared widely across social networks and became powerful tools in community outreach and narrative-building.

2204. LIVING PREHISTORY: PERFORMING, TASTING, AND EXPERIENCING OLD NARRATIVES

**Contribution format:** Oral  
**Contribution authors:** Sofia Figueiredo-Persson (CHAM- NOVA University, Lisbon | Iconictheory Lda) – Joana Valdez-Tullett (Durham University | Wessex Archaeology Ltd)

Prehistory constitutes 99% of human existence, yet it remains one of the most challenging periods to communicate. The vast timescales, absence of written records, and fragmented material traces make it difficult for contemporary audiences to connect with it. However, understanding prehistory is essential, as it shaped many of the fundamental aspects of human life. The challenge, therefore, is to bridge this temporal and cognitive gap, making it more tangible, relatable, and engaging. This paper explores how storytelling through rock art can be expanded and reshaped through theatre, photography, culinary experiences, and books. By merging archaeology with performance, visual arts, experimental reconstruction, and narrative-driven publications, we present case studies from Portugal and the British Islands, where prehistoric narratives were transformed into interactive and immersive experiences. The ImaginARTE project, for instance, used human representations in rock art as a starting point to challenge contemporary notions of beauty and identity through photography. Meanwhile, theatrical performances and dramatized re-enactments brought prehistoric imagery and myths to life, fostering deeper emotional connections with the past. Additionally, books provided an alternative medium, where an inspirational blend of objective recording, subjective analysis, and narrative interpretation allows us to travel through prehistoric societies, offering new ways of imagining their realities. By embracing multisensory and co-creative approaches, this paper argues that archaeology can transcend disciplinary boundaries, opening up new ways of engaging with and experiencing deep history.

2503. HOW ARCHAEOLOGICAL OUTREACH BENEFITS FROM DIALECTICAL COLLABORATION

**Contribution format:** Oral  
**Contribution authors:** Dominik Lengyel (BTU Brandenburg University of Technology Cottbus-Senftenberg) – Catherine Toulouse (Lengyel Toulouse Architects)

The intertwining of disciplines is an extremely fruitful endeavour if the mutual needs are taken seriously. For working with the media, it is not enough to let them interpret the archaeological messages. A dialectical approach is needed. The reason it works so well with architects is that they too work with uncertainty: the process of designing begins with a broad idea, comparable to a tentative hypothesis in archaeology. The more finds there are, or in architecture, the more ideas are incorporated into the design, the more concrete the building, or the visualisation of the archaeological hypothesis, becomes. The term ‘reconstruction’ is misleading, because a reconstruction is a repeated construction and this would not be an interpretation, but in most cases pure fantasy. Archaeological hypotheses are usually formulated verbally and make extensive use of the capacity for abstract formulation. Translating this abstraction into images is indeed the core skill of architects working in design. Like archaeologists, architects seek to synthesise incomplete data about the past into a meaningful and appropriate whole. This does not preclude interpretation, but in the dialogue it creates narratives that link past and present. It is not a question of whether there was an architect, as we understand the role today, but that there must be an intention behind every action. Giving form and image to this intention is the competence of architects. This makes communication accessible to the public, while at the same time remaining self-orientated through its proximity to science. Such illustrations stimulate the architectural and archaeological imagination, and also allow for alternative explorations. This is because the subtle effect of architectural visualisations, despite their abstract geometry, is able to provoke further thought and advance research in both disciplines. The paper illustrates this methodology with prominent projects from collaborations with numerous museums, research, cultural and educational institutions.

751. AR(T)CHAEOLOGIES: THE PLEAURES AND PITFALLS OF ARCHAEOLOGICAL INTERPRETATION AND ILLUSTRATION

**Contribution format:** Oral  
**Contribution authors:** Matthew Walsh (National Museum of Denmark) – Marianne Moen (Museum of Cultural History, UiO) – Eric Carlson (Desert Archaeology, Inc.)

Archaeologists have long relied on illustrations to visualize objects and indeed as an aid in reconstructing the past as a living thing. This often involves extensive – even over-use – of interpretive license. As an exercise, the development of archaeological illustration draws a fine line between accuracy and imagination. While fraught with potential problematics, when approached rigorously and collaboratively, archaeological reconstruction can be a beautiful thing, and an unparalleled form of inspiration and dissemination. However, the points of ‘rigor’ and ‘collaboration’ just mentioned cannot be underemphasized. This presentation offers a glimpse into the collaborative process between archaeologist and artist specifically as it pertains to developing and presenting accurate, engaging, and evocative visual interpretations of the past. It highlights some of the best practices established through the presenters’ own works together as well as offering some hopefully useful insights into ways in which objects, their biographies, interpretive frameworks, and the narratives they combine to communicate can be brought to life.

1274. NAVIGATING THE PREHISTORIC FOG: AN ILLUSTRATED FICTION APPROACH TO ROMAN CONQUEST, THE SCOTTISH IRON AGE AND ARCHAEOLOGICAL INTERPRETATION

**Contribution format:** Oral  
**Contribution authors:** Samuel Scott-Moncrieff (University of Edinburgh)

This paper draws literal inspiration from this session’s abstract: specifically, the “narratives that connect past and present, data and interpretation” and the “illustrations of the utility of the archaeological imagination”. These ideas will be explored through ‘graphic novel’ style vignettes, depicting the interplay between ancient sources, archaeological evidence, and archaeological interpretation in relation to the Roman invasions of Iron Age Scotland (1st-3rd centuries CE). Case studies will be unpacked by depicting Roman viewpoints, conceivable Iron Age pasts and archaeological interpretations in the near past and present. As an example, the destruction of brochs (dry-stone Iron Age roundhouses) in Southern Scotland during the second century CE has been attributed by some to the Antonine re-invasion of Scotland (139-142 CE) partly based on terse Roman descriptions. However, the archaeological evidence for Roman violence is limited, and alternative indigenous explanations can be made. Indeed, the prehistoric (or proto-historic) non-literate societies that lived in Iron Age Scotland maintained diverse relationships with the Roman empire. Some appear to have been clients, others belligerent adversaries, whilst still more probably steered a middle path. This paper will seek to depict the Scottish Iron Age’s complexity in a pictorial style that is legible and engaging for a wide range of audiences.

1243. ‘ARCHAEOLOGYSTORIES.COM,’ A PROPOSAL TO ESTABLISH A DIGITAL PLATFORM TO REACH WIDER AUDIENCES

**Contribution format:** Oral  
**Contribution authors:** John H Jameson (International Committee on Interpretation and Presentation - ICOMOS | EAA StoryArch Community Network)

In contemporary academia, much emphasis is placed on ethics and scientific rigor when publishing scholarly articles. However, the communication of archaeological knowledge to a wider public is often a neglected aspect of our professional responsibilities. Digital publications have revolutionized the way information is disseminated and consumed. Digital publications such as ‘Sciencefeatured.com’ provide an online model and mechanism for professional/non-specialist balancing to reach wider audiences. The goal is to promote and foster greater public interest and appreciation with the potential of greatly expanding archaeology’s reach to various non-specialist sectors of society. A similar platform to ‘Sciencefeatured.com’ is proposed to be established, which might be called ‘ArchaeologyStories.com,’ that would achieve this balance by collaborating with experts in the field to produce content that is both informative and accessible. A possible approach would be for articles to be nominated to a lead person or panel which would review them for acceptance and then assign them to a writer/archaeologist in consultation with the article author, ensuring that the information in the feature story is accurate and up to date. The platform would be dedicated to providing the archaeology community and the public with open access to significant archaeological and historical research. The platform would provide references and links to original research papers, allowing interested readers to delve deeper into the subject matter.

1580. THE STRENGTH OF NARRATIVES FOR DIGITAL TECHNOLOGIES: THE CASE STUDY OF BAI AE IN THE “INFINITI MONDI” PROJECT OF NAPLES

**Contribution format:** Oral  
**Contribution authors:** Maria Taloni – Alfonsin. Pagano – Crescenzo Violante – Ivana Cerato – Enzo D’Annibale – Domenica Dininno – Danilo Paolo Pavone (Institute of Heritage Science - National Research Council of Italy)

The Metaverse Laboratory, in the project “Infiniti Mond i Naples Innovation City” House of Emerging Technology, is coordinated by CNR ISPC and it is organized as an experiential pathway focusing on emerging technologies. It aims to provide a multisensory “journey”, presenting use cases related also to Archaeology. One highlight is the submerged roman city of Baiae, an underwater archaeological park in the Gulf of Pozzuoli, resulting from the ongoing phenomenon of bradyseism. Its unique nature has enabled its reinterpretation through specific digital narratives and emerging technologies showed in “multisensory islands”. The first, Online Metaverse, offers the 3D reconstruction of the submerged archaeological remains, based on ultra-high resolution acoustic remote sensing survey. It allows users to navigate the virtual environment with a mouse click or smartphone tap, thanks to ATON 3D visualization framework. Users can discover the narrated history of the archaeological site and the studies conducted for documenting and analysing the underwater cultural heritage and the geological characteristics of the seabed. The second island, AR Metaverse, allows users to explore a lead aqueduct pipe found in the viridarium of the Villa dei Pisoni. The ZSpace software, customised in its interfaces and usability, allows users to interact with the ultra-high resolution digital model, created by photogrammetry, using a virtual pencil tracer, listening to historical and archaeological metadata. In the fourth, Panoramic Metaverse, the users can navigate the gulf using a rowing Olympian simulator, adapted for the project, culminating in a virtual immersion into the seabed: a series of floating devices activate the narrative, which is divided into scenes designed for voiceover narration. The Lab emphasises the importance of designing experiences that mix storytelling and sensory immersion, creating spaces where users can learn and be engaged: embracing storytelling and drama, each interaction leaves a lasting impression on the richness of cultural heritage.

2266. “AND MY TROWEL!” COMBINING FANTASY RPG STORYTELLING AND PODCASTING AS ARCHAEOLOGICAL OUTREACH

**Contribution format:** Poster  
**Contribution authors:** Matilda Siebrecht (APN | EXARC) – Ashleigh Airey (APN)

The benefits of using storytelling as an approachable and accessible framework for the dissemination of archaeological information are becoming increasingly accepted by the academic community. In spite of this, many archaeologists remain unsure of the possibilities when it comes to both the formats and platforms available for such outreach. In this poster, we present an example that successfully combines the format of a role-playing game (RPG) with the platform of an audio podcast. “And My Trowel” is a podcast series produced by the Archaeology Podcast Network. Each episode places the two hosts - often with the addition of expert guests - as professional archaeologists in a fantasy world, and aims to explain archaeological method and theory through the lens of fantasy fiction. By combining the accessible and approachable context of a fantasy world with accurate and real

archaeological information, the podcast demonstrates the strength of storytelling as a framework for science communication.

88 RECONSTRUCTING THE HISTORY OF FIRE, CONTROL AND APPLICATION OF THERMAL ENERGY AND ITS TECHNICAL, SOCIAL, SYMBOLIC AND ENVIRONMENTAL CONSEQUENCES

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Discussion session  
**Session keywords:** Thermal energy role in human evolution and adaptation strategies, Thermal energy role in exploitation of natural resources, Thermal energy role in infrastructural and super structural changes, Thermal energy role in diversification changes and reproduction of social organization, Thermal energy role in environmental changes and its social consequences , Thermal energy role in symbolic and social reproduction contexts, as identity, art, religion, initiation and mortuary rituals including also sociopolitical and economic organizations  
**Session organisers:** Ramiro March (Umr 6566 CNRS) – Raquel Pique Huerta (Universitat autonoma de Barcelona) – Begoña Soler Mayor (Universitat de Valencia) – Pauline Hart (umr 6566 Cnrs)  
**Session discussant:** Stephen J. Pyne (Arizona University)

SESSION ABSTRACT

The reconstruction of the history of the control and application of thermal energy to the transformation of matter opens a window on the relationship between this cultural resource and their relation with the modes of production and social reproduction in the history of humanity from societies from hunter gatherers to state societies. This session will deal with this relationship between man and fire from archaeological examples of different human societies from the past including different societies, continents and paleoenvironments and their relationship with our current global situation. Our session will be dedicated to the discussion, enrichment and development of this theme through the presentation of different problematics and results from the archaeological context. Contributions will be presented in the form of communications and going to be part of a future collective publication related to research that have highlighted, through the analysis of archaeological data, the social impact of thermal energy control. Communications may relate to many rich and different topics, such as the use of fire, the different material productions related to the use of thermal energy and their relationship with the different modes of production, social organization and social reproduction including activities related to the symbolic or super structural world which manifest the influence of the use and control of thermal energy and its consequences in the different domains mentioned in the title of our session. The presentations could be be related to technical, productive, social, symbolic and environmental point of view, and related to our current situation in relation to control, use of thermal energy and it’s role with our socials systems. If our session can attract colleagues from other disciplines, I would be open to them.

CONTRIBUTION ABSTRACTS

572. THE HUT IS WARM BUT NOT ON FIRE: FIRE EXPERIMENTS AND FUEL MANAGEMENT IN MOLÍ DEL SALT (LATE UPPER PALEOLITHIC)

**Contribution format:** Oral  
**Contribution authors:** Andrés Robledo (Iphes-Cerca | Idacor-Conicet) – Bàrbara Mas (Université Côte d’Azur | SERP-Universitat de Barcelona) – Manuel Vaquero – Susana Alonso – Ethel Allué (Iphes-Cerca | URV-Departament d’Història i Història de l’Art)

In this work we will explore fuel management strategies and fire use adaptations in enclosed dwellings during the Paleolithic, with a focus on campsite scenarios such as the Molí del Salt archaeological site (Tarragona, Spain). Understanding the benefits and consequences of the use of fire inside a hut will allow us to explore the decisions behind fuel choices and the eventual health consequences of their use. Fire technology is evidenced in Moli del Salt by charcoal remains from numerous hearths left by several Late Magdalenian occupations (ca. 13-15.48 kyr BP), suggesting a preference for Pinus sylvestris type used as fuelwood, which was dominant in the local landscape during the Last Glacial. Other taxa, such as Juniperus, Prunus, Rhamnus cathartica/saxatilis, could have been used for other purposes, such as to smoke rabbit skin and to obtain pigments (Allué et al. 2010; Mas et al. 2021). For this, in the FLA HME project we developed a fire experiment protocol that allowed us to evaluate the

awareness of people in the past regarding the use of fire and their emissions. In this opportunity, we present the first set of six fire experiments made during winter in 2023 inside an experimental hut built for this purpose. Construction of the hut was made according to archaeological interpretations from engravings (García-Diez et al. 2015) and ethnographic references. A structure with a diameter of 3 metres and a height of 2 meters was built with *Corylus avellana* and covered with *Pinus sylvestris* green branches gathered in the nearby mountains. Results of these experiments provide a unique tool for understanding fire use in small, enclosed scenarios such as a hut; but also contributes to the study of human adaptations to the use of fire by relating fire emissions to health consequences, as well as dwelling situations.

627. WEIGHING PROS AND CONS : GAINS AND CONSTRAINTS OF CHERT HEAT TREATMENT DURING UPPER PALEOLITHIC

**Contribution format:** Oral  
**Contribution authors:** Julie Bachellerie (uniarq | UMR 5608 - traces) – Miguel Biard (INRAP Centre Île-de-France | UMR 8068 - temps) – Mathieu Lejay (GéoArchÉon SARL | UMR 5608 - traces) – Pierre Bodu (UMR 8068 - temps)

The heat treatment of chert is a deliberate technical process that alters the rock’s mechanical properties. It has been documented across various chrono-cultural contexts and environments, and its inconsistent use throughout the Palaeolithic and Neolithic raises questions about the conditions and factors that influenced its adoption, spread, and occasional rejection by certain groups Focusing on the Solutrean as a case study, this research examines the advantages and constraints of heat treatment from a techno-economic perspective. This approach explores multiple aspects of the technique, including the specific heating methods used. Alongside insights gained from the techno-economic study of lithic industries and archaeometric analyses of Solutrean lithic collections (Bachellerie, 2022), new preliminary experimental data have recently been collected and will be presented here. These findings refine our understanding of the technical and economic investment required for chert heat treatment in a Palaeolithic context, as well as the pyrotechnic know-how involved. They also lay the groundwork for a larger, more ambitious experimental project currently under development.

935. HEATING STONE TECHNOLOGY IN EUROPE

**Contribution format:** Oral  
**Contribution authors:** Pauline Hart (Chercheur associé UMR 6566 CReAAH (University of Rennes))

Hot rocks are regularly discovered in European archaeological sites. The precise functions of these elements, deliberately exposed to fire and then used for indirect heating, have still to be determined and are undoubtedly multiple. The corresponding hearths, called « cooking stones pits », « structures à pierres chauffées » in France » or « Koch(stein)gruben », « koge pits », « kokgrop » and « kokegropprojection » in Germany and Northern Europe, come in a wide variety of shapes. But dozens or even hundreds of them can also be found in standard form on sites often multi-phase and that cannot be identified as classic housings due to a lack of other domestic remains. It reveals the existence of a heating stone technology from at least the Mesolithic to the Roman period, but these sites, which vary in number from period to period and transcend cultures and societies, also seem to crystallise an extra-domestic, collective and social behaviour around this technology, on a European scale. The internal logic of the sites must be studied, from the organisation, functioning and function of the hearths to their rhythm of use. From a diachronic and anthropological perspective, we can also question the mechanisms by which the sites emerged and were maintained, the links between them chronologically and geographically, the rate at which they were visited and their relationship to other types of archaeological sites. To this end, we can explore the concept of « convergence » induced by « tendency laws » developed by A. Testart and A. Gallay, or of « persistent place » defined by S. H. Schlanger as a conjunction of particular human behaviours accomplished in a particular landscape.

1087. RECONSTRUCTING THE HISTORY OF FIRE AND ITS TECHNICAL SYMBOLIC AND ENVIRONMENTAL CONSEQUENCES EPISTEMOLOGICAL AND METHODOLOGICAL ASPECTS

**Contribution format:** Oral  
**Contribution authors:** Ramiro March (Umr Creaah 6566 CNRS)

THis oral presentation is destinate to our discussion session concentrate wit. the RECONSTRUCTING THE HISTORY OF FIRE AND ITS TECHNICAL, SOCIAL, SYMBOLIC AND ENVIRONMENTAL CONSEQUENCES and the epistemological and methodological aspects. : the will be a presentation about he history of fire through archaeology reconstruction and its social and anthropological significance in human history dicussing about epistemological and methodological aspects. The reconstruction of the history of the control and application of thermal energy to the transformation of matter opens a window on the relationship between this cultural resource and the dynamics of production and social reproduction in the history of humanity from societies from hunter gatherers to state

societies. This presentation will deal with this relationship between man and fire from archaeological examples of different human societies from the past of South America and other continents and their relationship with our current global situation. including the relationship between man and fire from archaeological examples of different human societies from the past of South America and other continents and their relationship with our current global situation. The reconstruction of the history of the control and application of thermal energy to the transformation of matter opens a window on the relationship between this cultural resource and the dynamics of production and social reproduction in the history of humanity, from hunter-gatherer societies to state societies

942. FIRE AND FOOD: DAILY LIFE IN A RURAL CHIMU VILLAGE IN THE VIRU VALLEY, PERU

**Contribution format:** Oral  
**Contribution authors:** Feren Castillo (Université de Rennes | Universidad Nacional de Trujillo) – Ramir. March (CReAAH, CNRS) – Oswaldo Ezet. – Astrid Vergara – Zafiro Vilchez – Arturo Marín – Luz Monzón – Kelly Castañeda – Diego Huaccha – Geanpiero Montenegro (Universidad Nacional de Trujillo)

The Chimu kingdom was a society that developed between 1050-1470 AD, from its capital Chan Chan (located in the Moche Valley) they controlled a vast territory on the north coast of Peru. In this conference we show the first research results in a rural Chimu village located north of the Viru River. The village is made up of 73 houses connected by paths and a system of terraces with stairs that allow connectivity within 76 hectares. At the top of Cerro El Diablo, they built their most important administrative center. On the slopes are located the residences of the middle classes, while in the lower parts the groups of farmers dedicated to the cultivation of corn, cucurbits and beans would have settled. The use of combustion structures is very similar in all the houses, which served to cook products based on proteins from camelids and terrestrial gastropods. These data show the daily life of this village, whose subsistence was self-sustaining.

2070. THE RAW AND THE COOKED: TELL SETTLEMENTS AND PYRO-OBJECTS IN THE GUMELNITA TRADITION

**Contribution format:** Oral  
**Contribution authors:** Dragos Gheorghiu (Doctoral Studies, National University of Arts - Bucharest)

The Chalcolithic in the Lower Danube region in the 5th millennium BC is characterized by the appearance of compact and fortified tell-settlements, with a spatial organization tending towards orthogonal forms, and whose frequent burning was due to various causes. During their construction, tell-settlements functioned as attractors of various materials of the local landscape, creating a culturally structured scenery, in which the raw materials were subject to geometry and cultural processes. The fire was encapsulated in open or perforated ceramic containers that allowed the control of air and subsequent control of thermal energy due to the physical principle of air-draught. There was a relationship of analogy of forms between these pyro-objects and the form of dwellings and [less frequently] of the settlements. The compact spatial organization of the tell-settlement also created air-draught effects during atmospheric disturbances, allowing the widespread burning in case of fires. After the consumption of the organic materials of the constructions, the settlement became a ceramic object and abandoned. People returned after a period, acquired new raw materials, and dwelt a new settlement, which burned in turn. This succession of raw and cooked materials led in many cases to the appearance of a symbolic landscape in the form of artificial mounds. Cooking raw material is a thermally transformative, symbolical process, and in this perspective the present paper will discuss the analogies and the functional and symbolic relationships between different pyro-objects and the spatial organisation and combustion of the tell-settlements.

89 GENDER, SEXUALITIES AND VIOLENCE IN THE ANCIENT WORLD MATERIAL CULTURE

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Discussion session  
**Session keywords:** Ancient World, Classical Antiquity, Gender Archaeology, Genders and sexualities, Violences, Gender relations  
**Session organisers:** Tais Pagoto Bélo (University of São Paulo) – Sarah Lino Fernandes Azevedo (Federal University of Bahia) – Erica Angliker (ArcheoPaideia)

**SESSION ABSTRACT**

This session aims to bring together researchers with topics on gender in material culture of the Ancient World, focusing on the diversity of sexualities and violences. In ancient societies, it is evident that dominant discourses on gender constructed categories such as “woman” and “man” which were hierarchically related, creating a sexualized violence that is inseparable from the notion of gender. Hence, it is necessary to question whether nowadays we analyse past societies based on our own categories of gender, sexuality and violence. For instance, how do we define what sexual crimes are today? What were sexual crimes to the ancient societies? In the Roman world, rapes of women appear as a mark of founding myths, and rapes of men were common as a form of punishment, such as in the case of adultery. Representations of violence are demonstrated in objects from Antiquity, and some of them reinforce the ideological discourse of gender binarism, that make us think about of how “gender” operates in societies with a variety of violence? Ancient cultures can be a fruitful field of discussion, because they can challenge our binary conceptions of gender. In addition, it brings reflections on the notion of violence itself. Studies on these themes help us to think about strategies against violence nowadays, showing that violence is historically constructed. In this way, our aim is to have critical and transdisciplinary remarks about material culture that indicate discourses of power, gender relations, violence and sexualities. In this sense, we wonder how Archaeology can contribute to rethinking genders, sexualities and violence in ancient times, through a perspective of subaltern and “from above”, as well as in a decolonization point of view. Thus, we welcome papers that explore gender hierarchies, sexual crimes, binarism and non-binarism, physical and symbolic violence, and others.

**CONTRIBUTION ABSTRACTS**

**155. MYTHOLOGICAL RAPE IN A PUBLIC SETTING – LEDA AND GANYMEDE ON THE LAS INCANTADAS OF THESSALONIKI**

**Contribution format:** Oral  
**Contribution authors:** Andrea Nyholm (Lund university)

Rape is a common theme in Greco-Roman mythology. It is a central aspect that often results in evolution or revolution and can explain the unexplainable, such as the changing of the seasons. This paper presents a case study from my ongoing doctoral project in which I consider depictions of myths containing rape in Roman material culture of the Republican and Imperial ages. The aim is to explore how the depictions of these myths were understood by Romans across different social strata. For this purpose, I have chosen four myths: The rape of Europa, The rape of Ganymede, Leda and the swan and the rape of the Sabines. Depictions of these myths are plenty in a large range of material, from small scale decorations on oil-lamps and gemstones to reliefs and sculptures to skilful wall-paintings and mosaics, and indeed on public monuments. One such monument is the so-called Las Incantadas, once to be found near the Roman agora of Thessaloniki, today housed in the Louvre. This ill-preserved 2nd century CE building bore at least five sculpted pillars, one of which depicted both Leda and Ganymede, as well as their respective avian versions of Zeus. In this paper, I will explore the implications of depicting and viewing myths of rape in a centrally located and public monument, such as the Las Incantadas. I will place the depictions of Leda and Ganymede in the context provided both by the erstwhile location of the monument, as well as by the other depictions of mythological figures on the remaining pillars, so as to understand the intentions of the creator and the experience of the viewer, of the Las Incantadas.

**25. STUPRUM AND HERITAGE ON BOUDICA’S REBELLION**

**Contribution format:** Oral  
**Contribution authors:** Tais Pagoto Bélo (University of São Paulo)

This work is about the violence perpetrated on Boudica, queen of the Iceni, and her daughters, during the Roman invasion of Britannia, around 60/61 AD. The history written by Tacitus and Cassius Dio outlines that after the death of king Prasutago, Boudica’s husband, Rome came to charge on the contract made between them, in which half of the Iceni’s land would go to Rome and the other half to their daughters. Boudica didn’t accept and she ended up being flogged and her daughters raped. The definition of stuprum will be presented to delimit the magnitude of such acts, and an allusion will be made with the rapes of Roman origin myths to correlate them. The event that happened to Boudica and her daughters is the worst kind of humiliation, not only because of the testimony of imperial ferocity, but because of the exposure of a woman recognized for despising the Romans. The rape was especially significant and degrading for her daughters and the royal house of Prasutago. The act demonstrated a subjugation of these women to Roman officials. The material culture presented will be that related to the memory of the tragedy of these acts, in other words, the memory of suffering and misfortune, which raises controversial concerns in history. It will be the memory impregnated in its statues, stained glass and museums belonging to the cities of Norwich, Colchester, London, St. Albans and Cardiff. There is also the memory of women’s groups such as the Suffragettes, with their posters of vindications and actions next to the statue of Westminster. Boudica’s memory raises matters that are pertinent to women in general, as she is a female symbol

of strength and struggle, since she didn’t give up facing adversity.

**1922. A POSTHUMANIST FEMINIST APPROACH TO THE APOTROPAIC POWER OF THE GORGON IN THE ANCIENT MEDITERRANEAN (7TH-4TH CENTURY BCE)**

**Contribution format:** Oral  
**Contribution authors:** Eloise Jones (University of Liverpool) – Sera Yelözer (Koç Üniversitesi, ANAMED)

This paper examines the use of the gorgon as an apotropaic symbol in the material culture of the ancient Mediterranean from the 7th to 4th century BCE, and the way that this is contextualised by a mythology in which male violence and the fear of the monstrous feminine are inextricably linked. By applying a posthumanist feminist approach to the figure of the gorgon, we decentre it from a dualistic, male-centred understanding of being. In doing so, we consider how this hybrid figure defies the binary of a human versus non-human world; she is simultaneously both and neither, and this liminality is crucial to her power. This in turn enables us to ask questions about how the image of the gorgon may give us an insight into the way that gender-based fear and violence were conceptualised and expressed in the ancient world. According to mythological tradition, the gorgon Medusa, snake-haired and horrifying to look upon, had the power to turn men to stone with her gaze. Slain by Perseus with the help of the gods, the gorgon’s head nevertheless retained its petrifying power and was used widely as an apotropaic symbol in funerary and religious architecture. This paper will also critically reevaluate shifting artistic traditions throughout the Classical period which grew to favour depictions of a ‘beautiful’ Medusa over her former incarnation as a glaring, grinning, tusked monster, considering how this attempt to sanitise the gorgon and bring her more in line with ‘humanism’ may reflect patriarchal fear of a more-than-human female power that transgressed contemporary social order.

**1413. MOTHERHOOD, POLITICS AND VIOLENCE IN THE EARLY ROMAN EMPIRE**

**Contribution format:** Oral  
**Contribution authors:** Sarah Azevedo (Federal University of Bahia)

This presentation aims to discuss issues that intersect motherhood, politics and violence in the early Roman Empire. It focuses on the Augustan and Neronian contexts, and addresses how the exercise of motherhood was exalted in the imperial propaganda undertaken by Augustus and Livia, and how it was despised by Nero, a contempt symbolized by matricide. Thus, analyzing documents about Livia and Agrippina together, this presentation explores the role of motherhood in the politics of the early Roman Empire. One hypothesis is that these documents reveal aspects of the relationship between motherhood and the construction of the imperial image, acting in the construction of the portrait of Augustus as an ideal emperor, and of Nero as an anti-emperor. In this way, we analyze how motherhood is presented in the imagery and rhetorical markers of the beginning and end of the first dynasty of the Roman Empire. In addition to an analysis of the construction of the image of emperors, this presentation mainly points to the political deeds of Livia and Agrippina.

**90 HUNTER-FISHER-GATHERERS IN A WORLD BECOMING AGRICULTURAL: LEGACY, PERSISTENCE, AND/OR RESISTANCE OF MESOLITHIC COMMUNITIES DURING THE EUROPEAN NEOLITHIC?**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Hunter-fisher-gatherers , Mesolithic, Neolithic, Neolithisation, Material Culture, Bioarchaeology  
**Session organisers:** Sonja Kacar (Austrian Archaeological Institute/ Austrian Academy of Sciences) – Maïté Rivollat (University of Ghent | Cnrs)

**SESSION ABSTRACT**

This session aims to explore the complex responses of Mesolithic hunter-fisher-gatherer communities during the long and intricate process of Neolithisation in Europe, focusing on archaeological and archaeogenetic evidence that sheds light on how these groups influenced, adapted to, or resisted the shift to agriculture. At the onset of the Neolithic, in regions with significant hunter-gatherer populations, the Neolithisation process is understood as the result of interactions between migrant farmers and indigenous hunter-fisher-gatherers. Their legacy is evident in the persistence of Mesolithic traditions in material culture and subsistence practices, as well as in the significant genetic component inherited from the hunter-gatherers detected in ancient DNA. Additionally, the current genetic dataset indicates an increase of this component in various parts of Europe over a millennium

after the establishment of farming. The apparent lack of evidence of Mesolithic cultural preservation in most of the regions suggests either a fast and direct integration of hunter-gatherers into the Neolithic paradigm, or that Mesolithic communities have been pushed back into less hospitable lands. We welcome contributions examining the legacy, persistence, and resistance of Mesolithic hunter-fisher-gatherer communities within the European Neolithic, particularly from material culture and bioarchaeological perspectives. Key questions include: What are biological and cultural evidence of hunter-gatherer and farmer interactions, along the different stages of the Neolithic? Can we identify the nature of these interactions (cooperation, interbreeding, cultural hybridization, or conflict)? Which elements of Neolithic material culture might reflect preserved Mesolithic traditions? How did hunter-gatherers respond to Neolithic innovations – by adopting, modifying, copying, or rejecting them? Are there archaeological examples that nuance evolutionary narratives by demonstrating societies that abandoned established assets and potentially reverted to hunter-gatherer practices, either intentionally or in response to environmental pressures or conflicts? Lastly, how can we archaeologically identify presumed “Mesolithic survival” in regions where direct evidence is lacking?

CONTRIBUTION ABSTRACTS

2272. FISHING IN THE MEDITERRANEAN DURING THE MESOLITHIC-NEOLITHIC TRANSITION: THE CASE OF LA FONT-AUX-PIGEONS ROCK-SHELTER, MARTIGUES, S. FRANCE

**Contribution format:** Oral  
**Contribution authors:** Aymeric Vignier – Tatiana Theodoropoulou (Université Côte d’Azur, CEPAM UMR 7264)

This presentation will explore fish exploitation in the Mediterranean Sea before and after the Mesolithic-Neolithic transition. First, we will review existing studies on fishing for each period. After this essential recontextualization, we will focus on the site of La Font-des-Pigeons (Marseille, S. France), actually situated at the Berre lagoon (étang de Berre) and at close distance from the shore. This site produced a significant number of fish bones. For the study, we employed several archaeological methods (identification, osteometry, seasonality, ethology) to define the fishing strategies. The results indicate a significant distinction between the Mesolithic and Neolithic occupations. The exploitation of the aquatic environments and fishing techniques differ between the two periods. In the Mesolithic, inhabitants of the rock-shelter mainly fished in freshwater environments using a specialized technique: poison-fishing. In contrast, during the Neolithic, fishing mostly took place in the deep rocky inlets of the shore, called calanques, using nets and other implements. Not only do the fishing practices differ between these periods, but the methods of preparation of fish catches also vary. In fact, during the Neolithic, the remains appear to have been treated differently, with the cranial parts being broken. Conversely, in the Mesolithic, the heads are missing, suggesting a different type of culinary preparation. These preliminary results will be included in an important group of sites chosen for an ongoing PhD study.

2136. CAN WE DETECT HUNTER-GATHERER LEGACIES IN REGIONS LACKING MESOLITHIC SITES? INSIGHTS FROM STARČEVO LITHIC PRODUCTION IN SOUTHERN PANNONIAN BASIN

**Contribution format:** Oral  
**Contribution authors:** Sonja Kacar (Austrian Archaeological Institute/ Austrian Academy of Sciences)

At the southernmost part of the Pannonian region, in the interfluvium of the Sava-Danube-Drava, numerous Neolithic sites have been identified. However, Mesolithic sites remain conspicuously absent, despite the area’s favourable ecological conditions for hunter-gatherer-fisher populations. Nevertheless, several researchers have pointed to indirect evidence suggesting a Mesolithic presence, particularly in subsistence practices, ritual elements, radiocarbon dates, and lithic assemblages. The latter is especially relevant in the case of small bladelets and trapezoidal microliths observed at several Starčevo sites, although these findings have never been explored in detail. This presentation focuses on two case studies, Tomašanci-Palača and Debela Šuma, dated to c. 6000–5300 cal BC, which may also exhibit technological traits reminiscent of Mesolithic traditions. These include bladelet production similar to the Castelnovian traditions, such as bladelets produced by pressure flaking or indirect percussion, and trapezoidal arrowheads manufactured using the microburin technique. Furthermore, these lithic industries appear to rely on locally available raw materials, with little to no integration into broader exchange networks involving non-local resources or, at most, a peripheral position within these distribution networks. Another notable feature is the use of heat treatment to enhance knapability . a technique documented in pre-Neolithic contexts of Central Europe. However, whether this is indicative of a continued Mesolithic tradition remains an open question. With this presentation, we aim to contribute to the ongoing search for the elusive Pannonian Mesolithic, which has yet to be definitively identified.

1885. RELATIONS BETWEEN HUNTER-GATHERERS AND FARMERS DURING THE NEOLITHIC IN THE VISTULA AND ODER RIVER BASINS. IS THERE AN APPROPRIATE TERMINOLOGY?

**Contribution format:** Oral  
**Contribution authors:** Marek Nowak (Institute of Archaeology, Jagiellonian University in Kraków)

According to a growing body of evidence, including radiocarbon dating and aDNA determinations, the coexistence of Mesolithic and Neolithic communities in the Vistula and Oder river basins until the turn of the 5th and 4th millennia BC is increasingly plausible. It is likely that hunter-gatherer communities persisted in these areas for up to 2,000 years longer, until the Bronze Age, possessing some Neolithic attributes, most notably pottery. Should the term “Mesolithic” continue to be used, or, following the tradition prevalent in Eastern European archaeology, should we nevertheless use the term “Neolithic”? Or, finally, would it be more appropriate to use terms like “para-Neolithic”, “sub-Neolithic”, etc.? Since questions of this kind concern terms invented by modern prehistorians, they may seem purely academic. However, from a wider anthropological perspective, they touch on the fundamental problem of the nature of interactions between farming and hunting-gathering communities and their long-term effects. To explore these questions, we will analyse archaeological and archaeogenetic data indicating interactions between farmers and hunter-gatherers in the Vistula and Oder river basins from the mid-6th to the end of the 3rd millennium BC. For the first 1,500 years, evidence of contact is modest and one-sided (Neolithic pottery and stone tools in Mesolithic contexts). In contrast, the following 2,000 years show an increasing number of indications of such interactions, including “hunter-gatherer” pottery at Middle and Late Neolithic sites. Additionally, Mesolithic components in Neolithic aDNA (e.g., in Funnel Beaker culture communities) become more pronounced than before. Therefore, one can hypothesise about the long-standing cultural self-awareness of local hunter-gatherers, including their mental resilience in relation to the “proper” Neolithic.

2436. TEACHING THE CRAFT? – EARLY NEOLITHIC IMPACT ON LATE HUNTER-GATHERERS OF THE NORTH EUROPEAN LOWLANDS

**Contribution format:** Oral  
**Contribution authors:** Andreas Kotula (Brandenburgisches Landesamt für Denkmalpflege und Archäologisches Landesmuseum)

In the northern lowlands, a contact and border zone existed for an extended period of time between early farmers and late hunter-gatherers in the late 6th and throughout the 5th millennium BC. While contacts in the second half of the 5th millennium BC are confirmed by Neolithic finds from Mesolithic settlement sites, evidence of earlier interactions are rare. Accordingly, e.g. northern German Mesolithic burials from the early 5th millennium BC show no sign of admixture with farmers. More to the east the Mesolithic sea-shore site Dąbki, Poland, is a unique example of early and long lasting contact between late hunter-gatherers and early farmers. The site was settled c. 5200-3600 BC and contacts to farming communities to the south are documented by non-local pottery starting as early as LBK and continuing throughout the 5th millennium BC, even indicating long distance contact to Hungary in the late 5th millennium BC. Local Mesolithic pottery is also present with pointed bottom vessels and lamps. Starting from the analysis of the Mesolithic pottery from Dąbki, the talk discusses if the innovation of Mesolithic pottery was at least partly influenced by Neolithic contacts. The supra-regional view highlights Mesolithic pottery in different areas of th. lowlands, indicating local impact of neighbouring Neolithic communities in the early 5th millennium BC.

1632. WE SHALL PERSEVERE – TRACES OF THE PERSISTENCE OF HUNTER-FISHER-GATHERER COMMUNITIES IN THE AUSTRIAN AND SWISS ALPS

**Contribution format:** Oral  
**Contribution authors:** Caroline Posch (Natural History Museum Vienna) – Marcel Cornelissen (Urner Institut Kulturen der Alpen) – Joachim Pechtl (University of Innsbruck)

From the 6th millennium BCE onwards, the Neolithic and its material package are introduced along the Danube and the Mediterranean. However, if we look at distribution maps of early Neolithic sites of Central Europe, the Austrian and Swiss Alps remain a white spot in between the dynamic developments seen in the regions North and South of the Alpine Arc. This lack of evidence is surprising, given the substantial number of Late Mesolithic sites a. o. in the Austrian and Swiss Alps. It seems unlikely that the regional hunter-fisher-gatherer groups (HFG) should suddenly disappear into thin air in the 6th millennium BC. Therefore, the question arises, where did they go? Or rather, did they go anywhere at all? In the Swiss and Austrian Alps numerous sites have been recorded, which yielded 14C-data attributable to the late 6th and 5th millennium BCE. However, they often lack some or all attributes of the classic Neolithic package. Therefore, the question arises, whether these sites are to be seen 1) as indications of a Neolithic use of the Alpine highlands (e.g. early pastoralism or hunting activities); 2) as a persistence of Mesolithic HFG groups within the agriculturally less suitable regions of the Alps; or 3) or if this lack of evidence is largely due to biased preservation? With our paper, we discuss available data from archaeological

surveys and excavations, using the newly excavated site Lache within the Lechtal mountains (Tyrol) as well as other recently discovered and analysed sites as proxies. Furthermore, existing data from palynological analysis of sediment cores will be considered to assess the potential extent of human impact. In doing so, we explore the potential persistence and/or coexistence of Mesolithic HFG within the alpine regions of a more and more Neolithic world.

1894. MESOLITHIC AND NEOLITHIC COMMUNITIES IN BELGIUM: EXPLORING A LONG COEXISTENCE AND ITS POSSIBLE INTERACTIONS

**Contribution format:** Oral  
**Contribution authors:** Solène Denis (CNRS umr 8068) – Eva Halbrucker (Prehistory Research group, Department of Archaeology, Ghent University) – Dimitri Teetaert (Prehistory research group, Department of Archaeology, Ghent University)

Belgium provides an ideal case study for examining the interactions between Mesolithic and Neolithic communities due to its unique archaeological record. For the sandy lowlands of North-Western Europe, Neolithisation was a gradual transition, where a primarily foraging lifestyle persisted much longer (until c. 4300 BC) by “hunter-gatherers in transition” (Swifterbant Culture) while neighbouring loess areas were already colonised by farmer-herders of the Linearbandkeramik Culture (starting c. 5300 BC), later followed by the Blicquy/Villeneuve-Saint-Germain groups. A significant gap in Neolithic occupation occurred between approximately 4700 and 4300 BC, after which the Michelsberg culture expanded more extensively across the region. During this transitional phase, Neolithic innovations—such as pottery or domesticated animals—were gradually adopted by the Swifterbant groups, though an uneven and varying rhythm. The tempo of these transformations, as well as the nature of interactions between foragers and farmers, remains a key question with hypotheses ranging from complete acculturation to demic diffusion or a combination of both. In this paper, we revisit the long-standing research tradition on this period in Belgium, focusing on the pace and mechanisms of cultural transmission, with combining results on pottery and lithic production and use as markers of contact, exchange, and adaptation.

1584. EVIDENCE OF HIGH GENETIC ADMIXTURE BETWEEN HUNTER-GATHERERS AND FARMERS IN THE MEUSE VALLEY, LATE NEOLITHIC BELGIUM

**Contribution format:** Oral  
**Contribution authors:** Maïté Rivollat (PACEA, University of Bordeaux | Department of Archaeology, Ghent University | Department of Archaeology, Durham University) – Prudence Robert – Michel Toussaint (Department of Archaeology, Ghent University) – Caroline Polet – Patrick Semal (Royal Belgian Institute of Natural Sciences) – Pierre Cattelain (Cedarc/Musée du Malgré-Tout, Treignes | CReA/Patrimoine, Université Libre de Bruxelles | Service de Préhistoire, University of Liège) – Kelly Blevins – Eva Fernández Domínguez (Department of Archaeology, Durham University) – Philippe Crombé – Isabelle De Groote (Department of Archaeology, Ghent University)

Southern Belgium, and more specifically the valley of the middle Meuse, is renowned for its rich archaeological record associated with prehistoric periods. Numerous human remains, dating from the Middle Palaeolithic to the Bronze Age, have been discovered in over 400 caves, providing unique fossil assemblages despite a significant hiatus between the Middle Mesolithic and the Middle Neolithic. Here, we present the first results of a paleogenetic analysis conducted on remains from collective cave deposits from Mesolithic and Neolithic. Most of these remains originate from early excavations, some dating back to the early 19th century and rarely accompanied by precise documentation. Therefore, a systematic radiocarbon dating campaign was undertaken to better understand the internal chronology of the burials. The results demonstrate that several cave burials previously identified as exclusively Mesolithic are mixtures of depositions spanning multiple periods. Focusing on the Mesolithic and Neolithic periods, we provide new insights into demographic movements, previously unknown from a biological perspective in the region. While the Mesolithic groups align with known patterns in Western Europe at the time, all Late and Final Neolithic individuals (mid-4th to mid-3rd millennium cal BC) exhibit a strikingly different profile, characterized by an unexpectedly high hunter-gatherer inherited component. This is similar to findings from a few sites in nearby regions, such as modern-day Germany or France. In Belgium, however, the archaeological evidence complements the genetic findings. Indeed, lithic and pottery technology albeit undergoing clear changes in the course of the Late/Final Mesolithic and the Neolithic, also exhibit long-term continuity, despite early import of domesticated plants and animals. The combination of these archaeological and biological patterns highlights unique local dynamics of acculturation.

549. NEOLITHIC ECONOMIC NETWORKS AND HUNTER-FISHER-FORAGER RESILIENCE: MAPPING CONNECTIVITY BETWEEN PITTED WARE CULTURE COMMUNITIES IN THE BALTIC SEA REGION

**Contribution format:** Oral  
**Contribution authors:** Mikael Fauvelle (Lund University) – Torbjörn Brorsson (Kontoret för Keramiska Studier) – Magnus Artursson – Niclas Björck (Swedish National Historical Museums) – Christian Horn (University of Gothenburg)

The Middle Neolithic (circa 3500 to 2300 BCE) Pitted Ware Culture (PWC) occupied the islands and coasts of southern Scandinavia and the Baltic Sea region where they engaged in a subsistence economy focused on fishing and seal hunting. Throughout their history the PWC competed with terrestrially focused agricultural groups including the Funnel Beaker Culture and the Battle Axe Culture. Despite small settlement sizes, PWC communities were able to thrive in their maritime environment and successfully resisted encroachment by their agricultural neighbors for over twelve hundred years. In this paper we present preliminary data on connectivity between PWC sites in order to better understand the social organization of these neolithic fisher-foragers. We use the results from Inductively Coupled Plasma Mass Atomic Emission (ICP-MA/ES) and thin section analysis of figurines and potsherds to build a snapshot of a ceramic exchange network centered on the site of Tråsättra (circa 2630 to 2470 BCE), located northeast of modern-day Stockholm. We also use viewshed analysis to map connections between sites in order to better understand PWC settlement organization. We argue that our results show that there was regular interaction between PWC communities and suggest that regional economic and political networks could have helped communities organize against any external threats that they might have faced over the course of the Middle Neolithic.

92 BEYOND BURIALS AND BRICKS - INTERDISCIPLINARY APPROACHES TO UNRAVEL SOCIAL COMPLEXITY IN PRE-INDUSTRIAL CITIES AND TOWNS

**Session theme:** 1. On artefacts and beyond  
**Session format:** Session with keynote presentation  
**Session keywords:** Social Complexity, Urban Archaeology, Paleodemography, Interdisciplinarity, Inequality, Heterogeneity  
**Session organisers:** Kirstine Haase (Museum Odense) – Maria Legut-Pintal (University of Wrocław) – Dorthe Dangvard Pedersen (University of Southern Denmark) – Saige Kelmelis (University of South Dakota) – Pawel Duma (University of Wrocław)

SESSION ABSTRACT

Towns and cities have traditionally been viewed as places with high social complexity and diversity. The lives of people from all layers of society unfold within the same physical space, creating the heterogeneity that is a defining element of urban life. However, the lives of those at the bottom of society and those from the upper echelons are, and were, very different. These social inequalities and stratifications were expressed and reproduced through differences in occupation, consumption patterns, health, diet, spatial organisation and distribution of social groups. Therefore, the session’s goal is to present an interdisciplinary approach that can contribute to a better understanding of social complexity in historic towns. We invite researchers from a wide range of disciplines to discuss and unravel social complexity in towns from the pre-industrial period. We want to explore what new insights and perspectives can be gained by combining archaeology and disciplines such as architectural studies, history, bioarchaeology, osteology, paleodemography and geography. We will discuss social complexity in cities by answering the following questions. Which social groups lived in towns, and how can we trace them. What were the living conditions, quality of life, health, mortality risk and way of life of different social groups. How significant were the differences between high and low social groups in towns, and how were they manifested. We invite proposals that present interdisciplinary work combining archaeological studies and other disciplines, such as: Osteobiographies. Paleodemographical studies. Mortuary practices. Environmental studies. Paleoepidemiological studies. Isotopic studies. Spatial and topographical studies. Architecture studies. Metabolomics.

CONTRIBUTION ABSTRACTS

2511. KEYNOTE: BIOARCHAEOLOGY, MEDIEVAL TOWNSCAPES, CHANGE AND CRISIS

**Contribution format:** Oral  
**Contribution authors:** John Robb (University of Cambridge)

Medieval bioarchaeology stands at an ambitious moment. Spatially and socially, bioarchaeology is evolving from

a focus upon single sites to investigating the complexity of townscapes, investigated by studying heterogeneous sites or by comparing multiple sites. Similarly with temporal variation: it is evolving from simply characterising medieval lifeways at one moment to trying to identify change over time, particularly as regards various forms of medieval crisis and transition. These are both important directions in creating a bioarchaeology that goes beyond studying skeletons to provide data and narratives of relevance to historical interpretation and long-term trends. However, achieving them poses challenges which appear to be methodological choices, but which really reflect our underlying conceptual assumptions - for instance, whether we conceptualise society as homogeneous or heterogeneous, change as gradual or sudden, and explanation as simplifying scientific models or as layered historical interpretations. This paper explores how we might take such considerations into account in designing research. As an extended example, it uses the study of several hundred individuals from multiple medieval sites in Cambridge, England.

1000. URBANIZATION AND HEALTH: HETEROGENEOUS MORTALITY AND SURVIVAL IN MEDIEVAL LUND

**Contribution format:** Oral  
**Contribution authors:** Blair Nolan (Department of Archaeology and Ancient History, Lund University)

The bioarchaeology of urbanization is an interdisciplinary field in which researchers collect osteological data that is interpreted within specific archaeological and historical contexts, theorizing on the various impacts of urbanization on past populations. In this presentation I report on changing health patterns throughout the Medieval period in Lund, based on data gathered from 1600 adult individuals from the Trinitatis church cemetery (c. 990-1536 CE). I conceptualize health using a survival and mortality approach, identifying disparities in survivorship and risk of mortality at the population level and between subgroups. Lund was a vibrant hub within the Danish Kingdom, in which people of varying social identities interacted. I unpack how health outcomes changed throughout the Medieval for the population of Lund and how these patterns differed based on factors such as sex or evidence of previous biological stresses. Changes in survivorship and mortality were measured using Kaplan-Meier survival analysis and Cox proportional hazards modeling. This data is contextualized within a town that over time experienced periods of growth and stagnation against a background of economic shifts, power struggles, and crises of climate and disease (e.g. Black Death). My results indicate that health outcomes fluctuated throughout the Medieval period. Notably, survivorship and mortality risk outcomes improved during the Late Medieval relative to the Early and High Medieval. Males and females showed no differences in health outcomes, whereas some stress markers did have had an impact. Health in urban settlements was mediated by several factors which included one’s position within society and their lived experience. Studies such as this further our understanding of the heterogeneous effects of urbanization on populations in Medieval cities and towns.

633. BIOARCHAEOLOGICAL APPROACHES TO STUDYING LEPROSY AND TUBERCULOSIS STATUSES AS EVIDENCE OF DIFFERENTIAL HEALTH AND DEATH TREATMENTS IN MEDIEVAL DENMARK

**Contribution format:** Oral  
**Contribution authors:** Saige Kelmelis (University of South Dakota) – Vicki Kristensen – Dorthe Pedersen (Unit of Anthropology (ADBOU), University of Southern Denmark)

Medieval Danish populations endured several infectious diseases that remain imprinted in our present-day imaginings of what medieval life was like. Especially leprosy and tuberculosis were wide-spread. However, were individuals from urban and rural populations equally susceptible to these diseases? Moreover, did their disease status potentially dictate their burial position within churchyards? This study integrates approaches from archaeology and paleoepidemiology to analyze differences in health and death treatments in 812 adults interred at four rural and two urban cemetery sites. Prevalence of both diseases were estimated using probabilistic approaches based on sensitivity and specificity measures of disease-related lesions, which were used as variables in nonparametric hazards models to assess differences in survivorship and mortality between burials with varying degrees and types of infection. The spatial distribution of burials of individuals with pre-existing health conditions showed no clear evidence of differences in death treatments. Variable differences in survivorship across different cemeteries were found (p<0.001), but none among rural and urban sites. There were no statistically significant differences between survivorship and hazards for those that scored negatively and positively for leprotic lesions, whereas individuals scored positive for tuberculosis had significantly higher survivorship compared to their non-lesioned age peers (p<0.001). Lastly, we found that cemetery location is a strong predictor for survivorship (p<0.001). Results remained unchanged even when controlling for tuberculosis (p<0.001). The different patterns of survivorship and mortality hazards for individuals affected by the diseases reinforces historical and paleoepidemiological evidence that leprosarias have filtered out severe cases of illness from the living population, thereby affecting the distribution of cases in non-leprosaria cemeteries. Tuberculosis was widespread with more robust, exposed individuals living into later stages of infection compared to their non-lesioned age peers. For both diseases, those with severe bone involvement seemed no differently treated in death than those without signs of disease.

266. FOR THE WEALTHY AND THE POOR: DIET AND HEALTH AS SOCIO-TOPOGRAPHICAL FACTORS IN MEDIAEVAL TRONDHEIM

**Contribution format:** Oral  
**Contribution authors:** Axel Christophersen (NTNU University Museum, Dep. of Archaeology and Cultural History)

Individual and societal health depend on access to critical nutritional sources. Access determines food, with both composition and amount having a significant impact on an individual’s immune system and hence health state. The environment and climate, as well as social and economic status, influence people’s access to nutrition. We can form an overall picture of a population’s health status by collecting data on the prevalence of diseases that weaken the immune system, such as infectious diseases like paratyphoid, leprosy, tuberculosis, and other contagious diseases, as well as those that can be linked to malnutrition or undernutrition, such as iron deficiency anaemia, vitamin deficiency, or other physiological stress factors in childhood. If the image depicts a poor health situation for a portion of the population, it can be interpreted as either a) this group has had limited access to available nutritional sources due to limited social/economic opportunities, or b) access has been reduced at times due to naturally limited nutritional supplies such as acute or longer-term climate changes, war, or other external circumstances. The NRC-funded interdisciplinary project “Mediaeval urban health. From Private to Public Responsibility 1000-1600” has, among other things, mapped health and disease prevalence in individuals buried in three different cemeteries located in central and peripheral Trondheim, Norway during the Middle Ages. We were able to record the prevalence and distribution of disease frequency, infectious diseases, and infection occurrences in 79 individuals from three cemeteries using a mix of traditional archae-osteological analysis, isotope analyses, and aDNA analyses. We used this complicated dataset to show disparities in nutritional access and food composition between the three demographic groups. Based on this we can establish a social-topographical distinction of urban area that has existed at least since the second half of the 12th century.

1151. EXPLORING THE SOCIAL FABRIC OF A MEDIEVAL TOWN

**Contribution format:** Oral  
**Contribution authors:** Kirstine Haase – Peder Dam (Museum Odense)

Over the centuries, the physical structures of towns have evolved in close interaction with the social geographies of their inhabitants. It is a well-established concept that towns possess distinct zones for various activities, and that individuals’ residences and movements within a town are partially determined by their societal status. This dynamic profoundly influences the functioning and development of a town. Consequently, reconstructing the social topography of a town is essential for understanding its structure and societal role. For certain towns and historical periods, written records provide valuable insights. However, for the medieval period in Denmark, such sources are exceedingly scarce, necessitating an interdisciplinary approach to gain a deeper understanding. In this paper, I will present a case study from Odense, Denmark, where the integration of maps, architectural studies, written records, and archaeological findings has enabled the construction of a more concrete and nuanced depiction of the interplay between the town’s social and physical structures during the Middle Ages and the early modern period.

776. MAPPING SOCIAL COMPLEXITY: SPATIAL HIERARCHIES IN PRE-INDUSTRIAL TOWNS IN CENTRAL EUROPE

**Contribution format:** Oral  
**Contribution authors:** Maria Legut-Pintal (Wrocław University of Science and Technology) – Paweł Duma (University of Wrocław)

The spatial structure of medieval and early modern cities was shaped by economic, political, social, and environmental factors, giving rise to both elite districts and areas of poverty. This study explores the mechanisms driving these spatial disparities: what determined the location of prestigious and marginalised areas, and how did these factors influence urban development over time? Can these patterns be identified using archaeological methods? Focusing on case studies from Central European towns, including Wrocław and Prague, we adopt an interdisciplinary approach that combines historical sources, architectural and archaeological research, GIS-based spatial analysis, and space syntax methodology. By examining urban functions and real estate values, we identify the key forces shaping social and spatial hierarchies. These data are integrated with artefactual analyses from excavations of selected sites to assess qualitative differences in assemblages across comparable time periods. The results are not always conclusive – at times they align with assumptions drawn from other sources, such as evidence of poverty, while in other cases they challenge these interpretations. Our findings highlight centrality and accessibility as critical factors in urban stratification. Highly accessible areas, located near marketplaces, main thoroughfares, and centres of power, tended to retain their prestigious status, whereas peripheral or isolated

zones often became enclaves of poverty. Additionally, urban planning decisions – such as the placement of noxious industries or the enforced segregation of specific groups (e.g., Jewish quarters), further reinforced social divisions. This research offers new insights into the spatial organisation of medieval and early modern cities and establishes a comparative framework for analysing long-term patterns of urban inequality. It also evaluates the effectiveness of different methodological approaches and underscores the value of interdisciplinary collaboration in interpreting historical urban landscapes.

94 GENRE, GÉNERO, GESCHLECHT...: NAVIGATING SEX AND GENDER TERMINOL-  
OGY IN EUROPEAN ARCHAEOLOGIES

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

SESSION ABSTRACT

This roundtable invites scholars to examine how European languages shape the concepts of sex and gender in archaeology. While terminology around sex and gender is well-defined in English, key terms, concepts, and nuances differ significantly across linguistic contexts. For instance, the term gender has been challenging to translate in some cases, or remains untranslated, complicating research in this field. In today’s “publish in English or perish” climate, impactful research in gender studies and gender archaeology risks being overlooked if not published in English. Yet, innovative work developed outside the Anglophone world often goes under-cited and underutilized in global debates. This session aims to create a space where non-English-speaking scholars can contribute insights from their cultural and linguistic contexts, enriching the typically Anglo-centric conversation. Participants will address key questions:

- What is the aim of gender archaeology in your perspective?
- How are sex and gender conceptualized in your research?
- How relevant is sex as an analytical tool?
- What is lost in translating these concepts between English and your language?
- How does gender archaeology intersect with sociology in your country?

By exploring these questions among experts from diverse linguistic backgrounds (Latin, Germanic, Slavic), the roundtable will provide insight into the varied ways gender archaeology is practiced across Europe. Panelists from French, German, Spanish, Italian, Scandinavian, and Slavic language groups will reflect on the challenges posed by linguistic differences and their impact on research. Following brief introductions from panelists, the discussion will open to all attendees. We encourage audience participation, inviting everyone to share their experiences and perspectives. This session ultimately aims to foster inclusive, cross-cultural dialogue, recognizing linguistic barriers and amplifying voices often overlooked in the global academic landscape.

96 BRIDGING THE GAP BETWEEN BIOARCHAEOLOGY AND CULTURAL STUDIES IN  
UNDERSTANDING TRANSITIONS IN THE PAST

|                     |                                                                                                                                                                                                                                                                                                                                            |

SESSION ABSTRACT

Transitions during prehistoric and historical periods cannot be fully understood as mere adaptations to new economic, subsistence, or production systems. Instead, these shifts are intricately embedded within complex social contexts, involving cross-community relationships, migrations, and the transmission of knowledge, ideas, and technologies. These processes vary significantly across different geographical and chronological settings, shaped by the diverse modes of interaction between distinct population groups. While bioarchaeological research provides valuable insights into these transitions—often highlighting large-scale patterns of human migration, genetic intermixing, and broad demographic shifts, especially in the case of ancient DNA studies—these perspectives do not always align with the detailed, context-specific findings offered by cultural studies. Cultural studies, with their focus on material culture, social identities, and the nuanced transmission of knowledge and technologies, often reveal more localized and intricate patterns of change. The challenge lies in reconciling these two approaches, as they often operate on differing temporal and spatial scales. This session aims to foster a critical dialogue between bioarchaeological and cultural perspectives, with the goal to: (i) refine and question the temporal frameworks of these processes; (ii) identify patterns of interaction that may either converge or diverge across disciplines; and (iii) explore the rhythms of contact and exchange, and their effects on human behavior, social organization, and technological evolution. Through cross-disciplinary discussions, we seek to bridge the gap between bioarchaeological narratives and cultural studies. We invite contributions from around the world that explore mobility, migration, and interactions among societies undergoing these transitions. Researchers from bioarchaeology, material culture studies, residue analysis, ancient DNA research, and related fields are encouraged to participate. By bringing together diverse perspectives, we hope to deepen our understanding of these transitions and integrate both large-scale and fine-grained views into the broader historical narrative.

CONTRIBUTION ABSTRACTS

345. WHOSE HERITAGE IS MESOLITHIC (IN SOUTH-WESTERN UKRAINE)?

|                       |                                                 |

Recent paleogenetic studies suggest that Eastern European hunter-gatherers interacted with incoming early farmers relatively late—only just before the advent of the Eneolithic epoch in the fifth millennium BCE. In contrast, lithic analyses have often been more optimistic about Mesolithic influences on Neolithic material culture, even in contexts dated to the sixth millennium BCE. How can this apparent discrepancy be understood? This study critically examines the evidence for Meso-Neolithic interactions through the lens of radiocarbon dating and contextual analysis. The findings allow us to refine the list of potential interacting agents, eliminating certain candidates. Furthermore, a more nuanced social interpretation of innovations and cultural borrowings in Neolithic lithic industries may provide key insights into resolving this debate. It appears that ‘Mesolithic’ technological components were adopted by early farmers only in specific contexts—primarily in newly colonized landscapes or frontier situations. Over time, even within the same cultural framework, standard early farming tools became predominant, often replacing the earlier frontier toolsets and sometimes marking a clear break in technological tradition.

1543. RECONSTRUCTING THE LIFETIME MOVEMENTS OF FARMING PIONEERS AND THEIR SUCCESSORS DURING THE NEOLITHIC IN THE SOUTHERN CARPATHIAN BASIN

|                       |                                                                                                                     |

Changes in mobility and settlement patterns represent an important aspect of studying the processes of Neolithization and the consolidation of Neolithic practices. Project MOVE aims to study the origins of the sedentary lifestyle by exploring the residential and lifetime mobility and settlement patterns of the first farmers that settled in the Southern Carpathian Basin during the Early Neolithic (~6250-5300 cal BC) and explore how these patterns differed between the Early and Late Neolithic (~5350/5300-4500 cal BC). We will address the long-standing questions in regional prehistoric archaeology: 1. What were the characteristics of the Neolithic settlements, how long were they occupied, and what was their internal organization? 2. What was the nature and magnitude of the mobility patterns? 3. Were Late Neolithic communities less mobile than the Early Neolithic ones? To reconstruct these aspects of the Neolithic, we combine a diverse set of state-of-the-art methods and a holistic approach to the archaeological record from Serbia and Croatia. Contextual analysis in combination with Bayesian modeling of C14 dates will reveal the settlement size, duration, and organization. We will directly estimate the degree of individuals’ lifetime mobility by analyzing the strontium stable isotopes from the human remains. The stable isotope analysis of carbon, nitrogen, and sulfur will reveal the dietary and environmental exploitation patterns of Neolithic communities. The study of faunal remains will infer economic strategies and indicators of mobility

associated with animal husbandry. The synthetic interpretation will contribute to our understanding of the settlement life of the Neolithic communities and the origins of the phenomena that led to the prevalence of sedentary lifestyles today. This research was supported by the Science Fund of the Republic of Serbia, GRANT No. 7498, Moving across the plain: reconstructing the lifetime movements of farming pioneers and their successors during the Neolithic in the Southern Carpathian Basin-MOVE.

1016. HOUSEHOLDS IN TRANSITION: ETHNOGRAPHIC PERSPECTIVES ON CYCLICAL CHANGE IN THE ARCHAEOLOGICAL RECORD

**Contribution format:** Oral  
**Contribution authors:** Sabina Cvecek (Field Museum of Natural History | Austrian Arcaheological Institute)

Discussions of transition in archaeological contexts often focus on large-scale societal shifts, such as subsistence changes, technological innovations, or demographic movements. These transitions are typically traced through changes in material culture, technology, and more recently, ancient DNA. However, at the scale of the household, transitions are not singular events, but continuous, cyclical processes embedded in daily life. Drawing on Jack Goody’s developmental cycle in domestic groups, this paper explores how households continually undergo internal transitions—through generational succession, marriage, inheritance practices, and shifting divisions of labor—that may not always manifest in macro-level genetic or cultural signatures. By integrating bioarchaeological and contextual evidence, I argue that recognizing these micro-scale transitions allows for a more nuanced understanding of social continuity and change in cases where large-scale genetic intermixing or migration appears present or absent. This broadens the analytical scope of bioarchaeology and encourages an engagement with the lived, dynamic nature of past communities. At the same time, it shifts our perspective from viewing communities in transition as moving from one fixed state to another (x to y) to understanding them as being in transition, continuously negotiating the spaces between x and y.

171. CAST INTO THE LIMELIGHT – BIOARCHAEOLOGY AND THE GAPS IN ARCHAEOLOGICAL KNOWLEDGE

**Contribution format:** Oral  
**Contribution authors:** Daniela Hofmann (University of Bergen) – Márton Szilágyi (Eötvös Loránd University, Budapest) – Julie Dunne (University of Bristol) – Ludwig Husty (Kreisarchäologie Straubing-Bogen)

Before the bioarchaeological revolution (and, in fairness, since then) not many people had heard of the Cham culture, a rather obscure regional grouping of the Late Neolithic in southern central Europe. As part of the “ugly pottery horizon”, there were few scholars brave enough to want to specialise in Cham culture material, which in addition proved difficult to define spatially or to pin down chronologically. Since then, the transition to the Corded Ware culture has been established as one of the most dramatic cultural, social and not least genetic changes in European prehistory, often associated with the catchphrase of a “steppe migration”. Suddenly, the Cham culture, as immediately preceding this watershed moment, should have monopolised scholarly attention. And indeed there has been a slight upturn in archaeological interest – but the main boom has yet to happen. Most likely, the reason is that the Cham culture is relatively poor in human remains, and so we cannot really answer the question of who these people were – or can we? In this paper, we briefly trace how lipid analysis of pottery and more traditional archaeological studies have begun to sketch an interesting picture of a society in transition, with varied and dynamic contact patterns that have the potential to cast a new light on the “steppisation” of southern central Europe. What we can say about the possible interactions with neighbouring groups, and how could a new research strategy integrating archaeological and bioarchaeological questions change the way we look at this forgotten piece of the puzzle?

1439. INTEGRATING BIOARCHAEOLOGY, ENVIRONMENT, MATERIAL CULTURE, AND TIME TO RECONSTRUCT SOCIAL ORGANISATION IN THE CZECH CORDED WARE CULTURE

**Contribution format:** Oral  
**Contribution authors:** Mikkel Nørtoft (Section for Prehistoric Archaeology, Saxo Institute, University of Copenhagen) – Adam Rohrlach (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

The display of wealth in archaeological contexts is an intriguing aspect of our understanding of past societies. How changes in climate, migration events, varying population size, and changes in burial practices may have shaped performative wealth display in burials and social organization over time in the Corded Ware Culture (CWC) has not yet been quantified and studied in detail. By integrating archaeogenetic data with multiple wealth measures at a regional scale using QuantWealth (Nørtoft 2022), we offer a nuanced perspective on evolving social mechanisms in Bohemia during the 3rd millennium BCE. During several years of “darkened sun” around 2900 BCE, migrants from the Pontic steppe mixed with agropastoralists of the Globular Amphora culture and began settling

in Bohemia. In this study, we integrate multiple lines of evidence to unravel several phases of social structure during the CWC period in Bohemia. As they built and maintained migrant networks with neighbouring CWC groups, visible through shared funerary practices and resource networks, they initially appear as a gerontocratic multi-lineage society with a growing population and high social mobility. However, concurrent with the appearance of a new paternal lineage in Bohemia around 2700-2600 BCE, displays of wealth in the CWC became more competitive, perhaps centred around feasting networks, and linked to power struggles between lineages. In the late phase (c. 2500-2300 BCE), a few select child burials became more elaborate with prestige objects, likely indicating intergenerational wealth transmission and early steps toward emerging persistent inequality in the CWC. By synthesizing genetic, archaeological, and theoretical approaches, with special attention to chronology, we thus propose a more detailed narrative about the CWC which may be further tested with future data.

1984. A NEW PERSPECTIVE ON BRONZE AGE MORTUARY DIVERSITY AND CONNECTIVITY FROM THE HAN-SUR-LESSE CAVE, BELGIUM

**Contribution format:** Oral  
**Contribution authors:** Hannah Leonard (Archaeology, Environmental Changes & Geo-Chemistry Research Group; Vrije Universiteit Brussel) – Giacomo Capuzzo (Archaeology, Environmental Changes & Geo-Chemistry Research Group; Vrije Universiteit Brussel | University Of Trento: Department Of Humanities) – Christophe Delaere (CReA-Patrimoine, Université libre de Bruxelles) – Caroline Polet (Royal Belgian Institute of Natural Sciences, Research Group Quaternary Environments And Humans) – Guy De Mulder (Ghent University Archaeology Department, Research Group Protohistory) – Koen Deforce – Possum Pincé (Royal Belgian Institute of Natural Sciences, Research Group Quaternary Environments And Humans) – Mathieu Boudin (Royal Institute of Cultural Heritage, Radiocarbon Dating Laboratory) – Sophie Verheyden (Royal Belgian Institute of Natural Sciences, Research Group Geological Survey Of Belgium) – Christophe Snoeck (Archaeology, Environmental Changes & Geo-Chemistry Research Group; Vrije Universiteit Brussel)

Bronze Age Belgium sat at the crossroads of Europe and as a result, was separated into two distinct cultures. This split was reflected not only in material culture, but also in the mortuary practices. The development of cremation as a funerary rite in barrow contexts, followed by the Late Bronze Age Urnfield Culture and so-called flat graves, were characteristic of the Scheldt basin (northern Belgium). However, in the Meuse basin (southern Belgium), collective cave burials of inhumations persisted in the Calestienne caves, lasting from the Neolithic until the Roman period. Han-sur-Lesse cave, located in the Famenne-Ardenne UNESCO Global Geopark, is argued to be the most significant of these, revealing over 3,000 bronze artifacts from across its occupation periods, considerable rare gold finds, as well as pieces of Mediterranean origin, all found in river contexts. Multi-disciplinary approaches in Belgium have already been successful at understanding transitory events. Absolute dating of human remains has determined that the Urnfield Culture began earlier than initially thought, and through strontium isotope analysis, early Urnfield adopters in the Scheldt basin are known to be local. Furthermore, 87Sr/86Sr analysis confirms that Bronze Age individuals from the Kempen region, in northeastern Belgium, can be connected geographically to the Meuse basin. Whilst extensive material culture connects the Han-sur-Lesse site to the wider European Bronze Age, who the individuals buried in the cave were cannot be fully grasped by this alone. Through isotope analysis (C, O, Sr) of inhumated remains, the geographic origins of those individuals can be discussed. This interdisciplinary approach can explore potential mobility during a time of gradual population expansion in the Scheldt basin, as well as exchange and connection networks not visible in the archaeological record, contextualising a unique site within the large-scale transitions of the Bronze Age, and mortuary diversity.

1662. BRONZE AGE TRANSITIONS IN ALSACE: MOBILITY, IDENTITY, AND CULTURAL CHANGES

**Contribution format:** Oral  
**Contribution authors:** Solène Chevallier (Inrap | Lampea UMR 7269, CNRS, Aix Marseille Univ., Ministère de la Culture | Archaeology, Enivronmental Changes & Geo-Chemistry) – Muriel Roth-Zehner (Archéologie Alsace | Archimède UMR 7044, Université de Strasbourg, CNRS, Ministère de la Culture, Inrap) – Hannah James (Archaeology, Enivronmental Changes & Geo-Chemistry) – Rebecc. Peake (Inrap | Artehis UMR 6298, Université de Bourgogne, CNRS, Ministère de la Culture) – Christophe Snoeck (Archaeology, Enivronmental Changes & Geo-Chemistry) – Estelle Herrscher (Lampea UMR 7269, CNRS, Aix Marseille Univ., Ministère de la Culture)

The end of the Bronze Age in Western Europe marks a key transition period, reflected in material culture, demography, and funerary practices. In the Alsace region (northeastern France), cultural influences evolve between the end of the Middle Bronze Age and the Late Bronze Age (1400-800 BCE), shifting from the Oriental Tumulus

culture (part of the North Alpine Group) to the Rhin-Suisse-France Orientale group. This transformation is visible in material culture, where ceramic types and decoration change gradually, as well as in funerary practices, with inhumations under tumuli becoming less common and cremation emerging as the dominant funerary practice. Grave goods also evolve: metallic objects, prevalent in the tumulus traditions during the Middle Bronze Age, are progressively replaced by numerous pottery vessels. These changes suggest complex social interactions and potential human mobility. This study focuses on the “Reguisheimer Feld” site in Ensisheim (Alsace), a major cemetery densely occupied at the end of the Bronze Age. Material culture, including pottery and metal objects, suggest close affinities with northern Switzerland and southwestern Germany. To investigate human mobility, strontium isotope analysis was conducted on bone fragments from 140 cremations that date from 1350 to 800 BCE. The isotopic ratios (0.7081 – 0.7120) compared with a regional isotopic baseline (isoscape) indicate that most individuals were local and shared a common environment. However, several isotopic outliers suggest greater mobility and connections to different environments. By combining bioarchaeological data and archaeological social identities, we aim to explore population dynamics, mobility patterns and social interactions at both collective and individual levels. It provides insights into a society experiencing significant cultural change during the Late Bronze Age in Western Europe.

**1146. LIFEWAYS OF LATE BRONZE AGE COMMUNITIES IN CENTRAL GERMANY: INSIGHTS FROM ANCIENT DNA, ISOTOPES, AND ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Eleftheria Orfanou (Max Planck Institute for Evolutionary Anthropology, Department of Archaeogenetics, Leipzig | Max Planck Institute of Geoanthropology, Jena | Chair of Pre- and Protohistoric Archaeology, Friedrich-Schiller University Jena)

The Late Bronze Age (LBA; 1300–800 BCE) of Central Europe has been proposed as a period of major population movements, socioeconomic changes, and cultural connections. However, reconstructing the impacts of these dynamics on different populations has been hindered by the fact that cremation was the dominant mortuary practice, limiting the use of biomolecular approaches. Here, we apply ancient DNA, oxygen and strontium isotope analyses, and osteoarchaeological analyses to rare inhumation burials from the sites of Kuckenburg and Esperstedt in central Germany. These sites present varied mortuary practices such as settlement burials, cemetery burials, skull-only burials, and multi-stage funerary rites, allowing us to investigate the community’s burial choices and societal perceptions of the individual. The analysis of 36 LBA individuals reveals regional genetic continuity over time with subtle differences between early and late LBA individuals. Comparison with 14 LBA individuals from Neckarsulm and published data from southern Germany shows a clear ancestry dichotomy: southern individuals have more Early European Farmer-related ancestry than those from central Germany. Oxygen and strontium isotope analyses suggest most individuals from central Germany, including those who were cremated, were local, with limited exceptions. Our findings suggest that the diverse inhumation practices at Kuckenburg and Esperstedt were culturally and socially motivated, reflecting local traditions and decisions rather than the influx of new groups with substantially different ancestries and/or “non-local” individuals.

**1581. PEOPLE FROM IRON AGE DHOFAR (SULTANATE OF OMAN): THE ARCHAEOLOGICAL AND ANTHROPOLOGICAL STUDY OF KHOR RORI NECROPOLIS**

**Contribution format:** Oral  
**Contribution authors:** Vittoria Bianchi (Department of Cultural Heritage, BonesLab, University of Bologna | International PhD College, Collegio Superiore, University of Bologna) – Matteo Vangeli (Department of Civilizations and Forms of Knowledge, University of Pisa) – Eugenio Bortolini (Department of Cultural Heritage, BonesLab, University of Bologna) – Silvia Lischi (Université Paris 1 Panthéon-Sorbonne, EHAAS | UMR 8167 – Orient & Méditerranée Ues, CNRS) – Stefano Benazzi (Department of Cultural Heritage, BonesLab, University of Bologna)

The area of Khor Rori, about 35 km east of the modern city of Salalah (Dhofar, Sultanate of Oman), is characterised by numerous archaeological remains from different periods that are currently under investigation. Most of these remains date to the Iron Age and are attributed to two distinct cultural traditions with fluctuating relationships: the Dhofar Coastal Culture and the South Arabians from Hadramawt. This paper presents a preliminary study of the KR-N1 necropolis, an extensive burial site dating to the Iron Age that covers approximately 22 hectares. Situated on a rocky hill overlooking the Indian Ocean and the Inqitat promontory, where the principal settlement of the Dhofar Coastal Culture was located, the necropolis comprises around 700 tombs. These tombs are cist graves, constructed of megalithic stone. Some burials are paratactic, placed side by side to form continuous units known as multiple cists, while others are isolated, known as dolmenic cists. A systematic survey has identified clusters where both forms coexist. Stratigraphic excavation of eight tombs have been carried out, and the human remains recovered from them have been analysed. Preliminary observations indicate that the bones

are significantly affected by diagenetic processes, which affect their preservation and visibility. Nevertheless, an anthropological study has been carried out, estimating the Minimum Number of Individuals to be four and providing age-at-death estimates. Given the challenges associated with macroscopic examination, sex determination is performed through amelogenin protein analysis, while mobility and diet are inferred through stable isotope analyses. This multidisciplinary approach, which combines osteoarchaeology, paleoproteomics, and isotope analysis, has been rarely applied in Dhofar. Yet, it is the only effective means to reconstruct past communities’ diachronic and synchronic dynamics. This study marks the first step in a broader project aimed at expanding this methodology across the entire region, bridging the gap between archaeology and bioarchaeology.

**1929. CHALLENGING TRADITIONAL MIGRATION PERIOD NARRATIVES WITH A MULTI-PROXY APPROACH**

**Contribution format:** Oral  
**Contribution authors:** Claudia Gerling – Margaux Depaermentier – Cornelia Alder – Michael Kempf (University of Basel) – Irka Hajdas (ETH Zurich) – Joscha Gretzinger – Zuzana Hofmanová – Johannes Krause (MPI Leipzig) – Peter-Andrew Schwarz (University of Basel)

The 1st millennium CE in Basel (Switzerland) is characterised by diversity in the archaeological record and complex political, cultural, and economic interactions. The present study aims to investigate mobility patterns, subsistence strategies, and communication networks in the region at the periphery of the Late Roman Empire, which became the centre of Early Medieval crossroads between cultural entities. This objective is pursued through an in-depth analysis of ca. 150 burials dating to the 4th to the 8th centuries CE using an integrative approach encompassing AMS radiocarbon dating, archaeological, anthropological, isotopic, and genetic analyses, as well as environmental modelling. Preliminary results call into question the previously held view of large-scale migrations from the 4th/5th centuries onwards. Instead, the results indicate that regional mobility was prevalent – besides the presence of large-scale communication networks. This study underscores the pivotal role that bioarchaeological approaches play in unveiling hitherto unanticipated facets of social dynamics during the late antique and early medieval periods in Basilia/Bazela, thereby facilitating the reconstruction of individual life histories. The study further demonstrates the benefit of integrating multivariate models involving high-resolution climatic and environmental data to disentangle potential drivers of isotope variability at various scales.

**2243. MIGRATION OR CULTURAL TRANSFORMATION? NEW INSIGHTS FOR THE EARLY MIDDLE AGES IN THE LIGHT OF BIOARCHAEOLOGICAL DATA**

**Contribution format:** Oral  
**Contribution authors:** Tivadar Vida (ELTE Eötvös Loránd University, Budapest)

Changes in material and spiritual culture generally indicate the transformation of cultural or ethnic identity, which has previously almost always been attributed to migration. However, archaeologists, historians and biological anthropologists tended to vehemently disagree on the exact nature and extent of these processes. Later, the critical re-assessment of the historical and archaeological record led to the proposal of elaborate new models and theories, in which these changes were attributed to cultural change or new social orientations (such as the Merovingian-German, steppe nomadic Avar or Slavic expansion). What was the fate of the Roman provincial population after the collapse of the empire in Pannonia, Germania and Italia? How did this Romanised community become an ethnic component of early medieval kingdoms? What was the extent and scale of the arrival and settlement of ‘foreign’ (barbarian) peoples? How was coexistence achieved – was integration peaceful or hierarchical? Isotopic data and DNA from individuals offer a previously unknown, new perspective on past cultural phenomena through the geochemical and molecular biological patterns underlying them, which can significantly broaden the scope of historical and social historical interpretation. The rigorous examination of the direction and extent of mobility and migration, the study of changes in dietary habits, and the analysis of kinship relations through an integrated multidisciplinary analysis will provide a more detailed and deeper understanding of early medieval society than ever before. Currently, we can work with not only transect data, but also with the bioarchaeological record of entire cemeteries (communities) from the Migration period and the early Middle Ages (thanks to the HistoGenes project), which provide sufficient comparative material for a better understanding of European migrations and cultural transformations after the fall of the Roman Empire.

**994. KNOWING HOW BUT ASKING WHY. BIOLOGICAL ANSWERS TO ARCHAEOLOGICAL QUESTIONS ON A MEDIEVAL BURIAL GROUND FROM ROMANIA**

**Contribution format:** Oral  
**Contribution authors:** Franceska Stirbu – Gabriel Vasile – Alexandru Morintz („Vasile Pârvan” Institute of Archaeology)

The study is based on recent research conducted at Buftea – La Cârna/Mănești site, the largest known medieval burial ground from Wallachia. The inquiry examines the convergence of health, diet, and funerary practices in

Mediaeval Wallachia, exploring how cultural and social factors shaped community responses to crisis and transition. The bioarchaeological approach investigates patterns of disease (especially infectious markers), nutrition (differences in diet), and burial customs (the presence of double burials, reburials and grave goods). The bioarchaeological analysis raises critical questions about funerary traditions and potential crisis-related responses, such as epidemic outbreaks or shifting socio-religious beliefs. Additionally, differences in diet and burial treatment may reflect social stratification or adaptive cultural behaviours during periods of upheaval. This research underscores the importance of interdisciplinary approaches in understanding past societies, demonstrating how bioarchaeology and cultural studies together can illuminate broader patterns of human resilience and adaptation. The research is designed as a questionnaire with targeted inquiries to specific archaeological contexts documented in the burial ground. The questions focus mainly on some deviations from funeral ritual customs, like multiple burials, medical treatments of the body, and non-standard orientation of the graves.

817. CHRISTIAN PIONEERS –STRONTIUM ISOTOPE ANALYSIS OF PEOPLE BURIED AT THE EARLY CHRISTIAN SITE OF VARNHEM, SOUTHWESTERN SWEDEN

**Contribution format:** Oral  
**Contribution authors:** Crista Wathen – Fanny Bengtsson – Sven Isaksson (Stockholm University) – Maria Vretemark (Västergötlands Museum) – Gunilla Eriksson – Kerstin Lidén (Stockholm University)

The Christianization of Sweden (8th–11th centuries) was a period of political, social, and religious change, and it implies a period of movement and mobility. Excavations at the Varnhem estate church grounds (Kata Gård), with a church originally constructed around AD 1000 in Västergötland, Sweden, have yielded information about this period. Key findings include a large socially stratified cemetery, burial practices that indicate remnants of pre-Christian burial customs, and grave goods suggesting contact with other areas. This study builds on previous DNA and isotopic analysis, and with a focus on strontium isotopic analysis using Laser Ablation to examine minute changes in the lives of these early Christians buried at Kata Gård. Through these results, we found that a significant portion of the adult population was non-local, having spent their childhoods in other geological areas, while the children mostly exhibited local strontium isotope signatures. These findings highlight distinct mobility patterns and the societal impact of Christianization in this region, emphasizing Kata Gård’s importance in understanding Sweden’s religious transformation.

1666. FROM EPISCOPAL CATHEDRAL TO PARISH CHURCHES: RELIGIOUS AND POLITICAL SHIFTS AND UNDERLYING BIOLOGICAL CHANGES IN SANT PERE CHURCHES, TERRASSA, SPAIN

**Contribution format:** Poster  
**Contribution authors:** Lelaina Pauli (Biological Anthropology Unit, Universitat Autònoma de Barcelona, España) – Gemma Garcia – Antonio Moro (Museu de Terrassa, Barcelona, España) – Xavier Jordana (Biological Anthropology Unit, Universitat Autònoma de Barcelona, España) – Fabian Crespo (Department of Anthropology, University of Louisville)

The Sant Pere Churches are a monumental Romanic complex in Terrassa (Spain) built over the cathedral of Egara from the Visigoth period (4th to 8th centuries AD). Socio-cultural and political changes ended with the episcopal cathedral transitioning into parish churches (9th century). This transition was also influenced by a new power structure established by the Carolingian Empire in the early 9th century, impacting the economy, diet, and social fabric, ultimately compromising overall health and survival. We proposed that reconstructing skeletal inflammatory phenotypes could help study biological shifts during this historical transition. This study explores novel scoring criteria using periodontal diseases severity (PDS) and periosteal lesion severity (PLS) as a proxy to reconstruct skeletal inflammatory phenotypes in 74 individuals from the necropolis (4th to 11th centuries AD) of the churches of Sant Pere de Terrassa. PDS was determined by a combined score from cemento enamel–alveolar crest distance (CEJ-AC) and interseptal bone texture and shape (Kerr). PLS was determined by a combined score considering severity and coverage.PDS, estimated by CEJ-AC distances, was significantly higher in older adults (over 45 years) and in individuals buried within the church complex, while the Kerr Score showed no significant group differences. The combined PDS score (CEJ-AC + Kerr) was also higher in older adults. PLS final scores (coverage + severity) were significantly higher in individuals from the Visigothic period and in those buried outside the church complex. A significant positive association, PDS + PLS, interpreted as a proxy for systemic hyperinflammation, was found only in Carolingian burials outside the complex (N=8, r = 0.781, p = 0.022). The historical and political changes observed in the Sant Pere population could have differentially generated early life stress and diverse inflammatory profiles in adults, contributing to hidden heterogeneities associated with ill health or increased mortality risk.

97 EASTERN MEDITERRANEAN CITIES IN TRANSITION: NEW ARCHAEOLOGICAL PERSPECTIVES ON URBAN LANDSCAPE AND PUBLIC ARCHITECTURE FROM THE ROMAN TO BYZANTINE ERA

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Roman and early-Byzantine Cities of Eastern Mediterranean, Urban Landscapes, Public Architecture, Resilience and Transformations, Ancient Architectural Restoration, Building Materials and Technology  
**Session organisers:** Sara Bozza (CNR - Istituto di Scienze del Patrimonio Culturale) – Paolo Maranzana (Boğaziçi Üniversitesi)

SESSION ABSTRACT

In recent decades, the transitional period between the Roman and Byzantine eras has garnered renewed attention due to significant advances in archaeology. Research has increasingly focused on urban centers and their monuments as key evidence for exploring both continuity and transformation from the Roman period to the early Middle Ages. Studies of Late Roman cities (3rd–7th centuries CE) have emphasized the remarkable resilience of urban spaces that endured challenges such as earthquakes, warfare, political and religious shifts. This session invites contributions on the resilience and transformations of urban centers and public architecture in the Eastern Mediterranean during this transitional period. We especially welcome submissions exploring new archaeological findings at urban, regional, comparative levels, and focusing on themes such as: 1. Maintenance and Renovation of Public Spaces: What happened to public spaces such as sanctuaries, agoras, theaters, baths, fountains? Can the analysis of these buildings’ biographies expand our understanding of the cultural and socio-economic needs behind new constructions as well as projects of restoration, maintenance, aesthetic refurbishment, redesign? 2. Urban ‘Replanning’ and Resilience: On an urban scale, how did building programs—demolition, restoration, refunctionalization, and the construction of new monuments and infrastructure such as city walls, streets, and aqueducts— reshape urban layouts and pathways? How did these initiatives foster the emergence of a new urban identity while preserving the cultural values embedded in the built heritage? How did cities demonstrate resilience by adapting or repurposing their monuments in response to disruptions? 3. Materials and Building Technology in Transition: We seek case studies exploring the role of building materials and technologies during this transitional period. What impact did evolving technical strategies and production procedures—large-scale use of bricks, recycling and incorporation of spolia, new supply chains of prefabricated architectural elements—have on building programs? What are the social and economic implications of these changes?

CONTRIBUTION ABSTRACTS

388. RESILIENCE AND TRANSFORMATION: THE LATE ANTIQUE RESTORATION OF THE MONUMENTAL NYMPHAEUM OF TRIPOLIS AD MAEANDRUM

**Contribution format:** Oral  
**Contribution authors:** Sara Bozza (CNR - Institute of Heritage Science) – Bahadır Duman (Pamukkale Üniversitesi) – Tommaso Ismaelli (CNR - Institute of Heritage Science) – Giacomo Casa (Sapienza Università di Roma | CNR - Institute of Heritage Science)

Thanks to Turkish-Italian collaboration\*, a multidisciplinary research project is conducting a reconstructive study and restoration of the Monumental Nymphaeum of Tripolis ad Maeandrum (Denizli, Türkiye), an ancient city at the crossroads of Lydia, Phrygia, and Caria. With its 40-meter façade and three orders of aediculae, the Nymphaeum, originally built in the 2nd century CE, was entirely reconstructed in the 5th century CE following a probable seismic collapse. This makes it an ideal case study for examining the resilience and transformation of urban centers during the transition from the Roman to the Byzantine era. Through detailed block analysis and archaeometric investigations, we demonstrate that the rear wall was rebuilt from its foundations using a new construction technique—small blocks and bricks replacing large blocks—while the hypostyle façade was reassembled using original elements with various adaptive strategies. These included reworking, repairing, modifying, and repositioning blocks within the architectural layout. The paper examines the strategies of this Late Antique restoration, highlighting both technical solutions—such as the selection of building materials and the reuse of earlier blocks—and the monument’s aesthetic renewal through newly carved elements. The Nymphaeum’s reconstruction, seamlessly integrated into the urban fabric of Tripolis, contributed to shaping a new urban identity while preserving its imperial-period built heritage. This case study offers insights into the interplay of continuity and transformation in public architecture, reflecting the evolving aesthetic, cultural, and socio-economic needs of the early Byzantine city. \* The ”Monumental Nymphaeum” project is supported by the Ministry of Culture and Tourism of the Republic of Türkiye, Denizli Governoship, Denizli Municipality, Pamukkale University, South Aegean Development Agency,

Buldan Municipality, and by CNR – Institute of Heritage Science (Joint Archaeological Laboratory and CHANGES Project) and the Italian Ministry of Foreign Affairs and International Cooperation.

2456. THE SO-CALLED “HARPY TOMB” AND THE MAKING OF A CHRISTIAN MONUMENT IN XANTHOS

Contribution format: Oral  
Contribution authors: Allison Kidd (The British Museum)

The so-called “Harpy Tomb” in Xanthos, erected in the early Classical period for a Lycian ruler, has been known almost exclusively for its enigmatic sculptural program in marble relief, situated atop a 6-meter-tall pillar monument. The monument’s afterlife has largely been overlooked, despite Charles Fellows’ description of the structure in 1838, which concluded that the tomb must have been inhabited by a Christian devotee—“perhaps a disciple of Simon Stylites”—due to the presence of crosses and a scroll on the interior faces of the marble slabs. This paper presents new research presently underway at the British Museum, which has verified that the interior of the tomb was decorated at least in part with a fresco. Although fragmentary, the fresco is of a high quality, included an inscription, and appears late antique in date. Its addition after nearly 1,000 years to the inner chamber of a tall pillar tomb, which itself overlooks the city’s ancient theatre, requires a reassessment of Xanthos’ late antique urban environment. The decision to locate this work in such a conspicuous place is hardly what one might expect of a member of an ascetic monastic order. What is more, it is located at the heart of the historic city centre but far from later urban development on a promontory to the west, which featured a grand basilica and monumental colonnaded streets. Although the Christian reinterpretation of this monument focused on its interior, the spectacle of accessing the tomb at such a height to complete a fresco must have been intended to draw public notice. By focusing on cultural values long-embedded in the built environment at Xanthos, this paper seeks to clarify decision-making strategies in the (re)creation of this monument and address the competing Christian identities that were on display in the city’s public architecture.

773. THE AMPHITHEATER OF PERGAMON: RISE, ADAPTATION, TRANSFORMATION AND FALL

Contribution format: Oral  
Contribution authors: Ihsan Yeneroglu (Technische Universität Berlin Fachgebiet Historische Bauforschung und Baudenkmalpflege | Deutsches Archäologisches Institut Istanbul, Pergamon Excavation)

The Amphitheater of Pergamon is one of the four known amphitheatres in Anatolia and the only one that has been systematically studied by an interdisciplinary team. This monumental structure, dating back to the Roman period, holds a significant symbolic meaning for Roman Pergamon, both due to its location and its architectural ensemble, which includes the theater and stadium around Musalla-Meralik Hill. Its construction between two slopes, on an active stream bed, represents a remarkable architectural and engineering challenge. Despite the irregularity of the natural topography, the amphitheater was built with a meticulously designed geometric plan, demonstrating the advanced architectural expertise of the period. Beyond its architectural monumentality, the amphitheater also played a crucial role in the Romanization of the city, serving as an important cultural and social symbol. However, with the establishment of Christianity as the dominant religion in Pergamon, the structure lost its original function. Over time, human-induced destruction and natural factors led to significant deterioration, yet the amphitheater remained an important landmark in the city’s historical and cultural landscape. Today, the study of the Amphitheater in Pergamon contributes significantly to our understanding of Roman architectural practices, urban development, and cultural integration in Pergamon. Its legacy endures not only in its surviving ruins but also in the historical narratives it helps to reconstruct, shedding light on the complex processes of adaptation and transformation that defined the ancient world.

1190. RESILIENCE AND URBAN TRANSFORMATION IN TREBIZOND FROM THE LATE ROMAN TO THE BYZANTINE PERIODS

Contribution format: Oral  
Contribution authors: Selin Sur (Middle East Technical University, Department of Architecture) – Ufuk Serin (Middle East Technical University, Department of Architecture | ANAMED Senior Fellow 2024-2025 (Spring), Koç University)

Trebizond (modern Trabzon) is one of the longest continuously inhabited cities on the Black Sea coast of Türkiye, with origins dating back to at least the Hellenistic period. It is also one of the few cities that seamlessly transitioned from its Classical past through the ‘Dark Ages’ (7th-9th centuries) into modern times without major settlement interruption. Unlike many other Byzantine cities that retreated to hilltop fortresses during the transition from Late Antiquity into the Early Middle Ages, Trebizond remained a prominent coastal stronghold. Although little archaeological evidence exists for the period before the 9th century, recent rescue excavations have revealed significant topographical transformations from Antiquity through the Middle Ages. Trebizond was a wealthy, fortified city until it was largely destroyed by barbarian tribes in the 3rd century. Literary evidence suggests

that the city struggled to recover until the 6th century when comprehensive restoration work of public buildings took place under Justinian (527-565). In the post-Classical period, the city’s dispersed character was remarkably preserved. Some pre-Medieval structures and open spaces, such as the Meydan, possibly associated with the site of the Classical and Medieval agora were preserved, modified, or repurposed. Moreover, the present research hypothetically identifies two main urban axes: one connecting the ancient port and the other linking the walled city to the agora, rather than the single axis previously suggested (modern Kahramanmaraş Caddesi). Based on architectural/archaeological, and literary evidence, and applying the methodology proposed by Charalambos Bouras (2002) for studying medieval Byzantine cities, this research uses GIS-based mapping and analysis to trace the urban evolution of Trabzon from the Late Roman period through the Byzantine Middle Ages. An examination of the city’s lost and surviving medieval structures will provide insights into Trebizond’s Late Roman and Early Byzantine layout (3rd-7th centuries) and the multi-layered nature of its resilient urban heritage.

325. BETWEEN CHANGE AND CONTINUITY – RECENT RESEARCH RESULTS ON THE DOMESTIC SCAPE OF LATE ANTIQUE MILETUS

Contribution format: Oral  
Contribution authors: Nadia Cahenzli (Hamburg University)

Despite the more than a century old history of research conducted at Ionian Miletus, buildings and developments of the Late Antique period have only started to interest scholars on a larger scale about a decade ago. As part of this development, sacral architecture has received special attention, whilst other building types, above all the large and manifold genre of housings, were left in darkness. Only recently, the revision of old excavation material succeeded to finally shed light on the long neglected domestic scape of Miletus that shall be presented in this paper. Based on the case study of what turned into an exceptionally large and wealthy equipped residence building around 500 AD, the paper will discuss a series of questions regarding the transformation period of Late Roman to Early Byzantine Miletus. The dichotomy of change and continuity will be one of the focal points during this examination, regarding building techniques and incorporated spoliated material as well as specific choices in layout and assemblage. Furthermore, their immediate effects on the city scape will be taken into account and the question whether they can be seen as reflections of socio-cultural developments that took place at that time will seek to be answered. As a result, both the ambivalent nature of concepts such as private and public, urban and domestic, and the significance of flexibility in Late Antiquity will become apparent.

40. SAMOS DURING LATE ANTIQUITY: AN EXAMINATION OF THE CITY’S TRANSITIONAL PHASE FOLLOWING THE EVENTS OF THE 7TH CENTURY

Contribution format: Oral  
Contribution authors: Georgia Delli (National and Kapodistrian University of Athens)

Samos during Late Antiquity emerged as a prominent trading harbor along the route to and from Constantinople. The city’s wealth is evidenced by the local production of its famous sweet wine, packaged in the distinctive Samos Cistern Type amphora. This product circulated throughout the empire’s markets, with archaeological finds discovered in locations such as Ravenna and Butrint. Additionally, it is likely that part of Samos’s prosperity derived from shipbuilding activities, a tradition that dates back to ancient times. The city’s elevated status within the empire is further underscored by inscriptional evidence of a small hippodrome located in the western part of the city. In the early 7th century, significant changes unfolded on the island. Archaeological finds indicate that around 625, a minor Persian incursion led to the destruction of parts of the city. Despite this event, daily life continued with minimal disruption. However, between 660 and 670, the island faced its first Arab incursion, marked by extreme violence that resulted in the near-total destruction of the city, including public buildings and monasteries. Consequently, many inhabitants sought refuge within the Eupalinos Tunnel for several years. Following these events, the urban layout of the city began to reflect the principles observed in the coastal cities of Asia Minor, as well as those in the eastern Aegean islands, Cyprus, and Crete. Utilizing spolia from their destroyed structures, the inhabitants constructed defensive walls, within which the early Byzantine city developed without a systematic organizational framework. Excavations from the previous century have revealed remnants of this city, showcasing a society that, despite enduring significant hardships, demonstrated remarkable resilience. Like islanders in other regions, they chose to persist in their way of life on the island, even amidst the tumultuous years that followed the 7th century.

1373. TRACING RESILIENCE: URBAN DYNAMICS IN CENTRAL ANATOLIA UNDER ROMAN RULE

Contribution format: Oral  
Contribution authors: Paolo Maranzana (Boğaziçi University)

The concept of resilience has recently gained prominence in the study of Roman urbanism, particularly concerning the “end” of Antiquity (ca. 4th–7th centuries CE). Despite their peripheral position within the Roman world,

cities in Central Anatolia—Pessinus, Ankara, and Amorium—not only endured but expanded in this period, especially during the late 5th and early 6th centuries CE. This growth was driven by a shift toward regional self-sufficiency, as long-distance trade, notably with the Black Sea, declined after the 3rd century CE. In response, local economies reorganized: rural settlement increased, and the production of food and goods intensified to support urban markets. By the mid-6th century CE, Central Anatolia had emerged as one of the most stable and productive regions of Roman Anatolia, largely insulated from the disruptions affecting coastal areas. However, the Arab invasions of the late 7th century CE disrupted this balance, triggering declines in agricultural output, rural settlement, and pottery production. This study examines the dynamics of resilience that sustained urban centers in Central Anatolia’s semi-arid landscape, emphasizing how economic adaptation, resource management, and regional integration fostered long-term stability within an evolving imperial framework.

1384. LIME KILNS BETWEEN DESTRUCTION AND CONSTRUCTION IN LATE ANTIQUE ASIA MINOR

**Contribution format:** Oral  
**Contribution authors:** Jessica Plant (University of Cambridge)

This paper investigates the transformation of urban sites in late antique Asia Minor through the lens of one form of pyrotechnology: the lime kiln. Occupying an ambiguous place between destruction and construction, these kilns have often been overlooked, on the one hand, or interpreted as an index of late Roman decline, on the other. I first conduct a brief historiographical survey of lime kilns in urban histories of the ancient Mediterranean. Where and when does this idea of lime kiln as a proxy of socio-economic challenge emerge? In light of recent scholarship on Roman recycling practices, in conjunction with the ancient economy, how can kilns illuminate what was distinctive about recycling in the late Roman world (e.g., Jacobs 2013; Munro 2016; Barker 2020; Duckworth and Wilson 2020; Munro 2024)? What can they reveal about entangled social environments where people dwelled, from the civic core with new sacred buildings, to the domus? In answering these questions, I turn to recontextualize kilns within their urban fabrics. I investigate the archaeological evidence from Asia Minor (e.g., Sardis, Sagalassos) in order to situate kilns in shifting urban contexts (as opposed to rural sites), for processes of building, dismantling, and recycling alongside inter-craft exchange (e.g., Murphy and Poblome 2021). What surfaces is a re-evaluation of the lime kiln as a nexus of skill and value which sheds light on late Roman practices of manipulating stone entities. This paper demonstrates how the kilns contributed to transforming urban environments through expertise and redefinition of material-architectural categories.

1571. SHIFTING URBAN LANDSCAPES: NEW INSIGHTS INTO LATE ANTIQUE EGYPTIAN SETTLEMENTS

**Contribution format:** Oral  
**Contribution authors:** Stefania Alfarano (University College London)

For years, archaeological research in Egypt has primarily focused on tombs and temples, leaving the study of urban landscapes and settlement dynamics relatively overlooked. This has limited our understanding of how cities and villages evolved, particularly during the Late Roman period, when many urban centres underwent significant transformations. The deterioration of archaeological evidence further complicates the reconstruction of these changes. Recent excavations and surveys have provided valuable insights into the reconfiguration of urban environments, revealing extensive construction and restoration efforts, particularly in the late 3rd and 4th centuries CE. In cities such as Hermopolis Magna and Antinoopolis, large-scale rebuilding projects marked a period of renewal. This transformation included the addition of new architectural elements, such as defensive walls and fortifications. The integration of fortifications into the urban landscape of cities and villages reflects the growing need to assert control over these centres, not only in response to political instability but also to ensure the supervision and continuity of trade networks. Another major shift was the construction of churches, which altered the cityscape and redefined public spaces, reflecting the increasing influence of Christian institutions. At the same time, abandoned areas and landfills became defining features of Late Antique urbanism. Some districts, abandoned due to shifting socio-economic conditions, were transformed into regulated quarries for material reuse, illustrating how urban decline and redevelopment coexisted. These spaces provide key insights into the complexities of cities in transition. This paper examines how the introduction of new infrastructure, the systematic reuse of building materials, and the transformation of abandoned spaces shaped the identity of Late Antique Egyptian cities. By integrating archaeological and documentary data, it aims to offer a clearer perspective on urban adaptation and resilience during the later Roman period.

2089. DECLINING URBANISM AND IMPERIAL EXPLOITATION: ACHAIA PHTHIOTIS BETWEEN THE HELLENISTIC AND ROMAN PERIODS

**Contribution format:** Oral  
**Contribution authors:** Edward Middleton (McMaster University) – Margriet Haagsma (University of Alberta)  
Sophia Karapanou (Ephorate of Antiquities, Larissa) – Adam Woznura (University of Groningen) – Vladimir Stissi (University of Amsterdam)

The region of Achaia Phthiotis, located in south-western Thessaly, experienced major shifts in its rural/urban demographic division over time. The Hellenistic period saw major investment and the foundation of new urban centers under the Successors of Alexander the Great, in an attempt to control territory during the turbulent dynastic struggles of the period. Yet many of these settlements were quickly abandoned, due to shifting political, military, and social concerns. At the same time, the transition from the Hellenistic period to the control of the region under Roman provincial rule introduced news shifts in the demographic patterns that remain poorly understood. Drawing on new data recovered by the Central Achaia Phthiotis Regional Survey (CAPS) between 2019 and 2024, this study focuses on shifting patterns of urbanism in Achaia Phthiotis, with a focus on the microregion surrounding the Hellenistic era settlement of Kastro Kallithea. Based on a preliminary analysis of diachronic ceramic distributions across the geographic region, we conclude that the region saw a shift away from centralized urban settlements, such as at Kastro Kallithea, to more dispersed farmsteads in the surrounding hinterland. Based on the recovery of ceramic remains, this new settlement pattern continued to focus on agriculture, while shifting its trade connections to more distant urban centers like Pharsalos or ports on the Pagasetic Gulf. As a result, we see areas of intense, but dispersed agriculture, characterised by late Roman storage wares and grinding stones. This shift may represent the changing nature of agricultural exploitation within the region: the movement away from smallholder farmers who owned property both within the urban center of Kastro Kallithea in favor of more diffuse Roman-era farmsteads, exploiting the landscape now under the control of the Roman Empire.

434. “URBAN HUBS” IN THE COUNTRYSIDE: FRAMING THE DEVELOPMENT OF SEMI-URBAN SETTLEMENTS IN THE 3RD AND 9TH CENTURY AD NEAR EAST

**Contribution format:** Oral  
**Contribution authors:** Nicolo Pini (Université libre de Bruxelles - CReA-Patrimoine | Fonds de la Recherche Scientifique - FNRS)

The paper illustrates the preliminary results of the project “‘Urban hubs’ in the Countryside: framing the development of semi-urban settlements in the Near East between the 3rd and 9th Century AD.”, funded by the Belgian FNRS and conducted at the Université libre de Bruxelles. The project aims to investigate the development of a considerable number of settlements in the countryside with mixed urban and rural features, a phenomenon that seems to characterise the Near East at least from the 3rd until at least the 9th century AD. Although studied in different regions and for different periods, and despite evidence for single case studies being relatively abundant across the Near East, a synthetic overview of the phenomenon is still missing. It is, therefore, a challenge to understand conditions and ways under which the phenomenon could be triggered and developed, distinguishing regionally specific from broader and trans-regional processes. A possible methodological solution has been a tighter integration of site-focused archaeological and architectural with broader landscape analyses, aiming to track the parallel development of the settlements with their hinterland. The paper will illustrate a series of sites from the former Roman provinces of Arabia and Palaestina, where extensive fieldwork has been conducted. In particular, remote sensing techniques have played a key role, particularly in combining UAV-based and terrestrial photogrammetry. Even though a globally valid explanation of the emergence of this typology of sites remains complex to support due to the uneven documentation available for all regions in the Near East, these proposed case studies are interesting methodological references and represent a sound basis for establishing a progressively broader comparative analysis.

100 CAVES AND ROCK SHELTERS: THE INTERACTIONS OF PEOPLE AND NATURAL ENVIRONMENT IN THE PREHISTORY

**Session theme:** 7. Climate Change in the Past and Present  
**Session format:** Regular session  
**Session keywords:** Karstic regions, Sandstone areas, Pleistocene, Holocene, Hunter-gatherers, Climatic change  
**Session organisers:** Katarína Kapustka (Institute of Archaeology of the CAS, Prague) – Mária Hajnalová (Constantine the Philosopher University in Nitra) – Adrián Nemergut (Institute of Archaeology of the Slovak Academy of Sciences) – Akós Petö (Hungarian University

SESSION ABSTRACT

This session aims to explore the adaptation strategies of hunter-gatherer communities to one of the most dramatic climate-environmental changes around the Pleistocene/Holocene transition. The sheltered archaeological sites (caves and abris) are one of the best archives of evidence for studying human-environmental interactions. The session will focus on the hunter-gatherer communities during the Upper Palaeolithic and Mesolithic periods. Special attention will be given to the use of plants and animals as evidence for shaping natural resources by the forager communities. We would like to invite all researchers who encounter this topic both in humanities (archaeology, anthropology, ethnography) and natural sciences (botany, zoology, palaeoecology, and similar disciplines). We will especially appreciate contributions focused on methods how to detect the direct evidence of human-environment interaction, which is often difficult to grasp. We usually have the record of the environmental characteristics on the one hand and on the other hand we have information about the cultural characteristics of the human past. It is difficult to link them together. By examining assemblages of plant and animal remains, together with archaeological finds in the caves and under the rock shelters, the session will provide valuable insights into the adaptive responses of hunter-gatherers to environmental transformations, offering a deeper understanding of the resilience and ingenuity of these early human societies in the face of environmental change.

CONTRIBUTION ABSTRACTS

1306. HUMAN-ENVIRONMENT INTERACTIONS IN THE SABANA DE BOGOTÁ: GEOARCHAEOLOGICAL AND PALEOPEDOLOGICAL EVIDENCE DURING THE PLEISTOCENE-HOLOCENE TRANSITION

**Contribution format:** Oral  
**Contribution authors:** Diana Santana (Instituto de Geología, Universidad Nacional Autónoma de México) – Angélica Triana Vega (Instituto de Geología, Universidad Nacional Autónoma de México) – Elizabeth Solleiro Rebolledo (Instituto de Geología, Universidad Autónoma de México) – Sergey Sedov – Jaime Díaz Ortega (Instituto de Geología, Universidad Nacional Autónoma de México)

The study of paleosols is essential for understanding extinct landscapes and environments (Retallack, 2001). These records contain distinctive features that testify to human activity, providing anthropogenic information on adaptations, landscape transformations and human activities preserved in pedosedimentary archives. In this context, the landscape of the Sabana de Bogotá (Colombia) represents a mosaic of pedosedimentary sequences that reflect processes of landscape, climatic and environmental stability and instability, while also containing a significant archaeological record. This region is of central importance in the process of South American dispersal and settlement, as it was home to some of the earliest populations to occupy Colombian territory (Tibitó, El Abra, Tequendama and Aguazuque), where soils show the effects of different human activities and environmental conditions. This research aims to reconstruct the human-environment relationship during the Late Pleistocene-Holocene transition at the Aguazuque and Hyká Aeiwi sites through geoarchaeological and palaeopedological studies. Chemical, physical and morphological analyses were carried out on natural and archaeological soils. Key findings include human bone remains (~11,000 cal yr BP) and paleosols, which highlight the interaction between climatic fluctuations, landscape dynamics and human adaptation. The transition from cold-dry to warm-humid conditions facilitated shifts in settlement patterns and subsistence strategies, as evidenced by archaeological and pedological records. Despite environmental challenges such as volcanic activity and drought, human resilience is reflected in the transformation of hunter-gatherer groups into agricultural societies, marking a turning point in cultural and environmental interactions during the Holocene.

1374. THE REINDEER CONNECTION: DIET, MIGRATION AND HUMAN ADAPTATION IN THE UPPER PALAEOLITHIC IN POLAND

**Contribution format:** Oral  
**Contribution authors:** Oliwia Oszczepalinska – Nina Kowalik – Sylwia Pospuła (Institute of Systematics and Evolution of Animals, Polish Academy of Sciences) – Alexander Pryor (Department of Archaeology and History, University of Exeter)

During the Upper Paleolithic, reindeer Rangifer tarandus were an important species in the ecosystems of Poland's steppe-tundra. Their seasonal migrations, influenced by climate and topography, shaped human subsistence strategies. Reindeer adapted to environmental fluctuations through dietary flexibility, feeding on green plants in summer and lichens, moss, and bark in winter. Their ability to dig food from under the snow allowed them to survive harsh winters. In this study we investigate mobility, diet and season of death of reindeers from selected

Palaeolithic sites located in South Poland. These locations characterize abundance of archaeological and zooarcheological material including reindeers and were connected to human activities, which suggests that humans may have exploited the migratory behaviour of these animals to hunt them, migrated with them and/or settled along their migration routes. Strontium isotope analyses provided detailed records of animal movements and revealed differences in their mobility patterns. Our data indicates that at some locations, reindeer migrated over long distances, while at others, their movement was confined to a more local area. Reindeer may have moved from different directions, suggesting the possibility of distinct migratory groups rather than a single uniform herd moving in the same direction. Conducted microwear analysis of teeth from studied sites confirms seasonal dietary adaptations, reflecting the steppe-tundra flora, while the season of death analysis provides additional context to this study. Acknowledgments This research is conducted within the ERC CoG project “Exploring Mammoth Bone Accumulations in Central Europe” (MAMBA) number 101045245, led by dr. hab. J. Wilczyński from the Institute of Systematics and Evolution of Animals, Polish Academy of Sciences in Kraków.

1857. TECHNO-FUNCTIONAL ANALYSIS OF THE SOLUTREAN LITHIC ASSEMBLAGE FROM POÇO ROCK SHELTER (LEIRIA, PORTUGAL)

**Contribution format:** Oral  
**Contribution authors:** Pedro Peça (Centro de Geociências | Universidade Autónoma de Lisboa | Laboratório de Arqueociências, Património Cultural, I. P. | Instituto Politécnico de Tomar) – Telmo Pereira (Centro de Geociências | Universidade Autónoma de Lisboa | Centro de Arqueologia da Universidade de Lisboa - Uniarq | Instituto Politécnico de Tomar) – Marina Igreja (Laboratório de Arqueociências, Património Cultural, I. P.) – Pedro Cura (Centro de Geociências)

The River Lis basin is one of the westernmost refuges for human occupation during the Last Glacial Maximum (LGM) on the Iberia Peninsula. It is characterized by a network of narrow canyons formed by the fluvial erosion of the Estremadura Limestone Massif, which forms a peculiar ecosystem and a natural sheltered territory against the climatic severity driven from the Marine Isotope Stage (MIS) 2. Poço Rock Shelter is located in one of those narrow karstic canyons, the Ribeira das Chitas. This site was found in 2002 and has been systematically studied since 2015 in the scope of the EcoPLis project, that aims to access the ecodynamics of the hunter-gatherer communities in this particular biotype cluster. The site has at least three horizons, one Epipaleolithic and two Solutrean. The Solutrean levels are rich in lithics and poor in fauna. The lithic assemblages comprise quartzite, quartz, but is dominated by chert, being this last component made mostly of by-products as incomplete and fragmented bifacial tips, fragments and chips. This is indicative that the site functioned as a workshop site directly dependent from the nearby chert sources. However, it is still unclear if the site had any other function and if artefacts such as blades, bladelets and retouched tools were used and for what purposes. Here, we present the first combined results of the technological, typological and Use-wear analysis of the lithic Solutrean assemblage aiming to clarify the functionality of the site between 23708–22900 and 22744–22210 cal BP. This data is expected to enrich the knowledge about human survival during the LGM in the Estremadura cluster.

1260. PINPOINTING PREHISTORIC SITES AND RESOURCES ACROSS THE RIVER LIS BASIN (WESTERNMOST IBERIA)

**Contribution format:** Oral  
**Contribution authors:** Telmo Pereira (Universidade Autónoma de Lisboa) – Telmo Gomes (SMAS - Serviços Municipalizados de Água e Saneamento de Leiria) – Eduardo Paixão (ICArEHB - Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) – David Nora (—) – Patrícia Monteiro (Laboratório de Arqueociências, Património Cultural, IP) – Carlos Simões (ICArEHB - Interdisciplinary Center for Archaeology and Evolution of Human Behaviour) – Sandra Assis (CRI. - Centro em Rede de Investigação em Antropologia | CRIA - Center for Research in Anthropology) – Alexandre Paya (Rococo, Cultura com Estilo, Lda) – Vânia Carvalho (Museu de Leiria) – Vanessa Antunes (Centro Português de Geo-História e Pré-História)

Resources and ecology were crucial in shaping hunter-gatherer settlements in central western Iberia. The unique latitude and Atlantic influence over his region combined these features and ensured population clustering throughout Prehistory, the preservation of diverse archaeological contexts while obliterating others. The EcoPLis project, conducted between 2015 and 2025, significantly enhanced our understanding of prehistoric occupation and mapped the resources' location. The region included coastal and river plains (the first expanding and contracting as the sea level rose and dropped), dry plateaus with sparse endemic vegetation, and narrow canyons with thriving ecosystems. Key abiotic resources comprise freshwater springs, sources of salt and chert, quartz-rich gravels, and numerous caves and rock shelters. Archaeobotanical and zooarchaeological evidence

confirms a diverse landscape that supported both Mediterranean and Eurosiberian species fluctuating according to the climatic cycles, which created favourable conditions for human settlement. Upper Paleolithic contexts appear across all settings, often found beneath shell-rich Epipaleolithic layers (when in rock shelters) and Early Prehistoric burial grounds (when in caves). Notably, the project uncovered several caves with burial grounds and shell-rich occupations but had difficulties in finding Lower and Middle Paleolithic contexts. Our findings indicate two main characteristics. One is that the best-preserved deposits are typically hidden under a covering flourishing vegetation, while easily visible sites (usually rock shelters) often suffer from sediment erosion that could have preserved archaeology and supported the covering vegetation. Another characteristic is the recurrent presence of campsites where both abiotic (particularly freshwater) and biotic resources would be concentrated, and of specialized sites where specific resources occur. In these cases, chert outcrops stand out for their sizes and artefact density. Here we present an updated map of archaeological sites and resources to deepen our understanding of the relationship between hunter-gatherers and their landscape.

**2426. EXPLORING PALAEOECOLOGICAL DYNAMICS IN THE LATE UPPER PALEOLITHIC OF EASTERN SICILY**

**Contribution format:** Oral  
**Contribution authors:** Maria Rosa Iovino (Italian Institute of Human Paleontology) – Italo Biddittu – Luciano Bruni (Italian Institute of Human Paleontology) – Roberto Ceccacci (Independent Researcher) – Salvatore Chilardi (The International Research Institute of Archaeology and Ethnology) – Marina De Angelis (University of Buenos Aires) – Luca Natali (Italian Institute of Human Paleontology) – Daniele Spigarelli (Independent Researcher) – Simona Pianese (Italian Institute of Human Paleontology) – Daniela Zampetti (Sapienza University of Rome)

This study examines the complexities surrounding human-animal interactions during the Late Upper Paleolithic in eastern Sicily through the analysis of faunal remains, lithic tools, and bone implements. The period is characterized by a lack of clarity regarding the size and distribution of human populations, complicating interpretations of anthropogenic impacts on local fauna. While quantitative and qualitative analyses of faunal remains can yield estimates of animal populations and their exploitation by humans, the demographic parameters of contemporary human groups remain largely elusive. The examination focuses on several archaeological sites, both caves and rock-shelters, with different geological and altitude location, where faunal assemblages provide insights into subsistence strategies and ecological contexts. Although not from all sites paleobotanical evidence were rescued, the diversity of herbivorous species identified allows for the formulation of hypotheses regarding suitable habitats and ecological niches present in the studied areas. For instance, the presence of large herbivores suggests varied environments, potentially ranging from open grasslands to more forested regions, which would have influenced human foraging strategies. By correlating the types of lithic and bone tools with the faunal evidence, this research aims to elucidate the technological adaptations of Late Upper Paleolithic populations in response to their environment and available resources. Furthermore, the study highlights the interdisciplinary methodological challenge that combines archaeological, bioarcheological, geological, ecological and behavioural approaches to better understand the intricate relationship between prehistoric people and their ecological environment in eastern Sicily.

**1035. MESOLITHIC LANDSCAPES OF BELIANSKE TATRY MTS (SLOVAKIA)**

**Contribution format:** Oral  
**Contribution authors:** Maria Hajnalova (Constantine the Philosopher University in Nitra)

In Slovakia the palaeoecological data that would enable the reconstruction of the environment - especially the vegetation and images of landscapes from the transitional period between the Plesitocene and Holocene are extremely rare. New light can bring the plant macro- and micro-remains recovered from the sediments of the Huciva diera rock shelter in Belianske Tatry Mts. It was unearthed and systematically sampled during the excavation of Polish and Slovak team in 2022 and radiocarbon dated to the 13th-12th millennium cal BC. In this paper we aim to present the results of analyses of anthracology (wood charcoal) and palynology. The images of the vegetation and landscapes reconstructed by the two studied proxies will be presented. The main focus on the talk will be on the interpretation and the reasons why the two proxy datasets provide different results - paint different landscape images, whether those are exclusive (or not), and what next steps should be taken to validate the results and their interpretation.

**907. THE INTERACTIONS BETWEEN PEOPLE AND THE NATURAL ENVIRONMENT DURING PREHISTORY IN THE RUŽÍN KARST (EASTERN SLOVAKIA)**

**Contribution format:** Oral  
**Contribution authors:** Adrián Nemergut (Institute of Archaeology, Slovak Academy of Sciences, Nitra) – Marián Soják (Institute of Archaeology, Slovak Academy of Sciences, Spišská Nová Ves) – Mária Hajnalová (Constantine the Philosopher University in Nitra) – Marianna Kováčová (Comenius University, Bratislava) – Lenka Lisá (Institute of Geology, Czech Academy of Sciences, Praha) – Monika Orvošová (Slovak Museum of Nature Protection and Speleology, Liptovský Mikuláš) – Tomáš Čejka (Institute of Botany, Slovak Academy of Sciences, Bratislava) – Tomáš Čeklovský – Ján Obuch (Slovak Museum of Nature Protection and Speleology, Liptovský Mikuláš)

Several caves with evidence of prehistoric occupation are known in the Ružín Karst (SE Slovakia). The most famous are Veľká ružínska Cave and Medvedia Cave. Research of this sites began in the 19th and continued into the 20th century. During the new excavation (2022-2023), Miriama rock shelter was excavated. Despite the small area of test pit, significant archaeological, paleobotanical and paleontological remains were recovered. Sediment deposits were formed between 9300–4700 uncal BP. The occupation horizons are related with the Mesolithic, Neolithic and Eneolithic periods. In this paper, we present the results of the multi-proxy data analysis of faunal and floral remains, which are effective in reconstructing regional climatic conditions. The Miriama rock shelters provide an excellent opportunity to understand the interactions of the last hunter-gatherers/the first farmers and natural environment during the Early Holocene. This work was supported by the Slovak Research and Development Agency under Contract No. APVV-23-0282 and project VEGA 2/0033/23.

**51. SITE SKALICE NEAR MĚŇANY (CZ) WITHIN THE CONTEXT OF THE FINAL PALEOLITHIC AND MESOLITHIC SETTLEMENT OF BOHEMIAN KARST**

**Contribution format:** Oral  
**Contribution authors:** Katarína Kapustka (Institute of Archaeology of the CAS Prague)

The hunter-gatherer settlement of Bohemian karst has been studied for a long time and this region contains important settlement and funeral findings. They are present in different landscape types under rock shelters, in caves, and as open-air sites too. Bohemian karst is a rich source of archaeological evidence and a place of many important palaeoecological sites. Unfortunately, information about the natural environment and its changes is not always linked to our knowledge of material culture and its transformations. We want to begin to service this debt. As the case study was chosen the rock-shelter Skalice (near Měňany). It is situated close to the area of the former Měňany lake. The human occupancy of the site is evidenced at the end of the Palaeolithic and during the Mesolithic period, which until now has been only exceptionally recorded in the Bohemian karst. During the Pleistocene/Holocene transition, this place witnessed several important changes. A rich paleontological samples obtained from the site by a series of excavations from 2007 to 2016 provides a robust record of the paleoenvironmental development, particularly for the period from 13 000 to 6 000 cal BP. The respective biostratigraphic sections yielded also some archaeological finds, namely lithics. We would like to frame new information about sites to the summary of what is known about the Mesolithic occupation from previous research. To have a better understanding of the region we focused on two aspects 1) radiocarbon dating of the sites and 2) linking archaeological and palaeoecological records.

**2051. INTEGRATING USE-WEAR AND MICROSCOPICAL RESIDUE ANALYSES ON MESOLITHIC TOOLS – CASE STUDIES FROM CENTRAL EUROPEAN ROCK SHELTERS**

**Contribution format:** Oral  
**Contribution authors:** Kristýna Budilová (Laboratory of Archaeobotany and Palaeoecology, Faculty of Science, University of South Bohemia)

Identification of a direct evidence for the specific use of stone tools is a key challenge of a current prehistoric archaeology. With the refining of the use-wear and residual analyses, a better understanding of the toolkit seems to be possible. This poster presents results of the use-wear analysis performed on lithic tools from the Mesolithic rock shelters in the Czech Republic (Bohemia), which were also sampled for analysis of micro-residues (mainly phytoliths, fibers and starch grains) adhering their surfaces. The tools were chosen mostly from the radiocarbon dated context with clear chronological association. The samples were taken directly as residues visible under binoculars and subsequently also by sonification, while the use-wear was documented by a digital microscope. The contribution discusses the gained results, as well as suitability of the chosen methodology and limitations for the interpretation. Use for plant processing was proposed for some of the tools, which shall be further specified by future application and integration of those methods on bigger sets of the same types of lithic industries.

79. HUMAN-ENVIRONMENT INTERACTIONS IN LATE UPPER PALAEOLITHIC ISTRIA (CROATIA): INSIGHTS FROM ZOOMS ANALYSIS OF FAUNAL REMAINS

**Contribution format:** Poster  
**Contribution authors:** Lia Vidas (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb) – Sara Silvestrini (Department of Cultural Heritage, University of Bologna) – Federico Lugli (Department of Chemical and Geological Sciences, University of Modena and Reggio Emilia) – Siniša Radović (Institute for Quaternary Palaeontology and Geology, Croatian Academy of Sciences and Arts) – Stefano Benazzi (Department of Cultural Heritage, University of Bologna) – Ivor Janković (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb)

The abundance of caves and rock shelters on the karstic Istrian peninsula has preserved evidence of human activities during both the Holocene and Pleistocene epochs. The archaeology of Palaeolithic hunter-gatherers remains a fascinating subject, raising numerous questions about human-environment interactions, often explored through the analysis of faunal assemblages. However, faunal material from this period is frequently highly fragmented, limiting morphological archaeozoological analyses. To address this challenge, various palaeoproteomic methods, including ZooMS analysis, are increasingly applied to osseous material, providing deeper insights into prehistoric human behavior and faunal composition. In this study, we present current data from ZooMS analysis of non-diagnostic osseous fragments from two cave sites in Istria, Croatia: Ljubićeva pećina and Pupićina peć. Both sites date to the late Upper Palaeolithic period, offering an opportunity to investigate the changing post-LGM environment and human adaptations. Their proximity, yet distinct topographical settings, allow us to examine how these factors influenced ecosystems and subsistence strategies at that time. In addition to analyzing the taxonomic composition of the assemblages, we assess the relative preservation state of collagen through glutamine deamidation calculations. The obtained results show certain differences in the taxonomic composition of faunal remains between the sites. Also, the collagen preservation differs slightly but seems to have a major influence on the resolution of the results. The described approach allowed us to identify osseous fragments that would otherwise remain undetermined and thus granted better insight into the region’s environmental and climatic conditions, changes in human subsistence strategies, selectivity, seasonality, and site-occupation intensity.

399. THE OPEN-ACCESS DIGITALIZED OSTEOLOGICAL COLLECTION OF IPHES-CERCA

**Contribution format:** Poster  
**Contribution authors:** Brice Lebrun – Javier Sopesens Aixalà (Catalan Institute of Human Paleoecology and Social Evolution (IPHES-CERCA) | Area of Prehistory, Rovira i Virgili University) – Antonio Rodríguez Hidalgo (Unit Associated with CSIC, Department of Paleobiology, National Museum of Natural Sciences | Catalan Institute of Human Paleoecology and Social Evolution (IPHES-CERCA)) – Palmira Saladié Ballesté (Catalan Institute of Human Paleoecology and Social Evolution (IPHES-CERCA) | Area of Prehistory, Rovira i Virgili University | Spanish National Research Council, Institute of Archaeology-Mérida (CSIC-Junta de Extremadura))

The COR-IPHES osteological reference collection, established during the 1980s–1990s, currently holds over 300 individuals of 80 species, primarily representing mammals and large birds. It includes rare fauna, such as the Iberian lynx and the griffon vulture, which provide a highly valuable comparative framework. This collection allows researchers to accurately identify a wide diversity of taxa, serving as an essential resource for advancing zooarchaeological and paleontological investigations and broader studies in prehistoric research. To enhance accessibility and align with contemporary open-science principles, the collection is undergoing an extensive digitization process employing a custom photogrammetry protocol. The developed approach presented in this poster, rapid yet precise, enables the production of high-quality 3D model, even for bones with challenging geometries and sub-optimal surface aspect. Adhering to FAIR guidelines (Wilkinson et al., 2016), the project employs Darwin Core standardized metadata (Wieczorek et al., 2012), open file formats, free software tools, and trusted online repositories under creative common licence, to promote transparency, collaboration, and long-term reusability of data in accordance with open-science principles. In doing so, the digital COR-IPHES collection aim to become a key online ressource for researchers studying prehistory and its interconnected fields of investigations. In conclusion, this poster illustrates a valuable open-science initiative, enabling zooarchaeologists and researchers in related fields to access a high-quality osteological reference collection from anywhere.

1845. SPELEOTHEMS AS ARCHIVES OF HUMAN OCCUPATION

**Contribution format:** Poster  
**Contribution authors:** Sophie Verheyden (Royal Belgian Institute of Natural Sciences - RBINS) – Christian Burlet – Soraya Bengattat (Royal Belgian Institute of Natural Sciences) – Hans Vandendriessche (Department of Archaeology, Ghent University) – Hai Cheng (Institute of Global Environmental Change, Xi’an Jiaotong University | Institute of Earth Environment, Chinese Academy of Sciences) – Xue Jia (Institute of Global Environmental Change, Xi’an Jiaotong University) – Philippe Crombé (Department of Archaeology, Ghent University)

Speleothems are increasingly used in archaeological studies for their precise chronological framing via U-series dating, covering much longer periods than the 14C method. Archaeological interest in these cave sediments grew even more since the discovery of a 176.5 ka-old speleothem structure in the Bruniquel cave (France, Jaubert et al., 2016). Broken stalagmites in the St Marcel cave in France, attributed before to tourists, are also linked to prehistoric activity between the end of the Upper Palaeolithic and the European Mesolithic (Delannoy et al., 2024). Moreover, speleothems may contain soot layers enabling the study of duration and frequency of human occupation (Vandevelde et al., 2018). In Belgium, speleothems from the entrance area of the Han-sur-Lesse and the Remouchamps caves also contain black deposits interpreted as soot incorporated in the calcite. Speleothems enable the precise dating of these deposits and thus of the related human occupation. In the Han-sur-Lesse cave soot layers were related to the use of torches during the last 200 years (Genty et al, 1997; Verheyden et al., 2006). However, other older soot layers are also present and are currently investigated. Remouchamps speleothems from the RBINS collections, previously studied in the 1980s by M. Gewalt for U-series dating and palaeoclimate studies, are now analyzed for their black layers. Soot deposits in the calcite (U/Th) date to between 11.0 ka and 9.3 ka, suggesting human activities in the entrance zone during Early Holocene. This seems a little later than a known occupation around the late Younger Dryas and Early Mesolithic (Crombé et al., 2024). Moreover, the cause of a breakage of the stalagmite at ~77ka , human activity or natural factors (e.g., frost, earthquakes, animals) remains uncertain. These speleothems are being studied as part o. the UGent-KBIN joint Meuse Basin project, financed by the Research Foundation Flanders – project G0C9323N.

1864. AN INTERDISCIPLINARY METHODOLOGY FOR DISCERNING HOMININ CAVE USE AND HUMAN-ENVIRONMENT INTERACTIONS IN THE LATE PLEISTOCENE CARPATHIANS

**Contribution format:** Poster  
**Contribution authors:** Alexander Wilkinson – Wei Chu (Universiteit Leiden)

Understanding the nature of cave site use impacts how we perceive human mobility, settlement dynamics, and human-environment interactions in the Late Pleistocene. The Late Pleistocene occupation of caves in Western Romania presents some of the first Hominin occupational deposits in Europe. However, many Carpathian caves are absent of dense Late Pleistocene Hominin features, causing difficulty in assessing their role as shelters. Low density of Hominin deposits at some Romanian caves might suggest more ephemeral occupations or a different function of caves in contrast to other areas Europe. Hominin cave use is additionally contrasted by the presence of regional open-air sites. Copious legacy excavations, and a dearth of securely dated anthropic deposits, cause difficulties in correlating patterns of cave use between sites in Western Romania and to the climate events of the Late Pleistocene. Therefore, the question of cave use within potential Hominin sheltering strategies requires the revisitation of legacy excavation data, contemporary excavation methodologies and analysis to be answered comprehensively. This contribution will display a newly proposed methodology to be undertaken at cave sites in Western Romania. Through excavation and an integrated inter-disciplinary analysis of fauna, artifacts and sediments, this research aims to assess hypotheses of cave use and sheltering dynamics. Additionally, cave use needs to be compared and correlated to contemporary open-air sites of the region to situate caves within wider Hominin occupation dynamics. Understanding cave use and their role within wider habitation strategies is important for discerning behavioural sheltering adaptations that contributed to Hominin survival in the adverse and variable climates of Late Pleistocene Europe. Proposed inter-disciplinary research provides a unique opportunity to disentangle occupation palimpsests to understand diachronic cave use, sheltering choices, and human resilience across the climatic fluctuations of the Late Pleistocene.

101 SHIFTING PARADIGMS: THE MULTIPLE FACETS OF MOBILITY IN THE BRONZE AGE BALKANS

Session theme: 8. Along and across the Danube!  
Session format: Discussion session  
Session keywords: Mobility, Archaeological Methodology, Bronze Age, Balkans, Ethnography  
Session organisers: Regina Uhl (Eurasien-Abteilung, Deutsches Archäologisches Institut) – Zoï Tsirtsoni (Centre national de la recherche scientifique) – Maja Gori (Consiglio Nazionale delle Ricerche)

SESSION ABSTRACT

The Balkan region has played a crucial role in population movements and the spread of innovations throughout European prehistory. Building on the foundation laid by the ‘MOBAB’ (Mobility in Bronze Age Balkans) project (2022-2024), this session aims to stimulate new perspectives on this topic. The MOBAB project examined various aspects of mobility during the Bronze Age (4th-2nd millennia BC), focusing on:

1. The temporal patterns of documented movements
2. Environmental influences
3. The transmission of artifacts and technologiesWe invite papers that challenge conventional concepts of mobility, exploring social characteristics and diverse trajectories.

Methodological approaches include:

1. Examining temporal scales of mobility
2. Investigating the relationship between mobility, innovation, and the transfer of artifacts and technologies
3. Utilizing ethnographic and recent historical examples, as well as further studies in pre- and protohis tory, to provide fresh insights
4. Innovative methods for integrating archaeological and ethnographic data with hard science approaches and computational methodologies to trace patterns of mobility

Key themes for discussion include:

- Cultural factors influencing various types of mobility
- The impact of environmental features, sea- and landscapes in fostering connections and movements across the Balkan region
- Methodological approaches for detecting and interpreting mobility in the archaeological record.

The aim is to refine our archaeological reconstructions and provide new insights into mobility, which may be beneficial for future research in prehistoric mobility.

CONTRIBUTION ABSTRACTS

1585. POTTERY MAKING AND MOBILITY DURING THE EARLY BRONZE AGE IN SOUTHERN BULGARIA

Contribution format: Oral  
Contribution authors: Masao Semmoto (The Ancient Orient Museum, Tokyo)

A cultural landscape comprising tell and flat settlements, along with flat cemeteries and burial mounds (kurgans), was prevalent in the southern Bulgarian region during the Early Bronze Age (3200-2200/2000 BC). The formation of this landscape is attributed to the varying degrees of mobility exhibited by local and non-local populations. During the early stages of the Early Bronze Age (late 4th millennium BC to early 3rd millennium BC), groups belonging to the Pre-Yamnaya and Yamnaya cultures, thought to have originated from the northern Black Sea steppe region, immigrated to the area and engaged in interaction with local populations while building burial mounds. In the later stage of the Early Bronze Age (late 3rd millennium BC), when the Yamnaya culture was in decline, metal products and other artifacts brought into the region indicate that local groups in southern Bulgaria had contact with early urban communities in the Anatolian-Aegean region to the south. This unidirectional influx of groups, artifacts, and technologies from external sources during the Early Bronze Age in South Bulgaria was accepted by the local society, although perhaps not necessarily all elements. However, the interpretation of this phenomenon, particularly concerning artifacts, has frequently been constrained by explanations based on externally visible characteristics such as form and ornamentation. To expand the interpretative scope, this paper explores human mobility and artifact transmission during and after the influx into South Bulgaria. To illustrate these points, we will examine the multiple aspects of mobility exhibited by styles, production techniques, and paste of pottery. This analysis will encompass two distinct categories of pottery: local and non-local (cord-impressed and red-slipped pottery), which are typologically identified in the Upper Thracian Plain and the Eastern Rhodope region.

17. A BONE DISC FROM VERBICIOARA (ROMANIA) AND ITS IMPORTANCE FOR THE LOWER DANUBE BRONZE AGE

Contribution format: Oral  
Contribution authors: Cristian-Eduard Stefan (“Vasile Pârvan” Institute of Archaeology, Romanian Academy)

The archaeological excavations at the Bronze Age key site from Verbicioara (Romania) were made in the 1950s by a team under the supervision of D. Berciu. That was the moment when the Verbicioara culture was discovered and defined as the main occurence for the Middle and Late Bronze Age in the southwest of Romania. Unfortunately, only a small part of the site inventory was published and today, still, there is much controversy regarding its stra-tigraphy and, by default, the general periodization of the Verbicioara culture. In this contribution a special object is presented, which raised our interest during the arrangement of the archaeological materials from Verbicioara, in order to process them for future publication. The piece represents a bone disc with clear analogies in another implement discovered at Beycesultan (Turkey), showing close connections between Western Anatolia and the Balkans. Besides the obvious proof of traveling people and/or ideas, the bone disc is also important for the abso-lute chronology of the Verbicioara site (and culture), since we don’t have any radiocarbon dates for it until now and the context for the object from Beycesultan was very well dated.

200. SIGNS OF MOBILITY OR THE “BALKAN TRACE” IN THE LISAKOVSK BURIAL GROUND OF THE BRONZE AGE, KAZAKHSTAN

Contribution format: Oral  
Contribution authors: Emma Usmanova (Saryarka Archaeological Institute Karaganda Buketov University; Margulan Archaeological Institute)

The cultures of the Carpathian-Danubian focal point participated in the formation of the patterns of the Andronovo culture at the beginning of the 2nd millennium BC. Such jewelry as a braid adornment (nakosnik) made of beads and bronze pendants, a gold “pendant” was found in th. Lisakovsk burial ground (Kazakhstan). An early analogue of the braid adornments appears on a clay figurine “Kličevačkog Idol” (IV-III millennium BC) from the Serbian Danube region. The headdress with a braid adornment is the result of the movement of design ideas arose as a result of the relationship of the Balkan-Carpathian with the Bronze Age cultures of the Kazakh steppes. The “Balkan image” is present in the “pendant”, which has a typological similarity with the pectoral pendant depicted on the clay female figurines from the Balkan culture. of the Bronze Age Gârla Mare. The style of the braid adorn-ments was adopted and reworked in accordance with the Andronovo tradition, while the “pendant” was most likely imported. It has no analogues among the Andronovo adornments. The ceramic product in the form of a dish with “ears” is part of burial inventory of th. Andronovo. A hypothesis was put forward that the dish is a model of a cart, which was made in the “scale of a hand” specifically for the funeral rite. In the complexes of the Bronze Age cultures of the Balkans and Carpathians there are miniature models of real carts. The interpretation dish as a model of a cart is based on the general stylistics of the image of the vehicle. It is could be a symbol of the path and mobility. The transmission of images of products between the cultures of the Balkans and the steppe cultures of the Bronze Age is the result of the mobility of people, ideas and things.

435. THE KARST REGION IN THE EARLY BRONZE AGE: FROM THE CETINA CULTURE TO THE RISE OF HILLFORTS

Contribution format: Oral  
Contribution authors: Federico Bernardini (Università Ca’ Foscari Venezia) – Elena Leghissa (ZRC SAZU, Institute of Archaeology)

The Karst region of Trieste, in north-eastern Italy, is rich in archaeological caves and protohistoric hillforts. However, the quality of recovered data remains uneven and insufficient to fully reconstruct the region’s cultural dynamics from the Late Copper Age to the Bronze Age. The latter period saw the rapid emergence of numerous permanent fortified settlements associated with the so-called Castellieri culture, which dramatically reshaped the landscape and left a lasting imprint still visible today. Their origins, often linked by scholars to the eastern Mediterranean, remain debated and not yet fully understood. This paper presents new archaeological data from two recently excavated sites: the Trmun hillfort in northern Istria, attributed to the end of the Early Bronze Age, and the Tina Jama cave in the Trieste Karst. At Tina Jama, archaeological layers primarily associated with the Cetina culture - whose most recent radiocarbon dates roughly coincide with the transition between the 3rd and 2nd millennium BC - are overlain by levels linked to the earliest phase of the Castellieri culture. These materials are comparable to those from the Trmun hillfort. These contexts provide a unique opportunity to examine patterns of technological and cultural change or continuity between pre-Castellieri evidence and the earliest hillforts. The findings not only refine our understanding of local archaeological sequences but also offer new insights into regional interactions and cultural dynamics during the Late Copper Age and Early Bronze Age.

2279. MOBILITY ALONG THE RIVERS IN THE BRONZE AGE BALKANS: A REASSESSMENT

Contribution format: Oral  
Contribution authors: Tobias Krapf (Swiss School of Archaeology in Greece)

The river valleys of the Balkans are often regarded as the primary axes of communication during the Bronze Age, with networks commonly mapped along these routes. However, to what extent does this assumption reflect prehistoric reality? Are site patterns biased by modern accessibility and routes and tend therefore to indicate similar axes of communication? Could alternative routes have played a more significant role than traditionally acknowledged? If so, how can their importance be evaluated—or, conversely, how can their relevance be systematically excluded? And by what means did this communication function? This paper critically reassesses the role of riverine mobility in the Southern and Southwestern Balkans, questioning whether ideas, innovations, and material goods travelled along the same routes. It further explores potential shifts in communication patterns over time, particularly during the 3rd and 2nd millennia BCE, but including comparisons with earlier and later periods. The study begins with an overview of prevailing research assumptions before addressing these key questions. Finally, it proposes a methodological framework for a more systematic and evidence-based approach to studying routes of mobility in the region.

1772. RULES OF ATTRACTION: INCREASING AND DECREASING MOBILITY AND INTERACTION ACROSS THE ADRIATIC BETWEEN THE MID-3RD AND THE 2ND MILLENNIA BC

Contribution format: Oral  
Contribution authors: Giulia Recchia (Sapienza University of Rome) – Francesco Iacono (University of Bologna)

Continentality, mountain range, valleys and rivers chiefly characterize the Balkan peninsula and shaped mobility and interactions; nonetheless maritime interfaces played a significant role in the inflows and outflows of individuals, raw materials, goods, ideas, technologies and in the development of cross-cultural social relationships and mobility. Since the Neolithic, the Adriatic Sea represented one of the main Balkan maritime interfaces. Its role was two-fold, as it channeled transmission but also represented a barrier, thus limiting the spread of tendencies and cultural patterns characterising neighbouring areas. From the mid-3rd millennium BC connective phenomena across the Adriatic dramatically increased, within a framework of mobility and interactions developing across the Mediterranean and Europe. Yet during the 2nd and early 1st millennia BC alternate phases of increase and decrease in Adriatic mobility and interactions as well as shifts in the directionality and intensity of contacts unfolded, while profound socio-cultural transformations were developing. By adopting a long-term diachronic perspective and considering new evidence offered by archaeological (both qualitative and quantitative), archaeometrical and biomolecular data we will discuss possible driving forces behind shifting in Adriatic connectivity and the impact these had on the communities involved in such processes.

102 LEGAL PROTECTION OF ARCHAEOLOGICAL HERITAGE IN TIMES OF CRISIS AND SOCIAL TRANSFORMATION

Session theme: 6. Intertwining archaeology, heritage, and museums  
Session format: Round table  
Session keywords: Heritage, Legislation , Climate Change, Wars and conflicts, Citizen science, Democratization of knowledge  
Session organisers: Hakon Glorstad (Community of Archaeological Legislation and Organisation) – Andris Kairiss (Community on the Illicit Trade in Cultural Material) – Francesca Benetti (Community of Public Archaeology) – Jean-Olivier Gransard-Desmond (Political Strategies Community) – John Carman (EAA Heritage Advisory Committee)  
Session speakers: Thomas Meier (Institut für Ur- und Frühgeschichte und Vorderasiatische Archäologie, University Heidelberg) – Cristina Gameiro (Centre for Archaeology. University of Lisbon) – Lenore Thompson (Innovation and Research, University of Derby) – Carenza Lewis (Lincoln School of Humanities and Heritage, University of Lincoln) – Harald Fredheim (Department of Archaeology, University of York) – Nils Anfinset (Universitetsmuseet, University of Bergen) – Marianne Mödlinger (Department of Chemistry and Industrial Chemistry, University of Genoa)

SESSION ABSTRACT

Climate change and warfare have recently created a whole new awareness of challenges and shortcomings in heritage management and legislation in Europe. Social developments have also increased the awareness of partially dated heritage legislation, where the development of citizen science is one of the opportunities archaeologists

can harness to face them. These macropolitical and geopolitical changes coincide with an explicit political interest in the archaeological heritage as means for creating a sense of belonging, a meaningful life for citizens, and an imperative of democratize knowledge through participation in knowledge production. A sense of belonging through engagement with the heritage can be understood as both a response to current crises and an unease with the traditional professionalization of heritage management to manage and distribute knowledge of the past.The aim of this round table session is to begin the process of creating specific policies and actions on key issues by the Association. Current crises and developments raise legal challenges that require principal and holistic thinking across national legislation and specific cases. To do this we plan to organise workshops and working groups on issues identified in this session based around approaches developed in the discussion. The discussion will be introduced by three carefully prepared and coordinated key notes on the ways current international and national legal instruments approach and interconnect the actual issues of. • Cultural heritage and climate change • Cultural heritage in conflicts and wars • Cultural heritage, citizen science and the democratization of knowledge By exploring these themes, we intend to cultivate a more holistic approach to heritage management that acknowledges its complexities and embraces collaboration across disciplines and communities and to develop appropriate regulation to be of benefit to archaeology and archaeologists, for promotion by the European Association of Archaeologists.

103 THE AMULETS, FROM THE OBJECTS TO THE BELIEFS

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: The Role of Amulets in Healing Practices or in Identity and Status, Differentiated Uses and Meanings, Funerary Practices and Afterlife Beliefs, Symbols, Materials, and Shapes, Origins, Materials, and Cultural Meanings, Trade and Cultural Exchange Networks  
Session organisers: Nova Barrero Martín (National Museum of Roman Art) – Alexandra Vieira (Polytechnic Institute of Bragança)  
Session discussant: Ana Cristina Hamat (Museum of National History and Archaeology Constanta)

SESSION ABSTRACT

The study of amulets within disciplines like archaeology and anthropology provides the opportunity to investigate the beliefs, religious practices, and cultural symbolism of both ancient and contemporary societies. Amulets are objects of profound significance in different cultures, reflecting the deeply rooted beliefs and traditions of the societies that create them. These objects often serve a dual purpose: they are intended to provide protection against supernatural forces, such as evil spirits or harmful energies, and also to give their wearers a sense of security as well as to attract luck, good fortune and prosperity. A key issue to address in this session is the clear definition of amulets, as it is crucial to establish criteria for their identification before proceeding with their analysis or hypothesizing about their function. The discovery of amulets at archaeological sites provides crucial insights into the worldview and cultural frameworks of the societies that produced them. By analyzing them, we can uncover distinct patterns related to religious beliefs, healing rituals, and magical practices, revealing how these communities understood and interacted with the supernatural realm. The symbols and materials used in the creation of amulets play a crucial role in conveying their intended meanings and functions. Each symbol often has a specific cultural or spiritual significance. The choice of materials is equally important, as different substances are thought to have unique properties. The availability of these materials can also provide insights into trade networks and the distribution of resources within ancient societies. The geographical distribution of amulets can illuminate the intricate networks of cultural exchange that existed between different groups and societies.

CONTRIBUTION ABSTRACTS

24. EGYPTIAN FAIENCE AMULETS AMONG THE LATE SCYTHIANS AND SARMATIANS

Contribution format: Oral  
Contribution authors: Olena Dzneladze (Institute of Archaeology of the National Academy of Science of Ukraine) – Denys Sikoza (The regional inspectorate for the Protection of historical and cultural Sites, Kherson)

Egyptian faience figured plaques and pendants are the amulets, popular among the Late Scythians and Sarmatians. The manufacture of faience objects of the Hellenistic and Roman periods is traditionally associated with Naucratis, territories of Syria and Egypt. The hypothesis about glassmaking centers in the North Pontic Region, from where imitations of some types of these items could have been come, has not been confirmed by archaeological material. According to the recent research 57 figurative items made of Egyptian faience and imitations made of glass

have been found at the Late Scythian sites of the Lower Dnipro. The most number was found in the Late Scythian necropolis Chervony Mayak in women’s and children’s burials. These are 42 scarabs of different types, plaques with a crocodile, a lion, double cylinders, pendants-genitals, amphora-shaped pendants, as well as figured pendants with the images of the Egyptian gods Bes and Harpocrates. Single finds of Egyptian faience pendants come from some Late Scythian hill-forts. The peak of the use of Egyptian faience by the Late Scythians of Lower Dnipro area could be dated to the second half of 1st – mid-2nd century AD. Such amulets were also popular among the Sarmatians. 120 figured items made of Egyptian faience come from the Sarmatian burials of Ukraine: scarabs, lions, turtles, anthropomorphic pendants, amphora, fig and grape-shaped pendants, double cylinders, altar item, and several types of beads. They were found in 25 Sarmatian burials. All of them are dated to the second half of the 1st – early 2nd centuries AD and, like in the Late Scythian milieu, were mostly the female and infant attributes. It is possible to assume that the Late Scythians and Sarmatians believed in power of amulets for different aims: protection of damage, the evil eye, as well as attracting good luck, fortune and fertility.

38. TRANSLATIO MONETAE - FOREIGN COINS USED AS AMULETS AND GRAVE GOODS IN A GLOBAL CONTEXT

**Contribution format:** Oral  
**Contribution authors:** Philipp Schwinghammer (German Numismatic Society / Society of Thuringian Coins and Medals)

In this lecture, I would like to address the phenomenon of coins as amulets and talismans with regard to my global numismatic analysis of about 4 billion coin finds worldwide. In America, European coins, such as Old German and British coins, have been used as amulets and grave goods. We are also familiar with Chinese coins from Alaska and Australia, which had a more ritual character. A summary of so-called coin amulets and Charon’s obols will follow in order to underline the difficulty of identifying coins as amulets in an archaeological context. We are also aware of Roman coins that have been used as grave goods in the Barbaricum, as well as Venetian ducats, which migrated to Asia, especially India and China, where they were imitated and subsequently worn as religious tokens and amulets. At the end of the lecture, an attempt at . definition for coins in their secondary use as coin decoration, jewellery, amulet and grave goods should be developed.

94. TEXTS ON HAN BURIAL OBJECTS AND THE IMPLICATIONS

**Contribution format:** Oral  
**Contribution authors:** Eileen Hau-Ling Lam (The Education of Hong Kong)

Ancient Chinese burial objects, made of bronze, jade, lacquer, ceramic, or textile, frequently bear decorative motifs or pictorial images on the surface, while inscriptions or texts are less prevalent. Apart from the inscriptions on bronzes, texts or words on ancient ritual objects are brief and tend to be subordinate, or serve to provide information related to their manufacture. Interestingly, during the Eastern Han period (25–220 AD), inscriptions or texts occurred on a wider range of burial objects, appeared as separate motifs or were placed in a more important position on the objects. These text-bearing objects, ranging from jade, bronze, ceramic, wood, and textile materials, are commonly regarded as amulets or objects offering auspicious meanings or good wishes for the afterlife. This paper will examine the function and implications of these text-bearing objects. By studying the content and the way the texts are displayed on the burial objects, this paper will also discuss the relationship between texts, materials, and objects, while investigating their embedded potency and function in relation to afterlife beliefs in the mortuary context.

382. AMULETS IN LUSITANIA: MODEL AND DIFFUSION FROM AUGUSTA EMERITA

**Contribution format:** Oral  
**Contribution authors:** Nova Barrero Martín (National Museum of Roman Art) – Abel Morcillo León (Consejería de Educación/Junta de Extremadura)

The amulets combin the magical power of their material with symbolic forms. The have protective, apotropaic and beneficent functions. On occasion, these amulets become real pieces of jewelry. In the province of Listania, we can found the typical types in the Empire. Among the most notable sets are the bullae, made of very diverse materials, as well as phallus pendats, in the latter case not only for the neck, but also as earrings. Likewise, we must stand out the presence of reused coins as amulets. Buy moreover, we sey out the female figures, made on bone, produced in Augusta Emerita, whose exact functionality is still questioned and whose diffusion throughout the province of Lusitania shows once again that Augusta Emerita was a cultural dissemination center. Tha capital of the province allowed a quickly dissemination of the roman religius and cultural meanings a long the provincial territories. The findings of the amulets also seem to demonstrate this.

442. FROM DRINKING VESSELS TO AMULETS: THE PROTECTIVE POWER OF THE GORGONEION IN ANCIENT GREEK CULTURE

**Contribution format:** Oral  
**Contribution authors:** Iryna Chechulina (The Institute of Archaeology of the National Academy of Science of Ukraine)

In the ancient Greek world, magic and rituals played a crucial role in daily life. Almost every action was accompanied by specific rituals, including sacrifices and libations. Within the Greek pantheon, each god or goddess was responsible for a particular aspect of life. A distinct group of deities and symbols were associated with protection. This study focuses not on the deities themselves but on their symbolic representations, particularly those used as amulets—protective talismans crafted from various materials. One of the most intriguing apotropaic symbols is the Gorgoneion, the head of Medusa, which was widely believed to ward off evil. The Gorgoneion frequently appeared in architectural elements (such as temple pediments), clothing (as seen in vase iconography), and even drinking vessels. A particularly compelling example of this symbolism is found in kylikes—popular wine-drinking cups—where the Gorgoneion often adorned the interior bottom of the vessel. This placement suggests a dual function: protecting the drinker from harm and serving as a cautionary symbol, perhaps reminding them to drink responsibly. Even more intriguingly, archaeological material from Olbia Pontica reveals that kylix bottoms featuring the Gorgoneion were sometimes deliberately modified after the cup was broken. This raises an important question: were these cup fragments repurposed as amulets for continued protection, or did they serve another function? By analyzing these artifacts, we aim to explore the evolving role of the Gorgoneion beyond its original context, shedding light on the blurred boundaries between everyday objects and protective talismans in the ancient Greek world.

545. THE DOG IN THE ART AND BELIEFS OF THE EARLY IRON AGE CENTRAL CAUCASUS

**Contribution format:** Oral  
**Contribution authors:** Nadezhda Kotova (Institute of Archaeology Ukrainian Academy of Sciences) – Sergey Makhortykh (Institute of Archaeology Ukrainian Academy of Science)

The Early Iron Age Koban culture is located in the mountainous Central Caucasus. Its population was involved in active economic and cultural contacts with inhabitants of South Caucasus, Iran and Anatolia. The presence of numerous imports and imitations at the local archaeological sites indicates that the Central Caucasus can be considered as the northern outskirts of the Near East. Our paper sets out to explore the special significance of such animals as dogs in the Caucasian religious environment, based on the archaeological and ethnographic regional data. The dog images are among the most popular and widely exhibited in the art of the Koban culture. They are represented as volumetric sculptural figures and as graphic incised depictions on belt buckles, belts, axes, fibulae, foot rings and daggers. Sculptural representations of the Canines include full figures, protomes and single heads. The bronze figurines in the shape of dogs have a loop for hanging. Canines are also represented as decorative details on the tops of some Koban pins and axes. The protomes and heads of dogs are used to decorate dagger handles, cheekpieces, pins and pendants. Bronze dog statuettes are characterized by open mouths, prominent fangs and small pointed ears. They were a part of unique amulet complexes that served as necklaces, which were representative accessories of the costume. It is notable that dog figurines were discovered in female burials as well as leg rings with the incised depictions of dog’s images. Although these objects belonged to one person, most likely a priest, their magical protection probably extended to the benefit of the entire community. The dog’s graphic depictions on the bronze belts, buckles, axes, and daggers were typical for male burials.

682. AMULETS FOR THE UNDERWORLD. THE CASE OF AMULETS FINDINGS FROM THE ROMAN NECROPOLISES IN DACIA AND MOESIA INFERIOR/SCHYTHIA MINOR

**Contribution format:** Oral  
**Contribution authors:** Stefan Georgescu – Ana Hamat (Museum of National History and Archaeology Constanta)

In the Roman era, amulets were used to protect a wide range of individuals, coming from every economic class of society. Some of these objects, even accompanied their master in to the Underworld. For these presentation, we will use and present, some particular inhumation graves discovered in Drobeta and Apulum from the roman province of Dacia along with Tomis and Callatis from Moesia Inferior/Schythia Minor, and dated during the 1st-4th centuries AD. Among the amulets discovered here, we will present especially the items of jewellery like medallions, rings, earring. along with simple gems and cameos. By discussing the functionality of this objects, we will try analyse the roll of these particular amulets in the life of the individuals and also the connotations related with the funerary inventory. Most of these amulets are part from exquisite jewellery made from precious metals, and others are made from particular materials like jet or mothers of pearls. Between amulet wearers we have mostly women and children and more rarely men. They have a wide range of protection from physical and mental illness to the evil eye, bad luck and they often grant to the owner a long and happy life with good health,

love, and many riches.

691. THE LANGUAGE OF JEWELS. THE VALUE OF APPEARANCE THROUGH SIX ENGRAVED GEMS FROM A ROMAN BATH DRAIN IN ARUCCI (SPAIN)

Contribution format: Oral  
Contribution authors: Isabel Aguilar Corona (University of Huelva)

Throughout history, human beings have tended to enhance their own physical appearance and to adapt to the aesthetic canons established in each era, responding more to social demands than to mere personal requirements. In this context, jewellery has served as an instrument through which individuals and collectives have manifested their own identity. Various groups—including political elites, armies, religious orders and women—have used materials, shapes, colours and symbolic representations to show their links with particular beliefs or social categories. The abundance of jewellery, hair needles and other adornments found in bath contexts underlines the importance of these spaces as social display settings. The diversity of items, ranging from gold earrings and precious stones to imitation beads made from vitreous paste, demonstrates that the use of adornment and social display transcended differences in social status. This paper presents an unpublished set of six engraved gems recovered in the archaeological excavations of the bath building of the Roman city of Arucci (Aroche, Huelva, Spain). These pieces, extracted from the final area of the drainage channel of the water from the natatio and the pool, date from the 1st to the 3rd century AD and reveal the types of stone and glyphic motifs characteristic of the period. Furthermore, the discovery of these elements in a well-defined archaeological context provides valuable functional and social information, offering a contrasting perspective to those materials which, coming from private collections, have no provenance.

1502. CONTAINERS FOR AMULETS FROM THE POLISH LANDS – POSSIBILITIES OF ANALYZING EARLY MEDIEVAL ARTIFACTS

Contribution format: Oral  
Contribution authors: Joanna Wawrzeniuk (Institute of Archaeology, Cardinal Stefan Wyszyński University in Warsaw)

During excavations at early medieval sites, kaptorgas and small woolen pouches were often found, which were frequently interpreted as containers for amulets. Kaptorgas are small rectangular or trapezoidal boxes made of silver, bronze, or tin sheets and richly ornamented. The name “kaptorga” originates from Turkish and originally referred to reliquaries. However, these types of containers also contained objects related to traditional, pre-Christian beliefs of the inhabitants of the Polish lands. Among the containers found were remnants of fabrics, fur, beeswax, threads, lumps of clay, piece of animal bone and seeds of various plants. The earliest kaptorgas finds were recorded in the Czech lands in the graves of local princely family, while finds in the Polish lands were concentrated at sites along the Oder and Warta rivers. These items were usually part of hoards, burial equipment, or offerings for the deceased. In contrast, relatively few pouches have been found at settlement sites. What role did these items play in early medieval communities? Who could have been their owners? What might their contents have symbolized, and in what religious contexts were they used?

1867. CHARMED, I AM SURE: AMULETS FROM ROMAN PERIOD SLOVENIA

Contribution format: Oral  
Contribution authors: Ana Kovacic (Independent | Univerza na Primorskem) – Mija Topličanec (Institute for the Protection of Cultural Heritage of Slovenia) – Kaja Stemberger Flegar (PJP d.o.o.)

In recent years, amulets have been gaining popularity as a topic to study in Slovenian Roman archaeology. The focus has been predominantly on items associated with children, such as bullae, lunulae, and to some degree crepundia, especially in funerary contexts, but systematic studies taking into consideration chronological and spatial distributions are still missing. Due to the proximity of the amber route and its relevance since prehistory, significant attention has been dedicated to amber objects as well. The aim of this paper is to examine amulets found in the territory of modern Slovenia from a typological, theoretical, and comparative perspective, including issues such as what objects could be interpreted as amulets, where they might have come from, and how they may be interpreted in different contexts. We will also address how amulets have been used in local settings, especially if this differs from the patterns determined for other parts of the Roman Empire. The ultimate goal of the paper is to go beyond individual objects and address the group as a whole.

2319. HARE AND DOG AMULETS FROM THE HUNGARIAN BRONZE AGE SITE OF SZÁZHALOMBATTA-FÖLDVÁR

Contribution format: Oral  
Contribution authors: Zsuzsanna Tóth (Hungarian National Museum, Archaeological Department)

Százhalombatta-Földvár is a fortified tell settlement alongside the Danube lying on the western bank of the river on a natural promontory of ca 160m high. First archaeological investigations at the site begun at 1952, excavations at 1963 shedding light on complex stratigraphy suggesting a long occupation from the Early Bronze Age Nagyrév culture until the end of the Middle Bronze Age Koszider period. From 1999 until today an international research group conducts excavations with finest techniques and evaluation of the finds. Personal ornaments, such as beads and pendants represent a remarkable group among the finds. Brown hare (*Lepus europaeus*) and dog (*Canis familiaris*) metapodia were perforated dorso-ventrally at or above the distal epiphysi. for suspension and were used as pendants/amulets. These objects are common during the Middle Bronze Age levels often found in association with each other suggesting a metaphorical pairing of the prey and its hunter. Such amulets were found at other geographical locations and in several different time periods suggesting a special meaning.

2323. TRANSMISSION OF AMULETIC POWER: THE MAGICAL PROPERTIES OF ANCIENT GEMS REUSED AS SEALS IN MEDIEVAL BRITAIN

Contribution format: Oral  
Contribution authors: Adél Ternovác (University of Reading, Department of Classics)

This paper explores the transmission of amuletic beliefs and the medico-magical properties of ancient gems in the Middle Ages, focusing on medieval Britain. Gemstones depicting mythical and everyday-life scenes or magical motifs played a significant role in ancient cultures from the Bronze Age onwards. In Britain, particularly from the mid-12th to the 14th centuries, surviving gems were often reset in metal mounts (matrices)—mainly signet rings or pendants—to serve as seals. Drawing on a corpus of two object types—medieval metal mounts set with gems and wax seal impressions made using such matrices—this research takes two approaches. First, it examines items where the legend surrounding the gem suggests an amuletic function. While metal seal mounts were often inscribed with owners’ names, some bore magical invocations, mottoes for good fortune, or brief descriptions of the stone’s therapeutic properties. Second, the study explores medieval lapidaries—texts detailing the magical properties of specific stones and motifs engraved upon them. Ancient gem lore was transmitted to the Arab world and later to Christian world, surviving in numerous manuscripts.. Amuletic beliefs in engraved gems persisted since antiquity, but medieval reinterpretations often transformed or redefined their meanings. While valued for their ancient origins, their magical powers were attributed to natural forces bestowed by God.

2338. BEYOND MAN’S BEST FRIEND. DOG TEETH AND BONES AS AMULETS IN EVERYDAY AND FUNERARY CONTEXTS

Contribution format: Oral  
Contribution authors: Borut Toskan – Brina Škvor Jernejčič (Research Centre SAZU, Institute of Archaeology) – Nives Ogrinc – Doris Potočnik (Jožef Stefan Institute, Biogeochemistry group) – Jessica Peto (University of Exeter, Department of Archaeology and History) – Alice Dobinson (University of Oxford) – Petra Vojaković (Department of Archaeology, Faculty of Arts, University of Ljubljana)

In the south-eastern Alpine region, the remains of dogs found in Late Bronze Age and Early Iron Age graves and other cemetery structures bear witness to the important role this animal played in the mythological sphere of the time. Apart from being the remains of sacrificed pets, the canine teeth/bones were possibly attributed special powers to protect the soul of the deceased in the afterlife. The choice of the skeletal element deposited, the place of deposition, the biological characteristics of the selected animal (age, sex, possible pathologies, paleodiet based on stable isotope results, insights provided by aDNA analyzes) and the traces of human activity (i.e. chop and cut marks) should provide information on the magical practices and/or religious beliefs associated with it. These results are confronted with canine remains from a selection of settlement contexts such as postholes or foundations of certain buildings. It is argued that at least some of the said dog remains may represent amulets contained within the foundation deposits.

2482. DYNAMIC SYMBOLS, STRATEGIC USES - VIKING AGE SCANDINAVIAN AMULETS

Contribution format: Oral  
Contribution authors: Bo Jensen (Indepedent researcher)

During the Scandinavian Viking Age (~CE 750-1100), we see a distinct tradition of manufacture and use of

miniature objects, mostly metal, mostly worn as pendants. This tradition largely disappeared with the end of the period, as Scandinavia becomes integrated in mainstream, European Christian culture. During the Viking Age, Scandinavian communities expanded overseas, often in violent ways, ranging as far as Greenland and North America, the Black Sea and the Caspian Sea. This brought them into far more contact with other cultures than ever before. This talk draws on my 2010 catalogue of 1350 Viking Age amulets, supplemented with some more recent finds, and investigates how people adopted, adapted and reinterpreted foreign and local types, with some attention to strategic use under specific circumstances. In particular, a case of likely castration highlights how an unusual crisis provoked an unusual response, and how this reflects a series of specific understandings of bodies and selfhood. Drawing on this, and on a couple of imported types (miniature snakes, combs), I argue that amulets are dynamic, and that their meaning and use changes through time and space.

**1340. THE BURIALS OF THE CHURCH OF SÃO JOÃO DA FOZ: PILGRIMAGE AND FUNERARY SYMBOLISM**

**Contribution format:** Poster  
**Contribution authors:** Alexandra Vieira (Instituto Politécnico de Bragança (IPB))

Inside the Fort of São João Baptista, the remains of a medieval chapel from the 11th/12th century stand out, as well as elements of the church of São João da Foz, the first Renaissance church in the Portuguese Empire, built in the 16th century and later incorporated into the construction of the Fort. This archaeological site is located at the mouth of the Douro River, in Oporto. The necropolis associated with the archaeological site shows a significant diachrony, with remains from different historical periods. The excavations revealed the presence of graves, some of which contained artefacts such as medals, beads, rosaries, pins, rings, coins, earrings, suggesting the practice of funerary rituals linked to spiritual and apotropaic beliefs. Among the materials found in the necropolis, scallops shells and jet figurines stand out, elements strongly associated with the Camino de Santiago. The scallop shell, an emblematic symbol of the pilgrimage to Compostela since the 11th century, was used by pilgrims as a container for water and food, as well as a sign of identification and devotion. The presence of these shells in funerary contexts suggests the presence of Pilgrims. Jet, a material widely used in the production of amulets and devotional objects, has a triple aspect - religious, superstitious and ornamental - which reinforces its importance in medieval and modern material culture. The symbolism of these elements is closely linked to protection and spiritual renewal. The scallop, associated with water, represents purification and inner transformation, while the jet, historically considered a protective material against evil, was widely traded in Santiago de Compostela and used as an amulet by pilgrims. These archaeological findings allow us to reflect on the importance of the site in the network of Jacobean routes and to highlight the cultural and religious impact of pilgrimages on the Iberian Peninsula.

**1429. AMULETS FROM THE ROMAN MILITARY CAMP OF BURNUM**

**Contribution format:** Poster  
**Contribution authors:** Ivana Jadric-Kucan (—)

To ensure their protection and achieve the best possible success on the battlefield, Roman soldiers often turned to various gods. In addition to invoking these deities in their prayers, they believed that jewelry featuring the images of these gods would provide even greater protection and bring prosperity, success, and happiness in all aspects of their lives. Therefore, soldiers frequently incorporated images of various deities into the gems adorning their rings, giving these pieces not only a religious significance but also the function of amulets. At the site of Burnum, several gems have been preserved, including those depicting Hercules, Minerva, Isis with little Horus, Tyche-Fortuna Panthea, and Apollo. Other decorative objects from this military camp also attest to their magical powers. Notably, a bead featuring the likeness of Medusa/Gorgon, which was believed to repel evil, stands out, as does a pendant depicting Harpocrates, along with a bulla that features the image of a frog. Melon-shaped beads made of Egyptian faience, simpler pendants made from readily available organic materials as shells also provided strong apotropaic power and protection for the wearer. This paper analyzes the amulets that were part of the personal jewelry of Roman soldiers, highlighting the significant apotropaic function these objects served, even within military sites. These amulets were discovered during systematic archaeological research at Burnum, which began in 2003. Most of the findings date to the first half of the 1st century, concluding at the early phase of Claudius’ reign, based on the archaeological material uncovered in the area of the amphitheater and training ground (campus).

**2302. AMULETS DEFINING BELIEFS WITHIN THE LATE COPPER AGE VUČEDOL CULTURE**

**Contribution format:** Poster  
**Contribution authors:** Mirna Šuljug – Petra Nikolić – Mirela Hutinec (Vučedol Culture Museum)

Beliefs related to certain prehistoric cults are relatively well-known within the framework of the Vučedol Culture of the late Copper Age, but less is known about the manner in which ritual activities were performed. Most beliefs

for which we have material evidence trace their origins to Neolithic period and are incorporated into the Vučedol concept of living as the first real Indo-European culture. During the systematic archaeological research of the eponymous site Vučedol in Vukovar, Croatia, at the position of Corfield Streim, a large number of amulets were found. Usually they represent the parts of ceramic vessels, the so-called Vučedol Terrina, i.e. biconical bowls that bear different symbols on the biconite in which the symbols of the Sun and the constellation Orion (Winter Sun) stand out in particular. The symbols are usually consisted of multiple circles with a cross symbol in the center, or small circular dots representing the stars of the constallations. The symbols are always decorated with white and rarely red incrustation. Besides these types of amulets, there are also some of the miniature ceramic findings which can be linked to a similar function, such as ceramic models of the stone axe and ceramic model of the consecrative horns. Two findings of small stone pendants are particularly interesting, and there is a possibility they also served as amulets due to the prominent fact that within the framework of the Vučedol Culture there is a large lack of jewelry finds.

**2349. GLASS EYE-BEADS: OCCURRENCE AND SIGNIFICANCE OF IDIOSYNCRATIC GLASS JEWELLERY IN MYCENAEAN CONTEXT**

**Contribution format:** Poster  
**Contribution authors:** Kalliopi Nikita (Ephorate of Antiquities of East Attica, Hellenic Ministry of Culture, Greece)

The current work presents and discusses the occurrence of glass eye-beads in burial contexts of Mycenaean Greece. Special emphasis is placed on examples that were found in cemetery sites in the Argolid, Peloponnese. First, an overview of the principal types of this distinctive piece of glass jewellery is given on the basis of the techniques employed in its manufacture. Their idiosyncratic morphology in conjunction with their rarity and uneven geographical and chronological distribution in the Mycenaean World demonstrates that glass eye-beads are not included amongst the typical jewellery produced by the thriving Mycenaean glass industry. Given that glass eye-beads are distinctive products of alien glass industries, their provenance is traced through the external relations network of the Peloponnese with the Eastern Mediterranean during the Late Bronze Age. A comparative study with examples from contemporaneous Mycenaean sites outside the Peloponnese, namely Rhodes and Cyprus, will facilitate a more comprehensive discussion. Ultimately, taking into consideration that Late Bronze Age glass eye-beads are principally found in burials, which are mostly associated with luxuries and exotica, the paper aims to interpret their idiosyncrasy in relation to their burial deposition, their possible symbolic attributes and social status of the dead within the context of Mycenaean funerary practices and beliefs.

**104 ANIMAL DIET, REPRODUCTION, MOBILITY, AND HEALTH: INSIGHTS FROM ISOTOPE RATIO AND BIOMARKER ANALYSIS**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** animal management strategies, isotope ratios, biomarkers, diet, mobility, reproduction  
**Session organisers:** Magdalena Blanz (Austrian Archaeological Institute, Austrian Academy of Science | Vienna Institute for Archaeological Science, University of Vienna) – Celia Díez-Canseco (Bioarchéologie, Interactions Sociétés environnements - UMR 7209, CNRS/ MNHN Paris) – Adeline Vautrin (Università Ca’ Foscari Venezia)

**SESSION ABSTRACT**

The study of animal husbandry has evolved significantly in the last decades, revealing increasingly detailed information on the complex relationships between humans and their domesticated animals. Advancements in analytical techniques and mass spectrometry have increased the accessibility and accuracy of isotopic analyses, and a growing body of research is showing the potential of biomarkers to study past animal biographies. This session will focus on how isotope ratio analyses, trace element ratio analyses, and studies of biomarkers in animal remains (bones, teeth, calculus, fur, leather, wool....) can reveal details about the diet, reproduction, mobility, or health conditions of domesticates, and provide insights into the human management of livestock worldwide since the onset of the Holocene. This includes isotope ratio analyses of carbon, nitrogen, sulphur, oxygen, hydrogen, strontium and zinc among others, and studies of biomarkers, such as polyphenols in bone, alkyl pyrroles in tooth calculus and cortisol in teeth. Together, these methods contribute to a more nuanced understanding of the complexities inherent in past human-animal interactions. This session encourages studies integrating these proxies to investigate animal domestication, husbandry systems, or management strategies in historical or prehistoric times. Presentations of work on method development, including the study of modern materials and model organisms, the creation of isoscapes, and discussions of pitfalls and cautionary tales are particularly welcome.

1715. ASSESSING CAT-HUMAN INTERACTIONS AT LATE ROMAN-EARLY BYZANTINE SAGALASSOS, TURKEY USING CARBON ( $\Delta^{13}\text{C}$ ), NITROGEN ( $\Delta^{15}\text{N}$ ), AND NON-EXCHANGEABLE HYDROGEN ( $\Delta^2\text{H}$ ) VALUES

**Contribution format:** Oral  
**Contribution authors:** Gene Shev (University of Rome Tor Vergata, Department of Biology) – Bea De Cupere (Royal Belgian Institute of Natural Sciences) – Anastasia Brozou (University of Rome Tor Vergata, Department of Biology) – Benjamin Fuller (University of Bologna, Department of Chemistry “Giacomo Ciamician”) – Marcello Mannino (Aarhus University, Department of Archaeology and Heritage Studies, Højbjerg, Denmark) – Wim Van Neer (Royal Belgian Institute of Natural Sciences) – Steven Bouillon (Department of Earth and Environmental Sciences, KU Leuven) – Claudio Ottoni (University of Rome Tor Vergata, Department of Biology)

Bone collagen carbon ( $\delta^{13}\text{C}$ ), nitrogen ( $\delta^{15}\text{N}$ ) and non-exchangeable hydrogen ( $\delta^2\text{H}$ ) values of humans, domestic cats (*Felis catus*), and other animals, were analysed from Late Roman – Early Byzantine (c. AD 350 –700) contexts at Sagalassos in Turkey. Analysed specimens include domesticated animals such as dogs, pigs, sheep, goats, cattle, chickens and geese, a selection of wild taxa, and small animals that likely served as prey for cats.  $\delta^2\text{H}$  values, a sparsely utilized isotopic proxy in archaeological research, provide extra information relating to diet, imbibed water sources, and trophic position to help discriminate the isotopic niches of different species. As cats are hyper-carnivores and non-obligate drinkers, their  $\delta^2\text{H}$  values are likely mainly dictated by their diets, which is evident in their relatively high values compared to most other species. Bayesian dietary mixing modelling using all three isotopic proxies was conducted on 16 individual cats to estimate how much of their dietary protein was derived from domestic animals, fish, or hunted small prey. Model results indicate that on average cats consumed mostly domesticated animal meats ( $\sim 40 \pm 20\%$ ) provisioned by humans, but supplemented their diets by hunting small commensal and wild prey. Interestingly, the  $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$  and  $\delta^2\text{H}$  isotopic niche spaces of humans overlap the most with cats (92.2%,  $\alpha = 0.95$ ) compared to any other animal including domestic dogs, suggesting especially intertwined cat-human relationships in western Anatolia between the 4th – 7th centuries AD.

443. ANIMAL HUSBANDRY PRACTICES AT THE BEGINNING OF THE NEOLITHIC: STABLE ISOTOPE RATIO INSIGHTS FROM SOUTHEAST EUROPE AND ANATOLIA

**Contribution format:** Oral  
**Contribution authors:** Magdalena Blanz (Austrian Archaeological Institute, Austrian Academy of Science | Vienna Institute for Archaeological Science, University of Vienna) – Günther Grabner (Vienna Institute for Archaeological Science, University of Vienna) – Danica Grujić (Institute of Archaeology, Belgrade) – Alfred Galik – Barbara Horejs (Austrian Archaeological Institute, Austrian Academy of Science)

When Neolithic farming communities spread from the Fertile Crescent via Anatolia into Southeast Europe, they introduced their livestock to a variety of new environments. For sheep and goats, in particular, these environments differed significantly from the generally drier environments in which they were originally domesticated. Farmers therefore had to adapt livestock management practices such as housing, transhumant herding, watering and feeding of their stock accordingly, while likely also being influenced in their decisions by cultural factors. Stable isotope ratio analyses of animal remains offer an opportunity to study dietary habits of domestic livestock, including winter-foddering, forest-grazing, seaweed-eating and the feeding of pigs with human food waste, faeces, or fertilised crops. In this presentation, stable carbon, nitrogen and oxygen isotope ratio results ( $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$  and  $\delta^{18}\text{O}$ ) from bones and teeth of domesticated and wild animals from Neolithic phases at Çukuriçi Höyük, Turkey, as well as bone collagen results from the Early Neolithic in Svinjarička Čuka, Serbia (Starčevo culture) will be presented. These results will be set into the larger context of stable isotope ratios of Early Neolithic animals at other pioneer sites in Southeast Europe and Anatolia, including the Starčevo sites Alsónyék (Hungary) and Măgura - Boldul lui Moș Ivčnus (Romania), and the sites of Halai (Greece), Zemunica (Croatia) and Uğurlu (Turkey).

409. METALLURGY, ENVIRONMENTAL CONTAMINATION, AND ARCHAEOLOGY: INSIGHTS FROM ANIMAL TEETH FROM MORIŠ SETTLEMENTS

**Contribution format:** Oral  
**Contribution authors:** Iride Tomazic (University of Michigan)

Environmental pollution and contamination are issues readily examined in numerous sciences. However, despite being in the ideal position to discuss these issues and their consequences, archaeology has hesitated to discuss the topic in detail due to diagenetic alterations of the biological material. This paper presents the pilot study done

between 2022-2023 of my ongoing dissertation project, “Dangerous Technologies”. The pilot study aims to show how archaeology can contribute to questions of environmental pollution and contamination debate by employing a rigorous sampling strategy, laboratory procedures, and using complementary analytical techniques such as ICP-MS and LA-ICP-MS. In this research, I use teeth from three animal species retrieved from the Bronze Age archaeological sites of Klárafalva Hajdova (2300-1500 BC) and Kiszombor Új-Élet (2700 -1950 BC), located in the Southern Carpathian basin. The teeth exhibited differences between various regions, as well as variations in inter-animal and intra-animal trace and rare earth elements (REE) abundances. The results speak about the importance of sampling strategy, which reflects various levels of animal exposure to these elements and possibly inciting metallurgical activity within and around the settlement.

1785. EXPANDING THE USE OF STRONTIUM: THE POTENTIAL OF STABLE STRONTIUM ISOTOPES FOR UNDERSTANDING ANIMAL HUSBANDRY

**Contribution format:** Oral  
**Contribution authors:** Hannah James – Tessi Loeffelmann – Jacob Griffith – Ben Gruwier (Vrije Universiteit Brussel) – Tamara Leskovar – Matija Črešnar (University of Ljubljana) – Christophe Snoeck (Vrije Universiteit Brussel)

Diet is an important aspect of animal husbandry. Strontium, which is incorporated into body tissues through dietary intake, has the potential to provide insights into both the geographic origin of consumed foods and the specific types of foods ingested. Radiogenic strontium ( $^{87}\text{Sr}/^{86}\text{Sr}$ ) is widely used to understand mobility, with the creation of strontium baselines expanding our ability to identify local and non-local individuals, and to track mobility around a landscape (such as transhumance patterns). Stable strontium (the comparison of  $^{86}\text{Sr}$  and  $^{88}\text{Sr}$ , expressed as  $\delta^{88}\text{Sr}$ ) is a new proxy, measurable in tooth enamel, which shows potential for understanding diet. Terrestrial, and marine or coastal inputs to diet, salt consumption, or changes in regional food sources are reflected in  $\delta^{88}\text{Sr}$ , as well as biological functions such as breastfeeding, weaning, and potentially growth rate. The simultaneous measurement of both these strontium ratios ( $^{87}\text{Sr}/^{86}\text{Sr}$  and  $\delta^{88}\text{Sr}$ ) alongside strontium concentration may allow for a more complete picture of animal ecology and husbandry practices. This talk will present bulk and sequential measurements of  $^{87}\text{Sr}/^{86}\text{Sr}$  and  $\delta^{88}\text{Sr}$  on cattle, sheep, horse, and pigs from modern and archaeological contexts, including 16-18th century Belgium and Bronze Age Slovenia. The analysis of modern samples of known provenance and life histories allows for an understanding of how these two isotope ratios vary according to animal age, location, or diet, allowing for the application to archaeological samples to provide more insights.

1956. EXPLORING DOMESTIC ANIMAL MOBILITY IN BRONZE AGE CAMBRIDGESHIRE THROUGH STRONTIUM ISOTOPE ANALYSIS

**Contribution format:** Oral  
**Contribution authors:** Bryony Rogers (School of Earth Sciences, University of Bristol) – Celia Díez-Canseco (BioArch, UMR 7209, CNRS /MNHN Paris) – Jamie Lewis (School of Earth Sciences, University of Bristol) – Marie Balasse (BioArch, UMR 7209, CNRS /MNHN Paris) – Joanna Bruck (School of Archaeology, University College Dublin) – Tim Elliott (School of Earth Sciences, University of Bristol)

Excavations at the two Bronze Age sites of Clay Farm (Oxford Archaeology 2010-2011) and AstraZeneca (Cambridge Archaeological Unit 2007-2016), located to south of the city of Cambridge, produced considerable domestic animal remains. The sites, within 1km of each other and separated today by a train line, are thought to be broadly contemporary with both domestic areas and a large multi-part enclosure within the landscape. Here we present incremental  $^{87}\text{Sr}/^{86}\text{Sr}$  data from animals deposited across the sites, combined with other isotopic data (e.g.  $\delta^{18}\text{O}$ , and  $\delta^{34}\text{S}$ ) to explore variation in the animal management practices through mobility both within and between the two sites. Initial analysis has identified small, but statistically significant, differences between the ‘local’ strontium isotope ratios found in the Clay Farm animals compared to the AstraZeneca animals. Both groups of which are within the expected range of local bioavailable strontium. Integrating other isotope system such as oxygen and sulphur, with the  $^{87}\text{Sr}/^{86}\text{Sr}$  data can allow for more detailed interpretations to be drawn even in areas where there is limited variation in the bioavailable strontium, such as Cambridgeshire and, more widely, southeastern Britain.

1996. INVESTIGATING ANIMAL HERDING AND LAND USE USING MULTI-ISOTOPE ANALYSES OF FAUNAL REMAINS FROM GIRD-I BEGUM (IRAQI KURDISTAN)

**Contribution format:** Oral  
**Contribution authors:** Jana Eger – Corina Knipper (Curt-Engelhorn-Centre Archaeometry) – Reinhard Bernbeck – Susan Pollock (Free University of Berlin)

Multi-isotope analyses were conducted on faunal remains from renewed excavations at the site of Gird-i Begum

(late 6th through mid-4th mill. BCE/early 3rd mill. BCE), located in the southeastern part of the Shahrizor Plain (Iraqi Kurdistan). The preservation of the animal bones is generally poor and sample sizes are small. However, the abundance of land snails of the edible variant *Helix salomonica* within the collected data is remarkable, similar to a number of Neolithic sites in the Zagros where mollusks were a frequent component of the archaeological material. Mammal remains of the assemblage are dominated by caprines. Central to the study are 15 caprine teeth, five cattle, and one modern sheep. Oxygen and carbon isotope compositions are investigated through sequentially sampled tooth enamel. Strontium isotope ratios of the same animals are determined to examine mobility or non-local origins. These analyses aim to identify patterns of mobility and grazing practices, such as seasonal herd movements or the exploitation of landscape microvariability with ecologically different conditions. We are interested in the question of how past communities organized animal husbandry, herd reproduction and used their zootechnical knowledge to navigate the potential challenges of maintaining and caring for a herd. To characterize local biologically available strontium, additional samples were analyzed, including pig and deer teeth as well as shells of land snails and freshwater mussels from the site. By comparing the results with available data from other sites in the region of the Zagros mountains, they are situated within the broader context of regional herding and land use patterns.

1967. PASTORAL PRACTICES AND MOBILITIES IN THE KURA VALLEY DURING THE BRONZE AGE IN GEORGIA

**Contribution format:** Oral  
**Contribution authors:** Adeline Vautrin (Università Ca’ Foscari, Venezia | BioArch UMR 7209, Muséum national d’Histoire naturelle, CNRS, Paris) – Rémi Berthon (BioArch UMR 7209, Muséum national d’Histoire naturelle, CNRS, Paris) – Elena Rova (Università Ca’ Foscari, Venezia)

The breeding of domestic ruminants was a major component of the past economy of agro-pastoral societies in the southern Caucasus. In central Georgia, the Kura Valley (600-700 m asl), characterised by a continental climate, occupies an intermediate position between the Greater Caucasus to the north and the Lesser Caucasus to the south. Numerous archaeological settlements have been documented there since the Chalcolithic and during the Bronze Age, but little is known about the pastoral practices of these agro-pastoral societies. This study will present the results obtained from three archaeological sites dating from the Early Bronze Age and the Late Bronze Age: Natsargora, Aradetis Orgora and its cemetery Doghlauri. “Classical” archaeozoological analyses have been carried out as well as carbonate isotope analyses of the teeth ( $\delta^{18}\text{O}$  and  $\delta^{13}\text{C}$ ) of cattle, sheep and goats, to compare pastoral strategies during the Bronze Age in the Kura Valley. The modalities and evolution of zootechnical practices (type of husbandry, products consumed/exploited, fodder, control of birthing seasons) and pastoral mobility (horizontal mobility, vertical mobility or absence of mobility) will be examined in order to characterise the environments exploited by the agro-pastoral societies of the southern Caucasus.

230. EXTENDED CALVING SEASON IN MIDDLE BRONZE AGE BRITAIN? EVIDENCE FROM STABLE CARBON AND OXYGEN ISOTOPE ANALYSES OF CATTLE TEETH

**Contribution format:** Oral  
**Contribution authors:** Celia Díez-Canseco – Marie Balasse (BioArch - UMR 7209, CNRS/ MNHN Paris) – Kate Kanne – Floor Huisman (School of Archaeology, University College Dublin) – Denis Fiorillo (BioArch - UMR 7209, CNRS/ MNHN Paris) – Joanna Bruck (School of Archaeology, University College Dublin)

Year-round calving means ensuring milk availability throughout the year. Year-round mating, and the resulting out-of-season calving, is a product of domestication and husbandry. Historical aurochs, as well as feral herds of domestic cattle, have seasonally constrained birthing periods, which typically coincide with the onset of the spring and the peak availability of food resources. Extending the birthing period requires significant technical effort, including ensuring a proper care and a good nutritional plane to support reproduction and lactation during less optimal times of the year. Previous studies have shown that extending the calving season would not have been easily achieved by the first farming populations in Europe, possibly constrained by environmental factors. When year-round calving first developed is still unknown, but it may have involved improvements in husbandry practices, such as sheltering and foddering. In this study, we explore calving patterns in the Middle Bronze Age sites of Clay Farm and AstraZeneca (Cambridgeshire, UK), where zooarchaeological evidence suggests that cattle played a predominant economic role and that dairy production was likely present. Sequential stable carbon and oxygen isotope analyses were conducted on tooth enamel to estimate the extent of the birthing season and infer cattle’s diet. Feeding strategies on a seasonal scale are investigated as a key parameter to maintain cattle fertility throughout the year. The combined analysis of second and third molars allows to monitor the seasonal rhythms of husbandry on a pluriannual scale, while the comparability of both records to infer birth seasonality is also assessed. Results from this study suggest that some husbandry efforts were made to extend calving period, although births did not occur all year-round. This study provides new insights into the husbandry

strategies developed by these communities, their organization of labor, and their patterns of milk production.

971. COMPARING NEOLITHIC AND CHALCOLITHIC CAPRINE HUSBANDRY THROUGH DENTAL ENAMEL ISOTOPE ANALYSES AT EL PORTALÓN DE CUEVA MAYOR (ATAPUERCA, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Juan Antonio Antolinos-Díaz – Amalia Pérez-Romero (Laboratorio de Evolución Humana, Universidad de Burgos) – Cristina Valdiosera (Laboratorio de Evolución Humana, Universidad de Burgos | Dept. Archaeology and History, La Trobe University) – Maria Ángeles Galindo-Pellicena (Centro Mixto UCM-ISCIH de Evolución y Comportamiento Humanos) – José Miguel Carretero (Laboratorio de Evolución Humana, Universidad de Burgos | Unidad Asociada de I+D+i al CSIC Vidrio y Materiales del Patrimonio Cultural (VIMPAC)) – Colin Smith (Laboratorio de Evolución Humana, Universidad de Burgos | Dept. Archaeology and History, La Trobe University) – Eneko Iriarte (Laboratorio de Evolución Humana, Universidad de Burgos)

In the context of caprine stable isotope research, there are very few studies on the Iberian Peninsula for the Chalcolithic period. During the Chalcolithic, farming practices were well understood, however, we can observe new cultural dynamics leading to hierarchical societies, as evidenced by individual burials in pits or tumuli with grave goods. At the site of El Portalón de Cueva Mayor (Sierra de Atapuerca, Burgos), burials are often associated with a lamb as a grave offering, indicating the importance of *Ovis*/*Capra* husbandry in their culture. The Chalcolithic layers show two phases: the pre-Bell Beaker Chacolithic (ca. 5000-4300 cal. BP), characterized by funerary use, and the Bell Beaker Chalcolithic (ca. 4000-3800 cal. BP), which shows evidence of habitation and sheepfolds. This study aims to contribute with additional biogeochemical data and new insights into the changes in management during this period compared to the Neolithic, focusing on primary and secondary products of sheep (*Ovis aries*) and goats (*Capra hircus*). To this end, caprine teeth from El Portalón de Cueva Mayor site were isotopically analyzed. Through the analysis of oxygen ( $\delta^{18}\text{O}$ ) and carbon ( $\delta^{13}\text{C}$ ) isotope sequences of enamel from dental series (first, second and third lower molars), we infer the seasonal management of births and their focus on meat production or secondary products such as milk or wool. To better understand the management of younger individuals, the lower deciduous molar, which develops during the first months of life, was also analysed. Here we compare the anthropic management of births between the Neolithic and Chalcolithic periods and an overall low mobility for this taxon. This implies an adaptation of caprine management, during this transition in the Northern Iberian Hinterland, for the acquisition of different resources depending on group needs throughout the year and we reflect on the cultural of the Chalcolithic burial practices.

105 GRAVE GOODS: BEYOND IDENTITIES

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Grave goods, Burial archaeology, Funerary practices, Archaeological theory  
**Session organisers:** Frida Espolín Norstein (Stockholm University) – Samuel Kinirons (University College Dublin) – Colin Quinn (University at Buffalo) – André Nordin (Stockholm University)

SESSION ABSTRACT

Grave goods have been an integral component of funerary practices across various societies, but what roles did they play within these funerary traditions? Archaeologists have long recognised that grave goods provide a wealth of information about the deceased’s social roles and identities, but this has also led to these objects becoming seen as passive reflections of these roles and identities. Overreliance on these interpretations has obscured variations in the meanings and motivations of grave goods over time. By employing alternative interpretive frameworks, archaeologists can uncover new interactions between the deceased, the items they were buried with, and the people who buried them. This session invites papers that look beyond the interpretations of grave goods as props in societal construction and markers of status. We particularly welcome studies that examine the influence of memory, grief, and performative and private ritual in the formation of grave assemblages. Papers highlighting the interrelationship of bodies and grave goods are also encouraged to submit here. The body is the catalyst and main focus of the funerary practice and has been described by some as ‘the essential artefact’. Bioarchaeological data should thus be given due consideration alongside the artefacts themselves whenever possible. We hope that the session will include a broad range of alternative perspectives on grave goods from a variety of regions and periods. Our aim is to help broaden the discourse around how we interpret grave goods by highlighting the multiplicity of meanings and motivations behind the placement of objects in funerary contexts. Suggested topics include

- Ritual functions of grave goods

- Relationships between the deceased individual(s) and grave good.
- The role of grief and memory in the formation of funerary assemblages
- Object agency and biographies
- Broader regional/temporal overviews

CONTRIBUTION ABSTRACTS

2034. (UN)SACRED REMAINS: THE BODY AND FUNERARY ASSEMBLAGE OF MARIA FRANCISZKA KOZŁOWSKA IN THE CONTEXT OF HER LIFE AND POSTHUMOUS FATE

**Contribution format:** Oral  
**Contribution authors:** Danuta Greding – Mikołaj Dobek (Nicolaus Copernicus University in Toruń)

The crypt beneath the Sanctuary of Mercy and Charity in Płock serves as the burial site of three bishops and Maria Franciszka Kozłowska, founder of the Mariavite Church and the first woman to be excommunicated by the Pope. More than a resting place, her tomb is a focal point of devotion, embodying ongoing interactions between the deceased, the living community, and the sacred. The recent archaeological study of these burials, conducted during renovations in 2022, revealed not only a unique funerary assemblage but also traces of ritualized care, memory-making, and sacralization of the body. Kozłowska’s remains were found in a non-traditional wooden coffin, reflecting multiple reburials and the turbulent history of her legacy. Among the most striking grave goods was a sealed vessel containing her blood and hair, a clear indication of her continued presence in the spiritual and social world of the Mariavite community. This study explores how the selection, placement, and preservation of grave goods transcend the simple category of personal items. Instead, they function as active participants in a dynamic process of religious devotion, reinforcing Kozłowska’s role as a spiritual guide both in life and beyond death. By framing these grave goods through the lens of ritual practice, object agency, and cultural studies, we reconsider their role in shaping religious memory and communal mourning.

656. COULD HE BEAR THE SWORD? INTERPRETING AN EARLY MEDIEVAL GRAVE FROM IVANKA PRI DUNAJI, SOUTHWESTERN SLOVAKIA

**Contribution format:** Oral  
**Contribution authors:** Kristian Jócsik (University of Lodz) – Jakub Tamaškovič (Institute of Archaeology Czech Acad Sci, Brno)

Ivanka pri Dunaji, site Farkasek (Senec District), is among the most recently excavated early medieval burial grounds in southwestern Slovakia. A total of 119 graves were excavated at the site. This study focuses on Grave No. 17, representing a specific case of interaction between the deceased, the grave goods, and the living community that buried the man (aged adultus I; 20–29 years). The unusual nature of this burial is highlighted not only by the grave inventory itself but also by its deposition. The sword, spear, and a wooden bucket were placed on the lid of the wooden coffin. This uncommon practice diverges from the typical placement of grave goods directly into the burial pit (or coffin) next to the deceased. Can the sword thus be seen as a status marker granted to the deceased by the living community post-mortem or during the funeral ritual? This study aims to offer a comprehensive perspective on this interpretation: I.) The burial context suggests an indirect connection between the sword and the deceased. Did the sword symbolize the social role of this man, even if he did not have the opportunity to achieve it due to his early death? Or was it an expression of the power and status of the social group to which he belonged? II.) The sword has been researched using an interdisciplinary approach, allowing us to understand it not only as a passive grave good but also in terms of its manufacture and provenance. This helps us comprehend the efforts of those who handled the weapon before it became part of the burial assemblage. The discussion includes comparisons with analogous burials based on the site’s relative chronology and AMS 14C data. Grave No. 17 is also interpreted within the context of other excavated burials at the locality.

638. DRESSED IN GOLD: MEDIEVAL TEXTILES FROM ARCHAEOLOGICAL RESEARCH IN HALYCH-VOLHYNIAN LANDS (WESTERN UKRAINE)

**Contribution format:** Oral  
**Contribution authors:** Iryna Lutsyk – Vira Hupalo (I. Krypiakevych Institute of Ukrainian Studies of the National Academy of Sciences of Ukraine)

Medieval textiles were found in 53 burials in the Halych-Volhynian lands of Rus’ (13 of them in Gródek Upon the Bug River and 1 in Czermno (now Poland)). These are mainly gold and silver woven ribbons with a silk base, as well as clothing decorated with embroidery. The collection of textiles from Gródek Upon the Bug River is representative and so far the only one fully published. However, textile finds have also been discovered at a number of other sites: Peresopnytsia, Plisnesk, Zvenyhorod, Horodok, Zelenyi Hai, Ostap’ie, the sacred complexes of Halych (Krylos, Shevchenkove, Zalukva, Pitrych), Horodnytsia, Oleshkiv, Vasyliv, Sokilets, Bakota, Chermno.

The collection of textiles from the cemeteries of princely Halych is exceptional. In particular, a unique chiltse from a female burial. Finds from Zalukva and Horodnytsia are among the interesting examples decorated with ornithomorphic ornament. In the first case, the embroidered figure of the bird is turned towards the floral ornament, which is believed to symbolize the “tree of life”. Instead, the gold-thread embroidered border of the collar from Horodnytsia is decorated with an image of a row of birds, each of which is placed in separate arches. The considered fragments of fossil textiles represent the remains of post-mortem clothing. Comparing them with the “lifetime” clothing models reflected in iconography demonstrates a certain specificity of funeral robes. Characteristic elements of decoration and accessories indicate the formation of traditions associated with the ritual of post-mortem dressing of the body and approaches to preparing the remains for the subsequent stages of burial. It is worth noting that the decorative gold-woven elements of the robes and the personal items of the Christian cult placed in the funeral complex carried different meanings. Accompanying the deceased, these items represent funeral rituals closely related to individual eschatology.

2068. METALLIC TRACES ON BONES: THE BIOGRAPHICAL FUNCTION OF CLOTHING AND GRAVE GOODS IN AN ALPINE MODERN BURIAL CONTEXT

**Contribution format:** Oral  
**Contribution authors:** Lisa De Luca (University of Insubria, Varese) – Alessandro Asta (Ministry of Culture Superintendency ABAP) – Davide Pacitti (Independent Researcher) – Ilaria Gorini (University of Insubria, Varese)

The cemetery of the Church of Santi Simone e Giuda in Borca di Cadore (Belluno province, Veneto region, Italy) was excavated between 2021 and 2023 as part of an archaeological investigation. The excavation uncovered a total of 21 graves dating back to the 18th–19th centuries, remarkable for the presence of grave goods and taphonomic indicators that suggest these were clothed burials. Only through a biocultural approach—integrating data from archaeology, cultural anthropology, and bioarchaeology—can we attempt to shed light on the life histories of individuals. In the specific case of the Borca di Cadore cemetery, the close relationship between bodies, clothing, and grave goods—primarily understood in terms of spatial association—has made it possible to infer the personal histories of the deceased. These histories emerge through subtle variations in dress and funerary assemblages within the framework of a mortuary ritual codified by Roman Catholic traditions. Modern burial contexts offer a privileged field of study due to the availability of abundant historical and cultural-anthropological documentation, enabling a more precise contextualization of bioarchaeological findings with significant support from archival sources. Research focusing on these more recent periods allows for the continuous refinement of investigative methodologies that emphasize the synergy of multiple biocultural aspects, further reinforcing the value of this approach in reconstructing the lived experiences of past populations.

2208. CUSTOMS AND BELIEFS RECORDED IN COFFINS. DO WE HAVE ARCHAEOLOGICAL EVIDENCE FOR ETHNOGRAPHIC DATA? (17TH-19TH C., POLAND)

**Contribution format:** Oral  
**Contribution authors:** Magdalena Majorek-Lipowicz (Institute of Archaeology, University of Lodz)

Man is a constant observer of life and phenomena around him. The appearance of coffin burials in funeral rituals carried certain content and enabled conclusions regarding religiosity, social and economic status of the deceased and his family. Above all, however, coffins were a testimony to death. They were, and still are, an extremely important and in many ways valuable piece of grave goods. Their functions include information, protection, verification and identification. They are not an easy subject to study because, as I once wrote: “There are no two identical coffins and the history of each of them is unique, which makes this research subject extremely interesting, however, it does not make interpretive processes easier”. In ethnographic sources that record customs, practices and beliefs related to funerary rites, we often find descriptions of gestures and rituals related to the preparation of the coffin (searching for a maker, choice of raw material, choice of carpentry technique, deliberate leaving of shavings, decoration), the display of the deceased’s body in the coffin, the transport and the funeral ceremony. In my presentation I will contrast the information provided by ethnographic data with existing archaeological evidence that verifies (confirms or denies) the observance of customs and the use of specific practices. I will focus on sources dating from the 17th to the 19th century that refer to Roman Catholic burial rites in Polish lands.

408. GRAVE GOODS IN COLLECTIVE BURIALS: FOR ALL, SOME OR NONE? THE CASE STUDY OF CUEVAS DE FUENTES DE LEÓN (SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Celia García-Domínguez (Universidad de Valladolid | Fundación Extremeña de la Cultura) – Teresa Fernández-Crespo (Universidad de Valladolid | University of Oxford)

Grave goods are key elements in the study of funerary practices. However, their role in collective burials has been barely explored. These graves usually contain fragmented and commingled human skeletal assemblages which were deposited during long periods together with some objects. Therefore, the individualization of the skeletal remains and its association to grave goods often is a difficult task. Late Neolithic/Chalcolithic collective burials of Cueva del Caballo and Cueva de Los Postes, both located in the Natural Monument Cuevas de Fuentes de León (Badajoz), in southwestern Iberia, serve as important case studies to approach this issue. Based on osteological and taphonomic biographies, formal and contextual archaeological data and radiocarbon dates, we suggest possible associations between grave goods and individuals. We also try to deepen into the potential meanings and motivations behind grave goods found in collective burials and how they can help address the influence of collective memory and the importance of tradition in these funerary deposits.

**2166. BURIED WITH MEANING: THE ROLE OF GRAVE GOODS IN THE ROMAN NECROPOLIS OF CRESCENTINO**

**Contribution format:** Oral  
**Contribution authors:** Alyssa Schrag (University of Pavia)

Between 1999 and 2003, a large Roman necropolis was uncovered in Crescentino (Vercelli), Northern Italy, during a building project. The 177 tombs, mostly indirect cremations, were only ever published in preliminary form (La Rocca, 2000). The pyre and grave goods found within these burials vary significantly, from single objects to assemblages containing up to 25 items, including rich glass vases, unguentaria, and mirrors, as well as tools of trade such as spindle whorls. These objects range from locally manufactured goods to imported Roman items, reflecting a broad spectrum of funerary choices and practices. This paper examines the relationship between grave goods and the rituals they took part in, considering how these interactions changed over time. By examining the selection, distribution, and contextual significance of these objects within graves, this paper highlights the active roles these items played in shaping funerary experiences and the ways in which the living chose to represent the dead. Additionally, this study considers how the function of grave goods may have shifted within the funerary context, as everyday objects transformed through ritual, symbolic offerings, or tools of commemoration. Decisions regarding grave goods did not happen in isolation. Therefore, this study also considers how the broader societal and economic context—in this case a settlement with Celtic influence located along the Ticinum-Augusta Taurinorum axis and the Dora Baltea and Po rivers—may have shaped funerary practices. By integrating these broader perspectives, this paper sheds new light on the complex motivations behind the inclusion of grave goods in the Crescentino necropolis, contributing to discussions on performative ritual, and the evolving roles of objects in Roman funerary contexts.

**939. STANDING IN THEIR SHOES: A PEOPLE AND COMPARISON BASED APPROACH TO INTERPRETING GRAVE GOOD RITES IN EARLY MEDIEVAL EUROPE**

**Contribution format:** Oral  
**Contribution authors:** Caitlyn Dunn (Macquarie University)

Grave good burial rites are a feature of cemeteries in many regions of Europe during the early medieval period. Grave goods have been used in scholarship to understand ethnic identities, migration patterns, and social status amongst the living. Currently, early medieval archaeology is moving towards using grave goods to understand the individual, and by doing this, as Fleming argues, we can “combat the...single story”. To date we have focussed on asking what grave goods mean, such as Härke’s 2014 article in Mortality. However, as per recent discussions of object biography and memory, it is people who give objects meaning. Based on a comparative study of furnished cemeteries from early medieval England (5th-8th centuries AD) and Croatia (6th-9th centuries), this paper argues that to interpret grave goods, we must attempt to understand the mindset of the people who chose to use them in the burial of their dead. This means that we need to consider individual personality and personal motivations, as well as external influences that were at play whenever a grave was created. This approach assumes that grave good burial rites, and the meanings behind grave goods, are complex, just as people are complex. Hence, there may have been many factors involved in the choice of whether to use grave goods or not, and which ones to inter with the dead. It also highlights that all interpretations of grave good meanings and uses must firstly be situated within the context of death and burial, and therefore, people’s emotions and beliefs about death and burial. To seek out these perspectives, this paper argues that comparative studies of graves and cemeteries, especially cross regional studies, are essential.

**1089. NOT AS IT SEEMS: A COMPARATIVE ANALYSIS OF ARCHAEOLOGICAL AND ANTHROPOLOGICAL DATA FROM SELECTED GERMANIC BURIALS FROM SEKULE, WESTERN SLOVAKIA**

**Contribution format:** Oral  
**Contribution authors:** Petra Dragonidesová (Institute of Archaeology of the Czech Academy of Sciences, Brno)  
– Ján Rajtár – Urszula Śmigielska (Institute of Archaeology of the Slovak Academy of Sciences, Nitra)

Cremation was the predominant mortuary practice among Germanic tribes in the Middle-Danubian Barbaricum. The interpretation of these cremation burials poses significant challenges for archaeological and anthropological research, primarily due to factors affecting the preservation of graves and the frequent incompleteness of grave assemblages. While researchers have attempted to establish correlations between artifact types and sex/age categories to facilitate interpretation in the absence of osteological data, the reliability of this methodology is often compromised, resulting in potential generalizations and misattributions of demographic characteristics. Our analysis of grave goods from the Germanic burial site at Sekule (western Slovakia), integrating both archaeological and anthropological data, underscores the limitations inherent in relying solely on artifact associations for such interpretations. Critically, the compromised integrity of these burial contexts, frequently characterized by incomplete inventories and insufficient skeletal material for anthropological analysis, must be acknowledged. Presented comparative analysis, which contrasts traditional artifact-based interpretations with conclusions drawn from anthropological evidence, reveals notable discrepancies and emphasizes the importance of a comprehensive, multi-disciplinary approach to the study of these burials.

**1494. COLLECTIVE MEMORY, INDIVIDUAL GRIEF AND PERFORMANCE IN MORTUARY PRACTICES AT THE END OF LATE BRONZE AGE IN SOUTHERN CARPATHIAN BASIN**

**Contribution format:** Oral  
**Contribution authors:** Daria Ložnjak Dizdar (Institute of Archaeology, Zagreb)

The southern Carpathian Basin, encompassing the river basins of the Drava, Sava, and the southern section of the middle Danube, is a region where diverse communication networks intersect, influencing the dynamics and adoption of change during transitional periods. One such process occurred at the end of the Late Bronze Age and the transition to the Early Iron Age, specifically during the first centuries of the last millennium BC. This paper presents a broader overview of mortuary practices, the relationships between the deceased and grave goods in the context of the widespread cremation burial rite at several sites (e.g., Batina, Sotin, Dolina) belonging to different communication spheres within the region. Objects and their biographies will be presented, revealing unique narratives on each grave based on bioarchaeological, archaeozoological, and other multidisciplinary data. Through examples of reconstructed grave scenarios, we attempt to interpret the individual and collective activities of families and communities involved in mortuary practices, as well as the role of communal memory and the grief of individuals close to the deceased. Material traces indicate that during the 9th and 8th centuries BC, some elements of mortuary practices were widespread and shared, while others remained localized or even individual within communities. The choice of objects and goods, along with the ways in which communities and individuals performed these practices, depended on their daily lives and available resources, as evidenced by the archaeological record. We can glimpse the meanings, motivations, and emotions that inspired and guided the farewell to the deceased.

**591. RITUAL AND REGIONALITY: THE ROLE OF GRAVE GOODS IN VIKING AGE FUNERARY PRACTICES**

**Contribution format:** Oral  
**Contribution authors:** Frida Espolin Norstein (Stockholm University)

Grave goods are a common feature of Viking Age burials and have long been used to explore the social roles and identities of the individuals buried with them. However, as this paper demonstrates, their use varied significantly across different contexts, reflecting complex cultural and ritual dynamics. Drawing on a database of over 1,300 graves and 5,500 artefacts, this paper examines large-scale patterns in the deposition of grave goods. By incorporating Viking Age burials from various sites in Sweden and Norway, as well as from the overseas settlements in Britain, Ireland, and Iceland, it highlights both regional distinctions and overarching similarities. This analysis enables a critical reassessment of the use of grave goods, questioning the extent of their uniformity and exploring the interplay between local, regional, and pan-regional traditions. The paper further argues that it is essential to understand grave goods as elements of ritualised practice, shaped by factors beyond individual or collective identities.

1290. BURIALS OR SACRIFICES? SOME CHARACTERISTICS OF INFANT REMAINS FROM MARIUPOL CEMETERY

Contribution format: Oral  
Contribution authors: Nataliia Mykhailova (Institute of archaeology of National Academy of Sciences of Ukraine)

The cemeteries of the Mariupol type of the Late Mesolithic and Neolithic, located mostly along the Lower Dnipro rapids, are characterised by their rich burial inventory. The cemeteries can be divided into two periods: Early Mariupol: 7000-5500 cal. BC and Late Mariupol: 5500-4000 cal. BC. Many of the dead were accompanied by elaborated ornaments made of bone, stone, pearl, carp teeth, deer canines and boar tusks. The study of these burial decorations provides information on the rites of the life cycle, including the ceremonies marking the change of age and social status, gender identification and marital status. The burials of the later phase of the cemeteries of the Mariupol type, are characterised by a particular richness and variety of the grave goods. There were numerous pearls and pendants of various materials: shells, bones, marble, jet, etc. The most impressive personal ornaments are the pierced boar tusks, which were abundant only in the cemetery of Mariupol; they belong to the burials of men, women and children. Some burials of children were richer than those of adults. A few of them contained special features such as a bone figurine of a bull, an axe and a pendant of porphyry, a rock crystal and so on. Probably these artefacts can prove a special sacral status or potential role of these children in the society. The position in the cemetery, the fragmentation and the specific inventory of some children’s burials are distinguishing. These are in particular the infant burial in the Sakarovka cemetery and the children’s skulls in the Lysogorskiy burial ground. The analysis of the remains and the inventory, mainly jewellery, suggests that they were evidence of sacrifices.

993. HUMAN-ANIMAL ENTANGLEMENTS BEYOND THE GRAVE: ANIMALS AND ANIMAL BODY PARTS IN FUNERARY CONTEXTS IN CENTRAL AND SOUTHERN PORTUGAL LATE PREHISTORY

Contribution format: Oral  
Contribution authors: Catarina Guinot (Universidade de Évora) – Nelson Almeida (Universidade de Évora, CHAIA, IN2PAST | Universidade de Lisboa, UNIARQ)

Funerary archaeological contexts are a major source of information regarding past societies. Human remains and grave good analysis have long been among the most prolific studies applied to these types of contexts. Considering the latter, this resulted in perspectives where the material record is mostly seen as a sort of proxy for the roles and identities of deceased individuals. During the last years, more-than-human and animal-human relations have resurfaced as approaches to the archaeological record. A wide corpus of studies has focused on Prehistoric funerary archaeology and human-animal relationships, but rarely do these perspectives combine. Late Prehistory funerary contexts are widespread in Central and Southern Portugal, with different typologies and funerary rites being described. Besides material culture, animal body parts and assemblages have been an integral part of these contexts. Concepts of structured deposition, segmentation, feasting and votive goods have been used in the interpretation of some of these funerary contexts. However, these have looked mostly at animal remains as related to the deceased roles and identities (which might be the case in several of the cases), while other interpretative approaches have not been widely attempted. A synthesis on animals and animal body parts found on Neolithic, Chalcolithic and Bronze Age (ca. 6th-2nd millennium BCE) Central and Southern Portugal funerary contexts is presented. We consider information concerning funerary behaviour, human biological profiles and zooarchaeology aiming to discuss human-animal relationships and funerary contexts, and how these may relate to aspects such as roles and identities, but also to other entanglements where animal agency and ideological variables can be meaningful.

788. INTERPRETING WORKED LITHICS IN EARLY MEDIEVAL AND VIKING AGE GRAVES IN IRELAND AND BRITAIN: A PRELIMINARY ASSESSMENT

Contribution format: Oral  
Contribution authors: Samuel Kinirons (University College Dublin) – Cian Hogan (Iarthar Heritage)

This paper will explore the poorly understood phenomenon of worked lithics in early medieval and Viking Age graves in Ireland and Britain. Often dismissed as residual, it is increasingly recognised that many were deliberately placed in graves. Uncertainty remains on how this act should be interpreted. Most of these artefacts consist of flakes of struck flint which are difficult to date. It is possible that they are contemporaneous with the burials – created and used as part of a toolkit, such as strike-a-lights. Alternatively, they could derive from prehistory – their use-life extended through incorporation into later belief systems. This touches upon a broader, long-standing contention which frequently occurs in the study of grave goods. Were they to be used by the dead or were they symbols intended to evoke belief, identity and memory. Here we present a preliminary summation of the existing evidence. In the cases where it appears that they significantly predate the burial, we suggest a range of theories on how they might have been conceptualised by the people placing them in the graves. Drawing upon

ethnographic and archaeological parallels, we will examine whether they were acknowledged as antiquities or conceived of as magico-religious curiosities. Despite the unimposing and enigmatic nature of many of these artefacts, they represent a means of thinking critically about how grave goods are interpreted. We argue that the occurrence of worked lithics within these graves undermines the dichotomy of the functional and symbolic interpretations of grave goods. It seems probable that some were indeed made in prehistory and that they were later found, curated, repurposed and subsequently interred. The blurring of lines between practical considerations and symbolic resonances should not be unexpected when one considers that these artefacts are associated with the disposal of the dead and the creation of fire.

1784. THE CUTTING EDGE: A RELATIONAL-ONTOLOGICAL PERSPECTIVE ON SHARP OBJECTS IN EARLY IRON AGE BURIALS

Contribution format: Oral  
Contribution authors: André Nordin (Department of Archaeology and Classical Studies, Stockholm University)

Sharp objects constitute a broad category of artefacts encompassing any object with a sharp edge or point. Despite their rarity in burials in the Early Iron Age of Sweden, sharp objects are often interpreted as relating to the buried dead by acting as signifiers of gender, social roles, status, wealth and power. However, such representational interpretations obscure other possibilities for why sharp objects are deposited in burials. In this paper, I will explore the phenomena of sharp objects in Early Iron Age burials from a relational ontological approach. Crucial to this approach is a strong focus on empirical observations pertaining to burials with sharp objects. Another key method employed is ethnography of sharp objects in rural Swedish and Finnish societies in the early modern period. Rather than applying ethnography as a direct analogy, ethnographic observations can be utilized as a tool to break free from modern Western ontological conceptions of what objects are and can be. Combined, the approach used in this paper can help expand the possibilities of what sharp objects in burials can be. As a case study to exemplify this approach, I use the Early Iron Age cemetery of Sörby-Störlinge on Öland, Sweden. I end by arguing that the significance of a relational ontological approach is that, using appropriate methods, it can help us move beyond past frameworks and potentially lead us into new fruitful territories of understanding past objects in past worlds.

1294. AXES OF DIFFERENCE: EXPLORING MULTIPLICITY IN SCANDINAVIAN STONE BATTLE-AXES

Contribution format: Oral  
Contribution authors: Amber Roy (Stockholm University)

The polished stone battle-axe is a defining artefact of the Scandinavian Battle Axe Culture (BAC) (3000/2800–2300 BC), frequently found in burial contexts alongside male inhumations and other grave goods. With few BAC settlements known, graves and their assemblages are the prime source for interpreting BAC people. Battle-axes have often been interpreted through fixed, symbolic frameworks that ascribe them singular meanings — as markers of the status, identity, or masculinity of the deceased. However, such interpretations overlook the inherent multiplicity and dynamic roles of these objects, both within and beyond the burial context. Drawing on use-wear analysis, pXRF data, posthumanism and depositional contexts, this paper challenges static interpretations by exploring the variability and difference seen through the itineraries of BAC battle-axes. Rather than representing a fixed identity or status, the multiplicity and variation of battle-axes highlight how variability within artefact itineraries and grave assemblages demonstrates multiplicities in meaning and function. These multiplicities impact our understanding of these artefacts and BAC burials. Indeed, variation is difference. Understanding where differentiation occurs and how this can create change allows us to better understand ongoing transformations within social and material networks. In all, by moving beyond singular symbolic interpretations, this presentation underscores the importance of recognising variability and multiplicity as essential to understanding the roles grave goods played.

585. DISSECTING THE WARRIOR.A DUALISTIC DECONSTRUCTION OF A WARRIOR BODY AND IDENTITY IN LATE BRONZE AGE KEFALONIA, GREECE

Contribution format: Poster  
Contribution authors: Efrossini Vika (American School of Classical Studies at Athens) – Eleni Papafloratou (Ephorate of Antiquities Kefalonia and Ithaca) – Anna Linderholm (Stockholm University) – Lisette Kootker (Vrije Universiteit Amsterdam) – Alice Toso (University of Bonn) – Vasiles Tatsis (American School of Classical Studies at Athens) – Grigoris Grigorakakis (Ephorate of Antiquities Kefalonia and Ithaca)

As a rule, Late Bronze Age burials with weapons signal an automatic interpretation about the status of the individual buried. A recent excavation in Kefalonia revealed the remains of a burial that had been furnished with several weapons and a boar tusk helmet. The unmarked grave and the poor skeletal preservation of the body

make this a unique find, that challenges our preconceived interpretations. We implement here a dualistic deconstruction of this burial: firstly, we break the skeleton down to the molecular level, implementing a multitude of state-of-the art analytical approaches. Then, we strip the ‘warrior identity’ down to its constituents, demonstrating how a reverse intersectional approach is obscuring regional and temporal particularities for burials with weapons, imposing a ‘one fits all’ interpretation. Finally, we use our approach to de novo reconstruct and critically resituate the multiple concepts of a burial with weapons in a time period heavily coloured by the idea of institutionalized warriorhood.

745. MEDIEVAL CAP FROM HAN BILA, BOSNIA AND HERZEGOVINA-ANALYSES OF FABRIC MATERIAL WITH SEM-EDS METHOD: LUXURY OR FAKE DESIGNER CLOTHING?

**Contribution format:** Poster  
**Contribution authors:** Adisa Lepic (National museum of Bosnia and Herzegovina/ Department for Archaeology, Section for Middle Ages) – Almir Olovčić (Independent) – Azra Bečević-Šarenkapa (National museum of Bosnia and Herzegovina/ Department for Conservation and Restoration) – Kerim Hrvat (University of Sarajevo/ Faculty of Science and Mathematics, Department of Physics)

In February 1950, during the quarry works at the Han Bila, workers have found a stone sarcophagus, with some bones and textile inside. Inside the sarcophagus, a cap, scuffia type was covering a deceased’s person face. Based on the materials used, it is assumed that the person inside the sarcophagus was a woman. After the excavation, cap was treated with conservation chemicals and preserved in the National Museum of BiH, in Sarajevo all these years. The aim of this research was to analyse material used for the making of scuffia, especially gilded parts. For this occasion, a non-destructive SEM-EDS approach was chosen. Samples were taken from four different parts of cap; two samples were gilded threads and two were samples of textile. Analysis showed that the initial chemicals used for conservation caused significant damage to the material, creating a thick paste, limiting the potential for proper SEM analysis. Yet, it was possible to get insight into some parts of the gilded thread analysed. Based on the few spots where the thread was free of the paste, the results showed predominantly copper, silver and gold. Their chemical content suggests that the wires used for creating threads were copper based, gilded with combination of silver and gold, a typical custom in Medieval times. The presence of sulphur and chlorine suggests the presence of passive surface protection layer of AgCl and Ag2S. SEM imagery showed that the thread could be classified as a more common S-twisting type (the other being the Z-type).

2488. AMBER RING-SHAPED PENDANTS IN LA TÈNE GRAVES IN CENTRAL EUROPE

**Contribution format:** Poster  
**Contribution authors:** Filip Korn (Department of Archaeology and Museology Masaryk University Brno)

This contribution examines the presence of amber ring-shaped pendants in graves in Central Europe during the La Tène period. Amber, as a well-known indicator of long-distance trade and connections in prehistory and proto-history, plays a crucial role in understanding the socio-economic dynamics of the time. The origin of this specific type of pendant can be predominantly found in the Carpathian Basin, where more than half of the discoveries originate and are typically dated to the LT B1 – C1 horizon. (Duleba – Markiewicz 2023, 317), where a notable concentration of such artifacts has been found. These pendants are typically attached to a delicate bronze chain, although in some cases, silver chains are also present. It is possible to determine certain associations between artifacts and gender based on burial context and the types of items found with the deceased. However, the presence of some artifacts, such as amber pendants, may not be strictly gendered and could potentially appear in graves of both men and women, especially in the case of high-status individuals or individuals with specific roles in society.

106 MOUNTAIN PASTORALISM THROUGH TIME: ARCHAEOLOGICAL INSIGHTS AND CONTEMPORARY CONNECTIONS

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Regular session  
**Session keywords:** Mountain livestock, interdisciplinarity, diachrony, pastoralism, environmental impact, archaeological dissemination & knowledge transfer  
**Session organisers:** Ermengol Gassiot Ballbè (Departament de Prehistòria. Universitat Autònoma de Barcelona) – Mélanie Le Couédic (ITEM Université de Pau et des pays de l’Adour) – Francesca Romana Del Fattore (University of Newcastle - School of History, Classics and Archaeology) – Ariadna Nieto-Espinet (University of Lleida)

SESSION ABSTRACT

Recent advancements in archaeology across European mountain regions have increasingly highlighted the study of livestock management, revealing a rich diversity of practices adapted to different geographical and chronological contexts. From the Neolithic to the present day, livestock husbandry has been recurrent in mountain communities, shaping local economies, environments, and social dynamics. This continuity reflects not only the adaptability of these communities but also the long-standing impact of livestock practices on mountain landscapes. This session explores how livestock management left its mark through diverse archaeological evidence: zooarchaeological remains, animal management artifacts, manure deposits, sheepfold caves, enclosures, and impacts on paleo-vegetation. These traces reveal not only the continuity of mountain pastoralism but also dynamic shifts in techniques, social relevance, and ownership patterns over time. We invite the submission of papers that address both scientific studies on livestock management in mountain areas and archaeological outreach initiatives aimed at revalorising these practices in their current territories. This session is open to research exploring common themes across different regions and periods, including the characterisation of mobility patterns, grazing methods, pastoral and herd management strategies, environmental impacts, and diachronic changes. Additionally, we particularly encourage contributions that integrate archaeological outreach and knowledge transfer to local communities, as well as cultural heritage and sustainable development initiatives. Such efforts foster a meaningful connection between scientific research and its present-day social impact. Through this interdisciplinary dialogue, we hope to gain a comprehensive view of mountain pastoral societies, their rhythms, transformations, and the potential of archaeology to elevate their recognition and appreciation in today’s world.

CONTRIBUTION ABSTRACTS

1044. INVESTIGATING LIVESTOCK FARMING AND ENVIRONMENTAL CHANGE SINCE MEDIEVAL TIMES IN THE KERRY MOUNTAINS, IRELAND

**Contribution format:** Oral  
**Contribution authors:** Eugene Costello (University College Cork | Stockholm University) – Benjamin Gearey (University College Cork)

This paper presents results from on-going research on late medieval and early modern pastoralism in the mountains of Kerry in south-west Ireland. Today this is a landscape dominated by extensive sheep grazing with minimal day-to-day herding taking place. Up to c.1900, however, cattle and goats were more dominant and since they were dairy animals there was also more day-to-day herding involved. These activities have left significant traces in the landscape, including hut sites, enclosures and pasture boundaries. However, it is only in the last couple of decades that excavations have taken place at such sites in Ireland and in other mountainous areas across the north of Europe. We will present results from recent excavations at abandoned herders’ huts in Kerry in order to shed light on the chronology of herding in this area. We will also present results from pollen analysis, place-name research and historical analyses which complement the excavation evidence. In undertaking this work, it is becoming clear that the environment has changed significantly since late medieval times. The paper will therefore also consider the impacts of livestock farming on mountain habitats and vegetation over time, especially in the context of increasing demands for food and other products from the late medieval period onwards. The challenges of ‘applying’ past environmental information in today’s world, in the areas of habitat management and conservation, will be discussed briefly too.

487. MOUNTAIN PASTORALISM IN THE SOUTHERN CENTRAL PYRENEES SINCE THE MID-HOLOCENE: SOME ARCHAEOLOGICAL AND PALAEOECOLOGICAL INSIGHTS

**Contribution format:** Oral  
**Contribution authors:** Ermengol Gassiot Ballbè (Departament de Prehistòria. Universitat Autònoma de Barcelona) – Ignacio Clemente-Conte (Institución Milà i Fontanals (CSIC)) – Sara Díaz-Bonilla – Sergi Mata-Ferrer – Laura Obea Gómez (Departament de Prehistòria. Universitat Autònoma de Barcelona) – Javier Rey-Lanaspa (Dirección General de Patrimonio Cultural, Gobierno de Aragón) – David Rodríguez-Antón (Departament de Prehistòria. Universitat Autònoma de Barcelona) – Guillem Salvador-Baiges (Deutsche Archäologisches Institut) – Alejandro Sierra (Università di Pisa)

For the last 20 or 30 years, archaeology in southern Europe has been paying increasing attention to high mountain areas, bringing to light extensive sequences of occupation, often covering practically the entire Holocene. Their study allows us to characterize different modes of occupation of these spaces and to identify livestock farming as one of the central activities in these processes from the ancient Neolithic period onwards. In this communication we present the results of 20 years of research on the southern slope of the central Pyrenees. Intense surface surveys have made it possible to document hundreds of archaeological sites largely related to pasture areas above

the current timberline. The characterization of these sites, largely vestiges of huts and enclosures, allows them to be assimilated to a large extent to livestock practices of the last millennia. The excavation of some of these sites provides sequences of occupation over several millennia, which suggest that the same places are repeatedly reoccupied over time. However, this recurrence in the locations of the settlements does not mean that the activities carried out in them remain stable over time. On the contrary, archaeological excavations and detailed analyses of these sites illustrate changes in the ways in which high mountain areas have been exploited over time. In some periods a clear livestock specialization of the occupations can be observed, while in others their coexistence with some type of agriculture can be seen. Patterns of mobility and interconnection with the lowlands also seem to vary over time. This dynamism is also reflected in changes in the intensity of human impact on high mountain environments, as palaeoecological evidence shows. In this sense, it illustrates that today’s altimontane landscapes are also the result of thousands of years of human history.

**758. FROM DIVERSIFICATION TO SPECIALIZATION: EVOLUTION OF LIVESTOCK STRATEGIES IN THE PYRENEES SINCE THE NEOLITHIC**

**Contribution format:** Oral  
**Contribution authors:** Sergi Mata Ferrer – Ermengol Gassiot Ballbé (Departament de Prehistòria, Universitat Autònoma de Barcelona) – Alejandro Sierra (Dipartimento di Civiltà e Forme del Sapere, Università di Pisa) – Javier Rey Lanaspá (Departamento de Educación Cultura y Deporte del Gobierno de Aragón) – Maria Saña Seguí (Departament de Prehistòria, Universitat Autònoma de Barcelona) – Ignacio Clemente Conte (Departamento Arqueología y Antropología, Arqueología de las Dinámicas Sociales (IMF-CSIC))

For more than a decade, archaeological research in the inland mountain ranges of the central Pyrenees has provided an extensive network of information on the economy of these mountainous areas, where livestock farming has played a fundamental role. The archaeozoological analysis of several high mountain sites, together with the documentation of livestock structures along the valleys, allows us to propose different interpretations of pastoral practices over time. These practices have varied according to the period, since livestock activity has been recorded from the beginning of the Neolithic period to the present day. Traditionally, early neolithic livestock husbandry in mountain areas has been associated with large seasonal movements of livestock, with the ascent to high altitude pastures during the summer. However, recent studies suggest that livestock activity in this period was carried out on a local and domestic scale, linked to permanent settlements and short-distance movements. Numerous sites, especially in caves, indicate that during late prehistoric times there were diversified herds composed of sheep, goats, cattle and, in this case, swine. These practices differ from later livestock models in the central Pyrenees, which changed to a system more oriented to a seasonal use of high-altitude pastures with specialized settlements. Over time, this model left as a testimony the presence of enclosures and pastoral huts, reused over the centuries for the exclusive management of sheep, goats and cattle.

**444. PASTORAL (DIS)CONNECTIONS. THE DECLINE OF THE TRATTURI NETWORK IN CENTRAL-SOUTHERN ITALY: RECENT CHANGES IN HERD MANAGEMENT STRATEGIES AND SOCIO-ECONOMIC IMPLICATIONS.**

**Contribution format:** Oral  
**Contribution authors:** Francesca Romana Del Fattore (Newcastle University - School of History, Classics and Archaeology)

In Central-Southern Italy, where pastoral activities are documented since the Early Neolithic phases (7h-6th mill BC), the historic transhumance network included about 3.000 km of iconic droveways (tratturi), part of which certainly date back to pre-protohistoric times. An articulated system along which animals, seeds, people, traditions, ideas and genes moved for centuries. Agricultural transformation, pre- and post-unification political and economic trends, competition from foreign wool, conflicts and – last but not least – the social changes of the post-war period have disrupted the Italian transhumance system and the related paths network, encouraging depopulation and socio-economic degradation. This is particularly evident along the core of the Apennine ridge – between Abruzzo, Molise, Campania and Apulia – where there are widespread abandonment phenomena, aggravated by seismicity, anthropic impact and recent historical-political events. Yet until the middle of the last century, these regions were closely interconnected through the seasonal movement of flocks: hundreds of thousands of sheep moved twice a year. What are the consequences of the collapse of the transhumance system for local landscapes and communities? What remains of the network of pastoral routes? Which solutions have been adopted by modern breeders in terms of their mobility patterns? Can archaeology be a concrete tool to raise the awareness of local communities and shepherds regarding the protection of heritage and pastoral landscapes, to inform future policies and to promote good management practices? We will try to answer these questions through two case studies from Abruzzo and Puglia, which are part of an ongoing Marie Curie project - PaTHS. Pastoral Tracks Heading South. The evolution of the droveways (tratturi) in Central-Southern Italy.

**1277. THE MOUNTAIN ECONOMY OF MARCESINA PLAIN (VI): STRUCTURES AND PASTORAL PRACTICES THROUGH ARCHAEOLOGY, ETHNOGRAPHY, AND HISTORICAL MEMORY**

**Contribution format:** Oral  
**Contribution authors:** Veronica Venco (University of Sassari) – Armando De Guio (University of Padua) – Sara Zecchinato (University of Sassari) – Luigi Magnini (University Ca’ Foscari of Venice)

In the eastern part of the Veneto region, the Asiago Plateau (VI), located within the province of Vicenza, has consistently held a vital role in pastoral dynamics, particularly regarding high-altitude activities. Characterized by extensive pastures interspersed with evergreen woodlands, this area includes the Marcesina Plain at 1,300m a.s.l. on its north-eastern border. Historically, Marcesina has been a shared jurisdiction between Veneto and Trentino, demonstrating evidence of human habitation that dates to the Palaeolithic period. This region’s rich environmental diversity has rendered it an ideal setting for mountain pasturing, with diachronic evidence of such practices reflected in both protohistoric and historic “malga” structures (alpine hut). This contribution intends to present the preliminary results of the landscape investigations carried out between 2022 and 2024, focusing on identifying evidence related to the gradual use and evolution of the environment and pastoral resources typical of mountain regions. These investigations revealed the presence of substantial agro-pastoral activities throughout various historical periods, which have left specific archaeological traces related to the alpine economy. Remote sensing and field investigations have revealed a range of structural types; however, their interpretation can be complex, particularly due to the limited material culture directly associated with these practices. In this context, the complementary nature of ethnographic investigations and archival research has proven invaluable, assisting in the clarification of structural patterns and the historical management of herds and pastures. Additionally, this approach has fostered a deeper understanding of the intricate socio-economic relationships that have influenced the pastoral economy and its communities over time. These dynamics are evident in historical documents and echoed in the strong sense of identity and belonging expressed by local pastoralists during ethnographic interviews. Thus, it is essential to advocate for the promotion and safeguarding of the cultural heritage that is intricately woven into the pastoral landscape of Marcesina.

**237. BEYOND SHEEP: SWINE HUSBANDRY IN THE PYRENEAN MOUNTAINS**

**Contribution format:** Oral  
**Contribution authors:** Christine Rendu – Maïalen Gauthier (TRACES Laboratory, CNRS – University of Toulouse) – Romain Vercasson – Baptiste Mellier – Muriel Llubes (GET Laboratory, CNRS – University of Toulouse) – Josu Narbarte (University of the Basque Country | Aranzadi Zientzi Elkartea) – Eneko Iriarte (University of Burgos) – Carine Calastrenc (TRACES Laboratory, CNRS – University of Toulouse) – Mélanie Le Couédic (ITEM laboratory, University of Pau)

The archaeological studies on summer grazing conducted in the Pyrenees have, until now, primarily focused on sheep farming, for which the material evidence is the most visible. All sources, whether archaeozoological, written, or oral, nevertheless show the presence in upper pastures of other types of livestock, driven there in single-species herds or in association with other species. While high-altitude swine husbandry is attested almost everywhere, including in the eastern Pyrenees, it is particularly present in medieval and modern written sources relating to the Basque Mountains. But what are its traces? In recent years, the hypothesis has spread that the numerous mounds recorded in the summer pastures of the French Basque Country by the archaeologist Jacques Blot - mounds that are different from Protohistoric tumuli – correspond to pig huts, attesting to the importance of this medieval and modern pig farming. After a historiographical overview, this communication will present recent works aimed at confirming or refuting this hypothesis. Conducted from an interdisciplinary perspective, they have combined ethnographic surveys of contemporary pig farming practices and a new series of archaeological approaches: analysis and mapping of Jacques Blot’s inventories, comparison of this inventory with new field surveys, geophysical exploration (electrical mapping and tomography), and sedimentary coring. The results of these studies, with their convergences and contradictions, show the difficulty in characterizing these mound structures, which might nonetheless be essential to understanding the socioeconomic changes in high-altitude pastoralism over the last millennium.

**175. THE ECHOES OF HERDS : ARCHAEOLOGY OF MOUTAINS IN THE DIGITAL ERA**

**Contribution format:** Oral  
**Contribution authors:** Carine Calastrenc – Christine Rendu – Nicolas Poirier – François Baleux (TRACES) – Nicolas Dobigeon (Université de Toulouse) – Nicolas Mellado – Arthur Chiron (IRIT) – Marie-Claude Bal (GEODE) – Josu Nabarte Hernandez (Aranzadi Zientzi Elkartea) – Matthieu Le Bailly (Chronoenvironnement)

It has taken three decades of interaction and dialogue between the humanities and environmental sciences, and a wealth of methodological advances, to ensure that high moutains are seen as something other than immutable. Subjected to integrated interdisciplinary questioning, they reveal complex dynamics that vary in time and space. By historicizing mountains over the long term, we reverse the global point of view on societies, and reconsider the totality of valley systems. To be a mountain archaeologist is to perceive the interactions between nature and human activities over the long term, to identify spatial and temporal dynamics, to measure the impact and adaptability of know-how to social and economic changes, and to assess their implications. In this context, it has to be said that the teams involved in this research are faced with the problem of acquiring and processing primary information. An essential prerequisite for all archaeological research, mountain prospecting has its own specificities and methodological challenges. Since 2018, the TAHMM program has been seeking to overcome two methodological hurdles: How can we go beyond the threshold of visible surface structures to enrich information with those made of perishable materials or covered by vegetation? How can we systematize acquisition in order to process larger areas more quickly and in greater detail? Technological advances (satellite images, airborne lidar, drone-based sensors (photogrammetry, thermography, multispectral, lidar), geophysical equipment (georadar, magnetometer, resistivimeter), soil chemistry and DNA) are opening the way to new multiscalar acquisition procedures. New data processing tools, work on software ergonomics and the possibilities offered by artificial intelligence all point to new ways of optimizing/automating the detection of archaeological remains at altitude, and of understanding the subsoil and the species kept in this initial approach.

**1750. MAPPING BIOAVAILABLE STRONTIUM IN THE WESTERN CATALAN PYRENEES: A BASELINE FOR RECONSTRUCTING HERD MOBILITY IN MOUNTAIN LANDSCAPES**

**Contribution format:** Oral  
**Contribution authors:** Rubén De La Fuente Seoane (Universitat de Lleida | Universitat Autònoma de Barcelona) – Leopoldo Pena – Ester García-Solsona (Universitat de Barcelona) – Ermengol Gassiot-Ballbé (Universitat Autònoma de Barcelona) – Ariadna Nieto-Espinet (Universitat de Lleida)

The RePiCa (Re-thinking Pirenean Cattle Management in the Context of Climate Change) project investigates long-term changes and continuities in livestock management in the Lleida Pyrenees. One key research focus is reconstructing past livestock mobility through a zooarchaeological and stable isotope approach, analysing strontium (Sr) and oxygen (O) isotopes in dental enamel. Additionally, a baseline bioavailable strontium map is being developed for the western Catalan Pyrenees for the first time in this region. The 87Sr/86Sr ratio provides insights into past animal mobility, as strontium transfers from the geological substrate into the trophic chain, integrating into plants and animals. Strontium is then absorbed into dental and skeletal tissues, preserving the isotopic signature of the region of origin. Simultaneously, oxygen isotope variations ( $\delta^{18}\text{O}$ ) in enamel reveal seasonal mobility patterns, offering key information on herd management, transhumance calendars, and altitudinal land use throughout the year. To determine bioavailable strontium levels in this area, a sampling program was conducted, collecting modern vegetation samples contextualized both geographically and environmentally. The methodology developed seeks to standardize the sampling and analytical process, integrating Geographic Information Systems (GIS) in both fieldwork and laboratory analyses. Furthermore, it emphasizes open-access data repositories to facilitate future research reuse. A preliminary correlation is now being explored between bioavailable strontium levels, Pyrenean landscape characteristics, and isotopic data from animal dental enamel, establishing an initial reference framework for studying pastoral mobility patterns in this mountain region. The preliminary results of this baseline strontium map will be compared with zooarchaeological data from Cova de l’Home Mort (Lleida Pyrenees), a Bronze Age site with evidence of pastoral activities. This study enhances our understanding of historical extensive livestock management, establishes a standardized methodology, and facilitates comparisons across regions and periods, emphasizing the historical and contemporary relevance of pastoralism in mountain landscapes.

**761. HERDING AROUND THE LAKES: INSIGHTS INTO NEOLITHIC SETTLEMENT IN THE CENTRAL PYRENEES FROM ARCHAEOLOGY AND PALAEOENVIRONMENTAL STUDIES INCLUDING SEDADNA**

**Contribution format:** Poster  
**Contribution authors:** Alejandro Sierra (Dipartimento di Civiltà e Forme del Sapere, Università di Pisa) – Lourdes Montes (Universidad de Zaragoza, Grupo P3A-IUCA) – Irene Julián-Posada – Graciela Gil-Romera – Penélope González-Sampériz (Instituto Pirenaico de Ecología (IPE-CSIC))

The onset of agro-pastoral economies in the Iberian Peninsula marked the human exploitation of ecological niches that had previously remained largely unused and whose natural conditions had been minimally altered. This trend is particularly evident in mountainous regions, which began to be occupied more intensively during the Neolithic, not only for grazing but also for diverse resource exploitation. Within this context, the process of Neolithization in the Pyrenees stands out, as farming and herding communities started settling in the region

from the second half of the 6th millennium cal BC. Over time, these mountain occupations had an unprecedented impact on the environment, reshaping landscapes to align with human interests, even in altitude areas. This study provides a synthesis of the available data on Neolithic occupation and its impact in the central Pyrenees, based on the analysis of around twenty archaeological sites. It also incorporates information derived from paleoecological records, such as pollen and fossil spores obtained from lacustrine sequences, with particular emphasis on new results from ancient sedimentary DNA (sedaDNA) analysis. These indicators not only help reconstruct past vegetation dynamics but, thanks to sedaDNA, also allow the identification of local domestic animal’s presence, offering a more detailed perspective on past ecosystems and human influence on them. The integration of this data enables the reconstruction of territorial occupation models practiced by Neolithic communities and their evolution from the onset of the Neolithic to the beginning of the Bronze Age. This approach also examines how natural climatic changes, such as the onset of the Neoglacial in mountainous areas, may have influenced these processes, while assessing the interplay between climatic variability and anthropogenic impacts on landscape transformation and vegetation formations construction.

**1667. PETRA. IN SEARCH OF DRY STONE BUILDINGS IN THE PYRENEES**

**Contribution format:** Poster  
**Contribution authors:** Melanie Le Couedic (ITEM university of Pau) – Benoit Pace (ITEM university of Pau | IRAA Upr 5500) – Alain Champagne – Patricia Heiniger-Castéret (ITEM university of Pau) – Hadrien Rozier (Centre d’Études Supérieures de la Renaissance)

Dry stone construction, closely linked to pastoralism, is a key part of the cultural heritage of the Pyrenees. Hundreds of kilometres of walls, paths, huts and other infrastructure shape the cross-border landscape of this region, having evolved thanks to age-old skills that have structured pastoral areas. These constructions, which have been used for centuries to support agriculture and livestock farming, have been recognised by UNESCO as intangible heritage of humanity since 2018. They illustrate a traditional know-how that has marked the Pyrenean landscape since prehistoric times. Dry stone heritage is an important resource for the development of sustainable and diversified tourism, helping to enhance the value of mountain areas. However, this heritage remains fragile and requires cross-border cooperation to safeguard it. The POCTEFA PETRA project aims to promote this cultural heritage through research and documentation, as well as the inventory, mapping and geolocation of dry stone constructions. The project aims to enhance the visibility and sustainability of dry-stone buildings, while capitalising on good local practice. In this way, it contributes both to the preservation of this ancestral technique linked to pastoralism and to its use as a tourist and cultural resource.

**1698. TRACING THE FIRST FARMING COMMUNITIES INTO THE PYRENEES: NEW EVIDENCE OF EARLY SHEEP IDENTIFIED THROUGH ZOOMS ANALYSES**

**Contribution format:** Poster  
**Contribution authors:** Celia Díez-Canseco (BioArch - UMR 7209, CNRS/ Muséum National d’Histoire Naturelle | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) – Héctor Del Valle (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Departament d’Història i Història de l’Art, Universitat Rovira i Virgili) – Eudald Carbonell (Departament d’Història i Història de l’Art, Universitat Rovira i Virgili | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) – Michael Buckley (School of Natural Sciences, Manchester Institute of Biotechnology, University of Manchester) – Carlos Tornero (Departament de Prehistòria, Universitat Autònoma de Barcelona | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA))

In the Iberian Peninsula, the occupation of mountain areas by the first farming communities is still poorly understood. In the Pyrenees, one of the main mountain ranges of northern Iberia, the archaeological sites linked to these occupations are scarce. Moreover, these sites often lack well-preserved bone assemblages, especially when located in exposed rock shelters or open-air locations, which prevents a complete characterisation of the economic background of these occupations. Specifically, the presence of sheep – a reliable evidence of farming communities in areas where wild sheep species are absent – is difficult to assess due to this limited availability of bone remains. Recently, a new site located in eastern Pyrenees has been excavated (Bauma dels Fadrins, Queralbs, Spain) where potential Early Neolithic occupations have been documented, yielding a rich bioarchaeological record. Caprine bone remains are abundant, but the identification of domestic caprines through traditional osteological methods is challenging due to bone fragmentation and similarities with other species, especially wild goat and chamois. Here, we present preliminary data from a new study where a wide set of bone samples from this site has been selected for ZooMS analyses. The study aims to identify the presence of sheep linked to these occupations, and to provide reliable radiocarbon dates of first farming communities for this area. The potential herd composition at the species level is also investigated. The results point to one of the earliest evidence of sheep

in the eastern areas of the Pyrenees.

107 SOCIAL TRANSFORMATIONS ALONG THE DANUBE AND ADJACENT BALKAN REGIONS DURING THE 2ND MILLENNIUM BCE

Session theme: 8. Along and across the Danube!  
Session format: Regular session  
Session keywords: Bronze Age, Balkan Prehistory, Social Transformations, Settlement Archaeology, Social Landscape, 2nd Millennium BCE  
Session organisers: Philipp Stockhammer (LMU Munich | Max Planck Institute for Evolutionary Anthropology, Leipzig) – Bogdan Athanassov (New Bulgarian University Sofia) – Barry Molloy (University College Dublin) – Alexandra Gävan (University of Cologne)

SESSION ABSTRACT

The 2nd millennium BCE has long been considered a period of significant social transformations throughout Europe and the Mediterranean. With increasingly robust chronologies and larger datasets, trajectories of the rise and fall of societies are an important focus of research in Southeastern Europe. The abandonment of long-lived tell settlements, for example, is indicative of the social transformations taking place in the region. This phenomenon has been associated with societal collapse by some researchers. In contrast, the appearance of the Late Bronze Age mega sites reveals resurgent prosperity. Rapid changes around 1200 BCE ended complex societies along the Danube and adjacent Balkan areas. These dramatic changes in settlement patterns have biased our knowledge of the 2nd millennium BCE, particularly when concentrated settlement systems are studied in spatial and temporal isolation. To better understand these trajectories, we must explore the wider social landscapes of these prominent multi-settlement entities together with 1) alternative phenomena of dispersed / less-stable settlement systems and 2) other made-places from cemeteries to hoards. This session aims to critically evaluate social transformations of the 2nd millennium BCE Middle and Lower Danube hinterlands in a nuanced manner that addresses the impact of connections through time and across the diverse, contemporary societies that shaped these landscapes. We call for contributions that shed new light on transformations of settlement patterns and land use, on changes in patterns of mobility, nutrition, infectious diseases, socio-political interactions between larger and smaller-scale settlement networks, management of and responses to societal-scale crises.

CONTRIBUTION ABSTRACTS

859. NO FANCY TITLE, WE DO SERIOUS CHRONOLOGY. RADIOCARBON DATING OF THE BRONZE AGE IN THE BALKANS

Contribution format: Oral  
Contribution authors: Maja Gori (National Research Council of Italy) – Barry Molloy (University of Dublin) – Marc Vander Linden (Bournemouth University)

The third and second millennia BCE in Europe were particularly pivotal in the long-term history of the continent, from major population turnover phenomena to the emergence of new and long-lived forms of social complexity. The prehistory of southeast Europe is one of the most diverse on the continent in terms of societal configurations, landscapes and climates. In the last decades, a relatively large number of radiocarbon dates has been produced for this area, even if unevenly distributed spatially and temporally. However, these data have been mostly used to define phenomena or metalwork and ceramic typo-chronologies at local to small-regional scales. Their potential for understanding wide-ranging cultural trajectories, the emergence, end of, or transition between social phenomena as well as relationships between neighbouring and more distant areas remained underdeveloped. In this paper, we present the first results of a project that has systematically gathered and analysed all available 14C dates for the timespan 3000-800 BCE in SE Europe. The geographic area covered is expansive, encompassing a present-day Slovakia, Hungary, Slovenia, Croatia, Bosnia and Herzegovina, Serbia, western Romania, western Bulgaria, Albania, Kosovo, N. Macedonia and central to northern Greece. The 14C data have been used to generate a broader framework for a comparative archaeology of SE Europe in these formative millennia. Using these data, we explore long-term regional trends in the intensity of human activity in a comparative perspective in this presentation. By evaluating the articulation between macro-trends revealed and local relative chronological schema, we also tested the robustness of the boundaries of ceramic typo-chronology sequences commonly used as the backbone in local and regional archaeologies in this area. Together, these approaches are used to present new regional scale models for social developments in the third to early first millennia BCE.

1460. THE RISE AND FALL OF A REGIONAL POLITY: THE MAROS GROUP IN THE SECOND MILLENNIUM BC

Contribution format: Oral  
Contribution authors: Amy Nicodemus (University of Wisconsin-La Crosse) – John O’Shea (University of Michigan)

The second millennium BC in the Eastern Carpathian Basin is a time of dramatic social and cultural transformation. It sees the multiple, regionally coherent, cultural entities of the Early Bronze Age interlinking into an emergent macro-regional system (EMRS) of interaction and trade. After about five stable centuries, it then sees the complete collapse of that same system, with ramifications that reverberate throughout these regional polities, creating a chaotic transition into the earliest manifestations of the Late Bronze Age. Extensive new excavations and the proliferation of high precision 14C dates now allows us to view the nature of these social transformations at an unprecedented scale and time frame. Here we consider the trajectory of change and transformation at the scale of a single regional polity, the Maros Group of southeast Hungary, western Romania and northern Serbia. While Maros tell settlements are already known in the EBA, an explosive expansion of settlements and cemeteries is observed at the beginning of the MBA (conventionally 2000 BC). These include the de novo foundation of three major tell sites, Pecica Șanțul Mare in western Romania, Rabe Anka Siget in northern Serbia, and Klárafalva Hajdova in eastern Hungary. These tell sites, along with the contemporary Szőreg C cemetery at the Tisza-Maros confluence, emerge as major centers and nodes in the EMRS. The rapid rise and tumultuous collapse of these centers is a defining feature of the regional MBA, and the transition to the early LBA .

2145. FROM TELLS TO MEGA-FORTS: SOCIAL, POLITICAL AND ECONOMIC TRANSFORMATIONS DURING THE SECOND HALF OF THE 2ND MILLENNIUM BC IN E-HUNGARY

Contribution format: Oral  
Contribution authors: Vajk Szeverenyi (University of Miskolc) – Anna Priskin – Balázs Wieszner (Hungarian National Museum)

The second half of the second millennium BC in the Carpathian Basin witnessed multiple major transformations clearly visible in the changes observed in regional settlement patterns. Around ca. 1500 BC, tell settlements along the Danube and its tributaries previously occupied for centuries were abandoned, giving way to a more dispersed settlement pattern. This, in turn, was replaced around 1350 BC by a new pattern dominated by “mega-forts” in southeastern Hungary, surrounded by medium-sized fortified settlement and unfortified hamlets. Fortified settlements in other areas east of the Danube, however, are rare. This “fortified landscape” disappears again in eastern Hungary sometime after 1200 BC. The aim of our paper is to investigate other spheres of social and economic life – such as burial wealth, hoarding and food preparation and consumption practices – during the period between 1500 and 1100 BC to see if other changes correlate with the transformations observed in the settlement patterns. We seek to answer the question what kind of social, economic and political processes might be behind the observed large-scale transformations in Bronze Age society in eastern Hungary.

502. THE ORGANISATION OF DOMESTIC AND NON-DOMESTIC SPACE: THE TISZA SITE GROUP (1600-1200 BC) IN THE SOUTH PANNONIAN PLAIN

Contribution format: Oral  
Contribution authors: Dragan Jovanovic (City museum Vršac) – Caroline Bruyere – Barry Molloy (University College Dublin)

The Tisza Site Group and associated settlements form a cluster of 120+ settlements that share an exceptionally similar canon of spatial organisation in the south Pannonian Plain (1600/1550-1200 BC). Established in an area with much fewer known habitation sites during the preceding Middle Bronze Age, this system flourished for as much as four centuries as settlements arose to form a dense and closely linked network. The settlements have very large dimensions, ranging from a few hectares up to 200 hectares, with a large number falling into the range of 40-90 hectares. An important feature of these settlements from an archaeological perspective is that their extent and layout can be defined, in many cases with excellent resolution, using remote sensing. Comparing these aerial images with geophysical survey data and intensive pedestrian survey data, it has been possible to demonstrate that what we see from the air is highly reflective of the archaeology on the ground. On this basis, we have been able to define a tripartite division of space. The outer boundary of the site encloses an unbuilt space that in turn surrounds an inner space, sometimes enclosed, that contains multiple domestic spaces, and each of these domestic spaces in turn appears to have been home to multiple foci of domestic activity. This paper will explore how the organisation of space within these settlements is an allegory for the wider organisation of the society that built them. In turn, we argue that the sharing of the same organisational logic at over 120 settlements is indicative of a form of hitherto undiscussed social complexity in the Late Bronze Age Pannonian Plain. We introduce the term agro-agglomerate to define the ideology shaping the society behind the Tisza Site Group and argue this

represents an important form of complexity fully distinct from urban frameworks.

478. FROM THE MIDDLE BRONZE AGE TO THE LATE BRONZE AGE IN THE EASTERN HUNGARIAN PLAIN: CRISIS OR CONTINUITY?

**Contribution format:** Oral  
**Contribution authors:** Alexandra Gavan (Institut für Ur- und Frühgeschichte Universität zu Köln) – Marian Lie (Institute of Archaeology Iași, Romanian Academy) – Tobias Kienlin (Institut für Ur- und Frühgeschichte Universität zu Köln)

The transition from the Middle to the Late Bronze Age in the Great Hungarian Plain is marked by the end of tell settlements in the region. Although this phenomenon was previously perceived as a short-lived horizon linked to a historical event – namely the supposed invasion of the Tumulus Culture into the Carpathian Basin, it is now recognised that we are dealing with a long-term process in which individual tells were occupied and abandoned at different times. Not much is known about the settlement system characteristic of the first phase of the Late Bronze Age in the eastern part of the Great Hungarian Plain, while absolute dates associated with this horizon are very few. In this presentation we will discuss the available radiocarbon dates for the transition from the Middle to the Late Bronze Age in the eastern part of the Hungarian Plain and review the archaeological evidence from this period, with a focus on settlement sites. Special attention will be paid to the multi-component site of Toboliu in western Romania, where recent investigations have revealed a continuity of occupation from the Middle to the Late Bronze Age.

1050. EXCHANGE AND ENTANGLEMENT: INTERACTIONS BETWEEN THE TERRITORY OF BOHEMIA AND WESTERN HUNGARY IN THE EARLY 2ND MILLENIUM BC

**Contribution format:** Oral  
**Contribution authors:** Eszter Melis (Institute of Archaeology HUN-REN Research Centre for the Humanities) – Daniel Hlášek (Archeologický ústav AV ČR, Praha | Jihočeské muzeum, České Budějovice) – Kosová Michaela (Archeologický ústav AV ČR, Praha) – Nóra Szabó (Institute of Archaeology HUN-REN Research Centre for the Humanities) – Michal Ernée (Archeologický ústav AV ČR, Praha) – Attila Kreiter (Hungarian National Museum Public Collection Centre, National Institute of Archaeology) – Viktória Kiss (Institute of Archaeology HUN-REN Research Centre for the Humanities)

There is now no doubt that bronze metallurgy led to the mobility of people, and the spread of economic structures and social practices in the 2nd millennium BC in Europe. While scientific methods of the so-called “third science revolution” have advanced our understanding of these processes, the investigation of material culture remains central to studying connectivity from an archaeological perspective. Within this framework, our research examines the relationship between the territory of Western Hungary and Bohemia between 2000 and 1500 BC. During this period, Bohemia was largely associated with the Únětice complex, while Transdanubian Encrusted Pottery dominated material culture in Western Hungary. Despite these cultural differences, both regions—linked by the Danube drainage system—relied on major copper sources from the Hron/Garam Valley (Slovakia) and the Alps (modern Austria and northern Italy), as well as on the assumed exploitation of tin deposits in the Czech-Saxon Ore Mountains, which were essential for bronze alloying. Our study focuses on the presence of foreign pottery and metal types, with particular attention to their analogies and degrees of similarity among the finds from these two regions. By analysing these artefacts within their most accurate contexts and dating, we aim to outline the spatial and temporal distribution patterns of foreign objects. This approach helps identify potential hubs of interaction and reveal the dynamics, main directions, and changes in interregional connections. Beyond exploring long-distance contacts in Central Europe during the 2nd millennium BC, our analysis contributes to understanding the social transformations that occurred between 1700 and 1500 BC within the Únětice complex and at its southern frontiers.

977. INVESTIGATION OF THE MBA-LBA TRANSITION THROUGH CERAMIC TECHNOLOGY AT THE BORSOD-PLAIN REGION (NORTHEASTERN HUNGARY)

**Contribution format:** Oral  
**Contribution authors:** Ákos Mengyán (Hungarian National Museum, Archeometry Laboratory | University of Miskolc, Institute of Exploration Geosciences) – Klára P. Fischl (HUN-REN Research Centre for the Humanities, Institute of Archaeology) – Ferenc Kristály (University of Miskolc, Institute of Exploration Geosciences)

The chaîne opératoire approach of pottery can allow us to investigate the variability of techniques used to produce a vessel, and to evaluate the technological choices and traditions in pottery production. The comparison

of technological choices in time and space permits to identify the continuity or change in pottery making traditions within and between communities. Therefore, this approach can be effective to investigate the connections between societies or cultural groups. In the Carpathian Basin, the Middle to Late Bronze Age transition had several interpretations in the last decades, including but not limited to climate change and migration. Our aim is to investigate this MBA-LBA transition in Northeastern Hungary, through the ceramic technology of the key cultural groups of the Borsod-Plain region. These are the Middle Bronze Age Füzesabony and Late Hatvan (ca. 2000/1900–1600/1550 BC), and the Late Bronze Age Tumulus and Piliny cultures and pre-Gáva style pottery (ca. 1600/1550–1100 BC). In order to evaluate this topic, we analysed three Middle Bronze Age sites, Bogács-Pázsagpuszta a Late Hatvan/Füzesabony tell-like settlement, Novaj-Földvár a Füzesabony tell settlement and Vatta-Telek-oldal-dűlő a Füzesabony/Late Hatvan cemetery and three Late Bronze Age sites, Maklár-Nagyrét, -Nagyrét II. and -Kospérium, involving Tumulus culture cemeteries, and settlements with Piliny and Pre-Gáva pottery. In this presentation, we analyse the raw materials and tempering, using thin section petrography and polarizing microscopy, and compare them to detect continuity or differences between the MBA and LBA ceramic technologies. The application of this method can help us to better understand the social dynamics of this period.

2400. THE EVOLUTION OF SETTLEMENT PATTERNS: MIDDLE AND LATE BRONZE AGES IN SOUTHERN CARPATHIAN BASIN

**Contribution format:** Oral  
**Contribution authors:** Hrvoje Kalafatic (Institute of Archaeology Zagreb) – Rajna Šošić-Klindžić (Faculty of Humanities and Social Sciences, University of Zagreb) – Bartul Šiljeg (Institute of Archaeology Zagreb)

The Middle and Late Bronze Ages in Southeastern Europe, particularly in the Danube and Balkan regions, marked significant social and cultural shifts, with settlement patterns evolving in response to resource availability and strategic locations. The Late Bronze Age saw the emergence of foundational settlement dynamics, with new settlements often established near fertile lands and key communication routes, providing optimal locations for agriculture and trade. Archaeological surveys and excavations, particularly in the Sava and Drava River Basins, have uncovered a wealth of new settlement sites, offering insights into broader patterns of human occupation. During the Late Bronze Age, the Barice-Gređani group expanded their territory, leaving behind well-documented archaeological records, including settlements and cemeteries. In Eastern Croatia, the Belegiš/Cručeni cultural group interacted with the Barice-Gređani group, marking the western boundary of Belegiš expansion and highlighting the dynamic exchange between these cultures. However, this period also marked the end of many settlements, with abandonment possibly tied to environmental changes or social transformations. Recent archaeological research and extensive rescue excavations have provided a clearer picture of settlement dynamics, revealing both the resilience and eventual decline of communities. These insights allow for a more comprehensive understanding of settlement development and abandonment during both the Middle and Late Bronze Ages in this region.

1233. TISZAFÜRED: A UNIQUE MICROREGION FOR UNDERSTANDING THE TRANSFORMATIONS OF THE 2ND MILLENNIUM BCE

**Contribution format:** Oral  
**Contribution authors:** Klara Pusztaine Fischl (HUN-REN Research Centre for the Humanities Institute of Archaeology) – Kristóf Fülöp – László Gucsi (HUN-REN Research Centre for the Humanities Institut of Archaeology) – János Dani (University of Szeged Institute of History Department of Archeology) – Tamás Hajdu (Eötvös Lóránd University Institute of Biology Department of Biological Antropology)

The transformations in the Carpathian Basin during the mid-2nd millennium BCE can be examined on multiple levels. One of the most striking is the changing of settlement patterns, which is characterized, among others, by the abandonment of long-lived tell settlements. At the same time, changes can be observed in the material culture, burial customs, and, based on the latest data, diets as well. All these factors led to the emergence of a new socio-cultural entity known as the Tumulus Culture. These changes – marked in Hungarian research as the transition between the Middle and Late Bronze Age – can be analysed at different levels. However, there are only a few archaeological sites where the full range of these transformations can be studied. One such area is the Tiszafüred microregion. The tell settlement of Ásotthalom, located next to the former Tisza riverbed, along with its surrounding cemeteries, provides an exceptional basis for a better understanding of the changes of the period. Among these cemeteries, Majoroshalom stands out. In this cemetery, adjacent to the outer settlement of the Ásotthalom tell site, more than 600 Füzesabony culture and 365 Tumulus culture burials were discovered between 1961 and 1972 by Zsolt Csalog and Tibor Kovács. In this presentation, we introduce our research project “Changes in Life and Death: Bronze Age Communities in Tiszafüred,” which started in 2024. Besides presenting the first results, we integrate more than 150 years of research on the Tiszafüred microregion into the complex issue of social transformations in the 2nd millennium BCE.

92. MAKLÁR – A MICROREGIONAL PERSPECTIVE ON THE MBA / LBA TRANSITION IN NORTHEASTERN HUNGARY

**Contribution format:** Oral  
**Contribution authors:** Tobias Kienlin (Department of Prehistoric Archaeology, University of Cologne) – Ákos Mengyán (Hungarian National Museum, Budapest | University of Miskolc, Institute of Exploration Geosciences) – Klára Fischl (HUN-REN Research Centre for the Humanities, Institute of Archaeology)

The end of MBA tell settlement in the Carpathian Basin has long fascinated archaeological research, with explanations ranging from traditional historicising narratives, the Tumulus invasion, to climate change, more or less globally conceived. With the current rise of interest in subsequent LBA ‘mega-sites’ we tend to perceive two apparently distinct pathways to social complexity: From tell-living with its characteristic emphasis on ancestry, but also widely associated with the rise of BA elites, to the much larger LBA fortified sites, run by a ruling class in control of distinct political territories, drawing on international trade routes – and sometimes falling victim to endemic Bronze Age warfare. This juxtaposition of EBA/MBA and LBA social formations, with their distinct settlement patterns and organisation of social space, is somewhat essentialising. It must neither conceal variability on either side of the assumed divide, nor often our fundamental lack of data in trying to understand how social life unfolded on either side. On a very basic level this also concerns our chronologies, for the abandonment of tells is a horizon rather than a distinct event, and in each microregion we may face differences in the chronological relationship between tells and post-tell LBA phenomena, be they graves or settlements – from overlap to clear distance between them. In this paper, we therefore turn to a specific microregion, the municipality of Maklár in northeastern Hungary, combining the evidence from two recent radiocarbon dating projects focusing on the MBA tell of Baglyashalom, and the LBA cemeteries and settlements of Koszépérium, Nagyrét I and II, in order to contribute to a better understanding of the end of ‘tell-living’ and its relation to subsequent LBA ways of life and death in this region.

2107. UNRAVELING CHRONOLOGY: A MULTIVARIATE STATISTICAL APPROACH TO LATE BRONZE AGE POTTERY FROM ŞAGU (ARAD COUNTY), ROMANIA

**Contribution format:** Oral  
**Contribution authors:** Sofia Bertea (Babes-Bolyai University)

The settlement at Şagu-Site A1\_1, Arad County, excavated in 2010 because of upcoming Timișoara-Nădlac highway constructions, revealed 306 Late Bronze Age features framing between 16th and 13th century BC, based on the existing 14C data. This period is one full of changes that are not obvious only through settlement and funerary choices, but also ceramic style. This study explores the internal chronology of the settlement through a comparative approach integrating multivariate statistical analysis of pottery’s morphological aspects and radiocarbon dating. Correspondence analysis and seriation were applied to ceramic assemblages to identify patterns of change in ceramic fashion, that can be observed over time, and then integrated in the absolute chronology of the site. The correlation between these datasets contributes to refining the site’s chronology and offers a broader perspective on Late Bronze Age ceramic production and use in the region. These preliminary findings underline the potential of integrating statistical and absolute dating methods in archaeological research, enhancing our understanding of settlement dynamics and material culture development.

521. GENOMIC STABILITY AND TRANSFORMATIONS IN PREHISTORIC TRANSYLVANIA

**Contribution format:** Oral  
**Contribution authors:** Adam Rohrlach (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) – Mikkel Nørtoft (Section for Prehistoric Archaeology, Saxo Institute, University of Copenhagen) – Sandra Penske (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) – Ainash Childebayeva (Department of Anthropology, University of Texas at Austin | Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) – Alissa Mittnik – Johannes Krause (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) – Philipp Stockhammer (Ludwig Maximilian University Munich | Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) – Wolfgang Haak (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)

Since prehistory, Transylvania has long been a landscape characterised by rich natural resources, fertile farming land and relative protection from the surrounding Carpathian and Apuseni Mountains. However, the genetic history of the people that have inhabited Transylvania is poorly understood, with the archaeological record

previously represented by only a few individuals. Conversely, the history of the regions in southeastern Europe surrounding Transylvania are well studied, and attest to dramatic genetic turnovers accompanying the change from a hunter-gatherer to a sedentary agricultural lifestyle, followed by the arrival of steppe-related ancestry with the expansion of pastoralist societies from the steppe zone east of the Carpathian Mountains. In this study we report archaeogenetic results from individuals from Transylvania and the surrounding regions in Romania, from a period spanning the Neolithic to the Late Bronze Age. We report a surprising level of genetic continuity within Transylvania, with little evidence for an influx of steppe-related ancestry into individuals associated with the main cultural groups until the Middle to Late Bronze Age. We also find evidence for Yamnaya and Yamnaya-related groups dating to the Early Bronze Age who, however, appear to have left only subtle genetic footprints in the region. In stark contrast, steppe-related ancestry is only widely introduced with the Late Bronze Age Noua groups. In summary, we find that while Transylvania was at times a melting pot of genetic profiles, the region still maintained an ongoing thread of a continuous genetic legacy during the Copper Age and for much of the Bronze Age.

2308. THE INHABITANTS OF EUROPE’S MEGAFORTS IN CONTEXT: NEW POPULATION GENETIC RESEARCH IN THE SOUTHERN PANNONIAN PLAIN

**Contribution format:** Oral  
**Contribution authors:** Miren Iraeta Orbegozo (University of Lausanne) – Anna-Kjær Knudsen (Globe Institute, University of Copenhagen, Copenhagen, Denmark) – Linda Fibiger (School of History, Classics & Archaeology, University of Edinburgh) – Dorothea Mylopotamitaki (CIRB, Collège de France, Université PSL) – Barry Molloy (School of Archaeology, University College Dublin) – Hannes Schroeder (Globe Institute, University of Copenhagen, Copenhagen, Denmark)

The rise of a new settlement network in the 15th century BCE in the southern Carpathian Basin termed the lower Pannonian network represented a dramatic change in the social dynamics of the region, with population expansion driving the establishment of numerous settlements in previously underpopulated areas. This network included several megaforts - sites of unprecedented scale and complexity. It remains unclear whether this massive growth in settlement numbers and scale was driven by internal demographic changes, such as shifts in family structures and mortality rates, or by external immigration. Cremation was the dominant burial rite, though inhumation burial is also known in cemeteries associated with these fortified sites and at other cemeteries in their hinterlands associated with different ceramic traditions. This provides a limited, but important, corpus of material suited to genetic analysis. The lower Pannonian network emerged following the collapse of the preceding socio-political model of the Middle Bronze Age ca. 1550 BC, centred around tells and tell-like mounds. After its collapse ca. 1200 BC, there was a period of low-density occupation in this same area, until the emergence of a new horizon of smaller enclosed sites between 1000 and 900 BC. To contextualise the rise and fall of this network, we have gathered genetic data from these three horizons and from neighbouring areas, which are co-analysed with published data. We discuss newly generated genomic data from 80 individuals from 22 archaeological sites in the Pannonian Plain and Dinaric Alps. Preliminary results are used to characterise population continuity and diversity, kinship structures, and shifts in societal organization across key transitions, including the collapse of Middle Bronze Age tell-centred networks, the rise and fall of the megafort horizon, and the transition into the Early Iron Age.

1721. MOBILITY WITHIN LATE BRONZE AGE COMMUNITIES OF THE SOUTHERN PANNONIAN PLAIN: STRONTIUM ISOTOPE PERSPECTIVES

**Contribution format:** Oral  
**Contribution authors:** Jason Laffoon (Leiden University) – Barr. Molloy (University College Dublin) – Cheryl Makarewicz (Ancient Stable Isotope Laboratory, University of Kiel) – Petrus Le Roux (University of Cape Town) – Linda Fibiger (University of Edinburgh)

During the 16th century BC, a new settlement network developed in the southern Pannonian Plain that has been termed the Tisza Site Group (TSG). This occupied a landscape that had seen low-density habitation during the preceding centuries of the Middle Bronze Age, when tell-centred communities across the plain hand thrived. A remarkable feature of the TSG settlements it that they shared highly similar organisational features, indicating they followed a common template for how habitation and landscape use intersected. In turn, these new settlements were very densely located within the landscape, with few lying greater than 5km from their nearest neighbour. There are hierarchical divisions of size that correlate with complexity and density of activity within, indicating that not all settlements were created equally and that they served different roles in this network. It has been argued that the network in turn operated as anchor points in a system that exploited the wider landscape extensively, potentially segueing to pockets of more intensive use in and around settlements. We envisage them as having been translocal – that is, individual settlements did not constitute bounded social entities in themselves, such that people moved between settlements. Such movement may have ranged from seasonal transhumance

to marriage to fostering. Mobility, in such a model, would have been a characteristic feature of communities. Contemporary to the emergence of the TSG, numerous cremation cemeteries were established. To the west of the TSG other social configurations are hinted at by differences in pottery and mortuary conventions. Samples of bone from cremation and inhumation burials were analysed for strontium isotope ratios. A baseline of modern plant samples were also analysed for context. This paper explores the evidence for mobility as revealed through strontium isotope ratios and evaluates how this helps us better understand conventions of TSG and surrounding communities.

**872. STABLE ISOTOPE ANALYSIS FROM CEREAL AND ANIMAL BONES SIGNAL AGRICULTURAL CHANGES ON THE GREAT HUNGARIAN PLAIN DURING THE BRONZE AGE**

**Contribution format:** Oral  
**Contribution authors:** Paul R. Duffy (Kiel University) – Kelly Reed (Oxford Brookes University) – László Bartosiewicz (Stockholm University) – Györgyi Parditka (University of Michigan) – Pál Raczky (Eötvös Loránd University) – Cheryl Makarewicz (Kiel University)

Archaeologists often identify changes in agricultural production, particularly the advent of plough use, as a transformative development in village societies, marking the transition toward more unequal systems and the potential creation of artificial land scarcity. In Eastern Europe, the Middle Bronze Age of the Great Hungarian Plain is frequently cited as a pivotal period when hierarchical systems began to emerge. This raises the question: how did these groups organize agricultural production? Did they follow the labour-intensive strategies of their Neolithic predecessors, or did they adopt the extensification and plough-based methods seen in the Bronze Age Mediterranean and Near East? This paper compares stable isotopic data from cereals grown at a Late Neolithic tell site, predating the introduction of plough agriculture, with cereals from two Middle Bronze Age sites within the Körös region of eastern Hungary. We analyze an extensive inter-household archaeobotanical dataset from the Late Neolithic site of Berettyóújfalu-Herpály and compare it with cereal data from the Middle Bronze Age tell site of Vésztő-Mágor and the nearby farmstead of Tarhos-Gyepesi-Átkelő. Our analysis focuses on the growing conditions of cereals from these three sites and incorporates stable isotope data from animal bones at the Bronze Age sites to examine differences in household herding economies. This approach provides insights into the social organization of these communities and the potential impact of agricultural practices on their trajectories.

**687. NEW ARCHAEOGENETIC INSIGHTS INTO THE ALBANIAN BRONZE AND IRON AGE**

**Contribution format:** Oral  
**Contribution authors:** Xiaowen Jia (Ludwig Maximilian University Munich | Max Planck Institute for Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM)) – Eirini Skourtanioti (Max Planck Institute for Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM)) – Daniela Heilmann (Ludwig Maximilian University Munich | German Archaeological Institute) – Lorenc Bejko – Maria Amore – Skender Aliu – Iris Pojani (University of Tirana) – Johannes Krause (Max Planck Institute for Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM)) – Philipp Stockhammer (Ludwig Maximilian University Munich | Max Planck Institute for Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM)) – Harald Ringbauer (Max Planck Institute for Evolutionary Anthropology | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM))

Situated at the interface of the Aegean and the Adriatic in southeastern Albania, the Kamenice Tumulus functioned predominantly as an inhumation burial site from 1700 to 500 BCE. This stands in contrast to the prevailing cremation rituals observed in Central Europe during the same period, which have typically impeded insights into archaeogenetic progressions. In this work, we generated genome-wide SNP data for 230 individuals buried in Kamenice over its complete historical span, alongside 19 Iron Age individuals from North Macedonia and 2 Late Bronze Age individuals from southwestern Bulgaria. Our comprehensive dataset provides the unique and first possibility for insights into, on the one hand, genetic continuities and changes of Late Bronze Age and Iron Age Albania; on the other hand, the function and meaning of tumuli in prehistoric Europe. Different societal transformations identified in the wider region are associated with a genetically stable and genealogically continuous population at Kamenice. Our results indicate that the local population maintained a distinct genetic profile while participating in a regional kinship network extending over 300 kilometers, as demonstrated through identified biological relatedness up to the 10th degree. Moreover, for the first time, we found evidence linking a partial turnover of male lineages around 750 BCE in a patrilineal society to a substantial shift in the structure and material

symbols of the tumulus.

**108 ADAPTATIONS AND RESPONSES TO CLIMATE CHANGE ON ISLANDS AND IN COASTAL AREAS AROUND THE MEDITERRANEAN**

**Session theme:** 7. Climate Change in the Past and Present  
**Session format:** Session with keynote presentation  
**Session keywords:** Islands , Mediterranean , climate , migration , water , anthropogenic- hazards  
**Session organisers:** Erica Angliker (Unicamp) – Tais Pagoto Bélo (University of São Paulo)

**SESSION ABSTRACT**

As environmental concerns become increasingly urgent, archaeologists are looking at how ancient societies perceived and interacted with the natural world and the impact of the environment on these societies. In this context, islands and coastal areas, where the interactions between the environment and communities are especially dynamic, are of particular interest. Given their geographical position, these areas tend to be more exposed than those inland to both natural and anthropogenic hazards. Thus, the effects of demographic overgrowth, variations in water level and supplies, the accumulation of debris, and the introduction of new animal and plant species are strongly felt in coastal and island environments. To address these issues, the proposed section will examine changes in island and coastal ecosystems and the responses of ancient communities in the Mediterranean region from the Bronze Age to Late Antiquity. The papers will address questions relating to ancient responses to environmental issues as well as modern archaeological perceptions of climate change and strategies for dealing with it, in particular.

- How did ancient people respond to changes in climate? What actions did they take to attenuate the impact of these changes, and how effective were they.
- How did ancient island and coastal communities manage their water supplies and other natural resources?
- Did climate change force ancient populations to migrate.
- How can climate change in antiquity be observed and assessed.
- How do archaeologists preserve and record archaeological data and materials related to ancient environments so that they remain unaffected by climate change and available to future generations?
- How can ancient practices rooted in Indigenous traditional ecological knowledge inform the responses to climatic changes and solutions for managing the threats that these changes pose today?

**CONTRIBUTION ABSTRACTS**

**877. ISLANDS, CLIMATE CHANGE & RESILIENCE**

**Contribution format:** Oral  
**Contribution authors:** Rebecca Sweetman (British School at Athens | University of St Andrews)

It has long been recognised that islands are particularly at risk to climate change; some islands are even taking the difficult decisions to prepare for permanent evacuation including making relocation agreements (Tuvalu and Kiribati). Although often treated as a microcosm for understanding the broader ramifications of climate change, the focus has primarily been on modern issues and challenges while investing in climate resilience through land management, community awareness and building food security. All of these methods of dealing with climate change are visible from an island perspective in the past through the complex and changing relationships islands had internally and externally, evidenced through changing settlement patterns, economy, mobility and networks. The aim here is to show how a diachronic analysis of the archaeology of Mediterranean island spaces can highlight the lived experience of island life as resilient and dynamic thus contributing to a wider understanding of the impact of climate change in contemporary society.

**892. MARGINALIZED COMMUNITIES IN COASTAL MICRO-ENVIRONMENTS OF LATE PREHISTORIC ITALY: PROBLEMS AND PERSPECTIVES**

**Contribution format:** Oral  
**Contribution authors:** Rafael Scopacasa (University of São Paulo) – Elisa Perego (University College London)

The late second and first millennia BC were periods of unprecedented shifts in human-environment interactions in the Italian peninsula, an area characterized by extended coastal and insular environments. Urbanization, increasing social complexity and Rome’s expansion were enmeshed with socio-environmental transformations, including agro-pastoral expansion, deforestation, as well as changing diets and pathological profiles of populations. Coastal, riverine and lagoon environments were affected by such variations. In archaeology, the focus has

usually been on the élites who supposedly drove these developments from socioeconomic powerhouses, such as the cities of central Tyrrhenian Italy. This has sidelined marginalized groups inhabiting agriculturally peripheral and/or ecologically fragile micro-environments. We discuss theoretical and methodological frameworks for exploring the agency of potentially marginalized communities in the face of climatic and environmental instability in late prehistoric and early Roman Italy. We focus on coastal, riverine and lagoon environments with intricate hydrological balances and fine margins of climatic stability, such as the flood-prone plains around the Po delta in the northeast, and drought-sensitive karst plateaus in Puglia in the south. We, therefore, explore how a microscale approach to archaeological and environmental data can afford a higher-resolution picture of marginalized experiences of climatic and environmental stress in the deep past, while increasing our understanding of the socioecological dimension of inequality in antiquity.

1866. GO WITH THE FLOW. THE ROLE OF WATER IN THE NURAGIC LANDSCAPE OF LBA-EIA SARDINIA

**Contribution format:** Oral  
**Contribution authors:** Yvonne Schmied (Institute of Archaeological Studies – Ruhr-University Bochum)

The challenges posed by contemporary climate change suggest that even in prehistoric times, environmental changes were of extraordinary importance to societies and influenced their interaction with the surrounding landscape. The role of water on a Mediterranean island, such as Sardinia, with its so-called ‘water temples’ of the Late Bronze Age and Early Iron Age, offers the potential for a deeper understanding of past societies. The emergence of these buildings – whether as individual constructions such as pozzi sacri or as sanctuaries comprising multiple structures – goes hand in hand with other architectural forms, including complex nuraghi, megara, rotundas and meeting huts, which are interpreted as indicators of social transformations. While research has traditionally emphasized a technological development, often drawing upon Eastern influences, the concept of a ‘water cult’ has emerged as a prominent interpretative framework. However, mounting evidence points to the influence of climatic shifts, increasing exchange processes and a rising population during this period. These had an impact on Nuragic society and influenced the way it dealt with water and the surrounding landscape. Nonetheless, these aspects have not yet been fully taken into account in the study of the ‘water temples’. Consequently, the present study – on the island of Sant’Antioco – proposes an integrated approach, combining a GIS- and prospection-based survey of Sardinia’s water resources with a landscape archaeological perspective. This comprehensive methodology focuses on the human-water relationship, particularly in relation to the Nuragic landscape, thereby seeking a more nuanced and holistic understanding of the socio-environmental dynamics of the region.

2263. THE CHALLENGES OF THE HERITAGE DESCRIPTOR IN ENVIRONMENTAL IMPACT STUDIES IN PORTUGAL

**Contribution format:** Oral  
**Contribution authors:** Vanessa Antunes (Centro de Geociências . Universidade Autónoma de Lisboa | Instituto Politécnico de Tomar | Património Cultural IP | ERA Arqueologia | Centro de Geociências)

Portugal has a rich history, influenced by various civilizations over the centuries. Its vast archaeological heritage reflects this cultural evolution. With its varied geography, the country favors the preservation of historical remains, but faces challenges in their protection and management. Despite not being bathed by the Mediterranean, Portugal is considered a Mediterranean country due to its climate and geographical proximity, which influences the culture and preservation of archaeological heritage. However, the management of this heritage faces challenges, especially in the identification and protection of remains. Environmental policy has been fundamental, promoting legislation to minimize impacts and improve preservation techniques. The implementation of specific legislation has boosted understanding of archaeological heritag. in Portugal. The processes of minimizing impacts make it possible to obtain valuable information about remains that, without this intervention, could remain hidden or be destroyed by construction. The archaeological heritage management model in Portugal has proved ineffective in the early identification of remains, which are often damaged during construction. Archaeologists point out flaws in Environmental Impact Assessments (EIA), which identify heritage impediments late, after projects have begun. Despite legislative advances and greater scientific rigor, gaps persist in the management of archaeological heritage. Obtaining data in the field is made difficult by dense vegetation, rugged terrain and limited access, compromising the prior identification of remains. Remote sensing, which has been used for years in Europe to collect data without direct contact with remains, is beginning to gain prominence in Portugal with official support. This technology has the potential to transform the management of archaeological heritage in EIAs. Remote sensing is an opportunity to overcome limitations in the identification of archaeological remains. Its integration into EIAs improves the preservation of cultural heritage. Combined with innovative practices and effective policies, it ensures a balance between development and protection, guaranteeing a sustainable legacy.

2356. SAFEGUARDING ARCHAEOLOGICAL COASTAL HERITAGE: REMOTE SENSING TECHNOLOGIES TO MINIMISE ENVIRONMENTAL AND HERITAGE IMPACTS

**Contribution format:** Poster  
**Contribution authors:** Vanessa Antunes (Centro de Geociências | Universidade Autónoma de Lisboa | Instituto Politécnico de Tomar | Património Cultural IP | ERA Arqueologia | Centro de Geociências)

The preservation of coastal archaeological heritage faces threats due to climate change, especially rising sea levels, coastal erosion and extreme weather events. Urban sprawl and tourism are intensifying the pressure. Against this backdrop, it is essential to adopt new protection strategies. Remote sensing has emerged as a fundamental tool, allowing sites to be mapped and monitore. without the need for invasive interventions. Although it is already widely used in various parts of the world, its application in Portugal is still minimal. Portugal has a long Atlantic coastline and is often considered Mediterranean due to its climat. and proximity to the Mediterranean Sea. Its largest cities lead to high population density, landscape changes, and resource pressure. Technologies such as LiDAR, aerial and satellite images make it possible to continuously monitor coastal dynamics and identify threats before they cause irreversible damage to heritage. The combination of these technologies is essential for heritage preservation, enabling detailed digital models, facilitating the analysis of the archaeological landscape and the recording of site. before they suffer impacts. As they are non-invasive methods, they reduce the risk of damage to sites and provide fast and accurate coverage of large areas, increasing efficiency in cultural heritage management. Methodological shortcomings in the early detection of archaeological remains, aggravated by the lack of multidisciplinary teams, result in identification errors and data loss. The complexity of the territory, combined with a lack of investment, makes it difficult to systematically implement these methodologies in the study and preservation of coastal archaeological heritage. However, the growing threat from climate change, coastal erosion, and human pressure makes adopting innovative strategies essential for anticipating risks and safeguarding heritage. Strengthening cooperation between research institutions, government bodies, and remote sensing specialists could represent a significant advance in protecting national archaeological sites.

109 VOICES OF THE PAST, HANDS OF THE PRESENT: COLLABORATIVE PATHWAYS IN ARCHAEOLOGY AND HERITAGE INTERPRETATION

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Regular session  
**Session keywords:** Community Engagement, Participatory Archaeology, Heritage Interpretation, Co-created Narratives, Sustainable Heritage Management  
**Session organisers:** Giuseppe Pace (National Research Council - Institute for Research on Innovation and Services for Development) – Szilvia Fábíán (Hungarian National Museum, National Institute of Archaeology) – Marko Mele (Universalmuseum Joanneum)

SESSION ABSTRACT

In recent years, archaeology and heritage interpretation have increasingly emphasized the role of community engagement in exploring and narrating the past. Drawing on insights from the Erasmus Plus project “EMpowering landscapes with Participatory Approaches to Heritage interpretation Skills (EMPATHS),” this session invites participants to reflect on how archaeological practice can become more inclusive, embracing diverse community perspectives. By actively involving local voices in archaeological and interpretative processes, we can co-create narratives that are more dynamic, representative, and impactful for broader audiences. This session aims to explore innovative methodologies and frameworks for participatory archaeology, focusing on case studies where community involvement has enriched both archaeological practice and heritage interpretation. Key topics include the creation of shared narratives, collaborative decision-making, and approaches to bridge gaps between academic researchers and community knowledge holders. Participants are also encouraged to discuss the complexities of balancing differing perspectives on heritage value, managing expectations, and addressing ethical considerations in collaborative work. Through examining community-led excavations, interpretive planning, and digital storytelling, this session will explore how engaging communities as active partners can support sustainable heritage management, foster local stewardship, and enrich archaeological narratives with lived community values. Contributions are invited from archaeologists, heritage professionals, community leaders, and scholars interested in promoting inclusive practices and redefining heritage interpretation as a tool for dialogue, cultural identity, and community empowerment. By gathering insights and experiences from diverse projects, this session seeks to inspire new directions in collaborative heritage work that honour the complexities of the past while empowering communities to shape their own stories.

2098. FROM ONE STORY TO MANY: ADVANCING PARTICIPATORY APPROACHES IN STRATEGIC HERITAGE INTERPRETATION PLANNING

**Contribution format:** Oral  
**Contribution authors:** Carmen Granito (The Story Behind | Durham University | Interpret Europe) – Caterina De Vivo (The Story Behind) – Giuseppe Pace (National Research Council - Institute for Research on Innovation and Services for Development)

Heritage policies increasingly advocate for community engagement and participatory approaches in heritage interpretation (HI), marking a paradigm shift. The traditional conservationist perspective—where meanings and values are seen as inherent in heritage assets and interpreted solely by experts—is giving way to a people-centred approach that respects the diverse meanings and values different communities assign to heritage. Ideally, HI should result from collaboration among heritage experts, communities, and other stakeholders. However, the sector lags behind in adopting such approaches, particularly in EU countries. While the design of front-end interpretive services (e.g. guided tours, interpretive panels, guidebooks) has been gradually embracing conversational and multi-perspective practices, strategic-level HI—such as interpretation strategies and master-plans—remain predominantly expert-driven. Participatory processes at this level are still rare due to the absence of an established work practice for strategic participatory HI and limited skills, methodologies, and awareness among heritage professionals to effectively facilitate community involvement and collaborative decision-making. The Erasmus+ project EMpowering landscapes with Participatory Approaches To Heritage interpretation Skills (EMPATHS) seeks to address these gaps by developing a specific methodology and training resources to support heritage professionals in participatory HI planning and decision-making. This talk will introduce the EMPATHS project and present findings from its research phase, which included: (a) a review of community participation & stakeholder engagement practices in participatory HI, (b) a collection of models and methods in participation, through expert interviews from both the heritage sector and other fields, and (c) a focus on three selected pilots’ participatory practices. By integrating these diverse perspectives, EMPATHS identifies key success factors and best practices for fostering participation in strategic HI planning. Key takeaways will include practical guidance for heritage practitioners on adopting participatory models at the HI planning stage, overcoming common challenges, and integrating local perspectives into strategic interpretation plans.

2480. TALK WITH THE LOCALS – WAYS OF POSITIONING ARCHAEOLOGICAL HERITAGE ON THE AGENDA OF LOCAL COMMUNITIES IN STYRIA (AUSTRIA)

**Contribution format:** Oral  
**Contribution authors:** Marko Mele (Universalmuseum Joanneum)

Prehistoric archaeological heritage in Middle Europe has a very high quality but is often barely recognized or unrecognized even by the local inhabitants as a potential for territorial, social and economic development, since it is not always visible in plain sight. The visibility creates different challenges. First and foremost is certainly the management and maintenance of the heritage, followed by recognisability with a clear USP (unique selling point), the adequate use of resources for touristic promotion of the locations, and the missing identification of the local inhabitants with the route. Especially smaller communities often face tough competition with larger, more established tourist destinations. Limited resources and visibility can make it difficult for local communities to compete for the attention of tourists in the broader tourism market. Developing and managing cultural tourism requires specific knowledge and skills. Local communities may lack expertise in areas such as marketing and heritage preservation. This lack of know-how can impede their efforts to create and sustain successful cultural tourism initiatives. How to empower local stakeholders for the successful management of archaeological heritage? How to raise awareness with local stakeholders for the value of their heritage? How to make the archaeological heritage more visible and what do the local stakeholders need to be capable to develop their heritage more easily? By start to talk with the locals. How to start a conversation will be the starting point of the paper, followed by different outcomes of such conversation build on experiences in Styria (Austria). We will also try to present possible solutions and tools for the support of the local communities on their way to make their heritage “great again”.

1739. BUILDING SHARED NARRATIVES AND NEGOTIATING FOR SUSTAINABILITY: THE HELLENIST NECROPOLIS OF NAPLES

**Contribution format:** Oral  
**Contribution authors:** Giuseppe Pace – Gabriella Esposito – Luisa Fatigati (National Research Council - Institute for Research on Innovation and Services for Development)

Heritage interpretation (HI) is undergoing a paradigm shift from a traditional conservationist approach, where meanings and values are defined by experts, to a more inclusive, people-centred model. This shift recognises that

heritage significance is dynamic, shaped by diverse community perspectives and highlights the role of heritage interpreters as facilitators of dialogue, ensuring that multiple values and narratives contribute to a comprehensive strategy. The Hellenistic Necropolis of Naples, located in the Borgo dei Vergini, part of the Sanità district, exemplifies the challenges and opportunities of participatory HI. Despite its archaeological significance, the site remains fragmented, with different organisations managing separate sections without a cohesive governance model. This lack of coordination has hindered its integration into broader heritage policies and urban planning frameworks, limiting its visibility and sustainability. To address these issues, a participatory HI approach is essential. Drawing from Strategic Transition Practice (STP), a framework developed by the COST action Underground4value, which integrates cultural, social, and ecological dimensions into heritage management, this presentation explores how community-led engagement, storytelling, and interpretive planning must be a primary step for making archaeology sustainable. Based on the involvement of local stakeholders, intermediary institutions, and policymakers, STP can help negotiate shared narratives, define convergent visions, and facilitate inclusive planning and decision-making. The case of the Hellenistic Necropolis is only at the beginning but already underscores the need for a unified vision and a motivated public or research institution to act as a promoter and facilitator. By activating a dialogue and stimulating collaborative learning among heritage professionals, local communities, and governing bodies, planners can bridge fragmentation, ensuring the site’s preservation while enhancing its cultural and social relevance, and making participatory heritage a driver for democracy, social cohesion, and sustainable development, as well as positioning archaeological practice at the forefront of inclusive and resilient heritage management.

2176. THE METHODOLOGY OF MOLEHILL SURVEYS: AN INNOVATIVE APPROACH TO DATA COLLECTION AND COMMUNITY ENGAGEMENT

**Contribution format:** Oral  
**Contribution authors:** Frances Breen (Epiacum Heritage CIO | Solent Southampton University)

Epiacum Roman Fort is situated in a remote part of northern England. With it’s unique shape and proximity to Hadrian’s Wall, it has long provoked interest from the general public and archaeologists alike. A Scheduled Ancient Monument, Epiacum remains almost entirely unexcavated. The site tantalisingly hints at its story, but the absence of focused fieldwork, and especially excavation, means necessary detail is missing. However, by utilising the skills of an unusual visitor, we have been able to learn from this unique site: presenting, the humble mole. This presentation discusses the results of the hitherto unpublished Epiacum Molehill Project. Established in 2011, it made a virtue of the one resource abundant across this landscape- moles and their distinctive hills of upcast soil, many of which could be seen to contain artefacts. While not unheard of, this methodology is yet to be widely explored using a consistent framework and over continuous fieldwork seasons - as it has been at Epiacum. Five field seasons of molehill collection were conducted between 2011-2015 by community volunteers and local archaeological groups. The project was carried out again in 2023. By actively involving the local community and volunteers, Epiacum Heritage was able to co-produce a sustainable, innovative project that introduced new audiences to both archaeology and their own heritage. Providing an explanation of molehill collection methodology, I will explore the results of all six field seasons. This presentation will discuss the usefulness of molehill collection to evaluate archaeological sites, arguing that the technique offers considerable opportunity, especially for community-based projects with a high number of untrained volunteers. By embracing an inclusive approach to data collection and engaging with archaeologists and community members and volunteers, the history of Epiacum can be explored more fully and can provide a useful methodological framework for other projects.

785. HANDS ON CLAY: BRIDGING THE GAP BETWEEN CRAFTSWOMEN KNOWLEDGE AND ARCHAEOLOGICAL RESEARCH IN IRON AGE IBERIA

**Contribution format:** Oral  
**Contribution authors:** Jaime Vives-Ferrandiz Sanchez (Museu de Prehistòria de València) – Mireia López-Bertran (Universitat de València) – Patricia Varea-Milan (Independent scholar and artist)

We shall offer a methodological proposal to the study of Iron Age Iberian clay figurines based on the engagement of local potters. Clay figurines of the Iberian Iron Age (roughly 6th-1st centuries BC) are a relevant source of information for dealing with social aspects of the communities that created them. As in many other Mediterranean contexts, these objects have been studied from an iconographic and contextual perspective, but little emphasis has been on manufacturing techniques. The project TERRACOT has outlined a methodology for the study of these techniques that seriously considers the knowledge of local craftswomen to identify steps of the chaîne opératoire. After exhaustive documentation that includes drawing and high-resolution digital documentation techniques -such as 3D scanning and Reflectance Transformation Imaging (RTI) and X ray-, technical gestures based on operational chains and technological knowledge are identified by both archaeologists and the potter. The reproduction of a selection of figurines following the documented technical sequences is key to this methodology to test the hypotheses of manufacturing techniques based on the evidence observed. As a corollary, reproductions

provide us with teaching material for the dissemination of the results of the project and for heritage interpretation in local museums and sites. This project not only deals with a growing interest in craft practices in the past but also in the present, including the people involved in their creation. By embracing a methodology that entails collaborative decision-making with local potters as knowledge holders, the objective is not only to gain a better understanding of the social practices of the communities that produced and used clay figurines in the past, but also to build research alliances between academics and craftspeople. TERRACOT (PID2023-150349NBI00) is funded by the Spanish Ministry of Science, Innovation, and Universities.

1804. FROM THE BOTTOM-UP: A SMALL-SCALE COMMUNITY ARCHAEOLOGY PROJECT IN NE HUNGARY

**Contribution format:** Oral  
**Contribution authors:** Borbála Nyíri – Vera Majerik (Institute of Archaeology, Hungarian National Museum and Public Collection Centre)

In 2024, a small-scale community archaeology project was launched by the National Institute of Archaeology, under the auspices of the Hungarian National Museum and Public Collection Centre. The case study area is located in the Zemplén region, NE Hungary which has long been famous for its viniculture, while today it faces numerous socio-economic challenges typical of many rural communities. The aim of the project is, with the active participation of the local community - to identify, (re)assess and protect archaeological sites currently under threat by intensive cultivation, as well as the conservation of heritage monuments. The programme’s approach is developed from the bottom-up, primarily to pique the interest of children, and – by engaging the younger generations – it intends to draw in adult audiences too. Within this framework, the project is to create a platform for a dialogue between different segments of a fragmented local community, to foster local stewardship of archaeological sites and to encourage the active involvement of locals in developing a diverse historical narrative of their closer homeland. The paper will discuss the range of activities designed to achieve this by employing the methodologies of public archaeology while it considers the dissemination of local voices and the different channels it can sustainably utilise.

1900. INTERPRETING CULTURAL LANDSCAPES: GEOLOGY, URBAN REGENERATION, AND COMMUNITY ENGAGEMENT

**Contribution format:** Oral  
**Contribution authors:** Erlisiana Anzalone (National Research Council - IRISS)

Heritage interpretation is a powerful tool for strengthening local identity and fostering active community engagement. However, the role of geological landscapes in shaping cultural heritage narratives remains underexplored. Geological formations not only preserve the Earth’s history but have also historically influenced settlement patterns, urban morphologies, construction materials, and resource management strategies. Understanding and communicating these geological foundations can empower local communities, enhancing their connection to the land and fostering a sense of ownership over their cultural landscapes. This presentation explores how volcanic and travertine landscapes have shaped human interactions with the environment, guiding the development of urban centres, cultural practices, and architectural traditions. Case studies on the Campi Flegrei volcanic ecosystem and the travertine-rich areas of Todi, Spoleto, and Paestum illustrate how geological features have defined the physical character of these regions and contributed to their socio-economic development. By integrating geosciences and human sciences, this paper proposes community engagement strategies - such as participatory mapping, heritage walks, and co-created storytelling – for actively involving local communities in the interpretation of their geological and cultural pas and transform geological knowledge into a catalyst for place-making, fostering resilience, identity, and sustainable development. This approach underscores the potential of geology as a narrative and educational tool, bridging past and present while promoting community-led conservation efforts. Recognising and communicating the geological dimension of heritage can lead to community awareness and open to new participatory approach, balancing scientific knowledge with local perspectives, and finally ensuring more inclusive, dynamic, and locally relevant heritage experiences.

1338. WEAVING CUSTODIANSHIP THROUGH COMMUNITY ARCHEOLOGY AND CONSERVATION

**Contribution format:** Poster  
**Contribution authors:** Ana Pastor Pérez (Getty Conservation Institute) – Sígrið Remacha Acebrón (Universitat de Barcelona | Museu Nacional de Ciència i Tècnica de Catalunya) – Eva Perisé (Ajuntament de la Torre de Capdella | Museu Hidroelèctric de Capdella) – Júli. Servera Gumbau (Independent) – Mercè Gual Via (Museu Nacional de Ciència i Tècnica de Catalunya) – Violant Bonet (Independent) – Clara Masriera-Esquerri (Universitat Autònoma de Barcelona) – Sandra Luque (Ajuntament de la Torre de Capdella | Museu Hidroelèctric de Capdella) – Olivia Sokol (Universidad de Buenos Aires | Conicet)

Archaeology, as a field that connects diverse historical narratives to contemporary society, has a distinctive role in fostering a more inclusive and equitable future. Initiatives to incorporate local people in decision-making within this discipline are growing and demonstrate multiple procedures and methodologies: Excavation, documentation, conservation, and digitization. We argue that archaeological sites embodying diverse histories, significances, and perspectives will be more accessible and sustainably managed due to the sense of belonging and place they generate. In 2020, we launched a participatory initiative aimed at conserving an abandoned cardboard hospital constructed in the early 1910s in the isolated mountainous region of Vall Fosca (Lleida). The initiative, undertaken by the municipal council and the local museum, focused on revitalising the peripheral historical narratives associated with the industrial sites and working-class communities of the area. In May 2021, community archaeology initiatives started, fuelled by several community-driven heritage initiatives. After four years, we have been able to see how this project has generated a series of networks of engagement that have included different stakeholders and the various ways in which they contribute to the co-creation of the narratives on this site. Thus, this poster examines how engaging local communities in archaeological projects is challenging but contributes to unveiling the diverse narratives and perspectives associated with the site, thus enhancing its social value and significance. The key techniques developed, including exploratory surveys, mapping, photo elicitation, and item conservation workshops, particularly photogrammetry, are outlined and analysed. These initiatives have sought to promote intergenerational and contextual multivocality through the incorporation of archaeological cultural heritage into the socio-economic and cultural dynamics of the valley, as well as the beneficial effects they may yield for its local communities in both the short and long term.

110 MEASURING TIME AND OPEN-MINDEDNESS: INTERPRETING RADIOCARBON DATA THAT DOES NOT MEET OUR EXPECTATIONS BUT MIGHT CHANGE OUR PERSPECTIVES

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** archaeological science, archaeometry, radiocarbon dating, data interpretation, changing perspectives  
**Session organisers:** Pavla Tomanova (Institute of Archaeology of the Czech Academy of Sciences, Prague) – Zbigniew Robak (Institute of Archaeology, Slovak Academy of Sciences) – Irka Hajdas (ETH Zurich) – Ken Massy (Ludwig-Maximilians-Universität München)

SESSION ABSTRACT

Radiocarbon dating has become a standard method used to determine the absolute age of artifacts and features. In archaeology, the method is often used to confirm or refine an estimated chronology that was built up on archaeological and/or historical data. However, in some cases the 14C results do not meet those estimations. What to do with the results that have let us down, or surprised us? Sometimes they are ignored on an assumption that the radiocarbon method failed. However, the method cannot fail and there is always a reason for unexpected and surprising radiocarbon ages. Thus, those 14C data can be accepted as a challenge and lead to further research. In this way, further research can progress sample selection, documentation and laboratory procedures. If, on the other hand, the procedures are correct, the confirmed 14C ages require explanation and understanding; therefore, the unexpected results must inspire researchers to a new way of thinking about the archaeological artifact/ feature under investigation and open a new perspective. This session aims to bring together case studies, in which radiocarbon dating provided unpredicted results and researchers took them as a challenge to further investigation. Thus, it will focus on positive examples, when those results brought a shift in methodology, opened a new research perspective or even changed the up-to-date paradigms. Invited are papers presenting radiocarbon dating of common types of materials, like wood, animal, or human bones, and especially welcomed papers based on dating of materials such as mortar, pollen concentrates from sediments, and other less frequently dated material. Accepted are contributions dealing with all periods from prehistory to the present. The goal of this session is to bring inspiration and discussion on how to approach and interpret data that, at first glance, does not match our research, and take advantage of them.

528. RETHINKING TIME: RADIOCARBON DATING CHALLENGES IN NEOLITHIC AND CHALCOLITHIC BUCHAREST

**Contribution format:** Oral  
**Contribution authors:** Vasile Opris (Bucharest Municipality Museum | ArchaeoScience Platform, Research Institute of the University of Bucharest) – Corina Simion – Cristian Mănăilescu – Maria Ilie – Doru Păceșilă (RoAMS Laboratory, Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering)

Recent collaborative efforts between archaeologists, chemists and physicists in Bucharest have focused on radio-carbon dating of animal bones and chaff-tempered pottery from Neolithic and Chalcolithic sites in the region. While radiocarbon dating of organic materials like animal bones is well-established, dating chaff-tempered types presents unique challenges due to the complex interactions between organic temper and ceramic matrix. In this study, animal bone samples were subjected to AMS radiocarbon dating. The results aligned with existing chronological frameworks, confirming the efficacy of AMS in dating such materials. Concurrently, attempts to directly date chaff-tempered pottery were undertaken, given the organic nature of the chaff temper. However, preliminary results indicate that the radiocarbon dates frequently deviate from expected chronological ranges when the safest fraction for radiocarbon dating is measured, namely the OREC. This discrepancy may arise from several factors, including reworking of older organic material into the temper, carbon-based constituents in the clay source or the complexities inherent in the firing and post-depositional processes. These results prompt a reevaluation of current methodologies in dating chaff-tempered pottery, particularly in selecting the most reliable fractions for analysis. Future research should focus on refining sample preparation techniques, assessing potential contamination sources, and exploring complementary dating methods to cross-verify results. This investigation underscores the importance of maintaining an open-minded approach, focusing on the relationship between clay sources, source depth and customs of material culture, especially when results challenge established chronologies. By embracing these challenges, researchers can develop more robust and accurate dating frameworks, enhancing our understanding of Neolithic and Chalcolithic periods in the Bucharest region. Research funded by a grant of the CNCS – UEFISCDI, project number PN-IV-P2-2.1-TE-2023-0876 (V. Opris). The radiocarbon dating was supported under PNII MEN-UEFISCDI, contract PN 23210102 and PN 23210201, while experiments were supported by the RGP through the IOSIN (RoAMS Laboratory).

2142. RADIOCARBON DATING OF DIVERSE SAMPLE TYPES AND CHRONOLOGICAL DISCREPANCIES IN MIDDLE AND LATE BRONZE AGE MORAVIAN BURIAL SITES

**Contribution format:** Oral  
**Contribution authors:** Klára Šabatová (Masaryk University, Brno) – David Parma (Institute for Archaeological Heritage Brno) – Mária Hajnalová (Constantine the Philosopher University in Nitra) – David Humpola (Institute for Archaeological Heritage Brno) – Romana Kočárová (Masaryk University, Brno)

As part of a study of Middle and Late Bronze Age burial sites in Moravia (Czechia), we have collected new radio-carbon dates from various types of samples. The bone samples from burials were mainly dated, but also burnt bones, archaeobotanical material of short-lived plants, and charcoal. Expectations of prehistoric chronology are best reflected by data from bone samples from inhumations and from short-lived plants gained by archaeo-botanical analysis. The charcoal samples are affected by the old wood effect, and the samples from carbonised bones that have undergone cremation are either affected by the charcoal from the firewood used in the pyre. It is possible that the measurements from cremated bones hide evidence for a more complex form of Urnfield burial ritual than we can reconstruct from our current archaeological evidence. However, this data needs to be synchronised according to certain rules. How to do this is the purpose of this paper. Using longer sequences of data from well typologically defined units and series of data from the same archaeological context (primarily the Znojmo burial site), we aim to discuss the relationships between data from different sample types, some of which fall completely outside the assumed chronological framework.

2304. RADIOCARBON DATING OF CALCINED BONES WITH HIGH CALCITE CONTENT: RESEARCH POTENTIALS AND LIMITATIONS. NEW ABSOLUTE DATES FROM LJUBLJANA, SLOVENIA

**Contribution format:** Oral  
**Contribution authors:** Brina Škvor Jernejcic (ZRC SAZU Institute of Archaeology, Ljubljana) – Christian Hamann (Leibniz Laboratory for Radiometric Dating and Stable Isotope Research, Kiel University)

The eponymous urnfield cemetery in Ljubljana (Slovenia), is one of the key sites for the chronology of the Late

Bronze and Early Iron Age in the south-eastern Alpine region. The site is situated in the Ljubljana city centre on the left bank of the Ljubljanica River. The cemetery is an example of an urnfield necropolis in which a uniform mode of burial – cremation – persisted throughout several centuries, from the beginning of the Late Bronze Age in the 13th century BC into the Early Iron Age in the 7th century BC. The absolute chronology of the cemetery, elaborated in the last decade, is mostly based on radiocarbon determinations of cremated bones. Surprisingly, cremated bones exhibit an unusual amount of carbonate, probably caused by calcite deposition from flooding or groundwater. This is to be expected as the site is very close to the Ljubljanica River. To assure the quality of radio-carbon ages of cremated bone in general and exclude the presence of deposited calcite in particular, a couple of parameters, e.g. carbon content and  $\delta^{13}\text{C}$  have proven to be helpful. The acetic acid treatment routinely used in the Leibniz-Laboratory turned out to be insufficient to remove deposited calcite in the samples from Ljubljana. We changed to higher concentrations of acetic acid, and measurements differ by up to 300 14C-years, with the date of the portion treated with higher concentrated acetic acid giving an older and more reliable date. To achieve best calendar age estimates, radiocarbon dates are arranged in a Bayesian model. Considering radiocarbon ages of the cremated bone samples are possibly still influenced by calcite depositions, we integrated an adapted outlier model.

1623. CONSTRUCTION HISTORY OF ONE RAMPART: DO RADIOCARBON DATES SUPPORT ARCHAEOLOGICAL OBSERVATION? LIPTOVSKÁ SIELNICA-LIPTOVSKÁ MARA SITE AS THE WESTERN CARPATHIANS EXAMPLE

**Contribution format:** Oral  
**Contribution authors:** Lucia Benediková (Institute of Archaeology of the Slovak Academy of Sciences) – Mária Hajnalová – Peter Barta (Department of Archaeology, Faculty of Arts, Constantine the Philosopher University in Nitra) – Miroslav. Kissová (Institute of Archaeology of the Slovak Academy of Sciences) – Dagmar Dreslerová (Institute of Archaeology of the Czech Academy of Sciences, Prague) – Karol Pieta (Institute of Archaeology of the Slovak Academy of Sciences) – Tibor Lieskovský (Faculty of Civil Engineering, Slovak University of Technology in Bratislava)

Liptovská Sielnica-Liptovská Mara settlement area is situated in the Liptov Basin in Western Carpathians, Northern Slovakia. The most important span of its history belongs to the La Tène and Early Roman periods. It consists of a fortified location on the hill Havránok and six settlements on its foothills. The subject of our paper is absolute chronological interpretation of construction history of the rampart in its SW segment excavated in 1965 and during revisional campaign in 2015. The excavations revealed a long-term (c. 350 year-long) and complex construction history with the beginning in the Early La Tene period (stage Lt B) and the last destruction phase in the Early Roman period (stage B1a). The stratigraphic sequence reaches max. thickness of 3 metres. Besides stratigraphic observations and not very abundant pottery finds, voluminous ecofactual assemblage was obtained including archaeobotanical and archaeozoological materials. AMS radiocarbon dates were measured on 14 short-lived charred archaeobotanical samples and 3 charcoals. During the 2015 excavations, the sampling was aimed to investigate the rampart chronometrically with possible refinement of the construction history based on observed stratigraphical phases and associated pottery finds. The paper shows difficulties in interpreting radiocarbon results from seemingly clearly recognized stratigraphic units. Acknowledgements This work was supported by the Slovak Research and Development Agency under the Contracts no. 989. THE IMPACT OF 14C DATING ON THE CHRONOLOGY OF THE MIGRATION PERIOD IN ROMANIA: THE CASE OF PAUCA CREMATION CEMETERY

**Contribution format:** Oral  
**Contribution authors:** Ioan Marian Tiplic (Lucian Blaga University of Sibiu) – Corina Anca Simion – Maria Valentina Ilie – Cristian Mănăilescu – Doru Gheorghe Păceșilă (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering (IFIN-HH))

The necropolises attributed to the so-called Mediaș group are among the first cremation cemeteries investigated through systematic archaeological excavations, beginning with Mediaș (Romania, 1969) and continuing with subsequent research in similar necropolises at Sibiu-Gușterița, Bratei, Dăbâca, Boarta, Târnava, Berghin, and more recently, Păuca (all located in the central and southern parts of Transylvania). These necropolises belong to a horizon of cremation cemeteries present in Central and Southeast Europe between the 6th and 10th centuries, according to relative chronology. The chronology of this horizon is based on comparative analysis and typological series conducted mainly during the 1970s and 1990s, without any radiocarbon 14C dating diagram for any of the necropolises. This has led to a broad chronological framework, spanning the 7th to 9th centuries, primarily

based on the typology of funerary ceramics. The dating of bones from cremation graves, a method developed toward the end of the 1990s, has already sparked discussions regarding the necessary corrections to the absolute chronology for the post-Roman period and the early Middle Ages, due to some inconsistencies between the relative dating methods used and the results from 14C dating. For this reason, the collaboration between ULBS and IFIN-HH marks a pioneering effort in Romanian archaeological research. Through the results obtained, it can offer a chronological diagram that will allow for greater accuracy in dating the cremation necropolises associated with the Mediaș group. Radiocarbon dating of samples from the necropolis at Păuca raises questions about the chronology of the necropolises attributed to the Mediaș group and permits a reanalysis of the chronology for the period between the 7th and 10th centuries A.D. for discoveries in the eastern Carpathian Basin.

**2305. ABSOLUTE DATING OF EARLY MAGYAR CEMETERIES:PRZEMYŚL (POLAND) AND BATAJNICA-VELIKA HUMKA (SERBIA)**

**Contribution format:** Oral  
**Contribution authors:** Irka Hajdas (Laboratory of Ion Beam Physics, ETH Zurich | Maria Curie-Skłodowska University) – Nevena Pantic (University of Belgrade) – Pawel Jarosz (Institute of Archaeology and Ethnology Polish Academy of Science, Cracow) – Marcin Wołoszyn (University of Rzeszów | Leibniz Institute for the History and Culture of Eastern Europe (GWZO), Leipzig)

An Early Magyar cemetery excavated in the late 1970s and early 1980s on Rycerska Street in Zasanie, the northern district of Przemyśl in SE Poland. represents a truly unique early medieval funerary site. It is the earliest known inhumation cemetery in medieval Poland and the only confirmed evidence of Magyar’s presence to the north of the Carpathian Mountains, known from Poland. Between 2021 and 2023, this archaeological assemblage was subjected to a new, comprehensive analysis, including radiocarbon dating. Fourteen of 20 radiocarbon dates were secured at the Poznan Radiocarbon Laboratory and six at CEZA in Mannheim. All dates fall within 8/9t. Ź early 11th centuries. Similar studies were made for an Early Magyar burial from Batajnica-Velika, found a few kilometers north of Belgrade in the historical region of Strymia (Srem). This burial was placed in the 10th -11th century in the contact zone between the Byzantium and Early Magyar holdings. The grave assemblage 1074 II from Batajnica-Velika was dated at the Poznań Radiocarbon Laboratory. Our presentation examines these dates in the context of other radiocarbon chronologies from Central Europe dating back to the 10th century. We will compare and analyze the results, assessing potential discrepancies and their underlying causes. Moreover, we will compare radiocarbon chronology with the evidence obtained from the study of archaeological materials and historical written sources.

**979. RADIOCARBON MEASUREMENTS OF THE GRAVES FROM THE CEMETERIES OF THE GREAT MORAVIAN EARLY MEDIEVAL SETTLEMENT AGGLOMERATION STARÉ MĚSTO–UHERSKÉ HRADIŠTĚ**

**Contribution format:** Oral  
**Contribution authors:** Lucie Valášková (Moravian Museum, Brno | Departement of Archaeology and Museology Masaryk University, Brno) – Luděk Galuška – Jakub Langr (Moravian Museum, Brno)

The paper will deal with questions and problems raised by radiocarbon dating of selected graves, uncovered during archaeological excavations of burial grounds in Moravia in the eastern part of the Czech Republic. In the 8th–10th centuries, these burial grounds were part of one of the centres of Great Moravia, the remains of which are currently located in the cadastral areas of the towns of Uherské Hradiště and Staré Město (Zlín Region, CZ). Radiocarbon dating has been used to a greater extent in recent research by the Centre for Slovanic Archaeology of the Moravian Museum. This research focused on the extensive early medieval burial ground in the sacral area at the site of Uherské Hradiště-Sady. The C14 dating was supposed to help answer the question of local continuity or discontinuity in burials in the “problematic” 10th century. A total of 27 graves were analysed. Some of the graves, originally dated to the 11th–12th centuries, were shifted to the 9th century based on the results of C14 analyses. In the case of other graves, which have been dated to the 9th century so far, there was a shift to the end of the 7th century and to the 8th century, i.e. to the time when burials were not yet to be held at the site and the church itself was not supposed to stand here. Along with questions related to the dating of the church and its construction phases, fundamental questions had to be raised regarding the socio-religious changes in this area in the early Middle Ages. The same questions related to the recently obtained radiocarbon research data are currently being addressed at other sites of the Staré Město – Uherské Hradiště agglomeration, for example: Staré Město “Na Valách” and Modrá near Velehrad.

**1098. RADIOCARBON DATING OF EARLY MEDIEVAL GRAVES. WHEN DID THE BURIED INDIVIDUALS ACTUALLY DIE?**

**Contribution format:** Oral  
**Contribution authors:** Renáta Prichystalová – Petr Dresler (Masaryk University Brno) – Sylva Kaupová Drtikolová (National Museum Prague)

More than 250 radiocarbon dates have been analysed for the early medieval Břeclav–Pohansko stronghold and its surroundings. Most of the samples come from skeletal graves. Some individuals were tested 4 to 5 times. It was a surprise that the calibrated data of one individual oscillated within an interval of up to 100 years, which is very limiting to unusable for refining the chronology of the Middle Hillfort Period burial site (Middle Hillfort Period: 800–950). Therefore, we continue to test a method that may be helpful to regulate broad time intervals based on radiocarbon dates of the tested human bone material. We will present a comprehensive set of burials from the cemetery around the First Church (location Manor Court). The selected burials are directly related to the church (interior burials, overlapping with the foundation of the temple). Stable isotope analysis of C, N and Sr (diet, origin) will be used to explain the wide variation in the radiocarbon dating of an individual, as it has been shown that the type of diet, its deficiency, poor health can influence the result of radiocarbon dating.

**228. ISSUES OF THE RADIOCARBON CHRONOLOGY OF THE BOJNÁ AGGLOMERATION AND OTHER GREAT MORAVIAN SITES**

**Contribution format:** Oral  
**Contribution authors:** Zbigniew Robak (Institute of Archaeology and Museology, Masaryk University, Brno) – Matej Ruttkay – Karol Pieta (Institute of Archaeology, Slovak Academy of Sciences, Nitra)

This presentation focuses on the radiocarbon chronology of the early medieval defensive agglomeration of Bojná in Slovakia, particularly the Valy fortress and the nearby Rotunda of St. George—one of the oldest surviving churches in Middle Europe. Initial radiocarbon dates from Valy suggested the site should be dated to the late 8th or early 9th century, a conclusion allegedly supported by the archaeological finds. However, this dating conflicted with later dendrochronological analyses of the fortifications, which placed their construction at the turn of the 9th and 10th centuries. A meticulous re-evaluation of the archaeological finds revealed that the initial chronology was based on a methodological error. This error stemmed from the misinterpretation of radiocarbon data from the nearby Pobedim stronghold in the 1970s, that had not been calibrated. Subsequent research revealed and corrected this mistake, and new samples confirmed a revised chronology pointing to the late 9th century. This re-assessment significantly undermined the established chronological paradigm for Carolingian-age artifacts in Middle Europe. Nevertheless, the reliability of the radiocarbon dates for Bojná and the reasons for observed discrepancies remained in question. Further analyses continued to indicate a broad chronology for the site, spanning nearly 200 years and suggesting early origins. It was only through collecting, sequencing, and analyzing a larger set of radiocarbon dates from Bojná that it became clear the dates were not “contaminated.” However, they did not represent an absolute chronology of the site and required strict interpretation within their archaeological context. This is particularly evident in the series of dates from the Valy ramparts and the St. George’s Rotunda walls. Seemingly improbable dates were explained only after analyzing technological, constructional, and post-depositional processes affecting the studied structures. These findings underscore the necessity of integrating radiocarbon data with archaeological evidence to achieve a comprehensive understanding of the sites chronology.

**224. TRADITIONAL PERSPECTIVES ON EARLY MEDIEVAL STRONGHOLDS VERSUS NEW RADIOCARBON DATA. CASE STUDY OF THE BUDEČ STRONGHOLD**

**Contribution format:** Oral  
**Contribution authors:** Pavla Tomanova (Institute of Archaeology of the Czech Academy of Sciences, Prague)

Budeč Stronghold belongs to one of the most important and long-time investigated early medieval strongholds in the Czech Republic. It is dated back to the end of the 9th to the 12th century. Under the influence of the testimony of some early medieval legends, the development of the site is traditionally divided into two phases. The first phase, characterised by the construction of the St. Peter’s Rotunda and the operation of the so-called “Duke’s Court”, is associated with the life and stay of Duke (and later Martyr) Wenceslas at Budeč. The other phase, defined by e.g. erection of the church of Virgin Mary, has been related to the change in the political situation and administration of the centre of Budeč after Wenceslas’ martyrdom. Recently, a review of archaeological sources is underway, including radiocarbon dating of selected graves from the burial sites at both Budeč churches. The 14C data are surprising for the proponents of the traditional perspective described above. Together with the revised archaeological data, however, they suggest an alternative perspective on the site. According to it, the construction of both churches may have been part of a unified construction plan to build a mission centre in Bohemia.

583. ISSUE WITH THE CHRONOLOGY OF THE MEDIEVAL CHURCH OF CISNĂDIE (SIBIU COUNTY, TRANSYLVANIA) IN THE LIGHT OF RADIOCARBON DATING

**Contribution format:** Oral  
**Contribution authors:** Maria Emilia Cringaci Tiplic (Institute of Social Sciences and Humanities Sibiu, Romanian Academy) – Corina Anca Simion – Cristian Manailescu – Alexandru Răzvan Petre – Oana Gaza – Maria Valentin. Ilie – Doru Gheorgh. Pacesila (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering (IFIN-HH))

In historiography, there is an ongoing debate regarding the chronology of the earliest medieval churches in Transylvania in general, and the Romanesque basilicas in southern Transylvania in particular. Recent archaeological excavations at the medieval fortified church of Cisnădie, one of the most significant Romanesque basilicas in Transylvania, located 8 km south of Sibiu, have revealed relics of the Romanesque basilica’s foundations, graves from a medieval cemetery, and a medieval bell-casting pit discovered inside the western main nave. Archaeological and stratigraphic studies indicate that this ecclesiastical edifice and its medieval cemetery developed in phases. This proposal aims to present the results of radiocarbon dating of various samples (lime mortars, human bones, and charcoal / fabric scraps from the bell mold) to establish an accurate chronology of the church, the earliest graves, and the bell-casting activity—one of the oldest pieces of evidence for bell production in Transylvania. However, an initial analysis of some samples yielded anomalously old radiocarbon ages for the Romanesque basilica’s foundations and an abnormal chronological sequence for the graves. In seeking the causes of these anomalies and having sufficient archaeometric arguments to support issues of absolute chronology, we have attempted to reconsider the radiocarbon dating analyses using alternative methods for different materials. Whether or not the same results are obtained is a key point of this presentation. Additionally, radiocarbon dating results obtained for the medieval churches and their cemeteries by the team at IFIN-HH (RoAMS Laboratory) will also be highlighted. The radiocarbon dating was supported under Research Programme Partnership in Priority Areas PNII MEN-UEFISCDI (PN 23210102, PN 23210201). Experiments were carried out at the 1 MV Tandetron™ accelerator from “Horia Hulubei” National Institute for Physics and Nuclear Engineering (IFIN-HH) and were supported by the Romanian Government Programme through the National Programme for Infrastructure of National Interest (IOSIN).

1809. AMS DATING FOR MEDIEVAL KYIV: A NEW APPROACH

**Contribution format:** Oral  
**Contribution authors:** Natalia Khamaiko (Institute of Archaeology of the National Academy of Sciences of Ukraine | Leibniz Institute for the History and Culture of Eastern Europe (GWZO), Leipzig) – Oleksii Komar (Institute of Archaeology of the National Academy of Sciences of Ukraine) – Irk. Hajdas (ETH Zurich) – Marci. Woloszyn (University of Rzeszów | Leibniz Institute for the History and Culture of Eastern Europe (GWZO), Leipzig)

In 2024, AMS dating of medieval material from Kyiv, Ukraine, was conducted. We selected 56 samples covering the period 700–1240. The samples come from the Desiatynna (Tithe) Church estate in the Upper Town (excavations 2005–2011) and 35 Spaska Street in Podil, the Lower Town (excavations 2007–2011). The stratigraphy of medieval Podil, overlapped by sterile layers of alluvial sand or deluvial clay, prevents mixing finds from different periods and ensures a reliable sequence of closed contexts. The absolute dating of Early Rus’ manor estates at 35 Spaska Street is supported by dendrochronology, coins, lead seals, and two major fires linked to Kyiv’s capture in 1169 and 1240. The stratigraphy at the Tithe Church estate is defined by the Starokyivske hillfort ditch, filled shortly after 980 and leveled during the construction of the Desiatynna Church (990–996). A mass grave of victims from the 1240 Mongol sack of Kyiv was also discovered at the site. All samples were analyzed at ETH Zürich Laboratory and calibrated using OxCal 4.4. The calibrated dating ranges, with 95.4% confidence ( $\sigma$ ), matched the predicted archaeological dates in 44 out of 56 cases (78.6%). An Early Iron Age sample from a pit below the rampart may belong to an earlier cultural layer. Additionally, an animal bone from the 1240 mass grave, predating human remains, may have come from an earlier layer. For the remaining 10 samples, stratigraphy rules out archaeological dating errors. Five calibrated ranges differ slightly from archaeological dates. Most samples with earlier-than-expected radiocarbon dates come from 1160–1240 layers at 35 Spaska Street (7 out of 8) and the 1240 mass grave (4 out of 8). Notably, radiocarbon dating agreement was much lower for animal samples (11.1%) than human bones (42.9%), requiring further investigation and discussion.

1330. READING THE 14C LAB REPORT: HOW RELIABLE IS THE RESULT?

**Contribution format:** Poster  
**Contribution authors:** Irka Hajdas (Laboratory of Ion Beam Physics, ETH Zurich | Maria Curie-Skłodowska University)

Researchers who seek to determine the age of events they study are always concerned with the precision of their analysis. However, accuracy is central to all radiocarbon dating analyses and must be addressed before discussing precision issues. Nowadays, most AMS laboratories achieve standard precisions of ca. 2-3‰ if enough carbon (0.5-1.0 mg) is available, but smaller samples can also be analyzed with lower precision. The procedures are standardized, and International Laboratory Intercomparisons projects provide the quality check. The sample type, size, and potential contamination problem might vary between the applications: archeology, geochronology, art research, forensic, and environmental studies. Still, the analysis targets the separation of carbon, which was the faithful ‘witness’ of the studied event in the past. The key question is: ‘How can we ensure the lab’s report is based on a 14C analysis of such carbon?’ New analytical methods currently support sample preparation and provide parameters to help assess the sample’s prospects. The paper will present an overview of the most common problems in archaeological samples and methods for detecting and neutralizing them. Finally, it will address the various parameters in the reports and discuss implications for the final radiocarbon ages.

2131. AN INVESTIGATION INTO THE EFFECTS OF CONSOLIDANT CONTAMINATION ON AN EARLY BRONZE AGE LOGBOAT IN IRELAND

**Contribution format:** Poster  
**Contribution authors:** Daniel Morris – Gerard Barrett (Queen’s University Belfast)

An investigation was carried out into the removal of consolidant contamination from wood taken from a possible Early Bronze Age logboat, found in Garraunfadda, Ireland. Samples from this object were originally submitted in 2017 and dated using standard AAA pretreatment techniques. The resulting dates did not agree with an assessment of the construction style of the logboat. Upon reassessment, contamination from consolidants was suspected, leading to a second measurement where standard consolidant removal pretreatment methods were used. The resulting date provided better agreement with archaeological evidence. However, suspicion still remains as to the extent to which existing pretreatment methods can effectively remove consolidants, as it has been shown that statistically significant contamination can remain, even when not apparent in FTIR spectra, a standard technique for diagnosing contamination. The results of an investigation, using novel ramped pyrolysis, to assess the extent of any remaining contamination, and if possible, minimise the its effect on the measured radiocarbon age, are presented.

111 LET’S ADDRESS THE OTHER-THAN-HUMAN ANIMAL IN THE ROOM: MOVING FORWARD WITH MULTISPECIES ARCHAEOLOGIES OF PREHISTORY

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Discussion session  
**Session keywords:** Multispecies Archaeology, European Prehistory, Interdisciplinarity, Posthumanism  
**Session organisers:** Eleanor Swallow – Nóra Nic Aoidh – Oliver Line (University College Dublin) – Gywain Jones (University of Bristol) – Alex Siekmann (Trinity College Dublin)

SESSION ABSTRACT

Ideas of animal-human and multispecies pasts have been gaining more widespread attention in prehistoric archaeology. Increasing engagement with posthumanist thought, relational ontologies, and ethnoarchaeology has made space for alternative narratives of the past that move beyond the uncritical othering, objectification, and commodification of prehistoric other-than-human animals. Animals are being recognised as active co-participants in and co-creators of prehistoric lifeways and sociality. Structured efforts are needed to ensure the longevity of these presently energetic discussions in multispecies archaeologies. Collaborative interdisciplinarity is essential to prevent these theoretical approaches to multispecies pasts being confined to “the lunatic fringe of archaeology” (Grant 1989). We encourage interdisciplinary collaborations that bridge the gap between humanities and the sciences. Likewise, collaborations between those studying different periods of prehistory that have adopted these theoretical perspectives at varied rates and applied them in different ways are encouraged. Special attention must also be given to the practical application of these theoretical frameworks. The data requires interpretation which creatively considers alternative ways of knowing and being in the world, to gain richer understandings of the past and animals’ central role in the emergence of prehistoric lifeways. We invite contributions, individual and collaborative, that address these and related themes from a broad range of archaeological disciplines within European Prehistory including but not limited to zooarchaeology, aDNA analysis, isotopic analysis, depositional practices, iconography, materiality, architecture, and landscape.

1644. FISHING AS INTERSPECIES COMMUNICATION: RETHINKING THE ROLE OF FISHING GEAR IN MESOLITHIC EUROPE

**Contribution format:** Oral  
**Contribution authors:** Anja Mansrud – Simo. Radchenko (Museum of Archaeology, University of Stavanger)

Social archaeology has long acknowledged the capacity of material culture to communicate, mediate, and ‘act back’ on people and social life, yet the role of objects in interspecies communication remains largely unexplored. This paper addresses the topic of objects in interspecies communication, by focusing on visual signalling practices in fishing. By drawing on insights from human-animal studies and multispecies approaches, we argue that fishing gear act as material binders, enabling interspecies contact and communication. Multispecies ethnographies further highlight that a successful catch depends on the ability to ‘think like a fish’ and consider fishing equipment from the fish’s perspective. Visual media is particularly significant in angling, where lures are used to attract fish to bait, and observations of fish responding to baits prompt humans to see them as active, purposeful agents. Such an approach allows a more active role to nonhumans in past life-worlds and is employed as a heuristic device to rethink fishing in Mesolithic Europe (8000-4000 BCE). We will discuss three case studies exploring angling, spearing, and net-fishing respectively.

1728. ANCIENT LIVESTOCK, ANCIENT GENES: THE GENETICS OF BRONZE AGE CATTLE AND SHEEP IN BRITAIN AND THE NETHERLANDS

**Contribution format:** Oral  
**Contribution authors:** Alex Siekmann (Trinity College Dublin)

Genetic analysis of prehistoric domestic animals can be a powerful tool in learning about those prehistoric societies and cultures that lived with domesticated animals. Since their domestication in the Middle East over 10,000 years ago, cattle and sheep have become two of the most important livestock species, accompanying human’s on their migrations into Europe and often outnumbering humans at settlements. Domestic cattle found in Europe descend from a small number of wild aurochs that were domesticated in South-West Asia but also show some levels of ancestry of local European aurochs populations that they interbred with before the final extinction of European aurochs in the 17th century. The genetic history of domestic sheep in Europe similarly goes back to an initial domestication event, followed by a change of ancestry correlating with the advent of use of secondary products, e.g. wool. This presentation reviews the work of a PhD project where whole genome sequencing is used to explore the genetics of cattle and sheep in Bronze Age Europe. The goal is to build a dataset that samples a high number of samples from a small number of select sites in Britain and the Netherlands. This aims to detect information about ancestry patterns and herd structure and also provides information about molecular sex to collaborators working on the same sites to add the dimension of molecular sex to other analyses (e.g. isotopes) in order to improve our understanding of the domestic animals that were so integral to the Bronze Age communities that kept them.

1213. WHERE THE CATTLE ROAM – THE LANDSCAPE AND ENVIRONMENTAL CONTEXT OF BRONZE AGE ANIMAL ARCHITECTURE

**Contribution format:** Oral  
**Contribution authors:** Floor Huisman (University College Dublin)

Animal architecture is an important source of evidence on human-animal interaction in the prehistoric past. Created for or by animals, the structure and features on archaeological sites which relate to animals, including shelters, fieldsystem enclosures and droveways, wells/waterholes, hoofprints and fences, shed light on animals’ active role in the Bronze Age of northwestern Europe. It demonstrates how animals co-created the archaeological record by shaping human and animal life spaces, and how they influenced everyday life and human sociality. The character and type of animal architecture used by past multispecies communities is shaped by the shared needs and interaction of humans, other animals, and (in many fieldsystems) arable crops. The physical landscape and environmental factors, including soil types and water sources, may equally influence the layout, organisation, function and use of fieldsystems and other animal architectures. Together with social factors, including available labour, intra- and intercommunity collaboration and negotiation, these result in different kinds of human-animal interaction and mobility patterns, which differ significantly from one place to another, and may change over time. To gain more insight into how social and environment factors influence animal architectures and human-animal interaction and mobility, this paper will integrate the spatial and social analysis of animal architecture with environmental data relating to (arable) land use and the wider landscape. It will compare sites located in different landscapes and environments and trace changes in human-animal interaction through time, to demonstrate how the interplay between social and environmental factors resulted in a great diversity

of variable multispecies lifeways in the Bronze Age of northwestern Europe.

1555. HUMAN AND ANIMAL COEXISTENCE DURING THE LATE NEOLITHIC IN THE SOUTHERN CARPATHIAN BASIN:A CASE OF THE BEZDAN-BAČKI MONOŠTOR SITE (SERBIA)

**Contribution format:** Oral  
**Contribution authors:** Maja Kokanovic – Jelena Jovanovic – Tamara Blagojevic (BioSense Institute, University of Novi Sad)

Understanding different animal husbandry and hunting practices is crucial when studying the processes of adaptation and consolidation of the economic practices of the first farmers and their successors in the Southern Carpathian Basin. The faunal remains analyzed in this study come from the Late Neolithic site of Bezdan–Bački Monoštor. They were collected during a rescue archaeological excavation conducted in 2013 by the Provincial Institute for the Protection of Cultural Heritage Petrovaradin in cooperation with the City Museum Sombor. The analysis revealed that the dietary habits and economy of the community were based mainly on the breeding and consumption of domestic animals, primarily cattle, followed by caprines, and then pigs. Game played a significant role in the diet, with deer, aurochs, wild boar, and roe deer among the most commonly hunted species. In addition to mammals, exploitation of aquatic resources is also evident, primarily river mussels and snails, while fish, such as catfish (*Silurus glanis*), were hunted occasionally. The obtained results are supported by isotopic analyses of carbon and nitrogen conducted on human skeletal remains from this site, which indicate that the local population’s diet was mostly based on the consumption of terrestrial mammals, thus confirming the general dietary pattern during the Neolithic in this part of the Carpathian Basin. These data have provided new insights into animal husbandry and hunting practices during the Late Neolithic while also laying the groundwork for further analyses, such as strontium and sulfur isotope studies, which will further deepen our understanding of this crucial period in the human past. This research was supported by the Science Fund of the Republic of Serbia, #GRANT No. 7498, Moving across the plain: reconstructing the lifetime movements of farming pioneers and their successors during the Neolithic in the Southern Carpathian Basin-MOVE.

1637. CATTLE-GORISATION? : NONHUMAN ANIMAL TAXONOMIES IN NORDIC BRONZE AGE ROCK ART

**Contribution format:** Oral  
**Contribution authors:** Nóra Nic Aoidh (University College Dublin)

Nonhuman animals are among the most common motif-type in Southern Tradition Nordic Bronze Age rock art, along with cup marks, ships, and ‘human animals’. Despite their prevalence, discussions of nonhuman animals in iconography have been quite limited, both in categorisation and application. Horses and bulls dominate what little literature has been published, and these are almost exclusively discussed anthropocentrically, in terms of social and political capital: bulls’ horns adorn the helmets of the “divine ruler” (Kristiansen, 2005: 333), and horse-head figureheads top the prow extensions of ships carrying sword-bearing warriors. In such examples, the nonhuman animals are abstracted and symbolified, and the associated anthropomorphs are shown to be (or presumed to be) male. Prevalent assumptions about the quintessential Bronze Age warrior chief have been, and continue to be, challenged in posthumanist literature. However, such debates have only just begun to query the role of nonhuman animals in these societies. Research preferencing specific nonhuman animal species over others leaves large gaps in understanding the physical and conceptual composition of multispecies rock art. It is inherently problematic to apply uncritically modern concepts of nonhuman animal categories — specifically taxonomy — to iconography created in the Nordic Bronze Age. However, categorisation can be a useful tool to help decipher multispecies lifeways in the past. Working within the limits of the “tyranny of categorisation” (Brück, 2019: 9), this paper explores a variety of alternative ways in which nonhuman animals may have been categorised, or categorised themselves, in the rock art. Using examples, this paper explores alternative nonhuman animal-attributes like ethology, size, and narrative context, in addition to compositional construction. In doing so, it demonstrates the remarkable diversity of nonhuman animals in Nordic Bronze Age rock art, both in the fluidity of nonhuman-animal-types and the wide array of circumstances in which they were depicted.

308. WHAT IF...? ANIMAL-HUMAN ENTANGLEMENTS IN WESTERNMOST EUROPEAN LATE PREHISTORY

**Contribution format:** Oral  
**Contribution authors:** Nelson Almeida (CHAIA-IN2PAST (U. Évora) / UNIARQ (U. Lisbon)) – Catarina Guinot (U. Évora)

The increasing adoption of posthumanist thought is allowing new vibrant multispecies and other-than-human approaches to the archaeological record. Data on prehistoric societies is growing and this fosters the discussion of pieces of evidence under renewed lens. Animals were of relevance in Prehistoric lifeways due to their agency, but also for being part of the material (and immaterial) records that we study. Westernmost Europe has a large and diversified evidence of Neolithic, Chalcolithic and Bronze Age contexts, some of which with a large number

of faunal remains. Other smaller faunal “anachronic” assemblages are also found, especially related to interpretations that go beyond mere economic perspectives. On this note, our aim is to discuss Central and Southern Portugal Late Prehistory zooarchaeological record in relation to other broader pieces of evidence. By looking at depositional practices and contextual taphonomy approaches, together with data from the “artistic” record and other materials, we intend to discuss the applicability of different perspectives related to segmentation, partition and participation, liminality and animal agency to these archaeological records. Adopting a *longue durée* approach, this data is assessed in relation to the diachrony and synchrony of Portuguese Late Prehistory. We argue that although availability and economic decisions, among others, limited human decision regarding animal exploitation and display, other variables related to animal agency and ideological aspects including the relevance social events had a strong influence on these decisions, specially in moments of socio-cultural and/or environmental tension.

**764. LET’S TALK ABOUT THE MAMMOTH IN THE ROOM: A STABLE ISOTOPE STUDY OF MOLDOVAN MAMMOTH REMAINS**

**Contribution format:** Oral  
**Contribution authors:** Jay Ford (University of Cambridge)

This isotopic study focuses on the mammoth remains from the Upper Palaeolithic site of Climăuți, Moldova. It has been evidenced at Climăuți, and other neighbouring sites that mammoths were exploited for multiple purposes; a suitable food source, a source of ivory fo. tools and personal ornaments, and as skeletal remains as a source of building material. Owing to these faunal remains, the improvement of knowledge regarding Upper Palaeolithic mammoths in Moldova and their relationship with the *Homo sapiens* populations it affords; Climăuți is a valuable site. To contextualise this site and gain a broader understanding of Moldova as a region, faunal material (not limited to mammoth) from other key Moldovan sites, has also been analysed isotopically. Existing relevant research in Moldova is limited, particularly isotopically, yet the regions geographic location in the mammoth steppe forming part of the bridge between Western Europe and the rest of Eurasia, paired with the richness of archaeological material make it a valuable source of information to investigate past human-animal relations in prehistory, such as between humans and mammoths. A stable isotopic analysis provides greater insight into the diet and movement of mammoths and through incorporating additional species, allows for the creation of more precise isoscapes. Through a focus on mammoths, a keystone species of the mammoth steppe, our understanding of human behaviour and how they exploited this species can be furthered.

**1180. ‘REFUSE’-ING THE DISMISSAL OF THE EVERYDAY: INVESTIGATING THE DEPOSITION OF DISARTICULATED ANIMAL REMAINS IN BRONZE AGE EUROPE**

**Contribution format:** Oral  
**Contribution authors:** Eleanor Swallow (University College Dublin)

While animal remains make up one of the largest volumes of material remains in the prehistoric archaeological record, they are often undervalued for their potential contributions of socio-cultural insight. Animal remains, especially in their more frequently recovered disarticulated form, are frequently confined to an interpretative box of economic-centric commodification, regarding both the implicitly objectified remains and the nonhuman individuals they represent. The multispecies approach encourages and facilitates interpreting outside this anthropocentric box. This paper will present the research of a Bronze Age case study which employs a multispecies- and posthumanist- inspired approach to exploring animal remains deposition practices. The study focuses on material from excavations at Westfrisiaweg, Netherlands, which revealed a rich, multi-phase perspective of the everyday lifeways and deathways of the area’s subsistence farming communities. The study incorporates spatial and quantitative distribution analyses of disarticulated remains, to approach the data without restriction of pre-imposed categories and assumptions of the extents of their interpretative value. The study trials a methodology which aims to look beyond the potentially limited, dominant interpretations of an all too familiar and uncritically dichotomous view of Bronze Age societies.

**2076. THOSE DEATH DID NOT PART. HUMAN-DOG BURIALS IN IRON AGE NORTHERN NORWAY**

**Contribution format:** Oral  
**Contribution authors:** Kristin Armstrong Oma – Arild Klockervoll (University of Stavanger)

A wide range of domestic and wild animals were incorporated in Scandinavian Iron Age (c. 500 BC–1050 AD) mortuary assemblages, but dogs – or human-dog relationships – held a special significance. In Northern Norway, dogs were included in more than a third of the Late Iron Age (c. AD 600-1050) graves with identified animal bones, and it is the only domestic species occurring prior to that, in three graves at a cemetery from c. AD 400. Unlike other animals, the dogs in these and several similarly well-preserved LIA burials had been carefully placed in close proximity to the human bodies, or even overlaying each other. The dogs lain across the legs of

an 18-year-old warrior and the torso of a 12-year-old at different locations in Merovingian Period (c. AD 600-800) Nordland are evocative examples from Ytre Kvarøy and northern Andøy, respectively. While exceptional, they can act as powerful case studies relevant to interpretations of more poorly preserved, excavated, or documented assemblages of this kind, and even to cremated ones. They provide unique insights into practices and beliefs and raise issues pertaining to ontological relationality. How, then, can we understand such burials? The Iron Age societies that they sprang from were multispecies communities, as attested by the Old Norse written sources. Old Norse mythology implies that animals had a place in the afterlife, and notions of those otherworldly places was probably inconceivable without them. We explore how a close analysis of some very well-preserved burials can give insights into more specific understandings of the intertwining of lived practices and mythology in these multi-species communities. We draw on ethological and biochemical research of human-dog relationships to gain a deeper understanding of what kind of shape and depth the intertwined pasts of humans and dogs took in Northern Norway in the Iron Age.

**2044. BRIDGING ALL THE BINARIES: INTEGRATING CONTEMPORARY THEORY WITH SCIENTIFIC APPROACHES TO ARCHAEOLOGICAL ANIMALS**

**Contribution format:** Oral  
**Contribution authors:** Katherine Kanne (University College Dublin)

Multispecies and posthumanist theory in archaeology has worked to centre the animal in the past two decades. The large and rapidly increasing corpus of biomolecular data of ancient animals at progressively finer scales of resolution has led to transformations in how we understand the processes of animal domestication, the lives of prehistoric animals, and human-animal relations. However, the animal often remains locked outside of the pastures of more mainstream archaeological theory, and in interpretations resulting from large biomolecular studies. Animals in archaeological theory more broadly continue to be relegated to the ‘back forty’, with interpretations that remain staunchly anthropocentric, economic, and techno-deterministic. Calls to integrate recent theory and biomolecular data have regularly been levied, but rarely has this integration occurred in practice. Reconciling multispecies and biomolecular archaeologies requires innovative theory grounded in tangible data explored in collaboration with biomolecular archaeologists open to novel interpretations. With examples from the European Bronze Age, this paper presents the initial efforts at developing an explicit theoretical framework that integrates contemporary archaeological perspectives with recent biomolecular archaeologies in order to produce new narratives of prehistory.

**231. THE GRAVE YAWNS FOR THE HORSEMAN. DEPICTIONS OF COLLAPSING AND DEATH OF NON-ROMAN HORSES ON THE COLUMN OF MARCUS AURELIUS**

**Contribution format:** Oral  
**Contribution authors:** Goldie Nagy (RTG 2304 Byzantium and the Euromediterranean Cultures of War, JGU Mainz)

Before the industrial revolution horses have been without a doubt the biggest non-human contributors to human-made conflicts, such as wars. Depictions of equines are also among the oldest and farthest spread motifs in history. Since the dawn of equine-enhanced warfare the image of this timid prey animal evolutionary constructed for flight became irredeemably entangled with symbols of war. Therefore, an equine history of war, as told by the way so called war horses were depicted, seems reasonable for a multispecies approach of human-made conflict. This iconographic case study investigates depictions of collapse and death of horses and their riders on the monumental relief column of Marcus Aurelius (finished 193 C.E.) and comparable relief images to enhance the perception of war horses on the Roman and their enemies’ side, their depicted treatment and violence against horses within their status between living beings and resources for war. By additionally observing Roman contemporary military manuals and archaeological realities from the middle Danuban provinces a contrast between images and the realities of violent conflict for equines shall be created to hopefully explore potentials for further research on horses as real and pictorial agents in war.

**2088. FIGURINES, HORNS AND VESSELS. ENEOLITHIC ANIMAL REPRESENTATIONS IN CROATIA**

**Contribution format:** Oral  
**Contribution authors:** Maja Pasaric (Institute of ethnology and folklore research)

Eneolithic sites in Eastern Croatia have yielded a number of animal representations manufactured from clay. Animals have mainly been represented as figurines, their bodies have also been associated with vessels and cattle horns usually modelled independently and in different variations. Animal representations have been discovered in settlements, sometimes in close association with built structures and living spaces and they have so far, mostly, been interpreted as symbols, ritual artefacts or reflections of human economic choices. Drawing from recent contributions that encourage the focus on multispecies societies and different ways in which people

relate to material culture the paper aims to move away from strictly economic or symbolic interpretations of Eneolithic animal representations. The contribution will consider how certain animals and humans might have intersected and interacted in shared settlements an. landscapes and how this might have affected humans to represent animal bodies in different forms and model them from clay.

45. THE ORIGINS OF ANIMAL TRACTION IN BRITAIN

**Contribution format:** Oral  
**Contribution authors:** Phoebe Liu (University of Sheffield)

Animal traction is one of the key technological innovations that drove socioeconomic transformations in prehistoric societies. However, its emergence in Britain has remained poorly understood, mainly due to the limited preservation of physical evidence and the absence of iconographic representations associated with animal traction. Given the fragmented archaeological evidence, the osteological approach is the most promising method for advancing understanding of the development of this technology. The convergent results from all osteological approaches indicate that the earliest substantial evidence for cattle traction in Britain emerged during the Middle to Late Bronze Age. This timing aligns with a period of profound social transformation characterised by agricultural intensification and the emergence of more complex hierarchical social structures during the latter half of the second millennium BC. Animal traction was revolutionary, not only enhancing cultivation capabilities but also fostering a new dynamic between humans and animals. Cattle were active participants rather than passive resources, working with humans to perform labour-intensive tasks that reshaped agricultural practices and economic structures.

1512. ENCOUNTERS IN STONE: RED DEER - HUMAN RELATIONSHIPS IN THE LATE MESOLITHIC ROCK ART SITE VINGEN

**Contribution format:** Oral  
**Contribution authors:** Yrja Skjærum (University of Bergen)

This paper investigates human-red deer relationships during the Late Mesolithic (c. 6400–4000 BC) through an in-depth analysis of red deer motifs at the Vingen rock art site on Norway’s west coast. As the country’s second-largest Stone Age rock art site, Vingen contains approximately 2,200 motifs, the majority depicting red deer (*Cervus elaphus*). Applying ethology—the study of animal behaviour—to the iconographical analysis of these depictions, this study explores how rock art reflects real-life encounters between humans and red deer. This theoretical and methodological lens recenters the animals as active participants in human-animal relations, acknowledging their agency in shaping these encounters. Integrating ethological insights with relational ontologies, this paper examines why red deer became a dominant motif and what their representations reveal about Late Mesolithic understandings of animals. I argue that red deer motifs in rock art were not merely symbolic abstractions but conveyed detailed observations of red deer behaviour, including social structures, seasonal migrations, and mating rituals. This approach offers a new perspective on motif selection, demonstrating that artistic representations in Vingen’s rock art were grounded in direct observations of red deer behaviour, rather than purely symbolic abstraction.

112 LIDAR IN MEDITERRANEAN ARCHAEOLOGY

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** LiDAR, Mediterranean archaeology, theory and methods, case studies, landscape archaeology, remote sensing  
**Session organisers:** Giacomo Fontana (Texas Tech University) – Giacomo Vinci (University of Padua) – Ale. Knodell (Carleton College)

SESSION ABSTRACT

LiDAR technology is revolutionizing Mediterranean archaeology by offering innovative approaches to surveying and interpreting complex landscapes. However, its application across the region remains uneven, particularly due to significant variations in data availability. While some countries benefit from comprehensive, large-scale government datasets at different resolutions, others must rely on ad hoc often drone-based, acquisitions. These disparities directly affect LiDAR’s research potential, shaping its ability to address archaeological questions at both landscape-wide and site-specific levels. The methodological divide between large-scale, lower-resolution LiDAR and high-resolution, site-focused data presents important considerations for researchers. In countries like Spain, Slovenia and Italy, where extensive datasets are accessible, efforts to identify archaeological sites across vast regions are progressing, often supported by machine learning techniques that automate site detection. In

contrast, countries that depend on ad hoc data acquisition tend to use LiDAR at a more localized scale, focusing on detailed analyses of individual sites or smaller portions of the landscape. These studies often investigate multiple aspects of the sites rather than concentrating solely on specific site typologies. The uneven availability of LiDAR data shapes research strategies and creates disparities in its use across the Mediterranean. This session aims to explore how the quality and accessibility of various LiDAR datasets influence regional research priorities. We welcome contributions on a range of topics, including methodological approaches such as the implementation of machine learning or addressing the challenges of filtering data in densely vegetated areas, as well as specific case studies and broader reflections on how LiDAR is shaping research and cultural heritage management in different countries. Our goal is to foster dialogue among researchers, encouraging critical reflection on how LiDAR is reshaping traditional archaeological questions associated with landscape archaeology and driving new research directions in the Mediterranean context.

CONTRIBUTION ABSTRACTS

14. POTENTIAL AND LIMITATIONS OF LIDAR FOR IDENTIFYING SMALL-SCALE MEGALITHIC STRUCTURES. THE CASE STUDY OF FONELAS (GRANADA, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Carolina Cabrero (University of Granada)

The necropolises of FoneLas are the main preserved group of the megalithic complex of the valley of the Fardes River, in the northeast of the province of Granada (Andalusia). This group, together with others such as the Gor River or Pasillo de Tabernas, is one of the main groups that compose the ‘Megalithic Phenomenon of the Southeast of the Iberian Peninsula’, characterized by a very high density of megaliths per km2, generally of small size (1-2 m long in average) and very variable typologies. This great variability is the result of the wide time range of construction of the megaliths between the Late Neolithic and the Late Copper Age (IV-III millennium BC), with frequent reuse in the Bronze Age (II millennium BC). A series of new megaliths were documented in 2022, revealing the presence of numerous previously unidentified burial sites in the area, including within already surveyed terrain. For this reason, a new and systematic survey of the area was planned for 2024, consisting of a digital terrain analysis using DTMs derived from LiDAR data to identify potential megalithic structures, followed by a traditional surface survey to verify these locations. The analysis of DTMs based on LiDAR data led to the identification of 40 anomalies, while field verification allowed 20 of them (50%) to be classified as positive. These include 13 tumuli, 3 orthostatic structures, 3 undefined structures, and 1 plundered chamber negative. In the absence of further geophysical work to verify the identified tumuli, this study helps to delineate the real possibilities and limitations of LiDAR in identifying small-scale structures, while also emphasizing the need for ground-truthing to validate the data.

111. A BOOST FROM THE AIR: LIDAR AND THE IRON AGE IN THE EBRO AND DOURO BASINS (NORTHERN SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Andrea Solana-Muñoz (Institute of Heritage Sciences, Spanish National Research Council (INCIPIT-CSIC))

This proposal is based on my doctoral thesis project, which aims to analyse the historical sequence of the Iron Age (8th-2nd centuries B.C.E.) in the Upper-Middle Ebro and Upper Douro basins (Northern Spain). One of the characteristics of this study area is the fragmentation and scarcity of archaeological information on this period, as well as the absence of studies that relate the different sites to each other and their surroundings. To overcome these limitations, in this project I approach the archaeological record from the theoretical-methodological framework of Landscape Archaeology, including the use of GIS and LiDAR products or derivatives. LiDAR datasets are widely available and open access in Spain thanks to the efforts of the National Geographic Institute. Despite the availability of these datasets, their archaeological application has been limited in the study area. Some preliminary results of its application as part of my doctoral project on Iron Age landscapes have been. 1. The identification of new archaeological sites thanks to remote sensing, which were later verified through archaeological prospections on the ground. 2. The improved characterisation of some sites already catalogued in the regional archaeological inventories. 3. Obtaining quantitative information to analyse the monumentality of the fortified sites and the effort invested in their construction, which allows us to approach social variables of the Iron Age communities. 4. Obtaining volumetric information to differentiate defensive elements from recent agricultural terraces, whose morphology generated interpretative errors in the location and interpretation of archaeological sites. In this paper, I discuss the results obtained in my on-going investigation to reflect the potential of LiDAR datasets for the archaeological analysis of Iron Age landscapes, as well as the possibilities it has to overcome interpretative problems derived from the morphological characteristics of some Mediterranean landscapes.

2429. ASSESSING THE POTENTIAL OF AIRBORNE LIDAR TO UNVEIL ROMAN LANDSCAPES OF RESOURCE EXPLOITATION IN THE WESTERN IBERIAN PENINSULA

Contribution format: Oral  
Contribution authors: Gil Vilarinho (University of Evora)

The exploitation of resources has perhaps been the most conspicuous aspect of the relationship human communities have with the surrounding natural environments. The Iberian Peninsula boasts significant natural resources known and exploited since prehistory. The Roman conquest, however, triggered a new impetus for exploiting these resources. The demand for ornamental stones, namely marble, and gold produced an expressive development of the respective extractive undertakings, frequently resulting in a significant impact on the landscape. Although the importance of these activities and their subsisting remains have been partly noted and there has been an increasing academic interest in this topic, in the western Iberian Peninsula, an area largely corresponding to the Roman province of Lusitania, the existing evidence remains largely undocumented. Recently, there has been increasing accessibility to equipment and geospatial datasets, particularly airborne LiDAR, which allows not only the detection of most of the traces related to these extracting activities but also, on a wider scale, to analyse whole exploitation complexes and even landscapes that are otherwise hardly perceived. Having Central Portugal as a case study region and following a comprehensive methodological approach, this paper explores the potential and constraints of airborne LiDAR surveys to identify and map Roman stone quarries and gold mining areas. Drawing on publicly available LiDAR datasets, this study also explores how different sources and data quality influence the models obtained and the interpretive process. The results analysed revealed a distinct picture for each of these resources, yielding significant results and presenting, therefore, a great potential for the study of Roman gold mining landscapes, while, contrastingly, the take on stone quarries was hindered by several limitations. Ultimately, this paper stresses the significant potential of LiDAR data for the archaeological investigation in a region where remote sensing techniques have been largely overlooked.

1386. INTRICATE PALIMPSESTS. DISENTANGLE THE COMPLEXITY OF (SOME) MEDITERRANEAN CULTURAL LANDSCAPES THROUGH LIDAR AND OTHER TECHNIQUES

Contribution format: Oral  
Contribution authors: Giacomo Vinci – Federica Vanzani – Alessandro Fontana (University of Padova)

A recently published systematic review of international studies on the application of LiDAR in archaeology over the past 20 years has provided valuable insights into its impact. The findings reveal that, so far, LiDAR applications in Mediterranean contexts have yielded relatively limited results (Vinci et al., 2024). One key factor behind this is the prolonged and intensive occupation of the same areas, making many Mediterranean landscapes intricate palimpsests that are difficult to disentangle. However, integrating high-resolution LiDAR data with other techniques, particularly the analysis of historical cartography and geoarchaeological fieldwork, can significantly advance our understanding of landscape evolution. Our study focuses on the Northern Adriatic, where high-resolution open-access LiDAR data have been analyzed in both the alluvial plains of Friuli and the hilly Karst region, revealing previously unknown cultural landscapes. One notable case from the Friulian coastal plain illustrates how the combination of remote sensing and paleoecological research, through pollen analysis of samples taken from peat-filled deposits, has uncovered a type of evidence previously unknown in the Roman world and has documented significant impact on the rural environment of that time. To expand this perspective, we compare these results with recent drone-based, high-resolution LiDAR acquisitions from the volcanic island of Ustica (Sicily). This comparative analysis highlights methodological challenges that reinforce the need for a multi-proxy, multi-temporal, and multi-scale approach to LiDAR-based research. Such a framework is essential for fully understanding land-use dynamics and long-term landscape transformations across different historical periods.

1212. MOVING BETWEEN SCALES AND FEATURE TYPES IN ARCHAEOLOGICAL LIDAR

Contribution format: Oral  
Contribution authors: Giacomo Fontana (Texas Tech University)

The Mediterranean region has a strong tradition of landscape archaeology. However, research in this field has often focused on coastal and lowland areas, frequently overlooking other environments such as mountainous and forested landscapes. Lidar presents a valuable opportunity to explore these historically understudied regions. This paper evaluates the challenges and potential of low-resolution but large-scale lidar in Mediterranean landscape archaeology, particularly in mountain environments, and compares its effectiveness with high-resolution, ad hoc lidar surveys conducted for specific sites. Drawing on insights from the Ancient Hillforts Survey, which analyzed 15,296 km<sup>2</sup> in south-central Italy, the study assesses the variability in site visibility across different lidar datasets. Specifically, it compares open-source, low-resolution lidar (average of 1 pt/m<sup>2</sup>) with high-resolution (up to 550 pts/m<sup>2</sup>) ad hoc lidar surveys conducted on similar sites. The findings highlight significant discrepancies in the identification and mapping of different site types, both within and across these datasets. Recognizing the

implications of this variability for spatial analysis, the paper explores the use of sampling areas as a strategy to mitigate potential biases. This approach seeks to refine methodologies for interpreting lidar data in archaeological research, emphasizing the need for nuanced analytical frameworks that account for differences in resolution and environmental context. At the same time, the study underscores the effectiveness of low-resolution lidar in addressing biases in landscape archaeology and in providing more representative datasets of site distributions.

2487. RECENT LIDAR FINDS FROM THE TERRITORIES OF BULGARIA

Contribution format: Oral  
Contribution authors: Todor Boyadzhiev (Veliko Tarnovo University)

The application of LiDAR technology in archaeological research has significantly expanded our ability to detect and interpret hidden structures across diverse landscapes. This contribution presents several notable discoveries made through recent LiDAR surveys in Bulgaria, highlighting both newly identified and confirmed archaeological features. One of the most significant findings includes a cluster of multiple burial mounds near the Sandanski region, which suggests a previously unknown necropolis with potential links to Thracian or earlier cultures. Additionally, unexplained terraces have been identified near officially registered archaeological sites in the Velinograd area. These terraces, whose purpose remains uncertain, may indicate previously unknown settlement or other type of activities. Furthermore, LiDAR imaging has allowed us to confirm the existence of a secondary defensive wall previously documented in the 19th century but later lost to historical records. This rediscovery not only validates historical accounts but also enhances our understanding of the site’s fortification system. In the Momchilgrad region, a previously unknown secondary wall of a medieval fortress was revealed, indicating a more complex defensive layout than previously assumed. Our analysis has confirmed the number and layout of defensive towers on a Roman fortification, providing new insights into its architectural and strategic planning. These findings underscore the critical role of LiDAR in advancing archaeological knowledge, offering a non-invasive means of uncovering lost or overlooked structures. The results of this study contribute to a more nuanced understanding of Bulgaria’s archaeological landscape and highlight the potential for future LiDAR applications in the region.

2056. LIDAR AND REMOTE SENSING IN CRNOBUKI AND DEMIR KAPIJA

Contribution format: Oral  
Contribution authors: Byron Smith – Nick Angeloff (Cal Poly Humboldt) – Rebekka Knierim (SWCA) – Jessica Bedell (Cal Poly Humboldt)

Cal Poly Humboldt, Museum Bitola, and Institute Prilip are utilizing both state provided Lidar data and high-resolution project flown Lidar data to gain a comprehensive understanding of the Paeonian and Pelagonian regions of ancient Macedonia at varying resolutions. Macedonia has regional point cloud data available and both these projects are currently utilizing this data to understand the broader landscape and context of our discrete project areas. In addition, Cal Poly Humboldt is conducting Lidar surveys of discrete areas associated with our direct project areas to provide higher resolution data and incorporating the use of photogrammetry and ground penetrating radar to further refine our remote sensing data associated with portions of our larger scale project areas. By utilizing the available datasets, we have been able to enrich contextual understandings that we would not have been available by utilizing a mutually exclusive framework. Of particular importance is utilizing the existing state provided Lidar sets in point cloud format to inform and target our use of higher resolution drone Lidar. These efforts have allowed us to focus our work on those areas that would benefit more from the archaeological resources of Macedonia as opposed to spending time and scarce resources utilizing more traditional methods. In Demir Kapija we faced challenges associated with dense, low lying vegetation and have developed post processing methods that allow us to alleviate much of the background noise resulting in high quality data, and in Crnobuki we found that the incorporation of photogrammetry and GPR enhanced our Lidar data resulting in an agglomerated data set that significantly improved our field methods and allowed for more effective use of scarce resources and time. Both are presented here to foster discussion and allow for advice of other experts to further refine our methods to our mutual benefit.

1751. MAQUIS, MARBLE, AND MACHINE LEARNING: CURRENT AND FUTURE APPROACHES TO CLASSIFICATION OF UAV LIDAR IN MEDITERRANEAN ARCHAEOLOGY

Contribution format: Oral  
Contribution authors: Hallvard Indgjerd (Museum of Cultural History, University of Oslo) – Evan Levine (University of Copenhagen)

The use of UAV lidar for low-altitude, high-resolution topographic survey is becoming increasingly common in archaeological field research, offering archaeologists direct control over the collection of lidar data. However, the processing workflows and classification algorithms most commonly employed by archaeologist were developed

for higher altitude, lower resolution airborne laser scanning (ALS), and are not optimized for the higher resolution topographic data collected by UAV lidar platforms. These algorithms are also unsuitable for Mediterranean vegetation profiles and are not designed to specifically target archaeological remains. This paper evaluates existing open algorithms and processing methodologies for point cloud classification with a focus on their ability to discern archaeologically relevant features in low altitude, high resolution lidar datasets. The case studies use data collected at ancient marble quarries on the Cycladic island of Naxos and the funerary landscape in Mølen, Norway, which present a diverse range of vegetation types, complex topography, and varied anthropic features. Looking ahead, we explore new advances in the use of deep learning for the development of semi-supervised classification models. Could the fast-paced development in machine learning lead to the creation of classifiers specifically targeted for Mediterranean landscapes and the documentation of archaeological features? We discuss possible workflows and compare test results of classification models produced from semi-supervised deep learning models to industry standard classification algorithms, exploring the strengths, weaknesses, and potential for advances in point cloud classification for archaeological enquiry. In so doing, we argue for the need to develop analytical tools designed specifically for the high resolution datasets produced by low-altitude UAV data collection in the context of archaeological feature documentation.

2252. ARCHAEOLOGICAL LIDAR APPLICATIONS IN GREECE: SUMMARY AND PROSPECTS

**Contribution format:** Oral  
**Contribution authors:** Alex Knodell (Carleton College)
