This paper provides a summary of recent archaeological applications of lidar-based remote sensing in Greece. It reviews the (relatively few) examples of published research on this topic, and summarizes a variety of recent and ongoing work that was presented at a conference organized at the American School of Classical Studies at Athens in 2024. Lidar data is not publicly available in Greece, with the exception of a few datasets covering specific areas. Archaeological lidar applications are therefore dependent on commissioning flights by private companies or independent data collection, usually via the use of drones. There is therefore a high-threshold for entry, in terms of access to funds, equipment, and expertise, meaning that lidar may not be well suited to all research questions and projects. That said, in some contexts, especially projects conceived at the landscape and regional scale, lidar can be a tremendous resource in feature detection, classification, and documenting human-modified landscapes over large areas. This paper aims to highlight some broad trends, themes of interest, and concerns for archaeologists interested in archaeological lidar and other, related forms of remote sensing in Greece. It also provides some recommendations concerning research design for researchers interested in archaeological lidar in comparable contexts elsewhere in the Mediterranean.

113 ALL FOR ONE, UNDERSTAND HUMAN AND NON-HUMAN RELATIONSHIPS IN COASTAL AND ISLAND CONTEXTS FROM AN INTERDISCIPLINARY PERSPECTIVE

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Zooarchaeology, Archaeometry,, Biomolecular, Isotope, Coastal and Island Archaeology  
**Session organisers:** Simon-Pierre Gilson – Aitor Brito-Mayor (Universidad de Las Palmas de Gran Canaria) – Mauricio Marciales Daza (Universität Tübingen)

SESSION ABSTRACT

Coastal and island regions, with their distinct ecological and cultural dynamics, offer unparalleled opportunities to study human-animal relationships, past ecologies, and recent animal evolution. These unique contexts are critical for exploring how human and non-human histories have been shaped by the interplay of terrestrial and marine environments, making them a priority for archaeological research. From an interdisciplinary perspective, the study of non-human remains in these regions has led us to identify sensitive management of animal husbandry and wildlife exploitation in the past. Integrating Zooarchaeology (along with its subfields) and Archaeometry (employing techniques such as microscopic analysis, biomarker studies, isotope analysis, paleoproteomics, or aDNA) has significantly advanced our understanding of these issues. However, a lack of platforms for cross-disciplinary dialogue has often led to fragmented knowledge and limited integration of findings. This issue is compounded when researchers face interdisciplinary challenges and struggle between strongly different theoretical approaches. This session seeks to prioritize discussing human and non-human relationships in coastal and island regions while fostering dialogue among specialists from diverse disciplines. Presentations will focus on methods, limitations, and how challenges were addressed through integrating multiple methodologies. By emphasizing methodological synthesis in these critical regions, the session aims to advance a deeper

understanding of the dynamic relationships between humans, animals, and environments in coastal and island contexts.

CONTRIBUTION ABSTRACTS

635. CHANGES IN COASTAL SUBSISTENCE STRATEGIES IN WALLACEA FROM THE PLEISTOCENE TO THE HOLOCENE

**Contribution format:** Oral  
**Contribution authors:** Hendri Kaharudin – Sue O’Connor (The Australian National University)

Wallacea, a biogeographical transition zone between Asia and Australia, provides a critical context for understanding coastal subsistence strategies from the Pleistocene to the Holocene. The region has been inhabited by early modern humans since at least 50,000 years ago. Archaeological evidence reveals how early inhabitants adapted to dynamic marine environments through diverse resource exploitation strategies, including shellfish gathering, reef fishing, and deep-sea resource utilization. These adaptive practices emerged in response to complex environmental shifts, sea-level fluctuations, and inter-island mobility. Technological innovations and socio-cultural adaptations enabled human resilience in fluctuating coastal ecosystems, with specialized fishing tools and mobility strategies facilitating survival across this fragmented seascape. To examine variations in coastal subsistence strategies and transformations in lifeways from the Pleistocene to the Holocene, we excavated four cave sites on ecologically distinct islands, documenting exploited faunal remains throughout periods of occupation. We also analyzed and discussed existing archaeological assemblages alongside previously reported coastal sites. By integrating archaeological, paleoenvironmental, and ethnographic data, this research reconstructs long-term human-environment interactions, illuminating the mechanisms of human adaptation in challenging maritime landscapes. The study offers crucial insights into marine resource utilization, migration patterns, and the development of coastal economies in island Southeast Asia, demonstrating how early populations navigated and survived environmental transformations through strategic resource management and technological innovation.

959. HUMAN-HARBOUR PORPOISE INTERACTIONS IN THE BALTIC SEA FROM PREHISTORY TO MODERNITY

**Contribution format:** Oral  
**Contribution authors:** Magie Aiken (Swedish Museum of Natural History | Trent University) – Youri Van Den Hurk (University of Bergen) – Pia Eriksson – Julia Carlström (Swedish Museum of Natural History)

Humans have interacted with harbour porpoises (*Phocoena phocoena*) in the Baltic Sea region since the initial human settlement of the area approximately 9,000 years ago. Over this time, anthropogenic impacts have reduced the Baltic Proper population, leading to its status as critically endangered and subject to intensive, multinational conservation efforts. This study traces human interactions with harbour porpoises in the Baltic Sea region from the Mesolithic through to the Modern period through a multidisciplinary lens, integrating zooarchaeological data, medieval manuscripts, historical accounts, and archival Swedish newspapers. Zooarchaeological evidence suggests harbour porpoises were actively exploited during the Mesolithic and Neolithic periods, likely for sustenance. By the Medieval period, however, the symbolic value of harbour porpoises appears to surpass its utilitarian role, with archaeological evidence indicating its growing social significance. Historical zoological reports and travel accounts from the 19th century show a development of scientific understanding of the species. Swedish archival newspapers offer detailed accounts of harbour porpoises observations and interactions, presenting perspectives ranging from being enemies of the fisheries to being regarded as playful curiosities. In the latter half of the 20th century, the development of ecological concerns shifted the focus toward protecting the Baltic Proper harbour porpoise. Through this study, we can see the transformation in human-animal relationships from primary substance based in the prehistoric to a species of symbolic (and monetary) importance, and later the subject of scientific curiosity and public interest. By synthesizing (zoo)archaeological, historical, and documentary evidence, this study traces long-term human interactions with harbour porpoises and contributes to broader discussions on the complexities of relationships with non-human species in coastal contexts and the importance of understanding long-term interactions for modern conservation.

2379. TRACING MOBILITY AND WATER SOURCING IN BRONZE AGE MENORCA THROUGH ISOTOPE ANALYSIS IN HUMAN AND FAUNA REMAINS

**Contribution format:** Oral  
**Contribution authors:** Mauricio Marciales – Marta Díaz-Zorita Bonilla (University of Tübingen) – Auxilio Moreno (University of Granada) – Monice Timm – Dobereine. Chala-Aldana (University of Tübingen) – Damiá Ramis (Museu de Menorca, Menorca, Balearic Islands) – Antoni

Ferrer (Institut Menorquí d’Estudis. Maó. Balearic Islands) – Maria José León (Museu de Ciutadella, Menorca, Balearic Islands) – Antonio Delgado (Instituto Andaluz de Ciencias de la Tierra (CSIC-UGR): Armilla)

Understanding how humans and animals moved across landscapes is crucial for reconstructing past societies, and isotope analysis provides a powerful tool for tracking these patterns. This is especially important in island environments, where geographic isolation, resource limitations, and distinct ecological conditions shape mobility and subsistence strategies. Our study integrates archaeology, archaeometry, and animal ecology to explore human-animal movement and resource use in Bronze and Iron Age Menorca through oxygen and strontium isotope analysis. The unique environmental conditions of Menorca, including its “limited” freshwater sources, low-altitude landscape, and diverse geological formation, provide an ideal context for investigating patterns of mobility and their effects on ancient island communities. To explore these dynamics, we examine oxygen isotope data from cattle, caprines, and suids recovered from five archaeological sites—Binipati Nou, Cala Blanca, Clariana, Cornia Nou, and Cala Morell—spanning the Bronze Age to the Iron Age. To gain further insight into human movement, we compare these findings with oxygen and strontium isotopic data from human remains excavated at Biniadrís Cave, a funerary cave in the south eas. part of the island with one of the longest utilization periods in the island, dating from ca.1400 to ca 500 BC. Preliminary results from the fauna indicate shifts in husbandry, trade networks, and settlement organization, reflecting broader social and economic changes. By comparing isotopic data, we investigate the origins of individuals not only buried in Biniadrís Cave, but also from the communities these fauna had direct contact from, providing a deeper understanding of mobility and human-environment interactions. Our analysis reveals seasonal movement patterns, livestock management strategies, and water resource use, offering valuable insights into past societies.

252. COMPLETE MITOCHONDRIAL GENOMES PROVIDE EVIDENCE ON THE GEOGRAPHICAL ORIGIN AND THE TEMPORAL EVOLUTION OF ANCIENT GOATS FROM CANARY ISLANDS

**Contribution format:** Oral  
**Contribution authors:** Clara Díaz Pérez (Universidad de La Laguna) – Kevin Daly (UCD School of Agriculture and Food Science, University College Dublin) – Aito. Brito-Mayo. – Alejandra C. Ordóñez (Universidad de Las Palmas de Gran Canaria) – Javie. G. Serrano (Universidad de La Laguna) – Jonatha. Santan. (Universidad de Las Palmas de Gran Canaria) – Ros. Frege. (Universidad de La Laguna)

Archaeological and linguistic evidence have confirmed the North African origin of the indigenous people of the Canary Islands. Additionally, radiocarbon data has shown that, excluding the temporal Roman purple dye workshop exploited in the islet of Lobos around the 2 nd century BC, the permanent settlement of the archipelago occurred at the beginning of the common era and lasted until the European colonization in the 15 th century. An alternative way of obtaining information on the geographic origin of populations is by analyzing their domestic species. One of the most abundant domesticates in the indigenous archaeological records are goats, providing a great opportunity to explore its origin and evolution in the islands. In this study, we apply for the first time next-generation sequencing to the recovery of whole mitochondrial DNA genomes of ancient goats from the Canaries (n=75), including animals associated to the Roman workshop, the indigenous occupation of archipelago and the colonial society. Phylogenetic analysis of the Canarian ancient goat mitogenomes indicates they belong to two different clades: A2a and the newly defined A8. Both have been observed mostly in present-day goats from the Middle East and North Africa, confirming previous results. Regarding the Roman goats, individuals from Lobos belong to the same clades as the indigenous ones. The sharing of specific haplotypes by Roman and indigenous goats from the islands closer to the African continent suggests that both settlements might have overlapped, leading to the movement of goats from the neighboring islands to Lobos. All historical samples fall within A8, pointing to the continuing use of indigenous herds up to the 18 th century.

2257. ANIMALS OF THE MAJOS (FUERTEVENTURA, CANARY ISLANDS): ZOOARCHAEOLOGICAL AND ISOTOPIC APPROACH TO SUBSISTENCE ON A DESERT-LIKE ISLAND

**Contribution format:** Oral  
**Contribution authors:** Aitor Brito-Mayor – Simon Gilson (University of Las Palmas) – Marta Moreno-García (Institute of History, CSIC) – Elías Sánchez-Cañadillas (University of Las Palmas) – Eneko Iriarte (University of Burgos) – Marta Díaz-Zorita Bonilla (University of Tübingen) – Jonathan Santana (University of Las Palmas)

This study examines human-animal interactions among the Majos, the ancient inhabitants of Fuerteventura (Canary Islands, Spain), in order to better understand their adaptive strategies in an arid and isolated environment. Ethnohistorical and historical sources suggest that their subsistence was primarily based on animal husbandry; however, few archaeological sites have been analyzed using a zooarchaeological approach to validate this claim.

Preliminary isotopic analyses of human remains indicate a significant intake of marine resources, highlighting the need to reassess these contrasting subsistence models with additional evidence. To address this, we conducted zooarchaeological and isotopic analyses ( $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ) on faunal remains from three archaeological sites on Fuerteventura. The results show an abundance of domestic, wild, and marine fauna at all sites, suggesting a more diversified subsistence strategy than previously assumed. In addition, the isotopic values of terrestrial faunal remains exhibit exceptionally high nitrogen levels and positive carbon values, probably reflecting the impact of Fuerteventura’s arid environment and lack of significant mountainous areas on isotopic baselines. This research highlights the need to integrate human and faunal remains in isotopic studies to elucidate the complex interaction between environmental factors, subsistence strategies, and isotopic signatures in archaeological contexts.

1199. KNOW YOUR FISH TO UNDERSTAND YOUR DIET. ISOTOPIC AND ICTHYOARCHAEOLOGIC STUD-IES OF THE CANARY ISLANDS PARROTFISH

**Contribution format:** Oral  
**Contribution authors:** Simon-Pierre Gilson – Aitor Brito-Mayor – Elías Sánchez-Cañadillas (Universidad de Las Palmas de Gran Canaria) – Eneko Iriarte (Universidad de Burgos) – Javier Cruz Viera – Jonathan Santana (Universidad de Las Palmas de Gran Canaria)

The faunal remains associated with marine resources in the Canary Islands have received limited attention, often being overlooked or considered secondary products. Since 2022, the IsoCan project (ERC) has focused on the ichthyoarchaeological remains from several precolonial settlements in the Canary Islands, leading to zooarchaeological studies that provide new insights into the role of marine resources in the diets of indigenous populations. Key findings from this research include the identification of specialized processing sites, such as La Herradura on El Hierro Island, which suggest the processing of fish before transport and distribution. Previous isotopic analyses of human remains have shown a significant contribution of marine resources to the diet of the El Hierro popula-tion. These isotopic values, associated with shell middens on the island, were interpreted as evidence of marine mollusk consumption. However, the ichthyoarchaeological studies emphasize the importance of the Parrotfish (Sparisoma cretense), which accounts for 70 to 80% of the identified fish remains. In the Canary Islands, this fish is predominantly herbivorous. Consequently, the reconstruction of past marine trophic levels using stable isotopes may challenge the interpretation of the significance of mollusks and underscore the importance of fish, particularly the parrotfish.

114 EARLY CAREER ARCHAEOLOGIST WORKSHOP: HOW TO BUILD AN INTERNA-TIONAL CAREER?

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Workshop  
**Session keywords:** Career planning, Professional development, International careers  
**Session organisers:** Jason Cohen (University College London | ECA Community Co-Chair) – Maxime Brami (Pre- and Protohistoric Archaeology, JGU Mainz | ECA Community Chairman Emeritus) – Florian Helmecke (Leiden University | ECA Community Co-Chair) – Nicola Scheyhing (Independet Researcher | Kulturbetriebe Burgenlandkreis GmbH | ECA Community Co-Chair)  
**Session speakers:** Laura Coltofean-Arizancu (German Archaeological Institute, Romano-Germanic Commission) – Maria Mina (University of the Aegean) – Sofia Fonseca (Teiduma Consultancy on Heritage, Culture and Sustainability) – Sabina Cveček (Field Museum of Natural History Chicago & Austrian Academy of Sciences) – Christina Tsoraki (University of Leicester) – Daniela Hofmann (University of Bergen) – Katherine Kanne (University College Dublin)

SESSION ABSTRACT

Early career archaeologists (ECAs) are increasingly expected to be mobile and actively seek international training, fieldwork, funding, and collaboration opportunities. However, while there are many paths to building an international career in academia, heritage and contract archaeology, or GLAM (galleries, libraries, archives, and museums), the journey is far from straightforward. Moving from one academic system to another can feel daunting, due to differing professional standards, job requirements, and language barriers. Moreover, navigating the complexities of diverse standards of recruitment, academic titling, and career progression paths makes career planning difficult. In Europe, these typically vary from country to country, and sometimes even from faculty to faculty. International mobility is even more challenging for professional archaeologists who work outside of

academia, whose skills are not easily recognized in other countries. In essence, there is no clear outline of an international pathway to secure (permanent) employment, despite increasingly transnational funding schemes within the field as well as a genuine will to better collaborate across borders. This workshop, organized by the Early Career Archaeologists (ECA) Community of the EAA, will explore diverse international career pathways, including the benefits and challenges they present. Our panel will discuss how early career archaeologists can game the system to advance their careers in the most effective way. Topics to be considered include.

- When is it worth moving abroad and what funding opportunities are available?
- What are the differences between academic systems in Europe (e.g. accreditation, tenure track, remuneration, recognition)?
- What are the international employment options for archaeologists in heritage, contract archaeology, and GLAM?
- Is pursuing a career outside of Europe worthwhile?

115 EAA COMMUNITY FOR CLIMATE CHANGE AND HERITAGE (CCH) ROUNDTABLE

**Session theme:** 7. Climate Change in the Past and Present  
**Session format:** Round table  
**Session keywords:** Heritage, Climate Change, Communication, Policy, Sustainability  
**Session organisers:** Peter F Biehl (University of California Santa Cruz) – Vibeke Vandrup Marten (Norwegian Institute for Cultural Heritage Research (NIKU))

SESSION ABSTRACT

Climate Change has impacted human life and its material culture and environment in the past and is transforming archaeological practice and the management of our heritage in the present and will do so even more in the future. Although we have made progress in formulating important statements including far reaching recommendations for mitigation and adaptation of our practices as archaeologists and heritage managers (<https://www.e-a-a.org/2021Statement>), SACC 2021 (<https://www.jma.uni-kiel.de/en/research-projects/sacc/sacc-statement-2021.pdf>), and the SAA 2022 (Microsoft Word - SAA Statement on Climate Change and Cultural Heritage (windows.net) we still struggle with funding our work, embedding and sustaining it with national and international policies and communicate and apply our findings and solutions beyond the professional communities to the public. This ninth roundtable organized by the EAA Community for Climate Change and Heritage (CCH) builds on the success of the previous ones and hopes to focus this year on: (1) funding, (2) policies, (3) sustainability, and (4) communication. We are inviting representatives of key archaeology associations as well as specialists in climate change and heritage research and policy as a sounding board for the CCH activities. The roundtable session will provide an update on the work done in and by the community since the previous meeting and discuss the results of a survey about opportunities and challenges as well as suggestions for next steps for the Community to grow and extend its network and activities to help adapt to a global climate crisis, find good solutions for adaptation and mitigation and their communication to the professional community and the public, and thus increase heritage and societal resilience.

117 BEYOND DATA: TOWARDS STANDARDIZED METHODS TO IDENTIFY ARCHAEOLOGICAL MATERIAL

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Discussion session  
**Session keywords:** persistent identifiers, archaeological material, collection management, archive, research data management, samples  
**Session organisers:** Thomas Rose (Forschungsbereich Archäometallurgie, Deutsches Bergbau-Museum Bochum, Bochum) – David Novák (Institute of Archaeology of the CAS, Prague)

SESSION ABSTRACT

Managing and archiving archaeological data is a long-term challenge in archaeology. For research on excavated remains, it is pivotal to know where they are stored and have access to basic information about them. Persistent identifiers (PIDs) offer this functionality in a digitized world. PIDs are unique identifiers that are permanently and unambiguously linked to research outputs, ensuring they can be reliably retrieved and referenced over time. Each PID is associated with prescribed information (metadata) about an output such that it can be comprehensively described, increasing its FAIRness (findability, accessibility, interoperability, and reusability) and openness. The

International Generic Sample Number (IGSN ID) is the first ever PID for physical samples—including all types of archaeological material—and is the global standard for their persistent identification. This session highlights the importance and value of PIDs for archaeological material. No matter your level of knowledge about PIDs and metadata, it is open to anyone with an interest in describing archaeological material in a standardized way or registering PIDs for their archaeological material. The session is particularly relevant to those managing archaeology collections and records. To the above end, we invite papers that offer insights on:

- \* Experiences of PID adoption for archaeological material, including from those in process of adoption.
- \* Unique/interesting use cases of (un)successful management of archaeological material, including using PIDs.
- \* Efforts to develop standardized (metadata) descriptions for archaeological material or vocabularies/ontologies for material properties.

Lots of time will be provided for discussion around the specific challenges that archaeologists face when it comes to managing and describing archaeological material, and the barriers to adopting PIDs. This session is organized by the IGSN Archaeology Community of Practice. Since March 2022, this group of archaeologists has met monthly to promote adoption of PIDs and develop a metadata profile for archaeological material.

CONTRIBUTION ABSTRACTS

1381. WITH A TROWEL IN HAND AND A DATABASE IN BACKPACK: ARCHAEOLOGY 2.0

**Contribution format:** Oral  
**Contribution authors:** Katarzyna Langenegger (Digital Humanities, University of Bern | Institute of Archaeological Sciences University of Bern)

Archaeology gains meaning through data describing artefacts and their contexts. However, the increasing volume of data in archaeological projects poses significant challenges, particularly in contemporary archaeology, where efficient storage and analysis are essential. Since the 1980s, relational databases have been widely employed as documentation tools. These databases are often highly customised to meet specific research questions, system requirements, budgets, and levels of user expertise. While customisation shapes database structures to suit needs, it often compromises sustainability, as many are developed for short-term projects and become unsupported once funding ends. This results in a fragmented data landscape, making long-term research and data integration more difficult. Additional challenges arise from the diverse data types—such as text, photographs, and GIS data—and from unexpected findings that may not conform to the rigid structures of relational models. The GeWis project at the University of Bern addresses these challenges with a flexible and sustainable graph database designed for archaeology. It supports various data types, including texts, images, GIS data, and 3D models, adapting to unexpected discoveries and complex relationships. By adhering to standards such as CIDOC-CRM and Open Research Data principles, GeWis ensures interoperability, machine readability, and long-term preservation. ETL processes integrate legacy data from systems like FileMaker (Sirkeli Höyük, Gonur Depe), bridging documentation gaps. A user-friendly, narrative-driven interface facilitates data entry and analysis, enabling users of different technical backgrounds to track artefacts from discovery to publication efficiently. This innovative approach enhances data integration, streamlines collaborative workflows, and ensures the sustainability of archaeological data for future research. The presentation will outline the development of the graph database and its potential to transform archaeological data management. In particular, the steps involved in setting up the ontology with corresponding metadata are presented.

806. ENABLING AN END-TO-END SAMPLE WORKFLOW FROM COLLECTION, TO MANAGEMENT, TO ARCHIVING, THROUGH RESEARCH TOOL INTEROPERABILITY

**Contribution format:** Oral  
**Contribution authors:** Vaida Plankyte – Rory Macneil (RSpace (ResearchSpace))

We present a case study of our end-to-end, integrated research data management workflow for material samples. We integrate three tools, covering sample collection, processing, storage, and archiving. - Fieldmark, an offline sample metadata collection tool - RSpace, an ELN and sample management system and RDM platform - Generalist and domain-specific data repositorie. The presentation will also explain how consistent use of IGSN IDs (the material sample persistent identifier) in every tool and at every stage of the process acts as an integrating force and enhances data discovery. We will also cover planned support for PIDINST. We wish to present both practical recommendations, as well as higher-level reflections on how to approach thinking and developing tool interoperability at an institution, and its benefits for researchers and RDM as a whole. In the course of implementing this workflow, we have been exploring how to best design metadata and data flows across tools that are used in different stages of the research process. These tools naturally have different requirements, focuses, and functionality from each other. In our presentation we will address lessons learned about the following questions. - How to facilitate researcher processes by integrating tools, ensuring traceability and no metadata loss for sample data? - What considerations need to be taken into account by institutions and tool developers to design flexible solutions

that satisfy user needs. We hope that attendees will gain a strengthened mental model of how their tools ecosystem could interact, and how to approach building greater interoperability in their workflows.

492. IMPLEMENTATION OF PERSISTENT IDENTIFIERS IN THE ARCHAEOLOGICAL MAP OF THE CZECH REPUBLIC: CHALLENGES, DECISIONS, AND BENEFITS

Contribution format: Oral  
Contribution authors: David Novak (Institute of Archaeology of the CAS, Prague)

Since 2016, archaeological fieldwork data in the Czech Republic has been integrated into a unified information system, the Archaeological Map of the Czech Republic (AMCR). This system consolidates tools for managing archaeological fieldwork administration and serves as a digital repository for related research data. Subsequently, additional application modules have been developed, either directly integrated into AMCR or incorporated into the broader research infrastructure of the Archaeological Information System of the Czech Republic (AIS CR). As part of the ongoing adaptation of the AMCR repository to international best practice, various types of persistent identifiers (PIDs) were implemented in 2025. These include DOI for documentation, ORCID and Wikidata for users and other individuals, and IGSN for archaeological finds and sites. This paper presents a practical case study of the implementation process, highlighting the challenges, key decisions and resulting benefits for users. In addition, the paper emphasises the importance of viewing PIDs as an integral part of a wider network of digital records relating to the archaeological heritage. Within AMCR, the standard assignment of PIDs has unlocked hundreds of thousands of digital objects, making them more accessible to users, ensuring their consistent and persistent identification, and enabling their use in a variety of contexts. This includes assessing the impact of archaeological research and giving appropriate credit to individual researchers throughout the research process.

1542. IMPLEMENTING AND USING PERMANENT IDS AT THE ADS AND HSDS

Contribution format: Oral  
Contribution authors: Kieron Niven (Archaeology Data Service, University of York)

This paper intends to present and discuss the continuing work being undertaken to develop data standards and structures within the Archaeology Data Service (ADS) and nascent Heritage Science Data Service (HSDS) at the University of York, UK. While the ADS has been preserving and disseminating archaeological data for almost thirty years, the HSDS is currently in its initial set-up phase, working to provide core digital research services as part of the RICHeS programme, the UK’s Research Infrastructure for Conservation and Heritage Science. The nature and structure of archived collections at both the ADS and HSDS will be described with a particular focus on the granularity of data storage and how this relates to the overarching catalogues and metadata specifications being developed for the HSDS. Existing native unique IDs in both services will be discussed, particularly in terms of their relationship to the long-term usage of DOIs and ORCIDs at the ADS. Additionally, IGSNs will be explored in terms of their initial adoption and the mechanisms and workflows available for their creation and inclusion within the various catalogues.

1123. HARVESTING INFORMATION FROM THE PID NETWORK: TERRALID AS CASE STUDY

Contribution format: Oral  
Contribution authors: Thomas Rose – Tim Greifelt – Katrin Westner – Annette Hornschuch – Yiu-Kang Hsu (Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum) – Helge Wiethoff (Technische Hochschule Georg Agricola, Bochum) – Sabine Klein (Leibniz-Forschungsmuseum für Georessourcen/Deutsches Bergbau-Museum Bochum | Ruhr-Universität Bochum)

Managing the ever-increasing amount of research data related to archaeological objects requires their organisation as structured information and deposition in repositories and research data infrastructures. Ideally, the data adheres to the FAIR principles. Persistent Identifiers (PIDs) play a pivotal role in this endeavour because they make both, digital and physical objects findable and referenceable. Usually, metadata about the respective object can be retrieved by using its PIDs. For example, bibliographic information of an online publication can be retrieved by using its DOI. Consequently, PIDs are a key element in a federated network of specialised (research) data infrastructures, each maintained by their respective specialists, between which information can freely flow. TerraLID, the emerging research data infrastructure for lead isotope data in archaeology, is no difference. Beyond lead isotope data and their metadata, TerraLID aims to re-use metadata stored in other data infrastructures, such as geographic and chronological gazetteers or associated with IGSN and ORCID IDs and to link to vocabulary entries. Providing key information about the object and its site, IGSN is envisioned to play a central role in the future. The use of PIDs will be actively promoted by TerraLID because harvesting metadata from other services facilitates data entry for the user while ensuring formal validity of metadata, reducing workload for data curation. This contribution will present how TerraLID uses PIDs to enrich its database with information harvested

from other services and keeping its metadata profile interoperable. It further shows how TerraLID places itself as in the PID network by minting PIDs to make its data and vocabularies available to the public and discusses some of the challenges faced and strategies developed to overcome them.

118 ‘PECUNIA NON OLET?’ — ARCHAEOLOGIES OF URBAN WASTE MANAGEMENT

Session theme: 3. Exploring methods in research, education and communication  
Session format: Regular session  
Session keywords: urban archaeology, waste management, rubbish, hinterland, cities, circular economy  
Session organisers: Paul Belford (Heritage Innovation) – Jeroen Bouwmeester (Rijksdienst voor het Cultureel Erfgoed) – Kirstine Haase (Museum Odense)

SESSION ABSTRACT

By its very nature urban archaeology deals with detritus, but the actual management of waste in towns and cities is often overlooked. Any densely populated area will generate large amounts of waste every day. This not only includes human and animal excrement, and rubbish from everyday life, but also waste from the various industrial and artisan activities — from metalworking to pottery manufacture to the production of leather and textiles. Of course one person’s waste is another person’s valuable resource. Metalworking slag is used for road-building; urine is used by fullers and tanners; cesspits are emptied into the rural hinterland to fertilise fields. Slaughtered animals provide food and skin, but also bone to make tools, buttons and other artefacts. Almost all waste eventually served a purpose. In this session we want to look at the archaeological evidence for urban waste management in the past — and to think about some of the lessons we might learn for the ‘circular economies’ of our cities in the future. We invite contributions on any aspect of waste and rubbish in urban contexts. Topics might include: - Recovery, sorting and re-use of waste — what, how, where and who? - The role of waste management in the control of hygiene and disease - Evidence for the regulation of waste processes by municipal authorities — and evidence of transgression and misbehaviour (such as illegal pollution and dumping) - Attempts at pollution control and urban zoning (brewers upstream, tanners downstream) - Paleobotanical and paleobiological markers for sanitation — and the lack of it. - What can the archaeological distribution of waste tell us about urban life. We encourage you to submit papers about rubbish — but not rubbish papers!

CONTRIBUTION ABSTRACTS

1499. JUST WASTE? A CASE STUDY ON THE DEPOSITION OF FAUNAL REMAINS FROM THE SITE OF PISTIROS, BULGARIA

Contribution format: Oral  
Contribution authors: Stella Nikolova – Emil Nankov – Alexey Gotsev (National Archaeological Institute with Museum - Bulgarian Academy of Sciences)

The following paper explores the discarding of food waste within the settlement of Pistiros, Bulgaria dated to the 5th – 3rd century BC. Pistiros is one of the most interesting Iron Age sites in Bulgaria, as its ongoing excavations from 1988 changed the narrative on ancient Greek colonization, as this site seemed like an outlier, established not like other colonies on the seashore, but deep inland within the Thracian valley which was the heart of the ancient Odrysian Kingdom. An inscription states that the population consisted of Greek merchants who commenced trade with the local people. While the excavations have yielded various artifacts and coin hoards, little attention has been given to the animal remains from this site, which formed the bulk of the recovered material. They were simply labeled as “food waste”, but in the course of their full analysis, it was made apparent that they were over 60,000 in number, something unusual even for large settlements. This sheer quantity of material opened new questions. Why were there so-many of them within the fill of buildings, and did they serve any purpose aside from waste. To answer this question, the following case study applies taphonomical and special analysis to explore any depositional patterns.

700. A NEW GREAT DRAIN CHANNEL AT CERRO DE LOSALMADENES (OTERO DE HERREROS, SPAIN). REFLECTIONS ABOUT HYDRAULICS, ARCHITECTURE AND STRATIGRAPHY

Contribution format: Oral  
Contribution authors: Juan Álvarez García – Mariano Ayarzagüena Sanz – Santiago Valiente Cánovas (Sociedad Española de Historia de la Arqueología) – Gonzalo Lozano Otero (Instituto Geológico y Minero de España - Consejo Superior de Investigaciones Científicas)

The archaeological site of Cerro de losAlmadenes (Otero de Herreros, Spain), as one of the main copper production

sites of the Iberian Peninsula, has provided a lot of information about hydraulics in the mining-metallurgical field. Although the first investigations on the north-eastern slope of the Cerro already showed the existence of important hydraulic structures related to the copper smelting furnaces, recent investigations on the upper platform have revealed new ones associated with the structure that could be the main area for the management and control of metallurgical activities, a possible Roman castellum built between 1st century BC and the 1st century AD. Specifically, a channel was discovered, which has been investigated between 2021 and 2024. This channel has features not seen at the site before. Its size is remarkable, which exceeds that of others previously found, but also its layout and the materials used are notable. Everything indicates that it is a large water drainage structure. In addition, the dating of related materials establishes its construction in the 3rd century AD. This date, together with the relationship of the channel itself and the structures and stratigraphy of the surrounding area, has led us to make interesting interpretations about the succession and functions of several of the constructions that made up the castellum. Thus, this channel has not only provided us with information about the water drainage system used here but also allows us to develop hypotheses about the construction phases of the building to which it belonged.

**1117. BUILDING ON THE RUBBLE. DISCARDED POTTERY AS A RESOURCE IN ROMAN CREMONA AND ITS HINTERLAND**

**Contribution format:** Oral  
**Contribution authors:** Anna Riccato (University of Milan, Department of Cultural and Environmental Heritage)

As is well known, pottery was one of the main waste products in the Roman cities. Equally well known, however, is the phenomenon of the recovery of this type of material, which was recycled and reused within a virtuous circle that ensured both better waste management and the optimisation of available resources. This issue is currently being studied within the “CircE Project”, led by the Universities of Milan and Verona, which aims to assess the development of such activities over the longue durée and in different contexts of the ancient Cisalpine territory (Northern Italy). This paper will focus in particular on the case study of one of the region’s most important urban centres: the Roman colony of Cremona. Through an in-depth survey of published and unpublished data, it was possible to identify the ceramic classes most frequently affected by reclamation and recycling and to recognise the different ways in which they were reused, mainly connected to the needs of public and private construction but also to various necessities of everyday life, thus leading to reflect on the main actors involved in the retrieval of discarded pottery and its reintroduction in the society. The comparison with some minor sites of the city’s hinterland provided interesting data to investigate how urban communities differed from rural ones in exploiting discarded ceramic containers. Finally, the broad chronological span covered by the research, extending from the Late Republican age to the Late Antiquity, allowed to assess the development of circular economy processes in a diachronic sense and to ask which drivers of change influenced the abandonment or - the contrary - the strengthening of waste recovery practices.

**1762. WASTE MANAGEMENT, URBAN DYNAMICS AND SOCIETY IN OLD DONGOLA (SUDAN)**

**Contribution format:** Oral  
**Contribution authors:** Lorenzo De Lellis (Polish Centre of Mediterranean Archaeology - University of Warsaw)

From its foundation in the 5th century to its decline and eventual abandonment in the 18th century, the city of Old Dongola (Sudan) remained a major urban centre along the shores of the Nile. Extensive archaeological excavations on the site have revealed a complex stratigraphic sequence, charting its evolution from capital of the Makurian Kingdom to a regional power centre under the Kingdom of Dongola. Recent research has concentrated on the exploration of the late medieval and early Islamic periods, illuminating transformations during this crucial transitional phase, including the shift from Christianity to Islam. A defining feature of the stratigraphic record across its late-medieval and subsequent periods is the substantial accumulations of organic matter, frequently intermixed with diverse types of waste deposits within the urban area. Notwithstanding significant transformations across the settlement’s later centuries, this practice persisted as a consistent feature of its urban trajectory. This paper offers an in-depth analysis of these accumulations, so far largely dismissed as mere refuse, to offer deeper insights into the social and urban organization of the city. Drawing upon the characteristics of vernacular residential architecture, the analysis illustrates spatial and social strategies of waste management and how they relate to the transformations of the urban space. Furthermore, compositional analysis of these deposits demonstrates variations and specialization in the activities producing waste, differentiated disposal pathways for different material categories, and diverse re-use strategies of spaces and materials. This allows us to reconstruct the dynamics of this fundamental aspect of settlement life and its implications for understanding the society that expressed it.

**186. WASTE OR NO WASTE - FROM LATRINE TO RUBBISH DUMP IN POST-MEDIEVAL COPENHAGEN**

**Contribution format:** Oral  
**Contribution authors:** Simone Mayer (Museum of Copenhagen)

The city of Copenhagen underwent a considerable population growth in the 17th century resulting in the need to develop new systems of infrastructure and maintenance such as waste management. Written sources convey laws describing responsibilities for waste disposal, placement and sorting of waste, but also document the need to enforce and repeat restrictions regularly indicating illegal dumping and transgressions of the law. But how do those regulations mirror the archaeological evidence? Methodological difficulties in urban archaeology arise when surveys comprising limited archaeological fieldwork are used to explain these processes. However, recent larger excavations have uncovered information on various stages and aspects of waste management. Analyses of latrines from the 16th and early 17th centuries indicate extensive reuse, sorting of materials and recycling in a local and personalised context. By contrast, the large-scale excavation of an official early modern rubbish dump in 2024 uncovered a mixture of waste materials from the whole city, with perhaps limited signs of reuse outside of the social lower classes. The degree of recycling and sorting of waste could depend on the disposal site’s location and context (latrine, dump, moat etc.), but may also be connected to and reflected in people’s changing attitudes towards waste and value taking place between 1650 to 1800. This is portrayed in the consumer revolution where the middle classes were becoming more prominent and identifiable as seen from increased consumption of artefacts. By collecting data on waste disposal and management from other sites throughout Copenhagen, the paper aims to give insight in the material traces of waste management in an urban context and will discuss discrepancies between written sources and archaeological material, as well as indications of chronological developments in post-medieval and early modern times.

**2262. FERTILE HERITAGE - ORCHARDS AND GARDENS ON THE MEDIEVAL AND EARLY MODERN CITY DUMP AT LONG GARDENS IN DANZIG**

**Contribution format:** Oral  
**Contribution authors:** Zuzanna Wozniak – Maksymilian Cimoch – Artur Ginter (Univeristy of Lodz, Institute of Archaeology)

The earliest traces of settlement in today’s Danzig can be traced back to a fishermen’s and craftsmen’s settlement from the 7th century, while Gyddanyzcurbs is mentioned as a city in the 10th century. During the reign of the Teutonic Knights Danzig became a member of the Hanseatic League in 1346. Archaeological research were conducted by scientists from University of Lodz in 2007-2012 was the area of the Long Gardens, which was the part of Lower Town established in the 14th century. As late as the mid-17th century, only the plots along the street were built on, while the rest of the land was used as a dumping ground for the waste from the Main Town. At the same time, almost the entire area was planted with trees, shrubs and probably also cereals and vegetables in analogy with other towns in this period. The layout of the archaeological layers suggests that waste was systematically deposited there, and analysis of the artefacts suggests that it came from an area of a rich and culturally diverse city. As a result of the archaeological research our knowledge of the history of this part of the Lower Town has expanded considerably. We have acquired more than 200,000 artefacts, among them objects produced in the most famous centres all over the Europe, and even from China and Japan. On the basis of the material, it has been established that the beginnings of settlement in this area date back to the 15th century. No buildings have survived from this time, but several farm buildings were erected in the modern period. In the 19th century first brick buildings were built, and this was the time when the city stopped throwing wastes in this area.

**1457. WASTEDUMPS AS ARCHAEOLOGICAL PHENOMENA AND THEIR ESSENTIAL VALUE IN THE STUDY OF MATERIAL CULTURE AND DEVELOPMENT OF CITIES AND SOCIETIES**

**Contribution format:** Oral  
**Contribution authors:** Kasper Van Den Berghe (FindX)

Wastedumps provide unique data not retrievable out of other sources representing the period where nowadays society was formed. Wastedumps are features containing large numbers of objects of all kinds, discarded by a large group of people in a special defined place. Its uniqueness lies therefore not only in the fact that objects retrieved represent an independent category of material culture but also in the number of objects which can be studied in one complex. Besides that a wastedump is a, not by historical written records or otherwise substitutable, source of information on archaeology, cultural history, sociology, etc. With that, it forms a new and key essential connection between written sources of different kind. Despite the fact that wastedump. and modern time cities are intrinsically connected, waste dumps are not considered important sources of data in archaeology. Therefore they lack protection in the structure of heritage management. Neither are they present in the current archaeological research agendas, leading to every year destruction, limiting the possibility for research not only now but also in the future. The importance of research of wastedumps and the methodical approach will be presented by the line of field practices and theoretical examples. As such the special and temporal characteristics, its material containments and methods and challenges of study.

1299. FROM TRADE TO CONSTRUCTION: NEW RESEARCH ON THE “CHAÎNE OPERATOIRE” OF POTTERY RECYCLING

Contribution format: Poster  
Contribution authors: Francesca Galanti (Università degli Studi Roma Tre)

This poster aims to introduce a phd research that wants to reconstruct, through a multidisciplinary approach, the “chaîne opératoire” of the dynamics of pottery reuse as building material during the Roman period. The study starts from the foundation of the north-south mole of the port of Claudius from the 1st century AD, known as Portus – the new port of Rome. Described by Cassius Dione in Roman History as one of the greatest engineering feats of its time (LX, 11, 1-5), Portus represented the grandeur of an imperial capital both for the size and technological innovation. The choice of this recently excavated and unpublished context is grounded in the formation of the archaeological deposit. Regularly fragmented and selected ceramic material was intentionally rejected in the foundations to raise the floor level. The goal of this investigation is to analyse ceramic from a fresh perspective, through measurements, statistical calculations and a typological study of the material, useful for reconstructing how the deposit was formed combined with a topographical approach useful to contextualise the deposit in relation to the storage locations of the waste material. This research aims to identify, starting from the context in exam, common dynamics and recurring elements in the formation of other deposits, adding information on the existence of a structured “recycling” system of waste ceramics materials, and to create an applicable model based on the “chaîne opératoire” concept for analyzing and studying similar dynamics in other contexts. My intention is to actualize an ancient reality within a “modern” problem such as waste disposal and its management.

119 RECENT DEVELOPMENTS IN HH-PXRF STUDIES AND THE GLOBAL P-XRF NETWORK (GOPXRF.NET)

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Round table  
Session keywords: Archaeological Science, pXRF, Material Culture, Soils, Chemistry, Innovation  
Session organisers: Luisa Dallai (University of Siena) – Michaela Schauer (University of Vienna) – Keelie S. Rix (Universitat Pompeu Fabra)  
  
Session speakers: Michaela Schauer (University of Vienna) – Luisa Dallai (University of Siena) – Kathrin P. Schneider (Bruker Nano GmbH, Am Studio 2D) – Sabrina Save (Amélie études environnementales et archéologiques) – Keelie S. Rix (Universitat Pompeu Fabra) – Robert Tykot (University of South Florida) – Kayeleigh Sharp (Northern Arizona University) – Kidane Gebremariam (University of Stavanger)

SESSION ABSTRACT

The Global p-XRF Network (GopXRF.net) emerged after a number of meetings in 2024, including a session at the 30th EAA meeting in Rome and at the University of Vienna conference, Methodological Innovations in P-XRF Studies, where it was formalised. The network is a reaction to the increasing maturity among the user community and in light of the ever-increasing popularity and application of HH-pXRF across the discipline of archaeology, including in academic, museum and professional contexts. The network provides an opportunity for users who are keen to examine their own practices and engage in related discussions on a number of theoretical and practical issues. It brings together a number of expert practitioners from across the world and includes users and specialists with a broad range of interests, ranging from those working in conservation to field practitioners, and across all classes of material culture and geological materials. The aim of GopXRF.net is to share good practice, disseminate newly emerging techniques and innovative methods, provide resources and training to support new users and to develop guidelines. In order to further these goals, this roundtable session will provide opportunities for a number of speakers to present their work and to engage in the critical discussion of current and developing initiatives. The topics addressed by speakers will include an overview on the rules of physics in X-Ray analysis; practical examples of pXRF used on archaeological soils and anthropogenic sediments; tips for instrumental settings and calibrations; the use of UAV, pXRF and Artificial Intelligence; examples of pXRF used for the study of paintings. The session is organized in two parts: the first includes oral presentations, the second will be a World Café, i.e. a structured conversational process, where participants discuss a topic in small groups at different tables, encouraging diverse perspectives and collective insights. 4 thematic tables with 3 rounds of discussion will focus on: Inter- and Intra-Device-Calibration; Good practice & guidelines for sediments analysis of archaeological soils; Guidelines for AI in p-XRF studies; Good practice for non-destructive p-XRF on paintings. For more details about the session please visit the Global p-XRF Network at <https://vias.univie.ac.at/projekte/standardising-portable-x-ray-flourescence-for-archaeometry/initiating-a-global-p-xrf-network/>

120 ARCHAEOLOGY AND CULTURAL EVOLUTION WALK INTO A POST-DISCIPLINARY BAR: HOW IDEAS, PRACTICES, AND ARTEFACTS SPREAD IN PAST COMMUNITIES

Session theme: 3. Exploring methods in research, education and communication  
Session format: Regular session  
Session keywords: archaeological theory, cultural evolution, cultural transmission, cultural attraction, post-disciplinarity  
  
Session organisers: Vaclav Hrnčíř (Max Planck Institute for Evolutionary Anthropology) – Jiri Machacek – Radek Kundt (Masaryk University) – Mark. Porcic (University of Belgrade) – Felix Riede (Aarhus University)

SESSION ABSTRACT

How do people learn to knap flint, make pots, write texts or make – and drink – beer? Why are two figurines from different places and times sometimes so different – and sometimes so similar? What socio-ecological pressures shaped human ritual behavior and how does it facilitate mutualistic cooperation. A vital aim of archaeology is to understand the variation of material culture, behaviors, and norms in space and time, and the processes that generated this patterning. Basic processes of migration and cultural diffusion were introduced to archaeology over a century ago as part of the cultural-historical paradigm, yet a coherent and robust theory of cultural transmission was not developed until the late 20th century within the theoretical framework of cultural evolution. As major developments are taking place in adjacent disciplines such as evolutionary anthropology, behavioral ecology, evolutionary psychology, and cognitive sciences, the field of cultural evolution remains relatively unknown among many archaeologists. In this session, we put the spotlight on novel cultural evolutionary theories, methods, and tools such as cultural attraction theory/cultural epidemiology, cultural immunology, niche construction theory, experimental research, cultural phylogenetics, computer simulations, and comparative ethnology. We are particularly interested in the applications of these approaches to the interpretation of empirical archaeological data and the development of materialistically plausible explanatory models. At the same time, we welcome any research that relates to the evolution and transmission of cultural technologies, norms and institutions. Only by integrating insights from across a range of human sciences (survival value, underlying cognitive mechanisms, path-dependency, development) can we start piecing together the complex picture of cultural transmission within and between past human societies.

CONTRIBUTION ABSTRACTS

1100. DEALING WITH UNCERTAINTIES: HOW RANDOM IS THE DIVERSITY OF HUNTER-GATHERER TOOL ASSEMBLAGES?

Contribution format: Oral  
Contribution authors: Aleksandr Diachenko (2024/25 VUIAS Fellow | National Academy of Sciences of Ukraine, Institute of Archaeology) – Ray Rivers (Imperial College London, Department of Physics) – Iwona Sobkowiak-Tabaka (Adam Mickiewicz University in Poznań, Faculty of Archaeology)

Over the decades archaeology has gained significant experience in revealing behavioural patterns of the remote past from an analysis of the diversity of the archaeological record. Diversity, as a measure of uncertainty in archaeological assemblages, can act as a proxy for identifying the uncertainty of subsistence strategies or copying mechanisms. Archaeological research on diversity distinguishes between style and function. In models of neutral (unbiased) cultural transmission, two driving forces for changes in style are cultural mutation (innovation) and stochastic processes. Instead, research focused on the diversity of artefacts’ function in lithic assemblages generally correlates the distribution of tool classes to activities of various kinds, overshadowing the impact of random events. As a step towards understanding how hunter-gatherers dealt with uncertainty with regard to their subsistence strategies, daily life etc., this paper questions the impact of chance on the diversity of stone tool assemblages. A test of our quantitative approach is made through an analysis of the Late Paleolithic Federmesser and Swiderian assemblages on the North European plain.

162. A QUESTION OF SCALE: DISTRIBUTIONS OF STONE TOOLS IN THE ETHNOGRAPHIC RECORD

Contribution format: Oral  
Contribution authors: Christopher Buckley (Tracing Patterns Foundation, Berkeley, CA)

It is a commonplace observation in archaeology that scale of observation plays a role in the findings. For example, trends that are apparent on a regional scale are not necessarily observed in diachronic studies of individual sites. In this talk I will investigate the question of scale using a survey of ground-and-hafted ethnographic stone

and shell tools in the Asia-Pacific region, combining ethnographic reports from the past century and a half. This includes field data on cultural transmission, quarrying practices and knapping sequences, as well as museum specimens that allow mapping of the distribution of tool types, from micro scales of a few kilometers to intermediate scales of a few hundred km, and thence to the region as a whole. I compare these distributions with linguistic boundaries and ecological zones. The results shed light on how the competing forces of convergence, divergence, and individual cultural histories played out in the Asia Pacific region. While not attempting to provide definitive answers to all archaeological problems, the patterns at differing scales in this survey provide food-for-thought.

**1225. CULTURAL TRANSMISSION AT THE LATE NEOLITHIC SITE OF VINČA-BELO BRDO (SERBIA): REVISITING OLD QUESTIONS USING NOVEL TOOLS AND CONCEPTS**

**Contribution format:** Oral  
**Contribution authors:** Mihailo Radinovic (University of Belgrade, Faculty of Philosophy, Department of Archaeology)

More than four decades have passed since the basic concepts of dual inheritance and cultural transmission theory have been formulated. Numerous theoretical models, computer simulations, and laboratory experiments of cultural transmission have been done, deepening our understanding of the effect of different individual-level actions on population-level cultural dynamics. However, empirical applications of the CT theory on archaeological record have been somewhat limited. The goal of this study is to show the potential of CT theory for explaining the patterns of material culture, using the material culture from the Late Neolithic site of Vinča – Belo Brdo (Serbia) as a case study. The long-term cultural dynamics on the site, which were of great importance for forming a general picture of the Late Neolithic of the Central Balkans, are revisited based on data obtained from the analysis of knapped stone tools and anthropomorphic figurines, as well as a synthesis of the inferred data with other knowledge about Belo Brdo and the Late Neolithic in this area. The two artifact classes were analyzed using novel methodological approaches and interpreted in the light of the cultural transmission theory – including the application of Approximate Bayesian Computation for identifying transmission models (such as conformist, neutral, and anti-conformist) – thus providing a new perspective on long-term socio-cultural changes at Belo Brdo. The results of this study have shown that some deeply held assumptions regarding the social dynamics (e.g. conservatism, sudden changes) of early researchers must be taken with caution, and that we can learn much by applying novel, empirically established tools and concepts to the archaeological record.

**579. CULTURAL EVOLUTION IN THE AGE OF ATHENS: DRIFT AND SELECTION IN GREEK FIGURE-PAINTED POTTERY**

**Contribution format:** Oral  
**Contribution authors:** Peter Schauer (Department of Archaeology, University of York)

Variation in Greek figure-painted pottery has previously been unsystematically described as the result of social, political and art historical influences. In this study we propose that variation arises from the process of copying itself. The neutral model states that if there are no other forces at work, at time t the frequency of a variant in a population of variants will be in proportion to its frequency at time t-1, modified by the probability that new variants might be invented and old ones might fail to be copied each time there is a copying event, a process known as drift. We test the degree to which variation in figure- painted pottery can be explained by this model using evolutionary approaches to archaeology and culture change (Neiman 1995, Bentley et. al. 2004, Bentley et. al. 2007). We develop and expand these approaches through computer simulation. Using data from the Beazley archive, we created a new database containing a sample of 38,707 Attic figure-painted vases dating from 650 to 300 BCE. Within this sample we explore the diversity, distribution and turnover rate of motifs over time, between shapes and across different decorative techniques. We also explore correlations between shape and motif, and examine the variant frequencies underlying the emergence of the red- figured technique. We show that some of the variation in motifs on figure-painted pottery can be explained as being the result of random copying. Where the neutral model is not sufficient as an explanation of observed variation, we show whether selection is due to bias towards novelty or conformity. These results show that an evolutionary approach to cultural change provides us with a powerful tool for assessing previous research and allows us to identify areas in which further research is required.

**634. HOW THE IDEA OF COOKING A PORRIDGE IN UGLY POTS SPREAD ACROSS EUROPE AT THE BEGINNING OF THE MIDDLE AGES**

**Contribution format:** Oral  
**Contribution authors:** Jiri Machacek – Martin Kostal – Vojtech Nosek (Masaryk University, Brno, CZ)

The Middle Ages in Central and South-Eastern Europe begin with a deep change in the habitus of local populations. This transformation is well documented by empirical archaeological data. People appeared with a different

housing culture, foodways and burial rites. The archaeological expression of the new habitus, traditionally associated with the Slavic-speaking population, is the so-called ‘Early Slavic’ or ‘Prague’ culture, characterised by the ‘Prague-type’ pottery, which consisted of handmade, non-symmetrical, undecorated ‘ugly’ pots. The narrow, tall ‘Prague-type’ pots were designed for cooking in stone ovens, especially for making thick soups and millet porridge, as confirmed by organic residue analysis of the vessels. In the paper, the process of cultural transmission between communities that adopted new habitus and utilitarian Prague-type pots across Central Europe will be analysed. The method employed is based on morphometric analyses of virtual cross-sections from digital 3D models of vessels, combined with multivariate statistics and network analysis. The potential variability within the uniform Prague-type pottery will be measured and then explained in terms of cultural evolutionary theories.

**625. AN EXPERIMENTAL INDUCTION OF STYLISTIC EVOLUTION**

**Contribution format:** Oral  
**Contribution authors:** Marko Porcic – Mihail. Radinović (University of Belgrade) – Aleksandr. Jovanić (University of Arts in Belgrade) – Marija Branković (University of Belgrade) – Vojislav Ristivojević (Independent)

Spatio-temporal distributions of stylistic attributes have been a central focus of the traditional culture-historical approach in archaeology. Although the interpretative framework of the old culture-historical paradigm has been rightfully criticized and largely discarded on both empirical and theoretical grounds, certain patterns identified by 20th-century culture-historians still require explanation. One of the most significant of these patterns is the waxing and waning of artifact types over time. This empirically established trend formed the foundation of the frequency seriation method for relative dating. A crucial step in linking seriation with cultural transmission theory was made decades ago when it was demonstrated that the neutral model of cultural evolution produces patterns similar to the rise and decline of artifact types observed in the archaeological record. This model assumes that cultural variants are copied in an unbiased manner, with their transmission proportional to their relative frequencies within a population. The neutral model of cultural transmission plays a key role in the study of cultural evolution, particularly in evolutionary archaeology, where it has been widely used as the primary model of stylistic evolution. Here, we present the results of an experiment designed to induce the neutral model of cultural transmission in material culture. Our goal is to explore, in a controlled laboratory setting, how pottery shapes evolve under specific conditions and to determine whether we can replicate the patterns observed in the archaeological record. By designing an experiment intended to induce the neutral model of transmission, we aim to assess its applicability and implications for both cultural transmission theory and empirical research on material culture variability in archaeology.

**498. MODELS OF VARIANCE-PROPORTIONAL CULTURAL TRANSMISSION AND THEIR RELEVANCE FOR ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Petr Turecek (Charles University, Faculty of Science | Center for Theoretical Study, Charles University and Czech Academy of Sciences)

Cultural evolution still struggles with the formalization of information transmission. Part of the reason for this could lie in the fact that cultural traits are usually modelled as discrete (or particulate), similarly to discrete genes. However, many cultural traits require continuous models. In the biological domain, continuous traits have been reduced to discrete genetic alleles. We suggest that the cultural domain requires the opposite: reducing discrete behavioural manifestations to an underlying continuous space. This approach already has two manifestations in the literature: vector embeddings of discrete artifacts in “design spaces” and the idea of a continuous “culture space” underpinning differences and similarities between individuals. We show how the continuous view can finally inspire a cultural version of mathematical formalism of population genetics that identified recombination, mutation, and environmental randomness behind stochastic biological inheritance. Equivalents to biological mutation (unintended deviation from the weighted mean of “cultural parents”) and recombination (constructive exploration of the culture space surrounding “parental” values) can be identified. Through a series of empirical experiments, we demonstrate that both “error” and “explore” terms are expected to exhibit offspring variance proportional to parental variance. Interestingly, the variance proportionality demands modelling multiple dimensions simultaneously, because high variance in one dimension (axial deviation) may provoke increased variance in dimensions perpendicular to it (lateral deviation). Computer simulations indicate that such underlying processes should leave identifiable signatures in the archaeological record, particularly in the overall variance of material culture. Patterns of variance should shift predictably with changes in population size and external stressors. Our framework thus provides testable expectations for the archaeological study of cultural transmission and offers new perspectives on previously puzzling phenomena.

1093. VARIANCE-PROPORTIONAL MODELS IN THE CULTURAL TRANSMISSION OF ARTEFACTS

Contribution format: Oral  
Contribution authors: Peter Kutsos – Petr Tureček (Charles University in Prague, Faculty of Science)

The traditional Galton-Pearson (GP) model of cultural transmission assumes offspring variability is independent of parental variability, thereby keeping population variability constant across generations. We aim to challenge this model by proposing an alternative: the Parental Variability-Dependent Inheritance model, positing that the variability in offspring is influenced by parental variability. To empirically test this model, we recruited participants from Charles University in Prague, University of Buea in Cameroon and Bokwango, Cameroon. Participants engaged with a user-friendly graphical interface in the Rhinoceros 3D design software to create an “offspring” artefact, inspired by two provided artefacts. The task required no specific technical expertise. Participants were tasked with designing their artefact to fulfill one of two objectives: an aesthetic (create an ornament) or a mechanical (create an artefact that rolls downhill fast) task. The artefacts were manufactured using a 3D printer and then presented to subsequent participants in the study. This experimental setup allowed us to directly examine the effects of parental variability on the design choices and outcomes of the offspring artefacts, providing insights into the dynamics of cultural trait transmission and shedding light on the effects of participants’ sociocultural environment. Our preliminary findings indicate that models incorporating variance proportionality provide a more accurate prediction than those assuming constant variance. However, the relationship between parental and offspring artefact variance is not strictly proportional. These insights challenge traditional assumptions about the stability of cultural variability over generations and have important implications for interpreting patterns of variance in the archaeological record.

1841. THE CULTURAL EVOLUTION OF CULTURAL EVOLUTION: ALIGNING THE MODEL WITH ARCHAEOLOGICAL DATA

Contribution format: Oral  
Contribution authors: Ross Pain (University of Bristol) – Christine Balasa (Capgemini)

Jonathan Birch and Cecilia Heyes (2021) outline a 5-stage framework for the emergence of cultural evolution via cultural evolution. In their “self-assembly hypothesis”, the cognitive mechanisms driving our capacity for accurate, fast cumulative cultural evolution are themselves built by cultural evolution. Their view opposes dual inheritance theories, which hold that those cognitive mechanisms are genetic adaptations to cultural environments. This paper adds archaeological detail to Birch and Heyes’ framework. The main aim is chronological. The paper identifies archaeological sites which signal key posits of the self-assembly hypothesis, and uses this to propose a chronology for the framework. The paper then links the 5 stages to specific hominin species, their cognitive profiles and socioecology. The chronology developed contrasts sharply with some aspects of the chronology Birch and Heyes’ propose. A secondary goal is to use archaeological data to test the self-assembly hypothesis, and see whether it fares better than dual inheritance theories. The paper argues that, while there is a lot more work to do in this area, Birch and Heyes’ present a viable alternative framework.

344. THE EVOLUTION OF COLLECTIVE RITUAL AS A COOPERATIVE SIGNALING PLATFORM

Contribution format: Oral  
Contribution authors: Radek Kundt (Masaryk University)

Collective ritual is one of the universals of the human behavioral repertoire. However, its omnipresence repeatedly puzzled evolutionary scholars because ritual participation requires substantial resource investments while seemingly not providing any apparent immediate benefits. We examine whether collective ritual could have evolved as a complex signaling system facilitating mutualistic cooperation. First, we identify similarity signals, coalitional signals, and signals of commitment to collective action as the main building blocks of the contemporary signaling systems in hunter-gatherers. Second, we trace the presence of possibly homologous cooperative signals in non-human primates and review the archeological record for the earliest evidence of ritualized signals in past hominins. Subsequently, we add the proximate level to our analysis, pinpointing the distinctive neurocognitive structures necessary for human ritualized signals and compare their estimated dating with the dating of the increased socio-ecological pressures on collective action in the Pleistocene. Synthesizing this evidence, we sketch a possible timeline for the evolution of ritualized cooperative signals and identify further areas of investigation that would advance this evolutionary model.

560. THE EVOLUTION OF SPIRITUAL MOVEMENTS AS A RESPONSE TO CULTURAL INTERACTION

Contribution format: Oral  
Contribution authors: Petr Kvetina – Jaroslav Ridky (Institute of Archaeology of the CAS, Prague)

Throughout human history, cultural interactions have frequently led to responses that result in the acculturation

of one of the groups involved. European overseas exploration and subsequent colonial expansion serve as prime examples, particularly since the acculturation process during this period is well-documented. A notable aspect of these interactions was the emergence of millennial religious movements in societies affected by acculturation. These movements can be seen as an evolutionary response, with the cargo cults of Melanesia being one of the most well-known examples. These cults anticipated the end of the existing world order, to be replaced by a new golden age filled with European material goods. However, similar spiritual movements have been observed globally, in regions including Oceania, Africa, the Americas, China, Burma, and Indonesia. These movements share common characteristics, emerging in societies facing crises, and can be broadly understood as part of an evolutionary process. This paper proposes that such phenomena may also have occurred in prehistoric Europe and aims to explore potential archaeological evidence to support this hypothesis.

436. LET’S DRINK OURSELVES TO CIVILIZATION: ALCOHOL, KAVA AND THE EVOLUTION OF SOCIO-POLITICAL COMPLEXITY

Contribution format: Oral  
Contribution authors: Vaclav Hrnčíř – Angela Chira (Max Planck Institute for Evolutionary Anthropology) – Scott Claessens (University of Kent) – Oliver Sheehan (University of Auckland) – Russell Gray (Max Planck Institute for Evolutionary Anthropology | University of Auckland)

The so-called “drunk hypothesis” argues that the consumption of intoxicants such as alcohol or kava (Piper methysticum) played an important role in the rise of the sociopolitical complexity of human societies. This is because intoxication promotes social bonding, increases cooperation, and enhances human creativity. Although many lines of evidence support these claims, systematic cross-cultural evidence is lacking. Here we present the results of two of our studies. In the first, we tested the effect of alcohol on the rise of political complexity using causal inference methods and a global sample of 186 non-industrial societies. We found a positive (albeit modest) relationship between the presence of indigenous alcoholic beverages and higher levels of political complexity, even after controlling for several potential confounders. In the second study, we examined the role of kava on both political complexity and social stratification. We used a sample of 78 Oceanic-speaking societies and a novel method of dynamic co-evolutionary models. We found a positive relationship between kava and both sociopolitical variables. However, the effect disappeared when we controlled for spatial non-independence. Our results support the idea that the group-level social benefits of traditional non-distilled alcohol may outweigh their disruptive effects, and that alcohol has facilitated the evolution of human societies. In contrast, we were unable to demonstrate the same effect in the case of kava drinking.

122 OF “TRIBES” AND “KINGDOMS” IN THE BALKANS DURING THE IRON AGE: INVESTIGATING PATTERNS OF SOCIAL COMPLEXITY AND POLITICAL ORGANIZATION

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: Balkans, Iron Age, social complexity, theory, burials, settlements  
Session organisers: Vasiliki Saripanidi (Université libre de Bruxelles) – Hristo Popov (National Archaeological Institute with Museum, Bulgarian Academy of Sciences) – Pero Arđanliev (National Archaeological Museum of the Republic of North Macedonia)

SESSION ABSTRACT

While at the end of the Early Iron Age the southern part of the Balkan peninsula saw the emergence of the Greek city-states, the rest of the modern Balkan territory remained the home of numerous stateless societies. In the frame of the culture-historical and world-systems approaches, these societies have been conceptualized as “barbarian tribes”, which fell within a single societal type and were eventually influenced by but “failed” to emulate the Greek polis. Moreover, the discovery of highly ostentatious burials at several sites has given rise to the view that the political landscape of the Iron Age Balkans was marked by the formation of “tribal kingdoms”. Aside from the fact that this term remains ill-defined, over the last years the aforementioned hellenocentric assessments have been severely criticized. More importantly, recent studies of older and new archaeological finds leave no longer any doubt that sociopolitical developments were neither uniform nor synchronous across the Balkans. In order to contribute to a more nuanced understanding of the organization and functioning of stateless societies within the region, this session will combine bottom-up analyses of material evidence with recent approaches of social complexity, which do not necessarily dismiss neo-evolutionary categories such as “tribes” and “chiefdoms”, but they acknowledge, first, the culturally- and historically-contingent character of sociopolitical processes and second, the fact that power may be diffused across multiple and not necessarily hierarchical networks. We

welcome papers that undertake contextual analyses of settlement and/or funerary evidence from any phase(s) of the Iron Age and any part(s) of the Balkans with the aim of investigating social inequalities, their extent and duration over time, their intersection with different facets of identity (such as age, kinship affiliation and gender) and their association with specific spheres of social interaction (such as feasting, warfare, craft production and supra-regional exchange).

CONTRIBUTION ABSTRACTS

1074. IRON AGE SETTLEMENTS AND CEMETERY IN NEA PHILADELPHIA: EVIDENCE OF THE SPATIAL AND SOCIAL ORGANIZATION

**Contribution format:** Oral  
**Contribution authors:** Vasiliki Despotidou (Greek Ministry of Culture)

At the end of the previous century, a large-scale excavation was carried out in Nea Philadelphia which brought to light important antiquities of the Iron Age, such as a. installation on a table-shaped hill, several habitations on the plain, and an oversized cemetery. These are located near a Bronze Age settlement on a hill in the vicinity of the Gallikos river (ancient Echedoros) and at a short distance from the large-sized Iron Age “trapeza” Naresh, which dominates the agricultural district. The latter are known from the topographical surveys of the early twentieth century scholars. This paper aims to portray the environment, the housing, the human activities. the commercial and cultural characte. of the local settlements based on the excavation data. From this point of view, questions of the spatial organization, the interrelation and the contacts among a network of neighboring communities will be raised, taking into account the extended area of the settlements along the Echedoros valley. Moreover, issues concerning social and political structure as well as collective identities will be commented. In this discussion data will be also drawn from the local cemetery, especially with relation to the configuration of the burial space, the variety of burial architecture, burial customs an. social perceptions that are visible though grave goods.

2514. IRON AGE CEMETERIES IN THE THERMAIC GULF; NEA EFKARPIA, ORAIOKASTRO, NEA PHILADELPHIA. INTERCOMMUNITY RELATIONS AND CULTURAL INFLUENCES

**Contribution format:** Oral  
**Contribution authors:** Anna Panti (Ephorate of Antiquities of Thessaloniki region | Hellenic Ministry of Culture)

In Northern Greece, in the hinterland of the Thermaic Gulf, lie the Iron Age cemeteries of Palaiokastros and Nea Efkarpia, located at a short distance to the east and dating primarily from the 8th century BC. Inhumation in pit and cist graves, covered with large schist slabs, prevails. There are also a few cremation burials in urns. Graves are generally poorly furnished, with bronze and iron jewellery. A few handmade clay vessels, e.g. phialai, also accompany the deceased, along with a few wheel-made vases, e.g. kantharoid mugs, reflecting the sympotic nature of grave offerings. Miniature vases, amphoriskoi, and jugs were likely used as perfume vessels. The aforementioned cemeteries, along with the Nea Philadelphia necropolis to the west, are located close to each other and form a significant cultural unit in the hinterland of the Thermaic Gulf region. Their proximity outlines the spatial organization and the common cultural development of the region during the Iron Age. This paper aims to present the burial customs emphasizing the sympotic practices and the diversity of grave furnishing based on gender, age, and social status. The distinctiveness of several female graves furnished with plenty extravagant jewellery and clay spindle whorls highlight the special role of women in the social or religious life of the community. Additionally, the practice of accompanying infant burials with a bronze gilded omphalion warrants further examination. These cemeteries, situated at the foothills of Mount Chortiatis, provide a unique opportunity to explore potential inter-community relationships, as well as connections with neighboring settlements and regions of southern Greece. Their proximity to the Axios River, which offers direct access to the north, also contributed to the cultural influence of northern Balkan communities, particularly those in the southern part of North Macedonia, evident in both mortuary practices and tomb furnishings.

784. ANCIENT ALMOPIA IN LOWER MACEDONIA: MORTUARY PRACTICES DURING THE IRON AGE AT NEA ZOI, REGIONAL UNIT OF PELLA

**Contribution format:** Oral  
**Contribution authors:** Anastasia Chrysostomou (Hellenic Ministry of Culture, Archaeological Service)

The ancient settlement on the Terikleia Hill, at Nea Zoi, extended over about 20 acres and occupied a strategic position that allowed for the control of the southeast passage to ancient Almopia, at the northern border of Greece. Limited rescue excavations have shown that the site was inhabited from the Early Bronze Age to the Hellenistic period. Residential remains from all periods are heavily disturbed. During the Iron Age, there must have been stone-built structures equipped with coarse storage and cooking vessels, pyraunoi but also smaller ones of well-known Macedonian types. In addition to the residential remains, there have been identified three

cemeteries that mainly date from the Iron Age. The first possible cemetery, located at the southwestern edge of the settlement, yielded in 1980 a cist grave, as well as iron weapons and an alabaster that imitates Mycenaean models, all dating from the Early Iron Age. In 1993, a cemetery with pithoi and pyraunoi used for child burials was excavated at the center of the settlement, dating from the 7th-6th centuries BC. Finally, in 1997-1998, the main cemetery, of 11 tumuli, was found outside the settlement, to its northwest and separated from it by a river branch. The finds from the tumuli cemetery, which accompanied successive burials of adults and children, span the entire Iron Age. The choice of the last burial type, which is also known from other sites in Almopia, should be attributed to the ideological association between human habitation and burial space. Although the choice of the tumulus may suggest that this burial type was tied to the cultural identity of the Almopes, the existence of the other two cemeteries raises questions, for which no conclusive answers can be reached without more systematic and multidisciplinary research.

1797. LOST IN TRANSLATION: A LANDSCAPE ALTERNATIVE TO THE SETTLEMENT HISTORIES OF EARLY MACEDON

**Contribution format:** Oral  
**Contribution authors:** Giannis Apostolou – Alfredo Mayoral – Konstantin. Venieri (Landscape Archaeology Research Group (GIAP) / Catalan Institute of Classical Archaeology (ICAC)) – Sofia Dimaki (Ephorate of Antiquities of Grevena) – Mercourios Georgiadis (University of Crete) – Arnau Garcia-Molsosa (Landscape Archaeology Research Group (GIAP) / Catalan Institute of Classical Archaeology (ICAC)) – Hector Orengo (Barcelona Supercomputing Center—Centro Nacional de Supercomputación (BSC—CNS) | Catalan Institution for Research and Advanced Studies (ICREA) | Landscape Archaeology Research Group (GIAP) / Catalan Institute of Classical Archaeology (ICAC))

Studies on the sociopolitical organisation of Early Macedon are often framed through the supposed dominance of geographically-fluid, tribal structures. Furthermore, traditional narratives have positioned the character of the local communities within a rigid teleological framework, assessing their evolution as opposed to the phenomenon of the Greek polis in the southern part of the peninsula. This paper discusses the results of a new multi-disciplinary archaeological survey in the Grevena region (modern Western Macedonia, Greece), offering a landscape-based reassessment of settlement dynamics from the Late Bronze Age to the beginning of the Hellenistic period (c. 1500–300 BCE). By integrating archaeological survey data, remote sensing and geomorphological analyses, we move beyond site distributions to explore the role of the communities, land-use strategies and environmental changes in shaping long-term models of habitation. In addition, we reconsider how these settlement forms and their territorial organisation may have responded to broader socio-political developments, in our case the Macedonian Kingdom. Rather than a linear trajectory toward centralised sites and urbanisation, the evidence suggests a more flexible and adaptive engagement with the landscape, where settlement stability and mobility coexisted throughout the shifting socioeconomic conditions. In conclusion, this research challenges static notions of tribalism, contributing to discussions on territoriality, state formation, and the contingent nature of social complexity in ancient Macedonia and, more widely, the Balkans during the Iron Age.

566. OF “TRIBAL KINGS” AND THEIR WORLD: SOCIOPOLITICAL STRUCTURES IN THE EARLY KINGDOM OF LOWER MACEDONIA

**Contribution format:** Oral  
**Contribution authors:** Vasiliki Saripanidi (Université libre de Bruxelles & Fonds de la Recherche Scientifique (FNRS) of Belgium)

Research on the sociopolitical structures of the Macedonian kingdom under its first dynasty, the Temenids, has remained focused on the reigns of Philip II and Alexander III, and it has primarily revolved around the so-called “constitutionalism debate” over the degree of absolutism of Macedonian kingship. Moving back to the 6th c. BC, this paper will investigate the sociopolitical organization of the kingdom at the time of its formation and during the first century of its existence, when its territory was limited to Pieria, Bottiaia and the region around the head of the Thermaic Gulf, east of the Axios River. Given that little textual and settlement evidence is available for this period, for this purpos. the paper will rely on the funerary remains that have come to light at about twenty sites from these regions. Combining a bottom-up contextual analysis of the funerary evidence with the frameworks of Dual Processual and Collective Action theories, it will seek to define the extent of social inequalities within and between the communities of Lower Macedonia during the 6th c. BC, the relationship of such inequalities with different aspects of identity, as well as the mechanisms that allowed for their production and maintenance. Finally, the evidence from this period will be briefly considered with relation to the evidence from the Classical period, in order to discuss the nature of Temenid kingship and its development over time.

1490. LIFE IN DEATH: BIOARCHAEOLOGICAL PERSPECTIVES ON SOCIAL COMPLEXITY IN THE CEMETERY OF SINDOS, THESSALONIKI

Contribution format: Oral  
Contribution authors: Daniela Heilmann (LMU Munich | RGK Frankfurt/M.) – Natasa Sarkic (Aita Bioarchaeology)

The socio-political organization of the Iron Age Balkans has long been a subject of debate, particularly regarding concepts of statehood, social complexity, and interaction with the “Greek” world. The Sindos cemetery (Thessaloniki), one of the few fully published burial site from the Late Archaic and Early Classical period in Macedonia, provides a critical case study for understanding social structures in the region. While material culture and grave goods have been extensively analyzed, the osteological record remains an underutilized resource for investigating the lived experiences of the individuals buried there. In this research, we present preliminary results and outline the aims of our ongoing study, which seeks to integrate bioarchaeological methods into the analysis of the Sindos cemetery. By examining skeletal markers related to health, muscle activity, and pathology, we explore social differentiation based on age, gender, and, prospectively, kinship. This approach shifts the focus from burial practices alone to broader questions of daily life, mobility, and labor specialization within the community. Furthermore, by placing the osteological data from Sindos within a broader comparative framework, we aim to refine methodologies for analyzing social complexity in Iron Age societies across the Balkans. Integrating bioarchaeological findings with archaeological context offers new perspectives on non-state political and social structures, moving beyond traditional Hellenocentric narratives. Our study highlights the potential of bioarchaeology to deepen our understanding of past communities and their internal dynamics, while also laying the groundwork for future interdisciplinary research.

933. “THE CEMETERY OF ACHLADA IN FLORINA: THE CENTER OF THE ANCIENT KINGDOM OF LYNCUS IN UPPER MACEDONIA”

Contribution format: Oral  
Contribution authors: Liana Gkelou (Ephorate of antiquities of Florina)

The present study concerns the cemetery in the area of Achlada, 22 km. NE of the city of Florina. The cemetery was revealed within the borders of a private lignite mine and brought to light more than 1500 graves, covering a long-time span, from the Late Bronze Age down to the Byzantine times. During the historical period, the area of Achlada belonged to Upper Macedonia and, specifically, to the kingdom of Lyncus. The northern part of Lyncestis is identified with the wider area of today’s Bitol. i. North Macedonia, where the capital of Roman times, Herakleia, was located. The southern Lyncestis coincides with most of today’s Florina Prefecture. The deceased of the Archaic and Classical period were accompanied with grave goods that included a wide range of terracotta vases. The majority of these vases were locally made but the local repertoire was enriched with imports from Ionia, Corinth and Athens, areas which clearly affected the local pottery production. Apart from pottery, they were also furnished with metal vessels, bronze, silver, and gold jewels as well as iron weapons. Similar finds have been found at the contemporary cemeteries of Macedonia, such as Sindos, Archontiko, Aiges and Aiani. The artifacts from the cemetery of Achlada are of great importance as they confirm the systematic commercial and cultural contacts with great artistic centers and they also provide us with a, so far lacking, piece of historical information concerning the Kingdo. of Lyncu. before the unification of the Macedonian Kingdoms under Philip II.

537. THE ARCHAIC NECROPOLIS NEAR KOROŠIŠTA: A LANDMARK DISCOVERY FOR THE UNDERSTANDING OF ANCIENT COMMUNITIES AND THEIR REGIONAL DEVELOPMENT

Contribution format: Oral  
Contribution authors: Pero Ardjanliev (National Archaeological museum of North Macedonia)

The recent discovery of an archaic necropolis near the village of Korošišta provides insights into the social, cultural, and economic development of ancient communities in the Ohrid-Struga region. This area has been home to several previously investigated Archaic-period burial sites, including those at Trebenište, Radolišta, Delagožda, and Gorna Porta. These extremely rich findings have long highlighted the region’s importance, positioning it alongside the Thermaic Gulf area, which also boasts numerous Archaic necropolises. The newly discovered Korošišta necropolis, located in an exceptionally strategic position, offers fresh evidence of regional connectivity, trade networks, and the role of ritual in social organization. By analyzing the grave goods, human remains, and contextual data, this study offers significant contributions to the archaeological record of the Balkans. It enriches our understanding of burial practices, social structure, and the dynamics of early societies, shedding light on how these communities interacted with their environment and each other. Ultimately, the Korošišta necropolis enhances our knowledge of the Archaic period, emphasizing the region’s central role in the broader development of ancient civilizations.

1726. DENDROCHRONOLOGY, ABSOLUTE DATING, AND WOODLAND USE AT THE IRON AGE UNDER-WATER SITE OF VRBNIK, LAKE OHRID, NORTH MACEDONIA

Contribution format: Oral  
Contribution authors: Andrej Maczkowski – John Francuz (University of Bern) – Valentina Todoroska (Independent) – Aleksandra Papazovska (Archaeological Museum of North Macedonia) – Bojan Taneski (Institute for protection of monuments and museum – Ohrid) – Matthias Bolliger – Johannes Reich – Alain Schaffner (University of Bern) – Lukas Wacker (ETH Zurich) – Albert Hafner (University of Bern)

The site of Vrbnik lies near the northern shore of Lake Ohrid, in the immediate vicinity of the town of Struga. The site was first excavated in 1998 and based on the material culture has been attributed to the 7th-6th centuries BC. Currently, the site lies 2-3 meters under the modern water table of the lake and extends towards the land. Besides the wooden piles protruding from the lake bottom, the archaeological finds comprise of fine and coarse pottery, often heavily eroded, as well as bronze and iron objects such as needles, blades, fishhooks, bracelets, and several iron spears. The initial sampling of the wooden piles for dendrochronological analyses took place in 2021 and continued with higher intensity in 2022. To date, 189 wooden piles were sampled from an area of 130m2. A first 156-years long tree-ring chronology from the Iron Age is presented. The combination of dendrochronology and high-resolution radiocarbon enables overcoming the problem of the calibration curve’s Hallstatt Plateau and allows us to narrow the end-date in the mid-1st millennium BC. Moreover, a detailed analysis of the tree-ring sequences shows regular patterns of tree growth suppression, likely a result of human forest use. Compared to earlier forest exploitation practices as deduced from the tree-rings of archaeological wood from other sites around Lake Ohrid, the patterns in Vrbnik seem more regular. This potentially highlights changes in resource use influenced by social organisation changes that are associated with the Iron Age.

1252. THE IRON AGE CEMETERY AT THE SITE ZAKOTORAC-GOMILE - NEW FAR-SIGHTED LIGHTHOUSE ON THE SOUTHERN ADRIATIC

Contribution format: Oral  
Contribution authors: Hrvoje Potrebica (University of Zagreb, Faculty of Humanities and Social Sciences, Department of Archaeology) – Marko Dizdar (Institute of Archaeology, Zagreb) – Domagoj Perkić (Dubrovnik Museums, Archaeological Museum)

The systematic excavation of the cemetery with stone burial mounds and dry-stone tombs at the Zakotorac-Gomile site on the Pelješac peninsula began in 2020. So far, three mounds and two dry-stone tombs were excavated, containing richly furnished inhumation burials dated from the beginning of the 6th to the beginning of the 2nd century BC. Each mound contained several graves with multiple burials including men and women of all ages, with possible kinship relations. There are few graves with exclusively child burials. The community of Zakotorac practiced this complex funeral ritual, with some minor changes, for several centuries. Pottery is almost absent from the oldest graves. Greek pottery appears from the 5th century BC and could be interpreted as the imported symposium sets. Male burials often contain offensive weapons (xiphos, machaira, spears) dating from the 5th to the beginning of the 4th century BC, while the Greek-Illyrian helmets of type III A2a were placed in separate constructions not related to any particular individual (perhaps as votive offerings). Numerous ornaments and other elements of women’s costume discovered in some graves emphasize the importance of these objects in the definition of their local visual code and identity, and also indicate that some women had prominent status in the community. Numerous objects imported from the Mediterranean and elsewhere, found in the same context with local ones, testify to intensive social interactions and connectivity with neighbouring and distant areas (central and northern Adriatic, western and central Balkans, southern Italy). The power of the local elite, manifested through prestigious goods displayed in their graves over centuries, could have relied on the management of local ‘resources’ (e.g. salt, slaves...) or their control over one of the crucial points on the communication route that connected the Mediterranean and the Adriatic, and further into the western and central Balkans.

1563. KATA ETHNE: ARCHAEOLOGICAL HORIZONS AND HISTORICAL REFLECTIONS OF POWER IN INNER THRACE DURING THE LATE CLASSICAL AND HELLENISTIC PERIODS

Contribution format: Oral  
Contribution authors: Slava Vasileva (National Institute of Archaeology and Museum) – Julij Emilov (Sofia University St. Kliment Ohridski)

The presentation provides an analytical overview of feasting, negotiating, and power control in Inner Thrace (during the second half of the first millennium BCE) as reflected in the archaeological record and texts of ancient authors. A brief review of the theoretical implications of the ethne concept outlines current limitations in tribal interpretations of ancient ethnonyms. Understanding the Aristotelean kata ethne as a description of

“comparatively free”, “barbarian” lifestyles in the cold places of Europe, serves as a theoretical framework for discussing some examples of feasting manners, competition, and violence in (Late Classical and Early Hellenistic) Thrace. A case study examining the archaeological horizons of power, the distribution and depositional patterns of Attic painted pottery, and references to the works of Xenophon and Diodorus Siculus (about the banquet arrangements of Seuthes, Dromichaïtes, and Lysimachus) offer insight into the practices of wine consumption in creating and maintaining social bonds in the region. The second case study is a suggestion to read the Seuthopolis inscription (IGBulg 1731) as an exceptional example of successful crisis management from the inner parts of South Thrace. The early 3rd century BCE monument propagates the news of an agreement between two houses of power, which is exhibited on four stone documents in the poleis under their control. The final part of the presentation addresses the topic of violence, reflected in the Diodorus Siculus narrative on the vicious and bloodthirsty kings of Caeni, who terrorized their subjects. The names of the cruel Diegylis and his son Zibelmios became synonymous with the dangers of uncontrolled authority, kata ethne. Beyond the moral visions of Diodorus, the text fragments contain valuable “ethnographic” knowledge regarding the application of capital punishment among the “Thracian barbarians”, a hint at the interpretation of some “unusual graves” in the “pit fields” of Iron Age Thrace.

**392. SEARCHING FOR THE IRON AGE “TRIBE” THAT OWNED A STOLEN NATIONAL TREASURE OF ROMANIA: THE GOLDEN HELMET FROM COȚOFENEȘTI CONTEXTUALIZED**

**Contribution format:** Oral  
**Contribution authors:** Dragos Mandescu (Arges County Museum)

Since its discovery on the hills of Coțofenești, which happened by chance almost a century ago, this sensational golden helmet from the Second Iron Age (dating from around 300 BC) has become a national treasure for Romania. Its recent looting from a museum in the Netherlands, at the end of a temporary exhibition on Bronze and Iron Age goldsmithing, meant shock, horror and anger not only for Romanian but also for European archaeology. The presentation deals in detail with this stolen jewel, aiming to highlight topics as its historical and cultural contextualization, its integration into the archaeological landscape of the area, but also the “ideological mechanisms” through which it imposed itself in the national consciousness of the Romanian people. The main significant elements for the shaping of the Second Iron Age “tribe” south of the Carpathians that owned and used it will be discussed: both those related to the density and shapes of the Iron Age habitat in the respective area, those related to control over the essential resources of that time (salt, pastures, forests and the trans-Carpathian access route), as well as the mythical and ideological ones (beliefs in the lineage from a prominent ancestor who through sacrifice ensures peace and balance in society).

**123 FROM GREECE TO GANDHARA: ALEXANDER’S EASTERN CAMPAIGN AND THE INTERACTION OF EASTERN AND WESTERN MATERIAL CULTURE**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Alexander, Greek Art, Gandhara, Buddhism  
**Session organisers:** Feng Liu (Heidelberg University,SAGE) – Fengyen Kuo (Fo Guang University)

**SESSION ABSTRACT**

This session will explore the eastward transmission of Greek culture following Alexander the Great’s campaign, which facilitated a dynamic interaction between Hellenistic traditions and local cultures across West and Central Asia. Alexander’s conquests paved the way for cultural exchange, as Greek artistic and philosophical traditions encountered the diverse practices of these regions. When Greek influence reached northern India, a profound synthesis emerged in what is now recognized as Greco-Buddhist art, with Gandharan art as its most prominent expression. This style uniquely blended Greek naturalism with Buddhist iconography, creating a hybrid art form that reflects both Eastern spirituality and Western aesthetic sensibilities. To fully capture this interaction, the session will examine a wide range of artifacts, including Buddha statues, stupas, coins, ceramics, amulets, seals, jewelry and so on. Emphasis will be placed on the archaeological contexts in which these objects were discovered, shedding light on their production, usage, and cultural significance. The establishment of the Silk Road further intensified these interactions, turning Gandhara and surrounding areas into cultural crossroads. Excavated material culture from Pakistan, Afghanistan, and northern India—including items from religious, domestic, and trade contexts—bears testament to the enduring impact of Greco-Buddhist art and the continuous exchange of ideas along these routes. By integrating an archaeological approach, this session will explore the evolution of Greco-Buddhist art and related material culture, investigating their roles in shaping visual and cultural identities along the Silk Road and their enduring legacy in South and Central Asia.

**CONTRIBUTION ABSTRACTS**

**857. RECENT EXCAVATIONS INDICATING TRENDS IN ARCHITECTURAL EVOLUTION OF BUDDHIST STUPAS IN BIHAR, EAST INDIA**

**Contribution format:** Oral  
**Contribution authors:** Ishani Sinha (SOAS)

Excavations at Vaishali in 1959-60 revealed a low hemispherical earthen stupa, very elementary in construction, ostensibly because it belonged to the beginning phase of Buddhism in the 5th century BCE. It was in sharp contrast to the morphologically differentiated high rise brick stupas earlier excavated at Nalanda between 1915-37 which belonged to the Gupta and Pala periods, close to the ending phase of Buddhism. With a large gap of about one thousand years it was difficult to trace their linkage in terms of architectural growth. A recent excavation (1999-2001) conducted by Archaeological Survey of India at Banaganga (Rajgir) has turned out to be very crucial in this context. Findings of Banaganga, viewed in tandem with those at Lauriya Nandangarh, provide definitive clues on the course of architectural development, diversification and differentiation of stupas during Maurya period and Post Maurya period. Another recent excavation at Kesariya further adds to our knowledge of stupa evolution during late Gupta period (6th century CE). The proposed research paper investigates the architecture of, and findings from, these excavated stupas in order to establish the trend of chronological evolution of the buddhist stupa architecture in the cradle land of Buddhism, the state of Bihar which may act as a model of stupa evolution in India and global context.

**274. THE EARLY DISCOVERY OF DIONYSOS IMAGES IN EAST ASIA: A DISCUSSION ON THE IDENTITY OF THE PATTERN OF XI’AN M1:64**

**Contribution format:** Oral  
**Contribution authors:** Mengyi Li (Ludwig Maximilian University of Munich)

Dionysos, a major deity in Greco-Roman mythology, is also one of the most widely disseminated gods across different civilizations. Recent archaeological discoveries suggest that through Alexander the Great’s eastward expansion and extensive trade networks, the cult and imagery of Dionysos may have reached China and East Asia via multiple routes. One possible route led from the Gandhara region through the Southwest Silk Road, passing through present-day Yunnan and Sichuan before reaching Chang’an, the capital of the time. Another potential path extended through Qinghai in the northwest, facilitating its transmission into the Central Plains. This presentation/paper examines a ceramic camel figurine unearthed in Xi’an, Shaanxi Province, employing archaeological and iconographic analysis to explore the representation of Dionysos in the Far East during the 5th century CE, as well as other possible images influenced by Hellenization. The specific identity of the figure on M1:64 remains highly contested, with leading interpretations suggesting it represents the god, Dionysos, Surya, Silenus, or other figures. This study argues that the figure should be identified as Dionysos, with its Silenus-like appearance resulting from cultural adaptation and misinterpretation during transmission. Furthermore, the author examines additional decorative elements on the ceramic figurine to support this conclusion while also exploring other Greco-Roman iconographic elements found in Chinese artifacts from the late 5th century CE. Additionally, the study discusses the possible transmission of these foreign motifs through the Gandhara region via the Southwest Silk Road.

**203. CULTURAL EXCHANGE REFLECTED IN GANDHARAN BODHISATTVA ORNAMENTS**

**Contribution format:** Oral  
**Contribution authors:** Fengyen Kuo (Fo Guang University)

The Buddhist sculptures of Gandhara and Mathura, though contemporaneous, exhibit notable differences in facial features, clothing, and hairstyles. Their distinctions are also evident in the ornaments worn by Bodhisattvas. Mathura Bodhisattvas, influenced by traditional Indian art, typically features simple V-shaped necklaces. In contrast, Gandharan Bodhisattvas are adorned with intricate and layered chokers and necklaces, among which the “double-animal motif chest ornament” stands out as particularly striking. The double-animal motif chest ornament, prominently displayed on the chest, features two identical and mirrored figures at its center. These are often animal heads but may also depict combinations of animal heads with plant forms or Greco-Roman-inspired designs, such as human-headed creatures with animal bodies. This dual-animal motif appears not only on Gandharan Bodhisattva sculptures but also in archaeological artifacts unearthed in Central Asia. It can be categorized into two main styles, with its origins potentially tracing back to Greek influences. As Buddhism spread, the double-animal motif chest ornaments were introduced to China, where they became popular and were widely adopted in Bodhisattva representations during the 5th and 6th centuries CE.

917. ADMINISTRATIVE CONTINUITY AND CULTURAL INTERACTION IN BACTRIA UNDER DYNASTIC TRANSITIONS: AN ARCHAEOLOGICAL PERSPECTIVE

Contribution format: Oral  
Contribution authors: Feng Liu (Heidelberg University, SAGE)

Prior to significant archaeological discoveries in the latter half of the 20th century, the history of the Greco-Bactrian, Indo-Greek, and Kushan kingdoms relied almost exclusively on numismatic studies. As the Greco-Bactrian influence expanded into northwestern India, some rulers began minting bilingual coins, featuring Greek inscriptions on one side and Indian inscriptions on the other. These coins may reflect a genuine cultural and social distinction between Greek and Indian identities. By the late fourth century BC, regions such as Sogdiana, Bactria, Arachosia, and northwestern India—formerly nominal provinces of the Persian Empire—were “conquered” by Alexander the Great and garrisoned with Greek troops. Around fifty years later, an independent Greco-Bactrian state emerged, controlling territories north of the Hindu Kush, while the southern and eastern regions became part of the Maurya Empire. By the late third century BC, Seleucid King Antiochos III attempted, but ultimately failed, to reclaim Bactria. Instead, Greco-Bactrian prince Demetrios, initially involved in negotiations with Antiochos, launched an invasion of India, possibly reaching the Ganges Valley. Despite successive regime changes, the administrative structures of Bactria remain poorly documented in textual sources. This study aims to explore the region’s administrative systems and agricultural production through archaeological evidence, shedding light on their continuity and adaptation under different rulers.

1818. BEYOND SOUTH ASIA: THE BUDDHIST KINNARA AND ITS INTERACTIONS WITH SURROUNDING REGIONS

Contribution format: Oral  
Contribution authors: Yu Sun (Department of Archaeology, Durham University)

The Kinnara, a mythical being in ancient South Asian Buddhist art, is commonly depicted as a human-headed bird in religious contexts. In the past, many human-headed bird images discovered in not only Gandhara but also the neighbouring Bactrian region have been identified as representations of the Kinnara. This paper reassesses the archaeological evidence related to these figures to clarify the development of Kinnara imagery in Indian Buddhism and re-evaluate previously misidentified human-headed bird depictions. Human-headed bird imagery appears in Indian Buddhist art from the 2nd century BCE to the 8th century CE, following three distinct phases: (1) Early Emergence (2nd–1st century BCE), (2) First Flourishing (2nd–5th century CE), and (3) Second Flourishing (6th–8th century CE). A key feature is the depiction of paired male and female figures, often associated with floral motifs and musical attributes. The mountainous landscapes of the Indian subcontinent helped preserve indigenous traditions, allowing Kinnara imagery to retain its original forms or develop distinct regional variations. However, in bordering regions, particularly Gandhara and adjacent Central Asia, a significant cultural exchange corridor connected South Asia with Central and East Asia. Within this zone, many previously identified Kinnara figures actually exhibit influences from Hellenistic, Sasanian Persian, and Chinese Buddhist artistic traditions. These artistic elements interacted within this exchange network and, in turn, contributed to the stylistic evolution of human-headed bird imagery in India, resulting in distinct regional artistic developments. Thus, while India’s mountainous regions preserved indigenous Kinnara traditions, its northwestern frontier facilitated external artistic influences, making it a dynamic site of cross-cultural interaction in Buddhist art.

124 ARCHAEOLOGICAL TOURISM AND SUSTAINABILITY FOR LOCAL COMMUNITIES

Session theme: 6. Intertwining archaeology, heritage, and museums  
Session format: Session with keynote presentation  
Session keywords: Social sustainability, Tourism, World Heritage, Local communities  
Session organisers: Francesca Benetti (Independent) – Mattia Sanna Montanelli (University of Cagliari) – Diego Calaon (Ca’ Foscari University, Venice) – Claudia Seabra (University of Coimbra)

SESSION ABSTRACT

In Europe, cultural and archaeological tourism is a key resource for many local economies due to the presence of sites of national or global significance. The inclusion of sites in the World Heritage List, for example, is generally perceived as a driver for tourism. Despite the numerous calls for sustainable policies and practices (by UNESCO, the WTO, the EU and other international stakeholders), the uncontrolled growth of this sector in several areas is generating side effects that threaten the integrity of archaeological sites and de-stabilise the socio-economic fabric of host communities. In many sites, there is growing intolerance of phenomena of “vitrification” - the transformation of communities into mere scenic backdrops - and “destinations built for others” in which residents no

longer recognise themselves in the place where they live. The consequences are tangible: unequal distribution of wealth, unaffordable housing, and often precarious employment. Indeed, communities are increasingly voicing their concerns with protests (e.g. in Spain, Netherlands, Italy). The fragility of the sector has been dramatically shown by the Covid pandemic, and this fragility is compounded by other factors such as war, terrorism and climate change, that also threaten the physical preservation of archaeological sites. This session proposes an interdisciplinary dialogue to explore innovative strategies and approaches to integrate archaeological tourism with the needs of local communities, promoting a model that preserves cultural heritage and supports balanced and inclusive local development. We welcome papers that explore: national frameworks and proposals for embedding sustainable practices in cultural tourism management; new theoretical perspectives and best practices oriented toward the management of tourist flows in heritage sites/areas; the use of digital technologies for responsible enjoyment of archaeological sites; challenges on the ground and critical evaluation of co-design practices; successes and failures of participatory models for the active and meaningful involvement of local communities.

CONTRIBUTION ABSTRACTS

2516. KEYNOTE: WORLD HERITAGE SITES: AUTHENTICITY AND PLACE-ATTACHMENT

Contribution format: Oral  
Contribution authors: Cláudia Seabra (University of Coimbra)

Since its first classification in 1978, World Heritage Sites (WHS) and tourism have shared a long and common history, as these places are viewed as icons and are highly valued as tourism destinations by the international community. As predicted by Russell Train, a mentor to the World Heritage Convention, the “World Heritage” classification would be eagerly sought and the sites identified as such would become “five-star” world attractions (Rao, 2010). WHS are extremely important tourism destinations, increasingly sought by tourists who want to experience authentic places that will enable them to establish a strong connection with local history, culture, and with the communities living in a given territory (NCDOT, 2000). WHS are treasures that belong to everyone, so they must be available to residents and tourists alike and must simultaneously be protected to be enjoyed by future generations. WHS are regarded as places whose authenticity makes them different and unique (Turok, 2009); they are granted a universal value (Naoi 2004, Kolar and Zabkar 2010), as well as a cultural and a heritage value (McKercher and Du Cros 2003). The latter is one of the factors that will have the highest impact on tourists’ destination choice (Yeoman et al., 2007). World Heritage Sites (WHS) represent the culture of the country in which they are located and, at a wider international level, are symbols of these places (Shackley, 1998). From a human, social and cultural perspective, a WHS is much more than a collection of buildings representing the accumulation of cultures and traditions and the heritage values that these cultures have produced or reused. More importantly, WHS are places made of people: residents, communities, visitors, tourists (Su and Wall, 2014). In WHS that are inhabited or fully functioning the relationships between residents or users, visitors and tourists are especially complex. In addition, the connections those different players establish with the place itself are multifaceted. Residents have a crucial role in WHS destinations fruition, since they play the main role in promoting tourists’ immersion in experiences that are intended to be unique and authentic (Ashworth and Tunbridge, 2000). Residents relate with the tourists and perform storytelling experiences giving meaning to the place. However, WHS own authenticity is perceived by residents/users and visitors/tourists in a number of different ways. Residents/users have a constructive perception of authenticity connected with cultural and social references; on the other hand, visitors/tourists have a more existential perspective that is linked to their enjoyment and entertainment (Richards, 2007). The current research paradigm reinforces the importance of analyzing and understanding the subjective, emotional, and symbolic meanings that individuals attach to places (Williams & Vaske, 2003). Also, it is important to understand the paradox of conservation vs visitation of these places. They should be preserved because of their intrinsic value, but they should be available for visitation as well. But how to balance both sides?

644. BALANCING ARCHAEOLOGICAL HERITAGE TOURISM AND SUSTAINABILITY: INSIGHTS FROM THE BAY OF NAPLES

Contribution format: Oral  
Contribution authors: Caterina De Vivo (Independent)

The relationship between archaeological heritage tourism and sustainability is complex and requires a multidisciplinary approach. Drawing from the author professional experience as both a tour guide and archaeologist, with a specific experience as a consultant on heritage management in some of the most effected by tourism European sites (e.g. Archaeological Park of Pompeii), this presentation will explore key challenges and some possible solutions to integrate tourism into more sustainable heritage management practices. Using the Bay of Naples as a case study, this presentation will raise the attention on the need for stronger collaboration between heritage and tourism professionals, with the contribution of local communities, since this issue is becoming urgent in areas, as Southern Italy, where tourism is rapidly becoming the dominant economy. Particularly, it will also focus on

how and why heritage managers and practitioners must play a more active role in shaping European policies concerning the regulation of key tourism professions, which significantly influence how tourism impacts heritage conservation and interpretation. Fostering dialogue between these sectors, could help achieving more sustainable tourism models that protect and enhance our shared heritage. This presentation aims to stimulate discussion on how to bridge the gap between heritage conservation and tourism management, ensuring that archaeological sites remain accessible and meaningful for future generations while preserving their historical integrity.

1140. HERITAGE 4.0: THE ROLE OF ICT IN CULTURAL TOURISM AND COMMUNITY ENGAGEMENT

**Contribution format:** Oral  
**Contribution authors:** Xavier Roda Gilabert (Departament de Prehistòria, Universitat Autònoma de Barcelona) – Susana Vega Bolívar (Departament de Prehistòria, Universitat Autònoma de Barcelona | Associació Recerca i Difusió del Patrimoni Històric, Centro I+D) – Javier Sánchez-Martínez (IPHES-CERCA, Institut Català de Paleoecologia Humana i Evolució Social, Universitat Rovira i Virgili | ICArEHB, Universidade do Algarve) – Jorge Martínez-Moreno – Paloma González Marcen – Rafael Mora Torcal (Departament de Prehistòria, Universitat Autònoma de Barcelona)

Archaeological and cultural tourism has emerged as a real game changer for the town of Camarasa, located in the Spanish Pre-Pyrenees, thanks to the valorisation of two significant sites: Roca dels Bous and Cova del Tabac, both with the highest level of protection granted by the administration (BCIN). The Neanderthal site of Roca dels Bous pioneered the use of digital tablets to provide an interactive experience that has been running successfully for 15 years. This initiative has positioned the site as a benchmark in heritage outreach, attracting a growing number of visitors and generating a positive economic impact for the municipality. Meanwhile, the Cova del Tabac, a UNESCO World Heritage Site, preserves a panel of rock art and archaeological materials linked to the earliest Neolithic settlements in the region. The popularity of the cave among hikers is proof of its importance and the value of protecting and promoting it. The collaboration between the Universitat Autònoma de Barcelona and the non-profit organisation Associació Recerca i Difusió del Patrimoni Històric (ARDPH), dedicated to the conservation and dissemination of the local archaeological heritage, has led to innovative approaches that integrate research, dissemination and community participation. Cultural facilities such as the Espai Orígens visitor centre and the Didactic Archaeological Park offer leisure activities and workshops on prehistory, fostering informal learning and responsible tourism. This sustainable tourism model has been strengthened by digital technology which facilitates the interpretation of heritage and the transmission of knowledge. Current projects are using virtual reality (VR) and mobile applications to develop immersive experiences, including serious games and self-guided tours. Our presentation illustrates the challenges and opportunities involved in consolidating a sustainable tourism hub, with a focus on improving local infrastructure, revitalising the local economy and ensuring the preservation of cultural heritage in rural areas.

2008. PARTICIPATORY APPROACHES TO SUSTAINABLE CULTURAL TOURISM: THE NEXTGEN HERITAGE EXPERIENCE IN TACKLING SOCIAL AND CLIMATE CHALLENGES

**Contribution format:** Oral  
**Contribution authors:** Marco Paladini – Martina Bergamo (Ca’ Foscari, University of Venice) – Jacopo Paiano (University of Trento) – Duna Viezzoli – Paola Peratello – Anna De La Torre Fornell – Margherita Zucchelli – Simona Bravaglieri – Giulia Ferro (Ca’ Foscari, University of Venice)

Cultural and archaeological tourism is an essential resource for many European local economies, particularly in sites recognized as World Heritage. However, the uncontrolled growth of the sector has generated negative effects, including the “vitrification” of local communities, the exclusion of residents from decision-making processes, and the unequal distribution of economic benefits. In many areas, mass tourism has led to the creation of destinations “built for others,” where residents no longer recognize themselves in the places they inhabit. Moreover, global factors such as climate change and migration are reshaping the relationship between heritage and society, highlighting the urgent need for social sustainability in cultural tourism management models, to reverse a process of progressive detachment of local communities from cultural heritage. The event NextGen Heritage – The Transformative Nature of Participatory Cultural Heritage, held in Venice between January and February 2025 as part of the CHANGES-CREST project, demonstrated the potential of participatory approaches in addressing these challenges. Through the collaborative management of thematic working groups, innovative strategies were explored to integrate social sustainability and environmental responsibility into heritage enhancement. Discussions focused on the impact of climate change on World Heritage sites and the role of migration in redefining cultural narratives and local identity. This experience highlighted how the active involvement of diverse stakeholders can enrich tourism and heritage management, fostering more inclusive and balanced development. This paper presents the results of an interdisciplinary dialogue on how participatory models can promote

a more sustainable and equitable form of tourism. Implementing effective strategies that integrate conservation, economic sustainability, and social inclusion is essential to preserve cultural and archaeological heritage while ensuring the well-being of local communities and addressing the global challenges shaping contemporary heritage management.

2018. NEXTGEN HERITAGE: COMMUNITY ENGAGEMENT FOR SUSTAINABLE TOURISM IN ITALY

**Contribution format:** Oral  
**Contribution authors:** Francesca Benetti (Independent) – Diego Calaon (University of Venice)

Building on the principles of the Faro Convention, NextGen Heritage explores sustainable tourism and cultural heritage management strategies in Italy through a community-driven approach. As part of the larger ‘CHANGES’ project, funded by the post-pandemic EU National Recovery and Resilience Plan (PNRR), this initiative aims to reimagine cultural heritage management by empowering local communities. This presentation analyses the tourism-focused strand of NextGen Heritage, examining a pilot grant programme designed to develop ‘bottom-up’ and green sustainable tourism solutions. The tender received 55 bids, 31 from organizations based in centre-south Italy and 24 from north Italy. By evaluating submitted proposals, this presentation will unveil critical challenges and pitfalls that the sector needs to face to move forward (e.g. a certain ‘community washing’, i.e. an unsubstantiated claim of community engagement and empowerment to reinforce the business case of the organisations). Simultaneously, the analysis identifies promising community-led approaches that offer potential pathways for more inclusive, sustainable cultural heritage tourism development.

863. COMMUNITIES ENGAGEMENT. AWARENESS-RAISING ACTIVITIES AND THIRD MISSION WITHIN THE OPERA PROJECT

**Contribution format:** Oral  
**Contribution authors:** Margherita Perri – Paolo Brocato (Università della Calabria, Dipartimento di Studi Umanistici) – Paola Palmentola – Ginevra Coppola (Università degli Studi di Bari, Dipartimento di Ricerca e Innovazione Umanistica) – Antonio Lio (Università della Calabria, Dipartimento di Studi Umanistici) – Virginia Stasi (Independent) – Filippo Trotta (Università degli Studi di Bari, Dipartimento di Ricerca e Innovazione Umanistica)

This intervention aims to illustrate the third mission activities carried out by the Universities of Calabria and Bari and by CNR-IMAA within the framework of the PRIN PNRR 2022 project “Oenotrians and Peucetians: Extensive Research Activities (OPERA). Archaeology, cultures, relationships (IX-III century BCE).” The project is focused on studying the relationships between the ancient Oenotrian and Peucetian cultures. The investigations were directed towards the case studies of Francavilla Marittima, Gioia del Colle and Castellaneta, indigenous contexts distinct from the Greco-Roman culture, which archaeological research has predominantly concentrated on, overlooking the history and monuments of the indigenous populations, thus slowing down the reconstruction of the ancient landscape, also for purposes of valorization. The project’s objective was to complement archaeological investigations with awareness-raising activities aimed at actively engaging local communities through an approach focused on making cultural heritage accessible and meaningful to all members of society. These initiatives - designed and organised on the basis of the results of surveys conducted among citizens to assess their perceptions of archaeological heritage - have not only promoted the exchange of knowledge and the active participation of communities, but have also acted as a catalyst for sustainable development, offering new opportunities to implement archaeological tourism strategies and to carry out actions to promote cultural heritage.

125 INTERREGIONAL PERSPECTIVES ON THE 6TH-5TH MILLENNIA BC IN THE NEAR EAST: UNDERSTANDING SOCIETIES AND TECHNOLOGIES

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Near East, Neolithic, Chalcolithic, Social organisation, Technology, Interregional contacts  
**Session organisers:** Milena Gošic (University of Belgrade) – Ianir Milevski (National Scientific and Technical Research Council) – Dina Shalem (—) – Anna Bach Gomez (Universitat Autònoma Barcelona)

SESSION ABSTRACT

During the 6th and 5th millennia BC, various societies emerged across the Near East, including the Levant, Anatolia, Mesopotamia, the Caucasus, and the Iranian Plateau. Over decades of research, these societies were classified into cultural complexes such as Shulaveri-Shomu, Halafian, Ubaid, and Ghassulian, spanning both Pottery Neolithic and Chalcolithic periods. These societies exhibit certain similarities in their material culture, such as ceramic styles, and their economy and technology, such as a household-oriented organization. These parallels attest to contacts of a yet poorly understood nature. The intensity of the contacts and the inability of archaeologists to sufficiently understand them are apparent when it comes to the introduction of extractive metallurgy in the region during the 5th millennium. We understand that to gain such insights, we must first obtain a more detailed picture of the contemporary societies in various regions of the Near East with emphasis on the economies and technologies they practised and the resources they used. We thus invite papers, including early-stage preliminary results, dealing with early metallurgy and its products, pottery and lithic industries, as well as iconographic manifestations of these societies. We also encourage discussion of the social organization of these crafts, as well as other aspects of social organization in any of the regions of the Near East. First and foremost, we encourage papers to take the interregional perspective to any of these questions.

CONTRIBUTION ABSTRACTS

459. THE EARLIEST NEOLITHIC IN THE SOUTH CAUCASUS IN THE FIRST HALF OF THE 6TH MILLENNIUM

**Contribution format:** Oral  
**Contribution authors:** Svend Hansen (Deutsches Archäologisches Institut, Eurasien-Abteilung | Freie Universität Berlin)

Did the first farmers in the South Caucasus come from the area of the Halaf culture and bring a Neolithic package with them? Various excavations over the last twenty years have provided new data and raise serious doubts about this old thesis. Based on our excavation in Aruchlo in Georgia, the new results are summarised. Enigmatic ditches were repeatedly dug in the settlement, which partially destroyed the buildings and over which new buildings were erected. The results of the DNA analyses show that the Neolithic settlers from Anatolia soon mixed with the local hunter-gatherer groups. All settlements in the South Caucasus were abandoned by 5400 BC at the latest. Neolithisation in the South Caucasus must be regarded as a failed experiment. There is no evidence of farming settlements for the following 700 years. These new insight will be compared with the contemporaneous developments of the Early Neolithic on the Balkan peninsula.

116. LATE CHALCOLITHIC ARCHAEOLOGICAL INTERACTIONS: SOUTH CAUCASUS, ANATOLIA, AND SOUTHERN LEVANT

**Contribution format:** Oral  
**Contribution authors:** Magda Batiashvili (European University)

The Late Chalcolithic period in the South Caucasus (Georgia, Armenia, and Azerbaijan) lacks a unified chronological framework. However, data from well-studied sites, such as Dzedzvebi in Georgia (dated to approximately 4328–4055 BC), Mentesh Tepe in Azerbaijan (4320 - 3990 BC), and Areni-1 in Armenia (3967–3800 BC), offer a basis for comparisons and potential connections with other regions. In this case, the primary focus will be on the relationships with South Levantine metallurgical contexts. This topic has been the subject of considerable scholarly debate, driven mainly by the evidence of the Nahal Mishmar hoard, which features highly sophisticated lost-wax casting techniques (cire perdue) and contains As-Sb alloys not present in the local geology. Previous research suggests that these metals could have originated from the South Caucasus, which is known for its rich polymetallic geology, particularly Fahlore type Cu-Sb-As ores, or possibly from Anatolia, which is geographically closer. Given that Anatolia was a major supplier of obsidian to the Levant during the Neolithic, similar exchanges might have occurred during the Chalcolithic period. To address these research gaps, the aim of this paper is to review literature from the post-Soviet era to the present, examine material culture, metallurgical workshops, and trace the movement of raw materials, with a particular focus on metallurgical practices in the South Caucasus during the Late Chalcolithic period. This approach also aims to raise awareness of the region’s archaeology, which often receives limited attention, mostly due to language barriers preventing the circulation of knowledge and new findings.

615. REVISITING TEGHUT. CRAFT PRODUCTION AND TECHNOLOGICAL PRACTICES IN THE LATE CHALCOLITHIC SOUTHERN CAUCASUS: PRELIMINARY INSIGHTS FROM GROUND STONE TOOL STUDIES

**Contribution format:** Oral  
**Contribution authors:** Karolina Hruby (Postdoc Fellow of Minerva Stiftung, Eurasia Department, Deutsches Archäologisches Institut, Berlin | Institute for Prehistoric Archaeology, Freie Universität

Berlin) – Mark Iserlis (Eurasia Department, Deutsches Archäologisches Institut, Berlin)  
– Ruben Badalyan – Armine Harutyunyan (Institute of Archaeology and Ethnography, National Academy of Sciences of Armenia, Yerevan)

The 5th millennium BC is a period of major changes in technology and social complexity throughout south-west Asia. In the southern Caucasus, however, it is characterized by a major settlement decline and relocation, and a patchwork of local phenomena that are still poorly understood. The most prominent of these is the so-called Leylatepe culture/phenomenon, the appearance of which marks the transition between the 5th and 4th millennium BC and the beginning of the Late Chalcolithic in the region. This phenomenon is typically associated with the introduction of some of the typical Chalcolithic technological innovations within the southern Caucasus, including wheel-made pottery and copper metallurgy. Its links with the Upper Mesopotamian Late Chalcolithic have been emphasized in the few existing studies, presenting it as a uniform case of migration from the south. Recent studies of the Late Chalcolithic deposits in the Karabakh steppe provide a much more nuanced picture of the Leylatepe phenomenon, suggesting significant intra- and inter-settlement dynamics in architecture, subsistence strategies, and technological choices. However, data from other parts of the southern Caucasus are very limited. The current paper focuses on the collection from Teghut – Late Chalcolithic settlement, located in the Ararat Valley. In the course of works focused on the review and analysis of the material culture from the 1960s excavations at Teghut, a small assemblage of ground stone tools from the site was studied for the first time. We present the ground stone tool collection from a typological and technological perspective and in the context of the technological habitus within the settlement. We also discuss the findings in the frame of the Leylatepe phenomenon as a whole, comparing it with the available data coming from the contemporaneous and earlier (Neolithic) sites in the region.

337. FROM WALLS TO VESSELS: THE SHIFTING BULL IMAGES AT LATE NEOLITHIC ÇATALHÖYÜK AND ANATOLIA

**Contribution format:** Oral  
**Contribution authors:** Patrycja Filipowicz (Faculty of Archaeology, Adam Mickiewicz University)

The Late Neolithic period in Central Anatolia witnessed a significant transformation in imagery, marked by the abandonment of figurative wall paintings and reliefs inside the houses. This paper examines the persistence of the bull motif, which reappeared in new, portable forms, within new contexts. Notably, bucranium appears on vessels in Late Neolithic/ Early Chalcolithic sites in the Lake District and Cappadocia. I focus on recent research conducted by Adam Mickiewicz University in the previously unexplored part of the Çatalhöyük mound: East Area, where scattered potsherds with bucranium motif were uncovered. Some of these sherds were attached to walls in non-domestic buildings, suggesting a novel practice in Late Neolithic Çatalhöyük, with no known parallels in the Anatolian Late Neolithic. I argue that this practice may be linked to the funerary sphere. Furthermore, this practice could echo Early Neolithic traditions, such as those at Körtik Tepe, where broken stone vessels were deliberately placed in graves as part of a communal commemorative act. Whether these potsherds indicate long social memory of earlier Near Eastern traditions or represent a distinct local innovation, they indicate a continued attachment to the bull image and reveal significant changes of the funerary practices during the last phases of Çatalhöyük’s occupation. The bucranium motif thus emerges as an important element in the iconography of post- Neolithic communities.

2031. TRADITIONS, INFLUENCES AND MANIPULATIONS: PERCEIVING CHALCOLITHIC SOCIETIES IN NW IRAN

**Contribution format:** Oral  
**Contribution authors:** Soheil Salamat (Freie Universität Berlin) – Judith Thomalsky (Deutsches Archäologisches Institut)

Earliest archaeological investigations have drawn a pattern of cultural relations that was based a priori on dispersing comparable ceramic styles—from West (Northern Mesopotamia) to East (the Iranian Plateau)—which later merged into rather simplistic core–periphery models. This perception has led particularly in Iranian archaeology to the adoption of apparently problematic cultural classifications such as “Ubaid-manipulated” or “Uruk-related” in recent decades. But what exactly is addressed when using such terms? How can we scale “cultural interaction”? Especially in the region under study (NW-Iran), relevant evidence of such interactions has remained confined to a very limited (and simplified) surface of ceramic styles, leading to circular reasoning that hinders our ability to encompass the overarching cultural aspects of the prehistoric society underlying the evident regional interconnectivity. Moreover, little is known about the settlement organization, economy, and social hierarchy of these communities. New data from the 6th–4th millennium BCE sites in the vicinity of Lake Urmia in NW-Iran re-echo our impression of strong cultural interconnectivity in the region. Equally, these new findings strongly recommend a socio-conceptual reconsideration of the underlying agents and requirements. Possible modes

of influence and adoption, scales of contacts, as well as a basic understanding of the economy and organization of the relevant societies, are currently examined in the ongoing Iranian–German joint project. This contribution will shed light on various scenarios of interregional dynamics that underpinned Chalcolithic societies in NW-Iran, such as the Dalma tradition on the one hand, and the “Northern Ubaid material culture” which spread until the SW-shoreline of Lake Urmia.

**1065. BURIALS IN THE LATE NEOLITHIC: TELL HALULA (SYRIA) IN THE ARCHAEOLOGICAL CONTEXT IN NEAR EASTERN VII AND VI MILLENNIUM**

**Contribution format:** Oral  
**Contribution authors:** Miquel Molist – Olivia Orri – Josep Anfruns – Anna Bach-Gómez (Universitat Autònoma de Barcelona)

In the Late Neolithic period, funerary practices exhibit significant variability concerning both the funerary gestures and the associated structural elements. The funerary assemblage identified at the Tell Halula site during the PreHalaf and Halaf phases, which has not been subjected to study until now, offers valuable insights into the populations inhabiting the Middle Euphrates region during the 7th to 6th millennium BCE. This study aims to conduct a thorough examination of the graves, adopting a holistic perspective that interrelates the data derived from various analyses and investigations pertaining to this innovative funerary ensemble. Furthermore, the detailed analysis of the graves will emphasize their characteristics in relation to the habitat, associated artifacts..., which allows a socioeconomic interpretation of the living society. This insight into the Middle Euphrates data from Syria and Turkey will make it possible to make a decisive contribution to the forms of population mobility through the analysis of grave goods.

**680. PLANT CONSUMPTION AND INDIRECT EVIDENCES IN THE 6TH MILLENNIUM CAL BC: EXPLORING PALAEOBOTANICAL DIVERSITY IN UPPER MESOPOTAMIA**

**Contribution format:** Oral  
**Contribution authors:** Míriam Gómez Andreu – Anna Bach Gómez (Universitat Autònoma de Barcelona) – Ramon Buxó Capdevila (Museu d’Arqueologia de Catalunya) – Walter Cruells Banzo – Miquel Molist Montaña (Universitat Autònoma de Barcelona)

The study of plant remains and grinding tools provides crucial insights into dietary practices and plant resource management in prehistoric societies. In Upper Mesopotamia, the 6th millennium cal BC marked a period of significant agricultural and subsistence transformations. This paper examines palaeobotanical evidence associated with grinding stones from archaeological contexts to explore plant processing techniques and the diversity of plant species consumed during this period. Through the analysis of charred macroremains and microbotanical residues, we assess the role of cereals, legumes, and wild plant species in the diet of Halaf communities. The presence of grinding stones suggests intensive plant processing, possibly linked to food production, ritual activities, or medicinal practices. Furthermore, variations in plant assemblages across different sites indicate regional adaptations and resource exploitation strategies. This study, based on Chagar Bazar and Banahilk materials, highlights the complexity of agricultural systems and their reliance on both domesticated and wild plant resources. By integrating archaeobotanical data with indirect evidences, we contribute to a broader understanding of subsistence economies and plant consumption diversity in consolidated farming communities of Upper Mesopotamia. The findings underscore the dynamic interactions between humans and plants, shaping subsistence strategies in the early stages of agricultural development from Upper Levant to Tigridian area.

**21. EARLY AND MIDDLE CHALCOLITHIC POTTING PRACTICES IN THE CENTRAL LEVANT: SYRIAN-LEBANESE TECHNICAL TRADITIONS AND INSIGHTS INTO INTERREGIONAL RELATIONS**

**Contribution format:** Oral  
**Contribution authors:** Johnny Baldi (CNRS, UMR 5133 Archéorient)

The evolutionary path by which the Central Levant, between the 6th and 5th millennia BCE, created the conditions for Late Chalcolithic social complexity is almost completely unknown. In the absence of sufficient stratigraphic and architectural data, pottery is the only documentary source that allows us to reconstruct (at least partially and macroscopically) the internal and supra-regional relations of the area corresponding to present-day Lebanon and southern Syria. In a number of recent projects, the application of an anthropological approach to the ceramic technical traditions documented in pottery assemblages from surface surveys and stratigraphic soundings has made it possible to observe some evolutionary lines that show both demic inputs and long-distance cultural borrowings. The picture that emerges is that of a vast area in which the traditional divisions into regions (Levant, Mesopotamia) or “archaeological cultures” (Wadi Rabah, Halaf, Ubaid, etc.) should be deconstructed and eventually discarded in favour of other criteria.

**20. THE EVOLUTION OF THE TRANSREGIONAL CONTACTS BETWEEN THE LEVANT AND EGYPT DURING THE 6TH AND 5TH MILLENNIA BC**

**Contribution format:** Oral  
**Contribution authors:** Gaia Cecconi (—)

The Levant has always been an important intersection between the Near East and Egypt. During the second half of the 6th millennium, most of the Northern Levant sites are stratigraphically related to the Amuq Valley (Amuq C), while in the Southern Levant the Wadi Rabah is prevalent. In the same period, agriculture and pottery were imported from the Southern Levant, first in Lower Egypt (Fayum A), and then in Upper Egypt. During the 5th millennium, the Levantine Chalcolithic cultures (Amuq D-F, Qatifian, Ghassulian, etc.) interface with several Egyptian cultures (e.g., Merimde, el-Omari, Tasian, Badarian, early Buto and Naqada), but the influences from Egypt to Levant begin and increase as one approaches the Early Bronze Age, arriving to the Eneolithic Byblos. This paper will provide an overview of the evolution of the interactions and the transmission of products and ideas between the Levant and Egypt during the Late Pottery Neolithic and the Chalcolithic periods (6th- 5th millennia BC). Starting from the essential bibliography and the latest studies, this study will draw a chronological map regarding the diffusion of technologies (pottery, metallurgy, ivories, lithics, etc.) and iconography (figurines, decorative motifs, etc.) between the two regions, trying to analyze the social and economic implications related to these connections and to promote future discussions.

**580. LINKED BY DESIGN: GLAZED STEATITE BEADS BETWEEN BADARI AND BE’ER SHEVA AND THE OPERATION OF SOCIAL POWER**

**Contribution format:** Oral  
**Contribution authors:** Julian Hirsch (—)

Contact between Badarian Egypt and the Late Chalcolithic Southern Levant has long been recognized, manifested primarily in small quantities of artifacts from one region found in sites of the other. These have been characterized as the result of sporadic exchange. While this exchange may indeed have been sporadic, the apparent introduction of metallurgy from the Levant to Egypt, near-identical designs in certain art media, and identical beads made from glazed steatite found in both regions may indicate that these exchanges may have been imbued with greater social significance. In this presentation, I focus on glazed steatite beads, objects glazed with copper-mineral colorant and found in large numbers in both regions. As no steatite is found in the Levant and since several scholars argue that 5th millennium copper found in Egypt originated in the Levant, I argue that these objects were mutual products, benefitting individuals living in both areas, and implicating them in mutual dependencies. Building on models emphasizing the link between the ritualization of copper smelting, specialized knowledge, and the operation of social power in the 5th millennium southern Levant, I argue that glazed steatite beads possessed similar linkages, and that the symbolic and social significance of these beads was also a result of the origin of their raw materials, the long-distance journeys involved in the extraction of those materials, and the knowledge of and contact with individuals living in other regions necessary for their successful creation. This suggests that the operation of social power in both 5th millennium Egypt and the Levant was to some extent linked to direct connections with far away regions and their inhabitants, as expressed through select objects.

**18. ECONOMICS AND SOCIETY OF THE 6TH-5TH SOUTHERN LEVANTINE CULTURES. LOOKING INWARDS, LOOKING OUTWARDS**

**Contribution format:** Oral  
**Contribution authors:** Ianir Milevski (National Scientific and Technical Research Council, Argentina. German Archaeological Institute)

The southern Levantine cultures of the 6th-5th millennia BC have consistently been described in relation to both the preceding and subsequent phases of the region’s late prehistory. These cultures primarily experienced the second phase of the Neolithic Revolution, characterized by the exploitation of animals for secondary production, which continued until the end of the Late Chalcolithic. At the end of this period, the domestication of the donkey paved the way for a significant exchange of commodities. While communities in the Late Pottery Neolithic/Early Chalcolithic (5800-4500 BC) of the southern Levant were also part of a broader interaction sphere extending to the Near East and beyond, the Late Chalcolithic (4500-3800 BC) maintained some of these connections but evolved in new directions. It developed an internal exchange system, a more complex division of labour, and a distinctive iconography. In both phases, the directionality of trade remained similar: asymmetrical along longitudinal routes and symmetrical along transverse routes. The quantity and variety of traded goods increased—such as ceramic vessels, basalt bowls, and copper objects—and their production was primarily carried out by craftsmen deeply involved in local communities. However, during the Late Chalcolithic, craft production and specialization became more standardized, likely under the influence of some form of authority for specific commodities, including copper items, ivory, and other products. In this context, pottery technology advanced with the introduction

of the tournette, and copper metallurgy not only promoted craft specialization but also introduced a new type of luxury elements into society.

529. ICONOGRAPHIC DEPICTIONS AS INDICATORS OF CULTURAL INTERACTIONS AND SOCIAL SHIFTS IN THE SOUTHERN LEVANT AND BEYOND (6TH–5TH MILLENNIA BC)

Contribution format: Oral  
Contribution authors: Dina Shalem (—)

Iconographic expressions often serve as key indicators of cultural differences, connections and influences, offering insights into shared beliefs. In some instances, these expressions are widespread across large regions, while in others, they highlight local cultural variations. In rare cases, they may reveal connections that might otherwise remain hidden. This presentation examines socio-cultural continuities and changes from the 6th–5th millennia, as reflected through iconographic expressions in the southern Levant, within the broader context of the Ancient Near East. Some examples include South Levantine female anthropomorphic figurines carved in stone from the 6th millennium BC, which show similarities to figurines from northern regions of the Ancient Near East, while clay figurines often exhibit distinct differences. Zoomorphic iconography, continuing long-standing Near Eastern tradition of small, simply crafted figurines, undergoes changes in the last quarter of the 6th millennium BC. Additionally, extraordinary iconographic expressions emerge in the southern Levant in the middle of the 5th millennium BC, reflecting rapid socio-cultural changes driven by specific circumstances.

1540. THE SOCIAL AND SYMBOLIC VALUE OF RAW MATERIALS AND LONG-DISTANCE EXCHANGE: THE VIEW FROM THE SOUTHERN LEVANT

Contribution format: Oral  
Contribution authors: Milena Gošić (University of Belgrade)

The origin of raw materials and artefacts and their exchange is a long-standing archaeological research topic. The advancement of archeometric techniques used for provenance analyses has facilitated connecting archaeological artefacts, including metals and by-products of metallurgical processes, such as slags and ores, with the natural deposits of raw materials used in their production. The exchange networks that facilitated the movement of raw materials are investigated mainly from the point of view of the economy and related issues of social organisations, such as control of resources and establishment of social hierarchy. The present paper explores how the symbolic significance of the origin of raw material, factual or fictional, can be significant for the ritual importance of artefacts. Considering that the southern Levantine Chalcolithic artefacts produced from materials acquired through the long-distance exchange, such as copper, copper-based alloys and ivory, were predominantly ritual objects, it is reasonable to conclude that the material and the exchange have multifaceted significance that extends beyond just economic transactions to include cultural and symbolic dimensions.

126 LONGEVITY SECRETS OF ANCIENT CONSTRUCTIONS: EXPLORING AND BEING INSPIRED BY BUILDING MATERIALS AND CONSTRUCTION TECHNIQUES THAT HAVE SURVIVED THE CENTURIES

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: building materials, architecture, scientific investigations, restoration, long time use  
Session organisers: Mircea Negru (University of Bucharest | Spiru Haret University Bucharest) – Pavla Tomanova (Institute of Archaeology of the Czech Academy of Sciences, Prague)

SESSION ABSTRACT

This session aims to highlight an exciting, but sometimes slightly underestimated research topic of archaeological building materials and ancient construction techniques. Building materials contain a wealth of essential information and interesting stories about monuments under investigation, the surrounding environment, and the builders’ knowledge. With every construction, we can ask questions like: Why are these materials selected for construction? Where did the building materials come from? What caused the quality and durability of buildings that have survived over centuries. What knowledge was essential to build up that construction? Ancient building materials and construction techniques proven through centuries of use are suitable for monument conservation and restoration of archaeological sites. All transdisciplinary perspectives are welcome related to building materials and construction techniques. Scientific investigations and experimental archaeology papers are welcome to present the development of construction techniques over time and analysis of the unseen knowledge and properties of so-seen archaeological building materials. This session is not limited to any chronological period, case

studies from Prehistory until Modern Era are invited. We hope to discuss buildings of various purposes (military, civilian, religious, infrastructures so on) and all kinds of materials (wood, clay, brick, stone and other ones). We welcome approaches to economic, social and cultural aspects, as well as approaches to investigation methods and visions for future research.

CONTRIBUTION ABSTRACTS

887. MUDBRICK ARCHITECTURE AND PRODUCTION FROM THE PREHISTORIC SETTLEMENT AT THESSALONIKI TOUMBA, GREECE: AN ARCHAEOLOGICAL AND EXPERIMENTAL APPROACH

Contribution format: Oral  
Contribution authors: Andreas Samouris – Stelios Andreou – Sevasti Triantaphyllou (Aristotle University of Thessaloniki)

The use of mud as building material has persisted since the early prehistory to the modern times worldwide. Sun-dried mudbricks have been extensively utilized across various archaeological contexts. Within this broad spatio-temporal framework, despite adhering to common origins, the production and use of mudbricks, display notable variability regarding the various stages of construction. While mudbrick structures have traditionally been examined as part of material culture, their social significance is unquestionable and thus building remains can be viewed in both technological and societal contexts. Decisions over which building materials to use, how and when to incorporate them, and how to shape and utilize the final product—the mudbrick—are considered widely to have been influenced by cultural traditions and social beliefs. In central Macedonia, mudbricks constitute the primary building material in prehistory since the 5th mill. BCE to the 10th c. BCE while the main settlement type, that of tells, are in fact formulated through the continuous use of mudbrick architecture. The Late Bronze Age tell settlement of Thessaloniki Toumba constitutes a perfect case study for the application of a multidisciplinary approach where archaeological and experimental paradigms can be combined. This presentation aims to showcase the preliminary results of such an analysis where the chaîne opératoire of mudbricks production and construction from the prehistoric Thessaloniki Toumba settlement will be investigated.

1173. BEHIND THE BRICK: INVESTIGATING THE EARTHEN CONSTRUCTION TECHNIQUES AT KUNARA

Contribution format: Oral  
Contribution authors: Pantelitsa Mylona (Department of Antiquities, Republic of Cyprus) – Aline Tenu (CNRS - UMR 7041 ArScAn - Équipe HASAÉ)

Kunara is located in Iraqi Kurdistan, near the modern city of Suleymaniyah, on the right bank of the Tanjaro River, a perennial stream of the Tigris basin. It covers about 7-9 ha and comprises an upper town to the west and a lower town to the east. Excavations revealed levels, mostly dated to the last part of the 3rd millennium BCE. The discovery of a finely carved cylinder seal, sealings, elaborated vessels, metal items, and exogenous material such as marine shells or obsidian, as well as more than 100 cuneiform tablets and fragments indicate Kunara was a significant regional centre. Public edifices are built with a stone footing and a superstructure made of earth. The identification of architectures was a challenge because the use of sundried mudbricks was much more limited than expected. According to field observations it seems that in Kunara several techniques of earthen construction co-existed. The field study revealed three main implementation methods for the walls: some walls were constructed with pre-fabricated modules (kinds of mudbricks but not in the usual sense of the term because they are not sudried) and plaster; others with long earthen layers superimposed, characterized as the cob technique, and the third one the use of mud lumps. Both were found in different structures at Kunara and they were used at the same time, often in the same building. The geoarchaeological study using soil micromorphology aims to describe the chaîne opératoire of the building techniques, from the collection of raw material to the implementation methods. It showed the use of fine sediments that have been carefully selected or sieved and then prepared in humid state. Different facies of mudbricks have been identified and their differences lay mainly on inclusions and pedological features.

756. GREEK COLUMNAR ARCHITECTURE: DESIGN, MATERIAL AND CONSTRUCTION TECHNIQUE

Contribution format: Oral  
Contribution authors: Therese Emanuelsson-Paulson (Stockholm University)

When discussing the development of monumental columnar architecture in Ancient Greece, traditional research has always cited the ancient authors claiming that said development was a linear evolutionary development from wooden post to stone columns resulting in the perfect marble temples. However, the evolution of the Greek columnated building was not that simple, nor can it be said to be linear. A unified evolutionary development of the Greek architecture is a simplified explanation, for a much more complex phenomenon. Different materials were chosen in different regions, for different reasons in different periods. Most commonly local materials were used

and we can see that in some regions the material was changed depending on the design of the building, where as in other regions the design was altered instead of the material. Much attention has traditionally been given to materials that are expensive today, such as marble, but research sometime overlook that the same material can be inexpensive if its locally available. More common stone might also have been an expensive choice, were they not locally available. The choice of material can be a conscious choice rather than only a chronological development. The construction techniques used at these sites are interesting enough not changing with the development of the architectural styles. A town could copy a new style from somewhere else, but the construction techniques and the materials, often remains the same. One continued to construct as one always had in that location. My research aims to understand how and when changes were made in Greek columnar architecture and the correlation between regional styles, construction techniques and materials.

275. BETWEEN THE WALLS: THE USE OF SHELLS IN THE CONSTRUCTION OF ROMAN WALL PAINTINGS AT BOCA DO RIO (BUDENS, PORTUGAL)

**Contribution format:** Oral  
**Contribution authors:** Daniela Martins (University of Algarve | University of Murcia | CEAACP) – Beatriz Pinto (University of Algarve | ICArEHB) – João Bernardes (University of Algarve | CEAACP)

The Romans were known for their capacity for construction, their architectural skills, and their ability to decorate spaces. This study examines the Roman wall paintings from Boca do Rio, an archaeological site located in the coastal zone of southern Portugal, with a focus on the presence of shell remains within the construction materials. The research aims to explore the significance of these marine inclusions in relation to the construction techniques, material acquisition, and the wider socio-economic context of the site. A multidisciplinary approach combining pictorial and zooarchaeological analysis has been employed to investigate the composition, origin, and potential functionality of the shells. Preliminary results indicate a strategic use of local marine resources, which may have contributed to the durability and qualities of the wall paintings. The findings shed light on the intersection of construction techniques, decoration and marine remains in Roman Lusitania, highlighting the role of coastal resources in building methods and artistic production.

683. THE PRODUCTION OF CERAMIC CONSTRUCTION MATERIALS IN THE ROMAN DACIA INFERIOR (MALVENSIS) PROVINCE

**Contribution format:** Oral  
**Contribution authors:** Mircea Negru (University of Bucharest | University of Craiova | Spiru Haret University Bucharest)

Construction materials were essential in building the fortifications, urban and rural settlements, as well as Roman farms in the Roman province of Dacia Inferior (Malvensis). Ceramic construction materials are specific to this province’s plain and hill areas, without missing those in the mountain area. The production of construction materials was possible thanks to the clay resources, widespread in the studied region. The production workshops were used by both military and civilians. The military workshops can be identified by the stamps of the military units that built the Roman fortifications, whether they were detachments of legions or auxiliary troops. Very likely, these also produced materials for civilian settlements of military families, near the Roman fortifications. The civilian workshops ensured the supply of construction materials for the needs of the civilian population in the urban, rural or Roman farms. The workshops at Romula can be attributed to civilian production, while the one at Enosesti-Acidava could also have a both military and civilian destination, being discovered in the civil settlement of the Roman fort. In these workshops, bricks of various shapes (rectangular, square, round), with variable dimensions, and tiles were made. Also, tubes for the hypocaust or water supply and decorated functional elements, such as antefixes, were produced. Scientific laboratory investigations indicate specific properties of these materials, among which we emphasize, the quality and long-term reliability, compression resistance, etc., they being preserved in perfect condition until today, being still usable, as they were almost two millennia ago. Considering the variations in the properties of the raw material, we can assume that only the technological stages could contribute to their quality and reliability.

2127. UNCOVERING HISTORICALLY RELEVANT PATTERNS FROM INTERDISCIPLINARY DATA: THE CLAY IMPRINTED STAMPS OF THE ROMAN CASTRUM OF POTAISSA

**Contribution format:** Oral  
**Contribution authors:** Cristina Mircea – Ioan Gabriel Mircea – Agnes Gal – Sorin Nemeti (Babes-Bolyai University)

An interdisciplinary approach combines computer vision and deep learning techniques to properly cluster Roman legionnaire stamps from the Roman castrum of Potaissa (Turda, Romania). It also employs geological analysis of the paste used for the tiles and bricks used as canvas for the stamps to unveil more profound aspects of the lives

of Roman legionnaires not only in the province of Dacia but in the larger context of the Roman Empire. Having as input several hundred bricks and tiles manufactured by Roman soldiers in the castrum of Potaissa, a pipeline that combines the data obtained from the automated visual analysis of 2D images of the stamps captured in controlled lighting conditions with numerical information describing the geological composition used for the tiles themselves is proposed to determine and analyze the underlying patterns that might occur in the interdisciplinary data. The objective is to explore the data more deeply, using state-of-the-art machine learning techniques for unsupervised and supervised learning and proper data visualization instruments. This will allow us to investigate patterns that might provide better insight into the history of the Roman castrum, its evolution over time, and its purpose in the larger context of the Empire.

614. A BIOMIMETIC PREPARATION METHOD OF CALCIUM OXALATE FILM FOR THE PROTECTION OF STONE BUILDING HERITAGE

**Contribution format:** Oral  
**Contribution authors:** Lu He (Northwest University | Sorbonne University) – Fuwei Yang (Northwest University) – Maguy Jaber (Sorbonne University)

Due to the increasing severity of environmental pollution, stone building heritage is often damaged in open-air environments by factors such as rain erosion, dissolution of settled acidic particles, and acid rain, etc. The protection of stone cultural heritage faces significant challenges. Calcium oxalate is widely adopted as a protection material to prevent stone building from environmental corrosion thank to the excellent weather resistance. However, compared with the calcium oxalate film found in nature, the artificial calcium oxalate film usually has coarse particles and is easier to peel off the substrate. Calcium oxalate films in nature are generally believed to form by the interaction between oxalic acid secreted by microorganism and carbonate stone, they usually have good adhesion with stones. Considering that microorganisms secrete various substances in addition to oxalic acid during their metabolic processes, such as erythritol, this study was inspired by this and used polyols as additives to prepare biomimetic calcium oxalate film. The results indicate that adding polyols during the preparation of calcium oxalate facilitates the formation of films with improved performance. In the presence of polyols, the particle size of calcium oxalate crystals is significantly reduced, the film has a strong adhesion to the substrate resulting it not easy to peel off from the stone. The porosity and water absorption of the stone are reduced, which is beneficial for protecting substrate from erosion caused by external solutions. At the same time, the bionic film will not have a significant impact on the appearance change of stone heritage. In addition, since polyols have a certain hygroscopicity, the moisturizing procedure is not required for the protection of outdoor large stone building and a bionic calcium oxalate film can be formed on the surface. The findings of this research are significant for the practice of stone building heritage conservation.

222. TIMBER REINFORCEMENT IN MEDIEVAL SACRAL ARCHITECTURE. REASONS FOR USE ON EXAMPLES FROM THE CZECH REPUBLIC

**Contribution format:** Oral  
**Contribution authors:** Filip Facincani (Charles University)

There are two types of (not only) medieval reinforcement, i.e. temporary and permanent. The latter was made of both wood and iron and was applied both in the foundations and in the above-ground masonry. Reinforcing elements were installed both horizontally and vertically, or interconnected to form a spatial frame. Some of the reinforcement was fully hidden in the masonry and thus invisible, while others partially passed through the space between the sections of masonry being reinforced. The aim of this paper is to present and discuss the newly discovered fragments of timber reinforcement from around 1300, which were found by the author in the attic of the presbytery of the Church of St. Francis in the St. Agnes Monastery in Prague — one of the most important early Gothic buildings in Bohemia, built between 1238–1245. What is the testimonial value of this particular example and what does it allow us to read in the context of other local and foreign analogies? What circumstances led to the use of timber reinforcement in sacral architecture, when in Bohemia we know them mainly from fortification one? The aim of the paper is to open up a discussion on whether it is possible to answer why this solution was applied here without a laconic statement “for reinforcement” being an acceptable answer.

651. THE ANDALUSI RAMMED EARTH: A SUSTAINABLE MEDIEVAL TECHNIQUE

**Contribution format:** Poster  
**Contribution authors:** Jorge Rouco Collazo (Institute of Heritage Sciences (INCIPIT-CSIC))

Rammed earth walls are one of the most common construction techniques used in the south-central region of the Iberian Peninsula since the Andalusí period. Their versatility in terms of construction materials used within the formwork (ranging from earth to various types of lime mortar, along with masonry) explains their widespread use throughout the medieval period for numerous applications, from fortresses to domestic dwellings.

Their success was such that they became a prestigious construction technique for various Andalusí dynasties from the 11th century onwards, partially displacing other techniques such as ashlar masonry. This versatility also explains the long-lasting presence of rammed earth walls in various forms as part of traditional architecture to this day, due to their durability and adaptability to local resources. In this poster, we present research conducted on medieval rammed earth construction techniques in the southeast of Spain (provinces of Granada and Almería), used in both fortifications and domestic architecture. These techniques have been characterized and described using new technologies for three-dimensional documentation, with the aim of creating a catalog of remains and an evolutionary chronotypology of fortifications. The ultimate goal of the catalog is to contribute to the conservation of these heritage remains and to promote their potential use today as a versatile and low-environmental-impact construction technique.

**1144. A REASSESSMENT OF PRESERVED LATE ANTIQUE WOODEN ARTIFACTS FROM AJDOVSKI GRADEC, SLOVENIA AIMS TO REFINE DATING, CRAFTSMANSHIP, AND ENVIRONMENTAL ADAPTATIONS**

**Contribution format:** Poster  
**Contribution authors:** Daša Pavlovic (National museum of Slovenia)

In the years 1977 and 1978, a cistern was excavated within one of the defensive towers of the Late Antique hill-fort settlement of Ajdovski Gradec above Vranje. Due to its exceptional construction quality, the cistern retained water even after 1,400 years. Within it, 271 wooden artifacts were preserved, including elements of the roof structure, roofing materials, gutters, ceiling, a trough, a ladder, and various smaller utilitarian objects. Some of the most significant artifacts were conserved and exhibited at the National Museum of Slovenia, while the majority were submerged in a large biocide-treated vat in the museum’s basement for long-term preservation. In 2024, a reassessment of the condition of the wooden artifacts in the vat was initiated, and a research plan for 2025 was developed. Preliminary chemical analyses confirmed that the wood is suitable for further radiocarbon dating and isotope analysis. Additionally, dendrochronological analysis will be conducted. The primary objectives of this research are to establish a chronological framework, study wood processing techniques for construction elements and utilitarian objects such as buckets, and obtain data relevant to climatic changes that may have influenced the lifestyle of Late Antique inhabitants. The study also aims to explore how these communities adapted to environmental changes. The poster will present the research plan, methodology, and any preliminary results.

**127 ANCIENT AGROSCAPES. EXPLORING THE COMPLEXITY OF AGRARIAN COMMUNITIES IN A CROSS-CULTURAL AND MULTI-ANALYTICAL PERSPECTIVE**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Rural archaeology, Agricultural communities, Production processes  
**Session organisers:** Lorenzo Zamboni (University of Milan - Department of Cultural Heritage and Environment) – Agostin. Sotgia (University of Groningen - Groningen Institute of Archaeology) – Federica Vacatello (Sapienza University of Rome)

**SESSION ABSTRACT**

Agriculture represents one of the most rational relationships between humans and the environment throughout antiquity. Humans select which species to cultivate in the fields and which animals to raise in pastures based on the characteristics of the landscape. However, where possible, they modify the landscap. to enhance its suitability for the needs of the communities present. This relationship is far from being simple or linear, exhibiting a number of complexities that are crucial to understanding various historical dynamics over time. For example, one may consider the insights derived from analyzing the relationship between nucleated centers, the landscape, and marginal or uncultivated areas, such as mid-slope pastures or wetlands. This enables the identification not only of the techniques and timing of resource exploitation, but also of the character of the communities involved and the various forms that they took. Terms like countryside, agrotown or ruralization describe a wide range of different situations that deserve further characterization. Similarly, the social and political relationships that underpin interactions between humans and the land, as well as those within agricultural communities, represent a crucial area of focus. Who owned the land and its produce? What roles did individual actors play in the production process? What impact has human activity had on the landscape and how have people responded to environmental changes? To what extent have non-elites and subalterns been involved in agricultural processes. The proposed session will examine a number of topics, which will be explored through a broad chronological and geographical lens. We welcome contributions that offer theoretical and/or methodological approaches, as well as case studies of specific contexts. It is our contention that only by investigating agrarian landscapes and the actors involved in their exploitation in a cross-cultural and multidisciplinary manner can the vast historical

potential of these elements be fully elucidated.

**CONTRIBUTION ABSTRACTS**

**966. INVESTIGATING THE LONG-TERM DYNAMICS OF INEQUALITY AS AGROSCAPES TRANSFORMED IN THE DEEP HISTORY OF SOUTH ASIA**

**Contribution format:** Oral  
**Contribution authors:** Adam Green (University of York) – Aftab Alam (Aligarh Muslim University)

Agroscapes are a critical feature in the deep history of South Asia. In 2600 BC, a small number of agro-pastoral villages that were dispersed across the Indus basin transformed into some of the world’s first cities. Indus cities were associated with high economic growth and an absence of stratification, with urban communities engaging in impressive feats of collective action and civic governance without a ruling class. These early cities co-existed with thousands of small-scale settlements—”rural” or “satellite” communities that transformed along with their urbanising neighbours. Indus cities de-urbanised around 1900 BC, a period associated with climate change, and the number of small-scale settlements in some regions, such as northwest India, grew. The growth of this agro-scape continued until the rise of the Early Historic around 1300 BC. In this paper, we review evidence for urban/rural differentiation over the course of Indus urbanisation and de-urbanisation, comparing settlement evidence from the Indus civilisation to that from cities associated with the Early Historic Re-urbanisation of northwest India. A better understanding of urban-rural differentiation is critical to our knowledge of Indus urbanisation (and de-urbanisation), and can help frame future research on the long-term trajectory of inequality and governance in South Asia’s deep history.

**1063. AGROTOWN ECONOMICS: A MULTIMETHOD APPROACH TO LANDSCAPE MANAGEMENT OF ECOTONES IN LBA KEFALONIA, GREECE**

**Contribution format:** Oral  
**Contribution authors:** Efrossini Vika (American School of Classical Studies at Athens) – Eleni Papafloratu – Grigoris Grigorakakis (Ephorate of Antiquities Kefalonia and Ithaca)

For Late Bronze Age Greece, the urban vs. rural conundrum has taken up a lot of the discussion on settlement planning and political economy. The urban and rural have been viewed as opposites of a linear trajectory in social development, resulting in a preconceived, restrictive narrative that valued urbanity but miscalculated the role of regional parameters and individual actors. In our study, we present a multimethod approach to the reconstruction of the agro-scape in Late Bronze Age Kefalonia, that includes stable isotope analysis and computational archaeology, with the aim of understanding the structuration of the land, taking into particular account mobility within ecotones and multiple resource management. Although it is well understood that subsistence related activities by default change the environment, the associated territorial and urban planning in Greek prehistory is not fully explored. Our results introduce the idea of organisation in ‘agrotowns’, and discuss the nuanced economics of a decentralised, pluralistic land management system, within the contested semiotics of the Late Bronze Age.

**663. SOWING THE CITY: AGRICULTURE AT THE ROOTS OF URBAN LIFE**

**Contribution format:** Oral  
**Contribution authors:** Agostino Sotgia (RUG - University of Groningen)

According to Aristotle (Politics, Book 7), the ideal location for a city is at the intersection between land and sea and along key communication routes, enabling efficient access to resources and their swift distribution across the region. Centuries later, Italo Calvino (Invisible Cities, 1972) observed that “every city takes its form from the desert to which it stands in opposition,” emphasising the essential relationship between landscape and urban experience. But what happens if the landscape shaping the city, and in which it is immersed, is an agricultural one. This paper explores how agricultural landscapes shaped urban development, focusing on Central Italy during the Early Iron Age, a period when the first urban concepts began to emerge. An analytical methodology was developed by adapting FAO land evaluation techniques into archaeological terms. This approach enabled the reconstruction of agricultural practices, the simulation of food production, and the estimation of population capacities sustained by these early communities. Beyond this specific case study, the paper also offers a broader theoretical reflection on the critical role of agriculture and those engaged in it within historical processes, contributing to a deeper understanding of early urban dynamics.

1646. YOU HAVE TO START SOMEWHERE...ASSESSING AGRICULTURAL CARRYING CAPACITY AS A HEURISTIC FOR UNDERSTANDING PAST SOCIAL ECOLOGY

Contribution format: Oral  
Contribution authors: Julian Laabs (Leipzig University)

This paper presents a transparent and reproducible approach to modelling agricultural production in relation to environmental characteristics and available labour, with the aim of assessing the ecological and social carrying capacity of past landscapes. Carrying capacity, as a heuristic measure, serves as an entry point for exploring the complex dynamics of social ecology at site, micro-regional and broader scales, and provides a framework for understanding cultural adaptation and resilience in changing environments. The approach (EstimatingLandLabourLimitations) integrates well-established open access tools (e.g. LandUseQuantifieR, FuzzyLandscapes) and uses topographic derivatives to assess environmental suitability. These suitability measures are translated into a carrying capacity index, which is applied across multiple agricultural and territorial scenarios to account for the uncertainties inherent in reconstructing past socio-ecological systems. Using diachronic case studies ranging from Early Neolithic river valleys in Slovakia to micro-regions of Asia Minor during the Roman Imperial Period, this paper illustrates the ecological constraints and opportunities that shaped past societies. By demonstrating how a simple heuristic can be used to transcend simplicity and embrace complexity, this research contributes to broader discussions of social and economic resilience, adaptation, and societal transformation in response to environmental challenges.

2466. WORKING HARD: GEOARCHAEOLOGICAL PERSPECTIVES ON AGRICULTURAL PRACTICES IN ANCIENT EASTERN IBERIA

Contribution format: Oral  
Contribution authors: Xavier Agulló Máñez (University of Alicante) – Mario Gutiérrez Rodríguez (IUIAI, University of Jaén) – Ignasi Grau Mira (INAPH, University of Alicante)

employed in these areas, we conducted a multi-scalar geoarchaeological analysis incorporating soil micro-morphology, bioarchaeological techniques, and geochemical analyses. These methods provided critical data on soil management practices, including plowing, fallowing, manuring, irrigation, and other intensive land-use strategies. By comparing the results from both sites, we aim to highlight patterns of continuity and change in agricultural practices across the Iron Age and Roman periods. The findings reveal the adaptability of these rural communities to environmental challenges and their capacity to manage limited resources effectively. Furthermore, this comparative approach allows us to investigate the socio-economic implications of these agricultural practices, shedding light on the integration of peasant production systems into broader regional and imperial frameworks. Through this study, we propose a nuanced interpretation of ancient rural landscapes, emphasizing the interplay between environmental conditions, agricultural practices, and socioeconomic organisation. By focusing on key processes such as terracing, irrigation management, and organic enrichment of soils, we aim to contribute to a deeper understanding of the resilience and sustainability of ancient agrarian systems in the Mediterranean world.

1408. BUILDING A RURAL ROMAN LANDSCAPE: LAND DIVISION, ROAD NETWORKS, AND GEOMORPHOLOGY SOUTH OF BEDRIACUM

Contribution format: Oral  
Contribution authors: Guglielmo Strapazzon (Independent) – Enrico Croce (University of Milan - Department of Cultural Heritage and Environment)

Traditional studies of rural Roman landscape formation in Italy have primarily relied on cartographical and historical sources. These approaches often follow a rigid, top-down perspective, with a strong emphasis on written records and cartographic analysis to examine land division, agricultural patterns, and road networks. However, the recent application of remote sensing and geophysical methods in the rural area of Bedriacum (Province of Cremona, Italy) has provided deeper insights into the process of landscape formation during Roman times. This modern approach is more inductive, grounded in field data, rather than relying solely on historical texts and maps. The data, mostly derived from extensive satellite imagery analysis and magnetic surveys, have revealed the relationship between the Roman rural land grid, road axes, and the area’s geomorphology. The findings indicate that factors such as the local slope gradient, and the morphology of Holocene river terraces were key drivers in shaping the rural landscape during Roman times. These results challenge the traditional view in Italian historical topography, which often emphasizes a culture-driven approach to Roman land management.

1265. AGRICULTURE AND TRADE IN CISALPINE GAUL BETWEEN THE LATE IRON AGE AND LATE ANTIQUITY. THE AGROTOWN OF BEDRIACUM

Contribution format: Oral  
Contribution authors: Benedetta Di Presa – Enrico Croce – Emanuele Intagliata (University of Milan) – Guglielmo Strapazzon (Indipendent) – Lorenzo Zamboni (University of Milan)

Traditionally, the archaeology of Cisalpine Gaul has focused on the major urban centres and the artistic representation and artisanal consumption of the elite, and has largely underestimated the role of the countryside, with its smaller agricultural sites and their inhabitants. As part of an ongoing interdisciplinary project (Rures), this paper aims to explore the interaction between landscape, settlement and economic strategies in a specific transect of the Po Valley, namely the area east of the Roman colony of Cremona.M.The long history of occupation of this settlement, as evidenced by the archaeological evidence collected so far, provides an important vantage point to explore the extent of this interaction over the longue durée, between the end of the 2nd century BCE and the 6th century CE. At the crossroads of riverine and cobbled roads, including the Postumia, the agrotown of Bedriacum offers a unique palimpsest of urban, productive and social adaptation strategies, as revealed by a series of integrated analyses. New data is provided on housing and storage facilities, infrastructures, near-site evidence, as well as on resilient economic activities.

1393. LATE ANTIQUE AGRARIAN LANDSCAPES IN NORTHERN ITALY. THE CASE OF RIVANAZZANO TERME AND OLTREPÒ PAVESE

Contribution format: Oral  
Contribution authors: Manuela Battaglia – Elena Calandra – Yuri Godino – Stefano Maggi (Università degli Studi di Pavia)

During the Roman period, the population of the Po Plain was significantly influenced by the major consular roads, the Via Aemilia and the Via Postumia, along which the main settlements were located. The extant archaeological data demonstrate that the countryside around the colonies was also densely settled and fully exploited in relation with the centuriation system. However, as one moves further from the urban centre, the overall picture becomes less clear. In the context of an ongoing interdisciplinary project (Rures), the present work seeks to explore the dynamics of ancient settlement in a specific region of the Po Valley. The research focuses on the area south of the river, extending between the Roman colony of Iria/Voghera and the foothills of the Ligurian Apennines. This area is situated on the periphery of a more extensive settlement network, encompassing the countryside between Dertona and Iria, and features a centurial system dating back to the late Republican period. Investigations conducted by the University of Pavia in Rivanazzano Terme (province of Pavia) have revealed evidence of a settlement pattern of greater density and complexity than previously thought, with continuous occupation spanning several centuries. The excavated sites have demonstrated multi-phase frequentation, ranging from the late Republican period to Late Antiquity. This provides a rare opportunity for diachronic analysis of the area’s occupation. In this paper we focus on the Late Antique phases, a historical context currently under-researched in the literature of these territories. The aim is to reconstruct ancient landscapes and advance hypotheses on environmental transformations considering the historical events of the period, from the fall of the Roman Empire to the Greco-Gothic war.

544. PALYNOLOGY OF ROMAN RURAL SITES IN THE CISALPINE GAUL (N ITALY): CASE STUDIES FROM THE RURES PROJECT

Contribution format: Oral  
Contribution authors: Jessica Zappa – Eleonora Rattighieri – Eleonora Clò – Assunta Florenzano – Anna Maria Mercuri (Laboratorio di Palinologia e Paleobotanica, Università degli Studi di Modena e Reggio Emilia)

Palynological research can be crucial for reconstructing past environmental and ecological dynamics in archaeological contexts. By analysing pollen preserved in ancient sediments, it is possible to gather information about past plant cover and understand human-plant interactions. Moreover, pollen can be an index of agricultural and other land use practices, providing a comprehensive view of daily activities of ancient populations. The palaeoecological perspective is therefore especially useful in the RuRES project (Rural Resilience. Decentralised Landscapes and Ecological Strategies of Non-elite Groups in Cisalpine Gaul), coordinated by Lorenzo Zamboni, which aims to investigate ecological strategies and resilience practices adopted by rural communities during changing environmental and political conditions. Isola Felice in Rivanazzano Terme (Pavia) and Calvatone (Cremona) are the investigated sites in Northern Italy. They represent important evidence of the Roman period in the Po Plain. Both are known for their historical significance and the discovery of archaeological materials testifying to the evolution of cultural and social practices. In this contribution, some results of palynological analyses carried out at the two archaeological sites are reported to outline plant diversity and the main traits characterising the different

contexts. Pollen sampling was carried out selecting conservative sediments and collecting samples from different layers in the excavations. In Calvatone, 22 samples were taken from Sector 4 and a productive area, while at Isola Felice, 36 samples were taken from sections of sectors West and East. Pollen was extracted following a concentration treatment and analysed with reference material and atlases. In general, forest cover was low, mainly composed by mixed oakwood (e.g., deciduous *Quercus*, *Corylus avellana*, *Fraxinus excelsior* type) and wet environments were also evident (e.g., *Alnus* among trees, *Sparganium emersum* type and *Cyperaceae* among herbs). Furthermore, human activities have been identified by the anthropogenic pollen indicators (cereals and other synanthropic taxa) and characterised both sites.

128 THE PRODUCTION AND DIFFUSION OF OBSIDIAN ARTEFACTS: EXPLORING SOCIO-ECONOMIC AND SYMBOLIC BEHAVIOURS FROM A TECHNO-FUNCTIONAL PERSPECTIVE

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Obsidian, Techno-Typology, Use-wear Analysis, Comparative Lithic Studies, Diffussion  
**Session organisers:** Zeynep Beyza Agirsoy (Ankara University, Graduate School of Social Sciences, Department of Archaeology-Prehistory) – Idaira Brito-Abrante (Tarha Research Group, Departamento de Ciencias Históricas, Universidad de Las Palmas de Gran Canaria) – Bogdana Milić – Fiona Pichon (National Spanish Research Council, Milá y Fontanals Institute (IMF-CSIC) – ASD research group)

SESSION ABSTRACT

The archaeological records of material culture are fundamental for understanding past societies, where lithic industries often play a key role. Obsidian has been frequently selected as a raw material for tool making, particularly in regions with volcanic rocks. Studies on obsidian have significantly expanded over years, ranging from the analysis of its geological provenance to its technological, typological and functional characterisation. These approaches allow us to trace the mobility of communities providing a deeper understanding of the economic, social and symbolic dynamics of the societies that relied on this specific lithic resource. This session aims to bring together researchers specialising in different methods and approaches to study lithics, with a focus on techno-typological and functional analyses of obsidian. Obsidian is particularly suitable for analyzing technological processes, typological variations, and use-wear patterns. We welcome contributions that illustrate the diversity of technological solutions used for its extraction, exploitation, circulation and diffusion of this material through case studies from various regions worldwide, aiming to highlight similarities and differences that enhance our understanding of its role in past societies. Key themes of the session will include.

- Comparative studies of core reduction techniques and technological strategies
- Typological analyses of tool assemblages
- Experimental archaeology for understanding the techniques of knapping and use
- Use-wear studies that shed light on tool function and activity areas
- Data sharing for standardisation of methodologies related to technology and function
- Procurement, diffusion and circulation of obsidia.

By welcoming contributions from different regions and periods, we encourage discussion and collaboration among specialists to advance our understanding of obsidian as a lively material in lithic studies. This session seeks to generate new perspectives and interdisciplinary approaches to broaden our knowledge in lithic studies and strengthen academic exchange.

CONTRIBUTION ABSTRACTS

1779. NEW INSIGHTS INTO REDUCTION PROCESSES OF OBSIDIAN BIFACIAL POINTS IN THE TERMINAL PLEISTOCENE OF NORTHERN JAPAN: MACROSCOPIC AND MICROSCOPIC ANALYSES

**Contribution format:** Oral  
**Contribution authors:** Jun Takakura (Sapporo International University)

The terminal Pleistocene lithic assemblages in northern Japan are mainly characterised by the bifacial points, including leaf-shaped and stemmed types. Until recently, many researchers have examined the spatial-temporal distributions of bifacial points and their implications for adaptation strategy of the terminal Pleistocene hunter-gatherers in northern Japan by focusing on techno-typological variability of leaf-shaped and stemmed bifacial points. However, there have been only a few studies on the reduction process of bifacial points in the terminal Pleistocene of northern Japan to evaluate technological and functional characteristics. Thus, no consensus has

been established on the emergence and development of bifacial point technology, particularly with regard to the transition of subsistence and hunting weapon technologies. In this paper, I attempt to examine obsidian stemmed bifacial point reduction strategies by considering macroscopic and microscopic traces reflect distinctive reduction trajectories. In addition, this paper analyses morphological and techno-functional patterns of tool damage and rejuvenation developed from a lithic artefact assemblage. The combined evidence provides new insights into the hypothesised interpretation of stemmed bifacial points as specialised projectile points manufactured by pressure knapping and used primarily for open-air hunting by the terminal Pleistocene foragers of northern Japan. These conclusions contribute to the growing picture of diversity and adaptive flexibility among stemmed point-making foragers in Northeast Asia.

524. USING OBSIDIAN SOURCING TO TRACE EARLY ISLAND EXCHANGE NETWORKS IN SOUTHERN WALLACEA

**Contribution format:** Oral  
**Contribution authors:** Shimona Kealy – Emily Nutman (The Australian National University) – Christian Reepmeyer (Deutsches Archäologisches Institut) – Sue O’Connor (The Australian National University)

Our species embarked on the world’s first great maritime journey from Sunda (greater Southeast Asia) to Sahul (greater Australia) at least 50,000 years ago. In the process they settled Wallacea, the archipelago of thousands of islands lying between these two continental landmasses. While this initial settlement has been the focus of many research efforts in the region, later developments in maritime capabilities and changing island community and settlement dynamics remain less understood. Recent discoveries of obsidian artefacts from a single geological source in archaeological sites on Timor, Alor, and Kisar, dating back to approximately 16,000 years ago, point to the emergence of the world’s earliest known multi-island maritime network. Here we present the results of combined geological and archaeological surveys, along with chemical sourcing analyses, to successfully identify the previously unknown source of this obsidian. This discovery provides a refined understanding of the procurement, diffusion, and circulation of obsidian across Southern Wallacea. We discuss how the improved insights into the timing, pattern, and extent of this exchange network highlight the advanced maritime capabilities and dynamic social interactions of communities during a pivotal yet often overlooked period in Wallacean prehistory.

1062. 6,000 YEARS OF MARITIME OBSIDIAN CIRCULATION IN NORTHWESTERN PATAGONIA. NEW TECHNOLOGICAL DATA FROM CHILOÉ AND RELONCAVÍ, SOUTHERN CHILE (42°S)

**Contribution format:** Oral  
**Contribution authors:** Simon Sierralta (Independent) – Constanza Cortés (Escuela de Arqueología, Universidad Austral de Chile)

Obsidian from the Chaitén volcano circulated widely across the Northwestern Patagonian Archipelagos during the Middle and Late Holocene. Its record in the first coastal hunter-gatherer sites has been interpreted as evidence of the early establishment of regional-scale mobility and/or interaction networks by 6,000 BP. The source continued to be exploited into later times, perhaps until Spanish settlement in the 16th century CE. However, technological modes and circulation mechanisms are poorly understood, especially in the northern margin of the archipelagos. This work presents technomorphological analyses of the lithic assemblages of Chepu 005 and Piedra Azul, two multicomponent sites from northern Chiloé Island and the Reloncaví Sound, reoccupied by hunter-gatherers since ca. 6,000 BP. We observe a general trend towards decreasing obsidian circulation during the Late Holocene. This is accompanied by variations in technological strategies that could be linked to changes in mobility, regional demographic density, and possibly intergroup interaction dynamics. However, obsidian continued to be exploited and was the only lithic raw material to circulate at a regional scale, suggesting it played a significant role beyond functional considerations. We also observe a turn from the “wasteful” use of obsidian for the production of formal and informal tools in the earliest occupations towards a more curated and normative approach after 3500 BP. This change can be framed in broader transformations of the lithic mode of production in the archipelagos during the Late Holocene. Finally, an inter-site comparison shows differences in provisioning ratios and technological management of obsidian reservoirs not necessarily linked to distance, suggesting uneven access to this rock in different areas of the archipelago. This can be further discussed in relation to local lithic landscapes, which varied significantly between Chiloé and Reloncaví. Some of these trends continue throughout the studied period, suggesting persisting socio-geographic dynamics across several millenia.

556. OBSIDIAN IN PRE-HISPANIC NORTHEAST HONDURAS: LONG-DISTANCE EXCHANGE NETWORKS AND SOCIO-ECONOMIC COMPLEXITY

**Contribution format:** Oral  
**Contribution authors:** Mike Lyons (The Commission for Archaeology of Non-European Cultures, German Archaeological Institute | University of Bonn, Department for the Anthropology of the Americas) – Jeannine Langmann (University of Bonn, Department for the Anthropology of the Americas | The Commission for Archaeology of Non-European Cultures, German Archaeological Institute)

Obsidian import into northeast Honduras during the pre-Hispanic period changed over time and space. Our investigations have uncovered a dynamic past in which the import of obsidian can be traced back to the Late Preclassic period (ca. 300 BC–AD 300), ceasing almost altogether during the Classic (ca. AD 300–1000), and increasing significantly during the Postclassic (ca. AD 1000–1525). X-ray fluorescence analysis of obsidian artifacts from various sites in the region reveals imports from both local Honduran sources and distant regions in present-day Guatemala and Mexico, up to 1500 km away. The large dataset allows us to paint a picture in which obsidian was not distributed equally among settlements. Instead, high-quality material was funneled to larger settlements, while lower-quality material—exhibiting different technological processing, especially in platform treatment and remaining cortex—was more common in smaller, coastal communities. These observations suggest that exchange networks and the management of obsidian resources were controlled by various actors throughout time, highlighting a major aspect of the region’s socio-economic complexity.

2459. IZTETE OBSIDIAN: MEXICO’S “BLACK GOLD”

**Contribution format:** Oral  
**Contribution authors:** Ericka Blanco Morales (UNAM)

Mexico is a country with great biodiversity because of its diverse topography. In the Magdalena Basin (Jalisco), for instance, the mountain ranges, lakes and rivers within the Neovolcanic Transversal Axis, are part of a large network of ecosystems that include many volcanoes. These volcanoes are responsible for hundreds of deposits of obsidian, a volcanic glass. At least 56 sources of obsidian have been documented here, which were exploited by humans since at least 10,000 years ago. Because of obsidian’s characteristics, it was an ideal raw material that fostered an economy linked to the manufacture, distribution, and exchange of tools used for cutting, scraping and abrading, among other uses. After AD 850 obsidian artifacts became highly important among Mesoamerican trade networks, including Western Mexico, particularly the inhabitants of Atitlán Island. Tools such as prismatic blades played a key role within the Aztatlán network and may have become standard items of exchange.

474. PPNA LITHIC TECHNOLOGY IN THE UPPER TIGRIS BASIN: OBSIDIAN USE AND HUMAN-ENVIRONMENT INTERACTION AT GRE FILLA (DIYARBAKIR/TURKEY)

**Contribution format:** Oral  
**Contribution authors:** Zeynep Beyza Agirsoy (Ankara University, Graduate School of Social Sciences, Department of Archaeology-Prehistory)

Gre Filla is a Pre-Pottery Neolithic (PPN) settlement in Upper Mesopotamia, located in southeastern Turkey within the borders of Diyarbakır Province. Excavations at this site have yielded significant data on PPNA and PPNB practices in the region. Approximately 10,000 years ago, sedentary communities knapped obsidian for hunting and daily activities. Techno-typological analyses at Gre Filla reveal its inhabitants’ obsidian knapping strategies. At Gre Filla, obsidian constitutes 56% of the PPNA chipped stone industry, with the raw material is believed to have been sourced from obsidian deposits located approximately 70 to 100 km from the site. These obsidian nodules, ranging in size from 50 to 80 mm, were knapped within the settlement using direct percussion until they were exhausted. The knapping strategy was primarily focused on blade production; as core sizes decreased, the process transitioned towards the production of bladelets. Technological analyses indicate that all knapping stages occurred on-site, with core trimming elements representing different phases of reduction identified within the industry. The persistence of knapping techniques traditionally associated with hunter-gatherer lifeways was observed at Gre Filla, even as the community transitioned to a sedentary lifestyle. Alongside this technological continuity, the similarities and differences in technical innovations of knapping at Gre Filla during PPNA will be assessed in comparison to other contemporary sites in the Upper Tigris Basin. The study examines obsidian knapping strategies from a technical perspective. This analysis will facilitate a more profound comprehension of subsistence practices in the context of the interactions between humans and their environment among Neolithic communities in the Near East. The obsidian knapping technology at Gre Filla is of particular significance in enhancing our understanding of lithic production not just as a technical process, but also as a pivotal element in raw material management, hunting strategies, and the social organisation of PPN communities.

1303. CHALLENGING THE IDEA OF NOMADIC PASTORALISTS’ CRUCIAL ROLE IN OBSIDIAN EXCHANGE DURING PRE-POTTERY NEOLITHIC B

**Contribution format:** Oral  
**Contribution authors:** Aleksandra Furczyk (University of Wroclaw)

Obsidian exchange during Pre-Pottery Neolithic B has drawn archaeologist’s interest since the middle of the twentieth century. In this period we can observe the rise of long distance exchange routes in the Fertile Crescent, bearing not only raw materials such as obsidian, but also ideas and cultural changes. These routes stretched from obsidian sources in Anatolian Peninsula to Euphrates and Tigris river basins, as well as Levant, spanning as much as 800km. Despite more than sixty years of reseach in this topic the question how such long distance exchange could have operated still remains. Models such as Renfrew’s „down the line” and various ones relying on agent based modelling were developed to explain the phenomenon, but haven’t been able to fully recreate the dispersal of obsidian, as it is seen in archaeological material. Possible solution might lay in the central role of pastoral transhumance in the long distance movement of obsidian, as proposed by some scholars. Herding of animals began in the early PPNB, but to what degree the pastoralist were mobile in this initial stage of animal husbandry? This contribution aims to explore the current state of knowledge, and its implications for long held theory of nomadic pastoralist role in obsidian diffusion. To do so, . will focus on well documented sites from regions of El Kowm depression and Southern Jordan, where nomadic pastoralist were supposed to emerge. Sedentary sites will be evaulated in terms of occurence of obsidian and evidence of long distance transhumance, attested by bioarchaeological and zooarchaeological data. Finally the sites connected with seasonal grazing will be examined: their interpretation and findings of obsidian artifacts.

1053. DEFINING SOUTHERN AEGEAN EARLY BRONZE AGE COMMUNITIES OF PRACTICE THROUGH ‘THICK DESCRIPTION’ OBSIDIAN CHARACTERIZATION STUDIES

**Contribution format:** Oral  
**Contribution authors:** Tristan Carter (McMaster University)

While the Aegean was a focus of the earliest Old World obsidian sourcing studies undertaken in the 1960’s, it has subsequently seen far fewer analyses compared to the neighbouring regions of Anatolia, and the Western Mediterranean. In part this may be due to the received wisdom, that aside from a few pieces of Carpathian or Cappadocian ‘exotica’, that most obsidian from the prehistoric Aegean is Melian. This may well be the case, however, this is to ignore the fact that there are two spatially, and geo-chemically distinct sources on Melos (Sta Nychia, and Dhemenegaki), and that there is no reason to assume that they had common histories of use. A new series of characterization studies suggests that there are indeed major differences in these sources’ exploitation, both chronologically and regionally. Focusing on the Early Bronze Age, through reference to studies from the Cyclades (Kastri, Keros), Crete (Malia, Mochlos) and western Anatolia (Çine-Tepecik, Liman Tepe) indicates a significant bias towards the consumption of Sta Nychia products by certain communities. Focusing on raw materials’ alone only produces broad stroke interpretations, that mask regional traditions. Our approach has long been to take a ‘thick description’ approach that melds elemental and techno-typological data to produce a richer artefact characterization, enabling the reconstruction of regional and or site-specific ‘communities of practice’, i.e. shared ways of doing things that emerge from intense interaction between social groups.

64. BRONZE AGE OBISIDIAN TRADE NETWORKS IN WESTERN ANATOLIA: BETWEEN SEA AND RIVER VALLEYS

**Contribution format:** Oral  
**Contribution authors:** Neyir Kolankaya-Bostanci (Hacettepe University)

The study of prehistoric trade networks is a fundamental topic of archaeological research, as the successful reconstruction of trade may illuminate not only economic aspects of ancient societies, but also the social characteristics of the settlements or cultures in which it operated. In this respect for the prehistoric societies obsidian provides an opportunity to reconstruct of its movement and to use these data to infer the changing scale of social life. Using the distances of obsidian movement a network model is developed and used in the reconstruction of the western Anatolia prehistoric social landscape. In the Early Bronze Age within the progressive relations with the Cyclades islands, Melian obsidian became an important product in the trade network. However, it is noteworthy that there had been a decline in the use of obsidian in western Anatolia as in the entire Aegean world, since the end of the third millennium BC. The most important reasons behind this decline include the social, political and economic variables of the period. On the other hand, when compared to other contemporary settlements, it is seen that there was no decrease in the use of obsidian in some settlements in both Middle and Late Bronze Ages. This study investigates the nature and extent of trade networks in western Anatolia during Early, Middle and Late Bronze Age using obsidian artefacts as a focal material. The mapping of obsidian circulation through time and space is a typical means of displaying and interrogating social behavior and processes, in particular

trade, as most clearly outlined in supply/contact zone models.

1369. FOLLOWING THE OBSIDIAN TRACES IN THE MEDITERRANEAN FOR HIGHLIGHTING TRADING ROUTES AND SETTLEMENTS’ SPATIAL CORRELATION IN THE BRONZE AGE

**Contribution format:** Oral  
**Contribution authors:** Athina Chroni (National Technical University of Athens | Hellenic Ministry of Education, Religious Affairs and Sports) – Vassilia Karathanassi (National Technical University of Athens)

Throughout the Bronze Age shipping has been highly developed to handle trade and product exchanges. Seafaring was the only way to reach remote areas and a vital means of communication between coastal settlements in the ancient Greek world. Consequently, maritime mobility, becomes the accelerator for social evolution, as well as for setting up webs of sea routes and enabling cultural interaction between different communities. The obsidian, an exotic, valuable material, found only in four islands of the Cyclades, constitutes the catalyst that intensifies maritime travel. During the Late and the Final Neolithic, when the systematic habitation of the Cyclades became more intensive, the obsidian trading became part of the increasingly complex trade networks of the Aegean. The obsidian then reached settlements beyond the Cyclades in the form of roughly processed cores. Given that the circum-navigation of the Peloponnese from its southern shores was the main sea route for communication between East-West and North-South in all past times, the western coastline of Messenia, Peloponnese, Greece becomes the gate for obsidian import and further transport to inland, thus directly affecting the socio-economic framework of the Bronze Age and the related political web for the same time periods. Under the perspective of highlighting the spatial web as developed among various settlements of the Bronze Age, GIS has been chosen as the optimum digital tool, functioning, also, as a database for various types of data.

297. WHY ARE THERE OBSIDIANS IN THIS PLACE? USE-WEAR ANALYSIS FROM THE GRANARY OF ‘EL CENOBIO DE VALERÓN’ (GRAN CANARIA, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Idaira Brito-Abrante – Amelia Rodríguez-Rodríguez (Tarha Research Group, Universidad de Las Palmas de Gran Canaria)

The Amazigh period on the island of Gran Canaria (2nd-15th centuries AD) was characterised by the great importance of agriculture as a fundamental strategy for the subsistence of the native population. Archaeological studies reveal that demographic stability depended on practices that, over time, led to an intensification of production. In this sense, a specialisation has been observed in those crops that were better adapted, such as barley, and research is being carried out to determine whether the use of irrigation and fertilisation of the fields increased. In parallel, the structures dedicated to the storage of surpluses became increasingly important. These grew in number and became more complex, from isolated silos to large sets of hollows organised around chambers and corridors, sometimes with several levels. These structures are known as collective granaries, often dug into inaccessible cliffs. Carpological and archaeoentomological analyses have provided insights into the characteristics of the silage practices once the grains and fruits reached the granaries. The good preservation of this evidence, along with other artifacts made of ceramics, leather and plant fibres, and construction elements made of wood indicates how these processes were carried out. However, stone tools have also been found in the granaries whose function in storage contexts remains unclear. This article presents the results of the traceological analysis of a set of obsidian artefacts recovered from the most significant granary in Gran Canaria: El Cenobio de Valerón. The data obtained and its correlation with other studies on the rest of the evidence shows the variability of activities that suggest a more complex role for these extraordinary structures.

2095. OBSIDIAN EXPLOITATION AND VOLCANIC ACTIVITY DURING THE FIRST HUMAN SETTLEMENT OF TENERIFE (CANARY ISLANDS, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Cristo Hernández Gómez (Área de Prehistoria, Departamento de Geografía e Historia. Universidad de La Laguna | Archaeological Micromorphology and Biomarkers Laboratory, Universidad de La Laguna) – Alvaro Castilla-Beltrán (Área de Geografía Física, Departamento de Geografía e Historia. Universidad de La Laguna) – Efraín Marrero Salas (Prored Soc. Coop. ) – Javier Dóniz Páez (Área de Geografía Humana, Departamento de Geografía e Historia. Universidad de La Laguna | Instituto Volcanológico de Canarias (Involcan)) – Francesc C. Conesa (Social Sciences, Heritage and Food research group (IPNA-CIC) | Archaeological Micromorphology and Biomarkers Laboratory, Universidad de La Laguna) – Emilio González Reimers (Universidad de La

Laguna) – Matilde Arnay De La Rosa (Área de Prehistoria, Departamento de Geografía e Historia. Universidad de La Laguna)

Research conducted to date on the exploitation of obsidian by the Guanche people, the first inhabitants of Tenerife (Canary Islands, Spain), has revealed a centralized model of supply and distribution of this raw material across the island. The main procurement sources are located in a high-altitude region at its center, where hundreds of obsidian workshops are concentrated in three exceptional sites: Tabonal Negro, in Montaña Blanca lava dome; Los Tabonales, on the slopes of Pico Viejo stratovolcano; and, most notably, Tabonal de Los Guanches, on the northern flank of Teide complex lava flows. This area is closely linked to eruptive processes contemporary with the indigenous settlement, which shaped the current morphology of the stratovolcano. This study explores the impact of volcanic phenomena on aboriginal productive activities, highlighting their influence on obsidian management. It examines the spatial distribution of workshops on Teide’s northern slope (in different lava flows units) and their connection to eruptive episodes or centres, while also characterizing the associated lava materials from a geochemical and volcano-stratigraphic perspective. The results reveal how the Guanches had to interact with volcanic phenomena in key areas for their techno-economic model, underscoring the intricate relationship between natural processes and indigenous productive strategies.

2096. CHALCOLITHIC PERIOD OBSIDIAN PROCUREMENT AND CIRCULATION IN INNER WESTERN ANATOLIA

**Contribution format:** Poster  
**Contribution authors:** Ali Umut Türkcan (Anadolu Universitesi, Dept. Archaeology) – Utku Umut Kocatürk (Çatalhöyük)

At the beginning of the 6th millennium BC, in the Early Chalcolithic Period, the Porsuk Culture, emerged in inner western Anatolia covering Eskişehir, Kütahya regions. The first definition of this culture, which began to take shape towards the end of the Early Chalcolithic Period and continued until the beginning of the Late Chalcolithic, was made by Turan Efe excavations at the Orman Fidanlığı Mound. Along with the Orman Fidanlığı Mound, whose materials have been studied in detail and published, the other well-studied and detailed reported settlement in the region is Kanlıtaş Mound. As a result of the analyses conducted on the chipped stone tools from the Kanlıtaş Mound, the diversity in raw materials attracted attention. In these two well-researched and well-preserved on roc. settlements, which are similar to each other in terms of settlement type of Porsuk Culture, Kanlıtaş Mound is distinguished from Orman Fidanlığı Mound in terms of access to raw materials. This abundance is also reflected in the variety of tools and a rich variety of raw materials. On the other hand, rare and special examples of obsidian tools and one core from 3 settlement. belonging to the Porsuk Culture are noteworthy. Although Orman Fidanlığı settlement also had few examples. examples showed a continuation through levels from Early to Late Chalcolithic. The exquisite tool types and one defined (analysed) Cappadocian with limited number. found especially on these excavated sites of Porsuk Culture seemed to have been prestige items rather being functional tools. It is an discussion of obsidian procurement, resources (Galatian, Kalabak and Morali) in NW Anatolia after Late Neolithic period.

129 URBAN ADAPTATIONS TO CLIMATE CHANGE

**Session theme:** 7. Climate Change in the Past and Present  
**Session format:** Regular session  
**Session keywords:** Climate change, Urbanism, Sustainability , Resilience, Vulnerability  
**Session organisers:** Manuel Fernández-Götz (University of Oxford) – Lorenzo Zamboni (University of Milan)  
**Session discussant:** Adam Green (University of York)

SESSION ABSTRACT

Archaeologists are increasingly engaging with the study of past climate change and its impact on societies at different scales. This is a crucial topic: thanks to its deep history perspective, archaeology is in a privileged position to contribute to address one of the most important challenges of our present world. In this session, we want to focus specifically on the influence that climate shifts had on urban life, i.e., how urban communities across the planet were impacted by, and adapted to, changes in temperatures and weather patterns. The impact of climate oscillations can be studied at the level of individual cities and towns, but also in relation to entire urban networks at a regional and macro-regional scale. Can we observe correlations between climate trends and phases of settlement nucleation or dispersal? How did different societies respond to similar environmental challenges? Can we identify strategies of resilience that prove helpful to current debates on urban sustainability? Conversely, were certain urban systems particularly vulnerable to climate changes in the past, and are there any lessons that we might

learn for the present and future? These and other questions can be explored within the session, which welcomes papers from all time periods that focus either on specific case studies or on wider comparative perspectives.

CONTRIBUTION ABSTRACTS

1321. CLIMATE CHANGE AND URBAN DYNAMICS IN 1ST MILLENNIUM BC TEMPERATE EUROPE

**Contribution format:** Oral  
**Contribution authors:** Manuel Fernández-Götz (University of Oxford)

In light of the present-day climate emergency that threatens life on our planet, archaeologists are increasingly looking at the impact that climatic changes had in developments experienced in the past. This includes the persistence and sustainability of urban sites and networks, including instances of both decline and resilience. In this paper, the influence of climate change on processes of urbanisation and deurbanisation will be explored on the basis of the evidence available for 1st millennium BC temperate Europe. I will discuss previous proposals that have linked processes of aggregation and dispersal with periods of warmer and colder climate respectively. In addition, the paper will highlight the need for multi-scalar approaches that take into account the variable effects that climatic changes could have depending on factors such as latitude and altitude, as well as the diverse strategies adopted by communities when confronted with similar challenges. Finally, I will highlight the need for more studies that take a multi-variable approach.

2351. ENVIRONMENTAL AND/OR SOCIAL CHANGES AND THEIR INFLUENCES ON LATE PREHISTORIC URBAN SETTLEMENTS IN THE SOUTHEASTERN ALPINE REGION

**Contribution format:** Oral  
**Contribution authors:** Matija Crešnar (University of Ljubljana) – Petra Vojaković (University of Ljubljana | Arhej d.o.o.) – Luka Gruškovnjak – Agni Prijatelj – Manca Vinazza (University of Ljubljana) – Branko Mušič (University of Ljubljana | Gearh d.o.o.) – Helena Grčman (University of Ljubljana)

In recent years, a number of extensive investigations have been carried out on settlements with a distinct urban character from the last millennium BC. Using modern excavation methods and interdisciplinary approaches, the findings have also opened up new ways of questioning the role of environmental and/or cultural changes in their existence, location, internal setting, duration, etc. Why did communities persist in inhabiting certain places with seemingly unfavourable conditions or resettling them again and again? Was it just the bliss of ignorance or were there other factors that drove them to the same places? How do other studies, which did not follow the same methodological standards, complement the picture when we zoom out to the southeastern Alpine region and also consult the paleoenvironmental data? In 2024, we began the preparatory phase of the MATRES project (MATerial RESilience in times of environmental and social change), funded by the University of Ljubljana. This project is helping us to intensively investigate these and several other burning questions associated with the archaeology of climate change and what our modern society can learn from our predecessors.

1293. WAVES OF CITIES. THE SUSTAINABILITY OF EARLY URBANISM IN SOUTH-CENTRAL EUROPE

**Contribution format:** Oral  
**Contribution authors:** Lorenzo Zamboni (University of Milan)

The archaeology of early urbanism has evolved significantly in recent years from a socio-evolutionary perspective to a multi-layered and interdisciplinary field of study. For Europe in the 1st millennium BCE, this revealed an unexpected richness and antiquity of urban experience, with several independent waves of nucleation and dispersal of people in distinct but interconnected regions. The aim of this paper is to explore questions of sustainability and resilience of cities in the southern Alpine regions before and during the Roman conquest, adopting a multiscalar and cross-cultural point of view. In addressing this objective, the paper will consider how these cities adapted to climatic and other environmental changes. Despite the scarcity of environmental research projects and the relative dearth of quantitative data in the study area, the time is opportune for the establishment of an agenda and the posing of questions regarding, for example, the differential reactions of compact cities and low-density agglomerations during periods of climate shift. There are documented cases of urban settlements that have been established in geographical regions exhibiting analogous environmental characteristics, demonstrating remarkable resilience over extended periods. Conversely, other sites have been observed to be more ‘fragile’, vulnerable and transient. A comprehensive understanding of this nuanced scenario necessitates a multifaceted analysis, encompassing levels of energized crowding, wealth imbalance, socio-political structures, and economic strategies. It is crucial to incorporate environmental and climate adaptation factors into the analytical framework to achieve a holistic interpretation of the dynamics underpinning urban resilience and sustainability.

1271. WHEN THE WATERS RISE: RESILIENCE STRATEGIES IN THE FACE OF CATASTROPHIC FLOODS IN PHOENICIAN IBERIA AND TARTESSOS (7TH-6TH CENTURIES BC)

**Contribution format:** Oral  
**Contribution authors:** Manuel Álvarez-Martí-Aguilar (University of Malaga)

In my paper, I will consider cases of adaptive and resilient responses by Iron Age I southern Iberian coastal communities to extreme environmental events, particularly fluvial and marine flooding. I will focus on two unique cases. The first case is that of the responses of the Phoenician community of Cerro del Villar, at the mouth of the Guadalhorce River in Malaga, after the fluvial flood that devastated the settlement at the beginning of the 7th century BC. In the second case, I will try to show how similar strategies were implemented in the port area of the Tartessian emporium of Huelva, after the occurrence of a catastrophic flood at the beginning of the 6th century BC. I will try to show how, in both cases, the affected communities, characterized by the coexistence of local communities, Phoenicians and, in the case of Huelva, also Greeks, implemented resilience and adaptation measures after these environmental disasters. These measures include the implementation of constructive responses aimed at preventing the risk of flooding. These dynamics seem to be deployed in the context of a phase of strengthening international trade networks and may be an expression of a ‘culture of resilience’ within the framework of the orientalizing koine.

2186. THE IMPACT OF NATURAL DISASTERS ON URBAN DISINTEGRATION IN THE LATE ROMAN PERIOD: A STUDY OF THE SOUTHERN IBERIAN PENINSULA

**Contribution format:** Oral  
**Contribution authors:** Juan Manuel Martín Casado (Universidad de Málaga)

This paper analyses the impact of extreme natural events and their interaction with human communities in the south of the Iberian Peninsula during the Late Roman period (3rd-5th centuries AD). This framework offers a considerable amount of evidence. Of particular interest are the seismic effects recorded in cities such as Corduba, Munigua or Baelo Claudia , as well as the evidence of a destructive horizon due to one or more extreme marine wave events found in various coastal settlements, such as the cities of Baelo Claudi. and Hispalis , and various coastal factories, such as El Terrón (Lepe), El Eucaliptal (Punta Umbría), the industrial area of Onoba and La Orden (Huelva) and Cerro del Trigo (Almonte) . The Spanish historiographical scenario is experiencing a renewal in explanatory models, which includes the recovery of the idea of “crisis” as a valid conceptual category to describe the process of disarticulation of the Roman urban system since the end of the 2nd century AD. However, there are no studies that collectively analyse the possible impact of these phenomena on urban disarticulation. We propose, as a hypothesis, that the impact of extreme natural phenomena can be understood using the concept of multiplier effect, as defined by C. Renfrew . This type of phenomena, characterised by a high intensity of impact in the short term, would be able to amplify its impact on an already weakened system, thus generating a synergy or negative feedback with the rest of the pre-existing political, social and economic factors, accelerating the transformation of urban structures.

130 ISLANDS AND SUBMERGED LANDSCAPES OF THE PALAEOLITHIC: THE COASTAL AND CONTINENTAL AREAS OF THE MEDITERRANEAN IN INTERACTION

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** palaeolithic, Mediterranean, coastline, islands, landscape and seascape  
**Session organisers:** Danica Mihailovic (Institute of Archaeology in Belgrade) – Tristan Carter (McMaster University, Department of Anthropology, Hamilton, ON) – Elli Karkazi (University of Crete, Department of History and Archaeology)

SESSION ABSTRACT

The islands and seascapes of the Pleistocene Mediterranean shaped the character and practices of the Palaeolithic world. This session explores how these environments contributed to early human adaptation, resource exploitation, migration, and inter-regional connectivity across the Mediterranean. As sea levels fluctuated over millennia, dynamic coastlines and now-submerged landscapes formed pathways that early humans likely used for movement, trade, and cultural exchange. Presenters will examine evidence from archaeological sites throughout the Mediterranean islands and coastal zones, investigating how these areas connected or separated human populations and influenced technological and cultural development. Key topics will include but are not limited to:

1. Palaeolithic Occupation of Islands and Coastal Regions: How early humans accessed and utilized these land- and seascapes, and the influence of fluctuating shorelines on habitation, mobility and subsistence.

2.

Palaeolithic Mobility Across Evolving Seascapes: Considering the role of fluctuating coastlines in direct ing movement and interaction between insular and continental areas.
3.

Inter-regional Exchange and Isolation: Examination of lithic technologies and material culture that suggest cultural connections across islands and mainland territories or instances of prolonged isolation.
4.

Methodological Advances in Landscape Reconstruction: Applications of underwater archaeology, GIS-based models, and paleogeographic studies that help reconstruct submerged landscapes and better understand Palaeolithic Mediterranean connectivity.

This session aims to broaden our understanding of the Mediterranean’s coastal and island zones during the Palaeolithic, contributing to a larger picture of human dispersal, adaptation, and interregional ties. Through interdisciplinary research, we seek to answer pressing questions about the role of Mediterranean seascapes as both barriers and conduits, offering fresh perspectives on early human history across this dynamic region.

CONTRIBUTION ABSTRACTS

265. LOWER AND MIDDLE PALAEOLITHIC DYNAMICS IN THE EDREMIT GULF: ACHEULEAN LEGACY AND HOMININ MOBILITY

**Contribution format:** Oral  
**Contribution authors:** Göknur Karahan (Hacettepe University Faculty of Letters Department of Archaeology-Prehistory 06800- Beytepe/ANKARA)

The Edremit Gulf, a critical crossroads for hominin movements in the northeastern Aegean, played a transformative role during the Pleistocene. As sea levels fluctuated, the region alternated between extensive landmasses and smaller bays, creating dynamic landscapes that facilitated hominin dispersals between Anatolia and Europe. This study investigates the Gulf’s importance as a corridor for east-west and north-south Palaeolithic movements, focusing on its ecological richness and natural pathways. Between 2021 and 2023, systematic surface surveys identified 29 Palaeolithic findspots in the region. Lower Palaeolithic findspots were predominantly linked to riverine and marine terraces, with occasional associations to geothermal resources. Acheulean lithic assemblages included large cutting tools, such as handaxes, cleavers, and trihedral picks, alongside pebble core technology and flakes produced by unprepared and prepared cores. Middle Palaeolithic evidence was concentrated in high-altitude plateaus and plains, characterized by Mousterian assemblages featuring diverse retouched tools and Levallois and discoid flaking methods. These findings offer new insights into hominin dispersal routes in the northeastern Aegean and enhance our understanding of Acheulean and Mousterian technological traditions in Anatolia. The Edremit Gulf emerges as a pivotal region for studying Pleistocene hominin adaptations, technological innovations, and mobility patterns.

1778. MIDDLE PALAEOLITHIC MOBILITY AND ADAPTATION AT STELIDA, NAXOS

**Contribution format:** Oral  
**Contribution authors:** Danica Mihailovic (Institute of Archaeology, Belgrade) – Tristan Carter (McMaster University, Anthropology department) – Daniel Contreras (University of Florida, Anthropology department) – Justin Holcomb (University of Kansas) – Christelle Lahaye (Université Bordeaux-Montaigne)

The Middle Palaeolithic site of Stelida on Naxos offers significant insights into early human adaptation and movement across the shifting seascapes of the Aegean. As a prominent chert source, Stelida drew repeated hominin activity over millennia. Although erosion and colluviation have impacted stratigraphy, excavations have identified multiple artifact-bearing units dating to at least 200,000 years ago. While the timing of human access to the site in relation to Pleistocene sea-level changes remains undetermined, fluctuating environmental conditions likely influenced patterns of site use and exploitation. The lithic assemblage features both Levallois and bipolar technologies, reflecting a range of activities. Bipolar reduction, often linked to contexts requiring expedient knapping strategies, appears alongside more formal Levallois methods. This coexistence suggests a flexible technological response shaped by cultural needs, task-specific requirements, and resource conditions. Bipolar technology, documented across diverse Palaeolithic contexts globally, is noted for its adaptability in both raw material exploitation and rapid tool production, particularly where raw material transport may have been limited by landscape features or mobility constraints. At Stelida, these strategies likely responded to a combination of abundant raw material availability and environmental variability, resulting in different modes of lithic production. Geoarchaeological evidence indicates that changes in sea levels would have periodically altered the site’s accessibility and connection to nearby regions, potentially shaping patterns of seasonal or episodic use. However, sedimentological studies have underscored that most artifact-bearing deposits at Stelida are secondary, complicating efforts to directly link lithic activity with specific environmental phases. Despite these challenges, the diversity of assemblages suggests that the site functioned not only as a resource extraction area but also as a central site supporting adaptive approaches. These findings contribute to ongoing research on Middle Palaeolithic mobility and adaptation

across the Mediterranean, deepening our understanding of how early humans negotiated dynamic landscapes and resource opportunities.

1509. THE EXCAVATION AT MEGALOS PERISTERES CAVE (CRETE). A PRELIMINARY REPORT

**Contribution format:** Oral  
**Contribution authors:** Thomas Strasser (Providence College) – Andread Darlas (Greek Ministry of Culture, Paleoanthropology and Speleology) – Miriam Clinton (Rhodes College)

The excavation at Megalos Peristeres Cave has as its primary goal to find evidence of hominin occupation associated with extinct Pleistocene fauna on Crete. There are three reasons that the location of this cave is propitious to answering the question. The first is that the coastal area between Rethymnon and the Apokoronas peninsula is the largest fossil bed in the Mediterranean, and has primarily Pleistocene fauna, which overlap temporally with hominins. The second is that such an association was reportedly discovered in a nearby excavation in the 1960s and early 1970s but was dismissed. Third, Paleolithic tools were found directly south of this coast in the Plakias region (ca. 30 kilometers south). Thus, it is possible that the areas of faunal and hominin occupation overlapped in the region of Megalos Peristeres Cave. Based on preliminary analyses, the excavation was successful in the 2024 and 2025 seasons. Below a sparse distribution of pottery (primarily Final Neolithic) were found skeletal remains of the Pleistocene dwarf Cretan deer (*Candiacervus ropalophorus*) and extinct elephant (*Palaeoloxodon creutzburgi*). Though sometimes mixed with later Holocene fauna, the bones indicate the presence of Pleistocene fossil remains. In addition, Upper Palaeolithic stone tools were found, some in close proximity to extinct elephant. These consist of scrapers, a shoulder point, and cores. The data presented here are provisional due to the early stages of the project and need for subsequent analyses. Nevertheless, they indicate the presence of both hominins and extinct fauna, suggesting that the cave is a promising location to pursue questions of human impact on Ice Age animals on Mediterranean islands.

2029. UPPER PALAEOLITHIC COASTAL CAVE USE IN THE MALEAS PENINSULA: NEW EVIDENCE FROM SOUTHEASTERN PELOPONNESE, GREECE

**Contribution format:** Oral  
**Contribution authors:** Elli Karkazi – Ioanna Efstathiou (Hellenic Ministry of Culture – Ephorate of Palaeoanthropology - Speleology) – Yannis Bassiakos (Laboratory of Archaeometry, NCSR “Demokritos”)

The southern Peloponnese comprises three peninsulas extending into the Mediterranean, likely providing diverse resources that supported human settlement and adaptation. Until now, Palaeolithic evidence has only been identified along the western and eastern coasts of the Mani Peninsula, the central of the three. This presentation introduces new evidence of Late Pleistocene habitation in the steep eastern coastal areas of the Maleas Peninsula, the easternmost of the peninsulas. Anavalos Cave, a spacious eastward-facing karstic cave at present sea level, contains lithified archaeological layers within a total sediment fill that originally reached approximately seven meters. Due to post-depositional lithification and diagenetic processes, stratigraphic sampling was conducted by extracting ten lithified blocks using an electric rotary saw. Laboratory excavation of one of them followed standard archaeological methods, while a limited in situ excavation was performed in deeper sections of the cave, where small deposits of non-lithified sediment remained. Dating analyses, including Optically Stimulated Luminescence (OSL) on four lithified sediment samples and one radiocarbon dating of charcoal, yielded ages ranging from 32.2±4.5 ka to 22.56±6.1 ka. Preliminary analysis of the lithic artefacts suggests an Upper Palaeolithic industry primarily knapped from local quartzite. These findings from the Maleas Peninsula help bridge a spatial gap in Greece’s Upper Palaeolithic archaeological record, contributing to a more comprehensive understanding of human activity in the southern Peloponnese.

913. CH-CH-CH-CH-CHANGES... A VIEW FROM VLAKNO CAVE (CROATIA)

**Contribution format:** Oral  
**Contribution authors:** Dario Vujevic – Mario Bodruzic (University of Zadar, Department of Archaeology) – Zlatko Perhoc (Independent)

During the end of the last glacial Adriatic Plain forged dynamic socio-economic networks of interconnected Paleolithic groups. Exchange networking, procurement of lithic raw materials and subsistence strategies brought the opposite regions of the Adriatic closer than ever. As sea level rose towards the Holocene, the inundated landscape changed the routes or closed some that Epigravettian groups used for hunting, movement and exchange, forcing groups to focus on areas that were not previously intensively used, such as the hinterland. The transgression did not significantly change the settlement patterns; at least on the borderlines of the Adriatic plain, where the previously used sites are still frequently visited, but have changed their position in the network. Vlakno Cave on Dugi otok (Croatia), with its well-preserved stratigraphic and chronological sequence dating back to 19550 cal

BP, offers an insight into these changes. The stratigraphy with no visible hiatus, with several clear chronological and stratigraphic markers in the deposit, makes Vlakno an excellent site for studying the adaptation of the Epigravettian groups to the major climatic and environmental changes during the end of the last glacial period and the early Holocene.

**1659. LIFE ON THE EDGE: INNOVATIVE APPROACHES TO SUBMERGED LANDSCAPE STUDIES AN EXAMPLE FROM KAŠTELA BAY, CROATIA**

**Contribution format:** Oral  
**Contribution authors:** Simon Fitch (University of Bradford) – Vedran Barbarić – Slavica Bosnjak (Faculty of Humanities & Social Science - University of Split) – Jessica Cook Hale (University of Bradford)

The need to identify, assess, analyse, and protect submerged archaeological landscapes becomes more pressing by the day as offshore development initiatives gather momentum to meet the global challenge of climate change. Such sites contain invaluable information about human responses to the last period during which our species had to adapt to rapid climate changes and relative sea level rise. They are also some of the most vulnerable components of submerged cultural heritage due to their small sizes, composition of natural materials such as stone, wood, and bone, and are comparatively more difficult to detect than marine cultural heritage sites such as shipwrecks. In this paper, we present results from our work at the UKRI funded Life On The Edge (LOTE) project which seeks new methods to locate Late Palaeolithic landscapes and their associated archaeology. The paper will present, new, refined palaeolandscape reconstructions of submerged landscapes from Kaštela Bay, which have been derived from geophysical survey and combined with refined sea level projections to account for isostasy. The preliminary results of this work and the associated survey indicate the presence of a preserved, formerly subaerial landscape. This information not only reveals the diversity of this landscape but has resulted in direct evidence of these populations being recovered. It will be argued that further survey in the marine zone offer the potential to expand our understanding of the submerged prehistoric archaeology of the Adriatic and the role the region played in the Late Palaeolithic.

**2271. LITTORAL PALAEOGEOGRAPHY OF THE IBERIAN MEDITERRANEAN REGION (SPAIN): EVOLUTION OF THE COASTAL CORRIDOR**

**Contribution format:** Oral  
**Contribution authors:** J Emili Aura Tortosa – Vanessa Extrem-Membrado (PREMEDOC, Departament de Prehistòria, Arqueologia i H. Antiga, Universitat de València) – Adolfo Maestro González (GI-GEOFSUB Research Group, Departamento de Geología y Geofísica. C.N. IGME-CSIC) – Salvador Pardo-Gordó (GISPRAYA Research Group, Departamento de Geografía e Historia, Universidad de La Laguna) – Esteban Álvarez-Fernández (PREHUSAL Research Group, Universidad de Salamanca) – Jesús F. Jordá Pardo (Departamento de Prehistoria y Arqueología, Universidad Nacional de Educación a Distancia (UNED))

Paleoclimatic changes between the last Pleniglacial and the lower Holocene (ca. 35 - 7.5 ka cal BP) have affected the morphology of the Iberian Mediterranean coastal region. The combination of glacio-eustatic changes and tectonic activity has modified the previous coastal morphologies, acting unevenly along the more than 1000 km of the Iberian Mediterranean coastline stretching from Valencia to the Strait of Gibraltar. This contribution analyses the changes occurred in the morphology and extension of the Mediterranean coastal zone located between 36° and 40°N. The surface of the emerged area at the end of the Pleistocene had a variable extension, but considerably larger than the present one, appreciating differences between the regions located south and north of Cape Palos (37°38’N). Along the selected time windows, the extension of the coastal plain during the Pre-LGM, LGM, Late Glacial, Lower Holocene is compared. Its reconstruction allows us to analyse the effects of these changes on the communication of human groups along the coastline and in relation to sites located in inland valleys during the Upper Palaeolithic and Mesolithic, based on the presence of marine remains. The radiocarbon dating of regional archaeological sites has been compiled in order to establish Bayesian models of the different phases (ca. 35-7.5 ka cal BP). As for the reconstruction of the coastline, bathymetric data from the EMODnet portal were used. The location of the coastline in the different time intervals has been determined using high-resolution sea level curves of the last 60 ka BP, calibrated from the radiometric time scale SPECMAP.

**2087. WHERE DID YOU CATCH YOUR FISH? ASSESSING MARINE RESOURCES UTILISATION AND SHIFTING SEASHORES IN PREHISTORIC MEDITERRANEAN**

**Contribution format:** Oral  
**Contribution authors:** Tatiana Theodoropoulou – Gabriele Carenti (Laboratoire CEPAM, CNRS, Université Côte d’Azur) – Matthieu Ghilardi (CEREGE, CNRS, Aix-en-Provence)

The Mediterranean constitutes an ecological and cultural palimpsest, a region of intense millennia-long occupation as well as a precious archive of environmental changes and refugia-phenomena since the LGM. Although cultural sites from later periods are abundant and offer a rich dataset of coastal marine exploitation, the place of coastal environments and marine ecosystems in the socio-economic systems of prehistoric Mediterranean groups is less well documented. This is mainly due to the radical changes of the coastline since the end of the LGM, including submerged coasts or prehistoric sediments buried under alluvia, that literally erased signs of coastal human occupation along the Mediterranean coast and hinder the mapping of coastal prehistoric sites. This inevitably creates a partial or skewed image of how coastal communities interacted with these environments, especially with respect to marine resources utilization, as many sites currently located at the coastal fringe actually lied at some distance away from the coast. This paper discusses the methodological problems encountered in this region and offers a combined synthesis of available geomorphological and zooarchaeological data (fish bones, shells) collected during the ERC-funded program MERMAID.

**132 DISEASE, DISASTER & DEATH: EXPLORING RESPONSES TO HEALTH AND MORTALITY CRISES IN THE PAST**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** mortality crisis, health practices, mortuary practices  
**Session organisers:** Anne Malcherek – Francisca Alves Cardoso (Laboratory of Biological Anthropology and Human Osteology–LABOH, CRIA, FCSH, NOVA University Lisbon | In2PAST–Associate Laboratory for Research & Innovation in Heritage, Arts, Sustainability & Territory) – Alexandra Lopes Esteves (Lab2PT–Landscape, Heritage and Territory Laboratory, University of Minho | In2PAST–Associate Laboratory for Research & Innovation in Heritage, Arts, Sustainability & Territory) – Nicholas Marquez-Grant (Cranfield Defense & Security, Cranfield University)

**SESSION ABSTRACT**

Mortality crises are episodes in which a population experiences an acute increase in the number of deaths—they may have many causes, including natural disasters, infectious disease outbreaks, economic crisis, armed conflict, and (frequently) combinations of the above. Such crises have always caused behavioral changes at different levels, namely in the way death is viewed from a material or physical point of view, as well as in the spiritual field. Social responses to such events are varied across cultural and spatiotemporal contexts, and they connect and intersect in complex ways. Changes may include, but are not limited to: disruptions and innovations in burial customs and mortuary practices, public and individual health measures, legal and policy responses, as well as personal and artistic expressions. Such responses not only exhibited a great deal of variation but were also often socially contentious and did not affect all members of a community/population in the same manner, thus leaving contradictory and hard to interpret traces in the material and written records. We invite submissions that engage with the multivocality of responses to health and mortality crises in the past, as reflected in the archaeological and historical records. We are particularly interested in multi- and interdisciplinary submissions, which combine a variety of methodological approaches and sources—including archaeology, history, (bio) anthropology, archaeoethanatology, and geobiochemical approaches.

**CONTRIBUTION ABSTRACTS**

**1270. MY BONES HURTS: EVALUATION OF THE STATE OF HEALTH DURING THE HALLSTATT PERIOD IN TAUBERBISCHOFSCHEIM-IMPFFINGEN, GERMANY**

**Contribution format:** Oral  
**Contribution authors:** Rocio Herrera Reyes (Independent Researcher) – Marta Díaz-Zorita Bonilla (Eberhard Karls Universität Tübingen)

The State Monument Protection Office of Baden-Württemberg carried out a rescue excavation in the 1970s, outside the town of Impfingen-Tauberbischofsheim. They found a cemetery area with burials from different eras, including the Neolithic period (5000-2200 BCE), and the Hallstatt period, specifically for the Late Bronze Age/ Pre-roman Iron Age (1200-450 BCE). This project concentrated on the Hallstatt period burials and tried to reconvene the context with the osteological analysis. More than 400 individuals were recovered from Gewann Rebhuhn rchaeological site, coming from inhumed and cremated assemblages, placed in various types nd sizes of structures. Around 254 individuals were categorized as belonging to the Hallstatt period. The criteria applied according to

the main objective was the use of inhumed individuals with at least 60% to 70% of their skeletons, from which the results show diverse osteological responses in their bones, leading to the diagnosis of possible pathological cases. The contextual information has been organized within common factors like the disposition, type, and amount of offerings, which can also be related to sex differences. The placements of the bodies were done directly on the bedrock or inside wood coffins, and in stone hexagonal structures. From the 24 individual samples, a couple of them present unusual body placements or lack of offerings; nonetheless, no signs of crisis or struggles seem to be visible. If we focused on the osteological analysis, the majority of the individuals show different types of lesions, from developmental issues to degenerative joint diseases with or without enthesal changes to infectious diseases in bones and teeth. The results of possible diagnoses show a probable case of poliomyelitis, periostosis on long bones, and other stress markers in the cranium and teeth. This project should light up an area and period that requires more understanding from our part.

**945. UNRAVELLING THE CIRCUMSTANCES LEADING TO MULTIPLE BURIALS IN ST. ROMBOUT’S CEMETERY IN MECHELEN, BELGIUM (10TH-18TH CENTURIES AD)**

**Contribution format:** Oral  
**Contribution authors:** Katrien Van De Vijver (Royal Belgian Institute of Natural Sciences) – Benjamin T. Fuller (Department of Chemistry ‘G. Ciamician’, University of Bologna) – Karen Giffin – Arthur Kocher (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig) – Ioannis Kontopoulos (Department of Geosciences, University of Tübingen) – Megan Michel – Federica Pierini – Kirsten Bos (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig)

Excavations at St.Rombout’s cemetery (10th-18th centuries AD) in Mechelen, Belgium. uncovered 4,158 articulated individuals. Most were buried in single graves but archaeologists also recorded 65 multiple burials, which included 2-14 individuals buried simultaneously in the same grave. Overall, 103 individuals from multiple burials were studied in detail and two types of multiple burial were analysed further, using both bioanthropological and biomolecular analyses to better understand the circumstances that led to these unusual graves. One type of multiple burial, dated to the 15th-early 17th century, consisted of burials with one deposition phase. The other type, dated after 1640, showed several phases of simultaneous deposition. The observed differences suggest varied responses to unusual mortality. The bioanthropological study found important differences, with high numbers of adolescents, young adults, and males in the multiple burials compared to single depositions, as well as differences between the types of multiple burial. In addition, individuals from multiple burials showed more evidence for growth disturbances, mechanical stress and disease. This suggests that multiple burial was related to social background, as well as particular circumstances of death. While the single phase multiple burials indicate abrupt mortality crises, several phases of use in simultaneous burials suggests the graves were used over longer periods. This indicates an association with a nearby Spanish military hospital from the late 16th-early 18th century. Recent biomolecular analyses corroborate this hypothesis, with human population genetic analyses finding a sub-group in the cemetery with a southern European ancestry. In addition, pathogenomic analyses have so far indicated hepatitis B, malaria, paratyphoid fever (Salmonella enterica enterica Paratyphi C) and plague (Yersinia pestis), suggesting disease and epidemics were at least partly responsible for the multiple burials. Finally, preliminary stable isotope ratio analysis also found dietary differences between individuals interred in single versus simultaneous depositions.

**1418. FUNERAL PRACTICES AND CONGENITAL DEFORMITIES: STUDY OF AN ANOMALOUS BURIAL IN VERCELL**

**Contribution format:** Oral  
**Contribution authors:** Roberta Fusco – Chiara Tesi – Nicole Rossetti – Arianna Vanni – Marta Licata (Department of Biotechnology and Life Science, University of Insubria)

The underground cemetery of Santa Maria Maggiore in Vercelli (18th century) offers a complex stratigraphy of funerary practices shaped by broader social and religious transformations. Among the individuals recovered, a striking case is that of a woman over 60 years old, interred in a prone position within a coffin. Anthropological analysis reveals she had severe congenital scoliosis, leading to a visible spinal deformity associated with chronic pain and physical limitations. Prone burials are often interpreted as “deviant” or “anomalous”, commonly linked to necrophobic beliefs and attempts to control the dead. However, this burial defies such a straightforward reading. Located in a privileged funerary chapel within an elite cemetery intended for the local nobility and accompanied by a votive medal with the head oriented towards the altar, the burial suggests a devotional rather than punitive context. The woman was not isolated but interred among others, members of a family group, indicating continued inclusion in the social fabric. This case challenges binary interpretations of anomalous burials as purely expressions of stigma or marginalization. Instead, it invites a more nuanced understanding of how pathological conditions, religious beliefs, and shifting perceptions of the body shaped mortuary responses during times of

health uncertainty and high mortality. By combining archaeological, anthropological, and historical data, this study contributes to broader discussions on how past societies articulated care, exclusion, and spiritual concern in the face of embodied difference and death.

**1965. UNVEILING THE VICTIMS OF THE 19TH-CENTURY CHOLERA OUTBREAK: BIOARCHAEOLOGICAL INSIGHTS FROM THE OPORTO MUNICIPAL PUBLIC LIBRARY EXCAVATION (PORTUGAL)**

**Contribution format:** Oral  
**Contribution authors:** Lucy Evangelista (Era Arqueologia, SA | CIAS - Research Centre for Anthropology and Health - University of Coimbra | ICArEHB - Interdisciplinary Centre for Archaeology and Evolution of Human Behaviour) – José Carvalho – Francisco Raimundo – Sérgio Amorim – Sofia Nogueira (Era Arqueologia, SA)

The archaeological excavation conducted at the Porto Municipal Public Library was carried out as part of impact mitigation efforts associated with the rehabilitation and construction project on the site. The fieldwork, undertaken since September 2024, focused on the external area—formerly a parking lot—where a cemetery for victims of the cholera outbreak that struck Porto in the 1830s was uncovered. A total of 4. graves were identified. of which 33 have been excavated to date. A total of 85 individuals were recovered, including 65 adults and 20 non-adults. Among the non-adults, the demographic distribution includes two fetuses, seven infants (0–3 years), five children (4–12 years), and five adolescents (13–20 years). Sex estimation of adult individuals revealed 15 females and 17 males, while the sex of the remaining 33 individuals could not be determined. Despite the poor preservation of skeletal remains, paleopathological analysis identified signs of physiological stress, including cribra orbitalia and porotic hyperostosis, as well as evidence of infectious conditions, degenerative joint disease, and non-articular degenerative changes. Dental analysis recorded the presence of caries, calculus, periodontal disease, periapical inflammation, enamel hypoplasia, and antemortem tooth loss. These findings offer critical bioarchaeological insights into the health, living conditions, and mortality patterns of Porto’s 19th-century cholera victims. The ongoing research will further contribute to a multidisciplinary understanding of epidemic outbreaks and their impact on past urban populations. The excavation is expected to be completed by March 2025, and a research project is currently being developed to integrate both the historical contextualization and the bioarchaeological study of the human remains recovered at the Porto Municipal Public Library. This initiative focuses not only on the factors that contributed to epidemic crises—such as the 1833 cholera outbreak—but also on how past societies responded to such events.

**110. “AND EVERYTHING CHOLERA REVEALED”. THE SANITARY STATE AND POLITICAL RESPONSES TO THE 1855 CHOLERA EPIDEMIC IN THE CITY OF PORTO**

**Contribution format:** Oral  
**Contribution authors:** Tânia Ferreira – Alexandra Esteves (University of Minho)

When in 1855, a new cholera epidemic reached the city of Porto and the northern region of Portugal, the deficient sanitary state of these territories facilitated the spread of the disease. In fact, at a time when basic sanitation was practically non-existent and poor hygiene conditions were generalized, cholera had no difficulty in infecting a debilitated population. At the same time, the disease exposed the fragilities of the public health system in Portugal and was a trigger for reforms in this sector, as had happened during the first outbreak in the country in the thirties of the 19th century. Using a variety of documentary sources, such as documentation from the Civil Government and Porto City Council, medical reports and hospital records, as well as the periodical press, this communication aims to demonstrate the health status of the population, as well as the social and political responses implemented to the 1855 cholera epidemic in the city of Porto. By cross-referencing sources, it will be possible to assess how social and territorial inequalities contributed to a differentiated incidence of this epidemic, as well as the level of preparation of the medical and political authorities for an epidemic that was not unknown in the territory.

**2162. CITY LIFE: A DOUBLE-EDGED SWORD? THE IMPACT OF URBANIZATION ON HEALTH-INSIGHTS FROM THESSALONIKI’S UNIQUE CASE**

**Contribution format:** Poster  
**Contribution authors:** Christina Kakasa – Asterios Aidonis – Elissavet Ganiatsou – Panagiota Bantavanou – Aggelos Souleles – Christina Papageorgopoulou (Laboratory of Physical Anthropology, Democritus University of Thrace)

Urbanization is considered one of the most significant transformations in human history, shaping cities through complex social, economic and technological systems over time. While the impact of urbanization on health is well-documented in modern societies, its effects on the health of ancient urban populations remain less understood. This study offers insights into how urban growth affected human health and societal dynamics in Thessaloniki, viewed through the lens of biological anthropology. Thessaloniki, is a city with a rich history and

continuous urban development since its foundation in 315 BC, and represents a unique case to examine health in ancient urban settings. The city’s extensive archaeological and historical record provides critical evidence of urban development and societal change over time. The sample includes 1,000 skeletons dating from the Hellenistic to Byzantine periods (3rd BC-15th AD), making it one of the largest datasets of its kind. Health is assessed using two key markers: stature and enamel hypoplasia. Enamel hypoplasia is a dental condition resulting from acute physiological stress, such as poor nutrition or illness, while similar instances and poor living conditions may result in shorter stature. These markers combined offer insights into the health challenges faced by ancient populations. In more detail, we aim to examine the correlation between enamel hypoplasia and shorter adult stature, investigating whether early-life physiological stress impacted growth and influenced adult mortality risk. This data will be combined with isotopic data on early-life diet using incremental dentine analysis and with hypoplasia at the histological level. We also focus to identify the historical periods, during which people were more susceptible to morbidity and lower health levels. Our study provides a clearer understanding of Thessaloniki’s health trends, revealing how urbanization shaped its population’s well-being and resilience. Funding: ERC-Consolidator Grant CityLife (Project: 101126337).

133 INTERTWINED THROUGH SPACE AND TIME: ARTEFACT USE AND REUSE ACROSS CULTURAL CONTEXTS

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: artefact, ontology, entanglement  
Session organisers: Emily Miller Bonney (California State University Fullerton) – George Prew (Treasure Trove Unit National Museum of Scotland)

SESSION ABSTRACT

Artefacts often reveal the entanglement of different cultures. Imitating motifs or appropriating technologies are some ways in which one society may lay claim to another’s material language. Such transfers from one creative source to another may still evoke their significance to the people from whom they were borrowed but, recontextualized, may also communicate the realities of their new cultural home. The movement of actual objects and their reuse across time and space raise different issues. Do the new “owners” regard the alien item as exotica or do they attempt to modify it in some way to make its original meaning resonant with their social values and expectations. What do the choices they make in the process of integrating the item into its new cultural home reveal about the new content of the object and its reality and its cultural entanglement? If they do not alter it what strategies do they employ to render it understandable or do they emphasize its novelty? If the object is not moved physically but remains in situ until, perhaps centuries later, a quite different culture discovers and reuses it, what is the result of this chronological shift? Can we detect their understanding of what might be an otherwise unintelligible object? These questions raise not just formal considerations but ontological as well. What is the reality of this reused item? What consequences does the cultural reframing impose on the meaning of the object? What impact can such transformations have on their material language? We seek papers from any chronological period or geographical location that explore these questions. While we encourage submissions that focus on a single object we also welcome papers that consider multiple objects or entire deposits of artefacts.

CONTRIBUTION ABSTRACTS

33. THE NILE AND THE THAMES: ANCIENT EGYPTIAN FINDS FROM THE BRITISH COUNTRYSIDE

Contribution format: Oral  
Contribution authors: Jason Lundock (Full Sail University)

This paper examines the curious phenomenon of objects of ancient Egyptian manufacture discovered in the rural plough soil of Britain and what might be inferred regarding the object biographies and cultural significance of such objects. Analysis will be offered of the site profiles, based upon other datable objects discovered in the vicinity of each find, which will provide the most likely timeframe within which the objects from Egypt were imported, utilised and deposited. Comment will then be offered regarding the place of these objects within the complex cultural backdrop of identity and multi-culturalism in Britain and how this may be utilised to inform current discussions of the cultural heritage of the island. While coin finds will be considered, the discussion will focus on small figurines and cult images discovered in the plough soil and elsewhere in rural Britain to build its argument for the cultural significance of the concept of ‘Egypt’ in the British countryside.

1315. REUSE AND REUNION: ROMAN METALWORK EMBRACED IN LATE IRON AGE CAULDRON HOARDS

Contribution format: Oral  
Contribution authors: Wenqing Zhang (University of Edinburgh)

The entanglement of Roman artefacts in Late Iron Age contexts appears frequently in British archaeological materials. One of the uncommon cases is the Carlingwark Loch cauldron hoard consisting of a large bronze cauldron and about 100 items including fragments of both local and Roman metal artefacts placed inside the vessel. These metalwork items cover various themes and aspects of both domestic and non-domestic contexts including cooking, feasting, transport and movement, personal ornaments, and agricultural tools. Some of the Roman objects have military associations. Iron Age cauldrons have long been suggested to be feasting vessels yet the Carlingwark hoard is a likely of non-domestic deposition. However, less attention is paid to who owned those artefacts and how did they end up together in a large cauldron under water? What social-cultural and ritual contexts might they relate to when they were possibly passing down from hand by hand across time or groups? Thus, this paper takes the Carlingwark cauldron hoard as a case study by using a biographical approach to reinvestigate possible uses of the Roman objects in the hoard. When the objects of Roman influence moved out of Roman hands, what changes might these objects have experienced in local Iron Age living and hoarding practice? Reversely, how may the uses of those Roman finds remain by locals? Why are certain types of artefacts contained in the large cauldron selected intentionally and how do these compositions differ in different cauldron hoards? This paper will therefore also address similar cauldron hoards in Britain, especially from North Britain from the Late Bronze Age to the Roman Iron Age to discuss how the use of Roman artefacts in cauldron hoards in Iron Age Britain could reflect relationships between Romans and locals not only in political and economic but also in ritual contexts.

641. COPYCATS AND MISTAKEN IDENTITIES: THE RE-USE OF STANDING STONES IN SCOTLAND

Contribution format: Oral  
Contribution authors: Heather Ford (University of Glasgow)

Prehistoric standing stones have served as a physical resource in the landscape of northern Britain for millennia. They have been variously re-used in larger structures, e.g. souterrains; adopted as foci for new ritual activity, e.g. cremation deposits; and carved to create new monuments, e.g. with Latin, Ogham, and/or Pictish symbols. As Bradley (1987, 1993, 2002, 2016) has emphasised, they are equally a symbolic resource. While the re-use of prehistoric standing stones is regularly noted, there are two cognate phenomena which have not been adequately addressed: perceived re-use and the re-use or use of imagery. These phenomena assuage arguments of incidental or solely pragmatic re-use and instead foreground the mechanisms and applications of re-use. Using Pictish symbol monuments, this paper will demonstrate how explorations of perceived re-use and the re-use of imagery can help recover contemporary approaches to standing stones – from the material selection process to the creation of meaning. Drawing on three case studies– a naturally cupmarked stone and an undressed stone (both erected in the Early Medieval period), as well as a re-used prehistoric standing stone . this paper will consider how holistic approaches to re-use can deepen our understanding of the cultural and temporal entanglements underpinning the phenomenon.

969. THE SACRED SPACE OF THE MEGALITHS: THE MAHAKAL DARA TEMPLE IN DARJEELING, INDIA

Contribution format: Oral  
Contribution authors: Upasna Chettri – Sukanya Sharma (Indian Institute of Technology Guwahati)

The megaliths in the context of Sikkim-Darjeeling Himalayas is a sparsely investigated topic. Some are visible on the landscape and some, though are not physically present are embedded in the memory of the inhabitants. However, some are re-contextualized for new forms of veneration by several groups of people over the course of time. This study investigates the third phenomenon with the help of a case study of Mahakal Dara Temple in Darjeeling. In the Sikkim-Darjeeling Himalayas, the practice of erecting megaliths, known as Longchok, was prevalent among the Lepcha community. However, in contemporary times, some of these megaliths are reinterpreted as sacred shrines and temples. Mahakal Dara Temple, being at the center of this investigation, serves as a focal point for examining the contexts and processes through which Longchoks have been repurposed and reinterpreted in the region. Methodologically, this study employs ethnographic observations and historical accounts to explore the relationship between material evidence and cultural interpretation within the communities of the region. The analysis also points towards transition that signifies adaptability and malleability of cultural symbols within different historical and cultural frameworks. The shifting cultural perspectives emphasize the significance of local beliefs and practices in shaping the meaning and visibility of megalithic structures over time. Thus, the key contribution of this study lies in demonstrating how the evolving interpretation of material evidence, in this case the megalith of Mahakal Temple, sheds light on the historical, political, and cultural transitions of the region, while at the same time, also demonstrating how these transitions influence the interpretation of the material.

2273. MEANING THROUGH MARITIMITY: EXPLORING SHIFTS IN STONE ANCHOR USE AND INTERPRETATION AT KITION, CYPRUS

Contribution format: Oral  
Contribution authors: Jaris Darwin (University of Cyprus)

More than 100 stone anchors have been found scattered throughout the ancient Cypriot city of Kition, primarily within the sacred district of Kathari (Area II). While Kition has been extensively excavated and numerous publications have focused on this polity, the reason so many anchors were found at this site is unclear; they primarily originate from Late Bronze Age floors of Area II, with a number of exceptions, and were incorporated into various features and elements at the site, from walls and thresholds to altars and benches. This paper utilizes GIS to explore the spatial distribution of anchors and statistical analyses to ascertain patterns in anchor placement, size and physical characteristics. These methods will help ascertain the meaning(s) associated with the stone anchors of Kition, and whether they may have shifted over time or varied between structures at the site. Two other major centres in the Eastern Mediterranean, Ugarit and Byblos, have also documented large quantities of terrestrial stone anchors, similarly coming from religious areas. Ugarit especially was a major trading partner of Cyprus (and Kition) in the Late Bronze Age, and the potential meanings attributed to terrestrial anchors at all three sites will be addressed to determine the (potentially) impact of culture on interpretation of anchors. Finally, anchors in their basic form are a tool used by seafarers. Whether differing contexts—secular and sacred—resulted in different meanings being attributed to these stone artefacts will be examined through the lens of Kition.

1514. BETWEEN ECONOMY AND CULTURE: THE ROLE OF FOREIGN COINS IN THE INDIAN OCEAN SOCIETIES

Contribution format: Oral  
Contribution authors: Emilia Smagur (Polish Centre of Mediterranean Archaeology, University of Warsaw)

The discovery of foreign coins provides crucial evidence of interactions between different regions of the ancient Indian Ocean world. However, they have often been primarily viewed as indicators of trade and foreign contacts, leading to limited exploration of their broader cultural significance. Coinage, as a cultural phenomenon, is deeply embedded in specific societal norms, meaning its function and interpretation vary across cultures. Coins and money can only be fully understood within the broader cultural framework in which they were used. Moreover, value itself is a social construct, defined by the cultural context in which it was created. Foreign coins could serve as powerful social instruments, symbolizing relationships between places, objects, individuals, and deities—relationships that were not always based on exchange value. As a result, these coins could circulate across different spheres of value, transcending their conventional economic role. This paper examines foreign coin finds from the Red Sea region, the Gulf, and the Indian subcontinent to reveal how they were integrated into local cultures, often repurposed and reinterpreted. It also explores the similarities and differences in how Indian Ocean communities perceived and used foreign coins, considering both human and object agency in shaping these processes. Ultimately, this study aims to enhance our understanding of how objects acquired value in specific historical and cultural contexts.

102. WHAT IS A VESSEL FOR? RESIGNIFICATION AND AESTHETIC REUSES OF GREYWARE POTTERY IN CATALONIA

Contribution format: Poster  
Contribution authors: Esther Travé Allepuz (Universitat de Barcelona) – Joan Vicens Tarré (Universitat de Girona)

The production of pottery fired under reducing atmosphere, commonly known as greyware pottery, has been a constant presence in Catalonia for many centuries, from the Early Middle Ages to the present day. Rooted in Late Roman Coarse Wares, it became the predominant production in medieval Catalonia, especially in rural areas. Despite the widespread adoption of glazed pottery, initially in luxury contexts and later in everyday use, greyware pottery never disappeared. Even after the deep crisis in the 20th century, when ceramics were largely replaced by plastic and other materials, greyware continues to be produced in Catalonia, albeit in a residual form. Meanwhile, many pottery items from the modern era, produced throughout the 18th and 19th centuries, and even older pieces, have entered the world of antique dealers and collectors, who value them as testimonies of the past. In some cases, they become cult objects, while in many others –without historical awareness from their owners– they are preserved simply as family traditions, often after a change in function. For example, some of the former basins used for laundry or grain storage, and large jars from wineries and barns in Catalan farmhouses, are now repurposed as garden features, holding plants and flowers. In all cases, a new bond is created between the person and the object, mediated not only by its current use –which is no longer the same– but also by the historical use made by previous generations. The artefact acquires new symbolic significance, connecting

the individual to their familial past. Enriched with this new sentimental layer, the once-functional greyware vessel now takes on new roles, either as a decorative object or as a didactic element with intrinsic heritage value. Our contribution explores this transformation and its implications for archaeological knowledge and offers some examples about this phenomenon.

134 EXPLORING EMOTIONS IN PREHISTORIC AND HISTORIC CONTEXTS THROUGH MATERIAL REMAINS

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: Emotional Archaeology, Material Culture, Environmental Change, Cross-Cultural Research, Emotional Landscapes, Interdisciplinary studies  
Session organisers: Milica Mitrovic (University of Belgrade) – Sanna Lipkin (University of Oulu)

SESSION ABSTRACT

We invite submissions that explore the role of emotions and emotional bonds in prehistoric and historical contexts, focusing on how emotional experiences can be understood through material remains. This session seeks to integrate insights from psychology, anthropology, evolutionary biology, sociology, philosophy, and archaeology to examine how emotions, affects and feelings are expressed in material culture. Research investigating the interconnectedness of emotions with cognition, behaviour, and material practices is especially welcome. Topics might address community responses to cultural and environmental changes and the emotional facets of daily life, as evidenced by archaeological findings. Comparative cross-cultural and interdisciplinary perspectives are encouraged, with themes that include emotionally charged contexts such as interpersonal bonds, parenting, expressions of care and violence, intergroup conflicts, rituals, death rites, and emotional connections with animals, the natural environment, and inanimate objects, as well as emotions of non-human animals. Contributions may also address the emotional impact of environmental changes and societal transitions, such as interactions between Neanderthal and anatomically modern humans, the spread of Neolithic culture across Europe, or migration during various historical periods. How did local communities emotionally respond to the arrival of new lifeways and populations? How did those who relocated respond to their new living surroundings? How have people responded to environmental changes and species loss? Were these encounters marked by fear, resistance, grief, or positive emotions. We also emphasize the significance of reflective, emotionally aware writing and the researchers’ emotional connection to the subject matter as integral to exploring past emotions. Abstracts presenting case studies and new theoretical and methodological approaches are encouraged to foster interdisciplinary exploration of the emotional lives of past communities and the landscapes they inhabited.

CONTRIBUTION ABSTRACTS

648. EMOTIONS IN TRANSITION: MATERIAL REFLECTIONS FROM THE MESOLITHIC TO THE NEOLITHIC

Contribution format: Oral  
Contribution authors: Milica Mitrovic (Archaeological Collection, University of Belgrade)

Studies on emotions confirm both their natural and cultural foundations. Basic emotional capacities are innate and emerge early in phylogenetic development across all known cultures and in higher mammals. However, the organism actively interacts with its environment and plays a crucial role in its own development. Can a unified methodology for studying emotions in archaeology be developed? Just as the study of emotions in other disciplines does not follow a uniform path, neither can archaeology, as each new investigation expands the possibilities and scope of emotional reconstruction. Nevertheless, the knowledge of emotions and previous archaeological research provide some fundamental guidelines: 1) While there is no consensus on the universality of emotions, we are biologically predisposed to experience basic affects 2) The materiality and emotional life of a given culture (and of the human species as a whole) are deeply interconnected. Psychological research has confirmed the interconnection of cognition, emotion, and behaviour, encouraging archaeological efforts to incorporate emotional factors into the interpretation of material culture. If artifacts, bioarchaeological remains, and landscapes allow for the reconstruction of past human actions and thought processes, they are valid for assessing emotions. As with other aspects of research, understanding the context of findings is essential for interpreting emotions. When archaeologists write about emotions, they describe their experiences and perceptions, not as direct analogies but as sources of inspiration, hinting at competence and responsibility in addressing a particular topic. From the emotional perspective of a researcher shaped by a country in transition during the era of globalization, I examine Mesolithic hunter-gatherer communities encountering the agricultural world of the Neolithic, exploring: 1) Whether traces of prehistory reveal cultural temperaments - cultures of hope or cultures

of fear, 2) How material culture reflects the relationship between collective, group, and individual emotions in times of instability.

**1764. A GLIMPSE INTO ANCIENT BONDING: THE SIGNIFICANCE OF A ZOOMORPHIC FIGURINE WITH CHILD’S IMPRINTS FROM THE VINČA CULTURE**

**Contribution format:** Oral  
**Contribution authors:** Lidija Balj (Museum of Vojvodina)

In this paper I will present a case study of a zoomorphic figurine found at the multilayered Gomolava site, originating from the Vinča culture. This representation depicts a four-legged animal, probably a bovine, with a small dent resembling a receptacle in place of its head. Although this figure may not appear aesthetically pleasing at first glance, its body is well-crafted and carefully polished. The most significant feature of this artefact is the presence of well-preserved fingerprints, formed when the ridge on the back was created. Papilloscopic analysis conducted at the Ministry of the Interior in Novi Sad (Serbia) revealed that the fingerprints belonged to a child approximately four years old. Based on the manner in which the figurine was made and the fingerprint analysis results, it can be inferred that it was created through the collaboration of an adult and a child. While the figurine was not made with great attention to detail, it is clear that the emotional connection between the two creators is undeniable. After the adult shaped the figurine, the child contributed by using their fingers to form the ridge on the animal’s back. This shared moment of creation, marked b. emotional bond, left its imprint on the piece. Thanks to the characteristics of clay—a soft material that is easily shaped and hardens after firing, preserving permanent traces of modeling and use—we are witnessing a joint creative endeavor between an adult and a child. This figurine is just one example of small ceramic objects that enrich our understanding of childhood during the Vinča culture. In this presentation, I will discuss a few more such objects and explore their potential interpretations.

**647. RITUAL PERFORMANCE, AND THE UNDERWORLD: EXPLORING THE EMBODIED EMOTIONS OF DEATH IN MALTA’S LATE NEOLITHIC HYPOGEA**

**Contribution format:** Oral  
**Contribution authors:** Dawn Saliba (University of Malta)

Architectural remains and material evidence from Neolithic Malta’s two underground necropolises—the Hypogeum of Ħal Saflieni and the Xagħra Circle (c. 4,100–2,400 BCE)—offer archaeologists the unique opportunity to explore the emotional experiences of Malta’s prehistoric “Temple” civilization. Evidence from both hypogea indicates these underground structures functioned as sites of elaborate ritual performances, likely death-rites, as well as resting places of the dead. Ħal Saflieni’s monumental architecture, acoustics, and spatial organization reveal sophisticated proto-theatrical engagement, while rich material remains yielded from the Xagħra Circle’s excavations display complex burial praxis, including skeletal disarticulation, animal sacrifice, and the deposition of grave goods. Taken together, these elements provide a framework for exploring possible emotional dimensions surrounding death, including mourning, ancestral veneration, and spiritual encounters with the departed. Embodied movement analysed through on-site phenomenological experimentation and reflexive documentation further suggests that these subterranean labyrinths were purposefully constructed as powerful sensory landscapes designed to elicit profound emotional responses, including wonder and awe. Ritual architecture implemented in the structural design served as a focal points for performative engagement, enhancing the embodied emotions of ritual performers, practitioners, and spectators alike. Likewise, evidence of sound-engineering within Ħal Saflieni amplified acoustics, further heightening the emotional intensity of performative ritual. Through an interdisciplinary approach incorporating archaeology, anthropology. phenomenology, and performance theory, this study elucidates how the hypogea’s material and architectonic remains facilitated communal expressions regarding the afterlife. In both Ħal Saflieni and the Xagħra Circle, emotions surrounding mortality were expressed not only through burial practices but also through performative ritual within monumental proto-theatres, thus creating shared, liminal immersive experiences that bound communities together.

**1219. HOARDS AS AFFECTIVE PRACTICE: A CASE STUDY FROM SNETTISHAM, NORFOLK**

**Contribution format:** Oral  
**Contribution authors:** Jody Joy (Museum of Archaeology and Anthropology, University of Cambridge)

Influenced by recent work in the social sciences on affect and emotion, this paper takes a different approach to prehistoric hoards by arguing hoarding is an affective practice, a process which has emotional effects on its participants. Traditional approaches to prehistoric hoards have tended to focus on whether they were deposited for safekeeping and later retrieval or were votive deposits. Concentrating on explaining the wider process of hoarding has a universalising effect, implying a single meaning or reason for a widespread practice risking overlooking the impact of discrete deposits and actions where processes are repeated, but rarely as precise duplicates of one another. Taking as its case study the Iron Age hoards from Snettisham, Norfolk, UK, the potential

emotional effects of selecting objects for deposition and the performance of burying them in the ground will be examined. It will be concluded that viewing hoards as an affective practice is potentially advantageous because it focuses attention on what prehistoric hoards did rather than what they might have meant.

**1653. MONUMENTS AS ACTIVE COOPERATION. MOUND CONSTRUCTION, EMOTIONAL REGIMES, AND THE 536 AD CLIMATIC HAZARD OF ØSTLANDET, CENTRAL SCANDINAVIA**

**Contribution format:** Oral  
**Contribution authors:** Andreas Sæbø (University of Oslo)

Scandinavia and other parts of Europe suffered a series of dramatic tumults in approximately the middle of the 6th century AD, including but not restricted to climatic deterioration and wide-spread famine. The event has been suggested as the historical background for the myth of the Fimbulwinter, the prelude to the end of the world in Norse mythology. In areas such as Østlandet, present-day Norway, the 6th century cooling event coincided roughly with, first, the construction of larger earthen monuments – mounds – than Scandinavia had ever seen before. Second, with peak and eventual sudden, drastic reduction in deposition of gold and other artefacts. This presentation explores the move from gold to mounds from a Durkheim-inspired approach to mass rituals. By comparing the affordances and allowances of the materials employed in mound construction versus artefact deposition I examine the emotional regimes of people whose world was ruptured by climatic change. The presentation is inspired by and draws on psychological studies of mass congregation and solidarity.

**1471. EMOTIONAL ATTACHMENTS RELATED TO ARCHAEOLOGICAL TEXTILE FINDS**

**Contribution format:** Oral  
**Contribution authors:** Sanna Lipkin (University of Oulu)

This paper aims to offer a more nuanced understanding of the emotional and social meanings tied to textile items found in archaeological contexts, helping to reconstruct the experiences and resolutions of people in the past. Textile items often carry emotional value, serving as identity, memory, or status expressions. Examining the contexts in which these textiles were found, such as burials, can offer clues about their significance to individuals or communities. Furthermore, the physical condition of textiles – evidence of mending, patching, or wear – can reflect personal attachment, suggesting long-term use, care, and value placed on the items by their owners. Additionally, textiles can be linked to emotional bonds, such as feelings of comfort and security, but also to more complex emotions, such as those associated with losing a loved one and inheriting ‘useless’ yet emotionally significant items. Based on modern psychological attachment theory and through a selection of examples, this paper aims to study the attachment that people in the past may have had to personal belongings and other textile items.

**1631. EMOTIONAL RESPONSES TO DEATH IN MEDIEVAL IRELAND: INSIGHTS FROM RANELAGH, CO. ROSCOMMON, IRELAND**

**Contribution format:** Oral  
**Contribution authors:** Eileen Murphy (Queen’s University Belfast)

The remains of some 527 human skeletons were recovered during excavations at the predominantly Early Medieval (AD 600-1150) settlement cemetery of Ranelagh, Co. Roscommon, Ireland. The majority of the Ranelagh people were interred in an extended, supine position, with their head to the west – the typical position for a Christian. However, a proportion of individuals were buried in an atypical manner and such graves can be particularly emotionally charged. Using a multi-proxy approach that includes osteoarchaeology, palaeopathology and archaeo- thanatology, the individuality of some of these burials will be explored. This approach explores the nature of the deceased’s life as well as how they may have been viewed by the society in which they lived. It can provide glimpses of the heightened emotions the dead person may have experienced during their life, while also revealing insights about the emotional investment made by the living when preparing a burial. Love and concern for the deceased are evident at one end of the spectrum of feelings, while indifference, fear and hatred can be found at the other. A deeper understanding can be gained about the diversity of ways in which individuals in a Medieval community could respond when faced with a death. In some cases, the evidence suggests that it may have been viewed as a particularly tragic loss or, conversely, one that was of little importance. An unusual death could elicit an extreme reaction. These diversities of emotional responses all serve to remind us of the humanity of the past people we study.

**403. FROM LOVE TOKENS TO GRAVE GOODS: THE EMOTIVE DIMENSION OF CLAY TOBACCO PIPES**

**Contribution format:** Oral  
**Contribution authors:** Sabrina Liebetrau (Independent)

Omnipresent cultural artefacts in post-medieval Europe, clay tobacco pipes provide multiple gateways to everyday

culture. Most of them can be dated, assigned to their makers, and feature images of life and beliefs typical of their time. Yet do these characteristics give explicit insights into the emotional worlds of the people involved in pipe smoking? Based on psychological and anthropological theories about the role of objects in the formation of self-image and non-verbal communication, it seems plausible to look for material identities in smokers and their pipes. This pipe study will therefore not focus on the emotional ties caused by addiction, but on the socio-emo-tional aspects of material culture. In this context, pipe finds are to be considered as a potential link to their owner’s emotional life and rites of passage, and a semiotic approach might help to understand what feelings the design of clay tobacco pipes could have triggered in smokers and observers. Pipes came both as plain commodities and as works of applied art, designed to provide daily comfort but also mark the most extreme moments in human life. Featuring period symbolism and personalised letterings, pipes can tell stories of loving relationships, heartfelt faith, and political pride. Even without decorations, scientific research, just like pure archaeological methods, can prove that pipes played a role in human tragedies like the thirty year’s war or slavery. In sum, a more holi-stic approach can enable pipe research to explore the socio-emotional connections to and through clay tobacco pipes and thereby recognise them as a materialised form of emotions.

**1786. GHOST OF THE PAST. EMOTIONS ATTACHED TO THE EARLY MODERN FINNISH EXECUTION SITES IN MUHOS, FINLAND**

**Contribution format:** Oral  
**Contribution authors:** Marisa Kuusisto (University of Oulu)

The act of executing a tried and condemned criminal is one full of many emotions: the emotions of the person to be punished by death, as well as those of the people in the community and society as a whole. The archaeolog-ical study of execution sites offers a fruitful tool for us to look deeper into the many emotions attached to these sites—not only in the past but also in present-day society. In my presentation, I look into the case of the Northern Ostrobothnian Finnish town of Muhos, where we find two separate local execution sites (named Teerikangas and Rovastinsaari) used between the years 1758–1802. Altogether, five individuals were executed in Muhos during these years. Looking into historical records and local folklore, as well as studying the local landscape and pres-ent-day usage of the sites, I aim to establish a view of these sites as being filled with strong emotions and meanings.

**2226. HEAVY STUFF: ANGER, ABUSE AND IMPULSES IN THE PAST**

**Contribution format:** Oral  
**Contribution authors:** Saara Tuovinen (University of Oulu)

Archaeology of the attachment has been able to bring up new elements of past people’s emotional lives. Care, nurture and even love are essential human feelings. The attachment theory has brought us the attachment models and what their significance plays in the further life of an individual. Always the human relations are not positive, just like all the emotions we feel are not positive. Negative feelings can also be seen in neglect and abuse. We do not yet understand fully the processes behind all of such behavior, but in this work these feelings are approached and presented as a theme useful and suitable for archaeology of emotions. This presentation als. approaches the negative feelings through the historical archive material, applying it to the themes of archaeology of attachment. In this presentation the main focus is on the negative themes such as bad family relations and neglect. The war, emotional detachment and generational trauma have had a long shadow in the Finnish society. A special atten-tion is given into elder abuse at historical time, as even today, according to the World Health Organization (WHO) every sixth over 60-years or older have been subject to some sort of elder abuse.

**66. FAITH OF THE FINNISH TROOPS OF THE FINNISH WAR IN THE WESTERN BORDER REGION OF SOUTHERN LAPLAND**

**Contribution format:** Poster  
**Contribution authors:** Tiina Väre (Laboratory of Chronology, Finnish Museum of Natural History, University of Helsinki | Archaeology, University of Oulu) – Sanna Lipkin (Archaeology, University of Oulu) – Laura Arppe (Laboratory of Chronology, Finnish Museum of Natural History, University of Helsinki)

We analyzed the δ13C- and δ15N-values of a young soldier of the Finnish War fought between Sweden and Russia as a part of the Napoleonic wars in the early 19th century. Their remains were either buried or secondarily disposed of with those of several others some kilometers from the town of Oulu. He presumably succumbed in late November 1808 while retreating from the town toward the northern border region, as obliged by the terms of an armistice settled earlier in the fall. The δ-values of recently grown hair keratin and gradually remodeled bone collagen, representing different periods during this individual’s life, were compared to investigate the influence of wartime on their diet and/or health. The war for this young man ended just north of Oulu, but many others continued a long walk northward in the winter’s coldness, dressed in ragged uniforms, sick, hungry, and

tired. A couple of hundred men never made the journey, and once the rest had settled around the border region, the accommodations were substandard. Epidemics that had already troubled both armies now fueled into full rage. Mortality among both the Finnish troops unable to continue to the Swedish side of the border and the local people increased regionally into a crisis of the century. Several mass graves now serve as a memorial of the events. We explore the impact of the hardship on emotional sensitivity among the residents who – after the supply lines and maintenance of the Swedish army failed – had to accommodate, care for, and eventually bury the neglected remnants of the Finnish troops. Based on archaeological and historical records, we consider how it felt to be sick and desperate far from home in a strange place or to care for strangers posing a mortal danger to one’s family and the whole community.

**719. ATTITUDE AND FEELINGS TOWARDS LARGE CARNIVORES IN CUCUTENI – TRYPILLIA CULTURE**

**Contribution format:** Poster  
**Contribution authors:** George Bodi (Institute of Archaeology, Romanian Academy, Iași Branch) – Loredana Solcan (Moldova’s History Museum, “Moldova” National Museum Complex)

The Cucuteni-Trypillia civilization developed in Eastern Europe approximately between the Vth and the IIIrd millennium BC, covering parts of Romania, Republic of Moldova and Ukraine. In the final stage of evolution (Cucuteni B/ Trypillia CI), some ceramic vessels are decorated with images of predatory animals. The main-stream interpretation of these images associates them with cosmogonic myths and presumed ancient deities. Our study adopts a phenomenological approach and, while we do not deny the possibility of these images being symbols for more complex religious concepts, we consider them first and foremost expressions of emotions that may, subsequently, be rationalized and dealt with through their incorporation into a religious system. In order to infer the emotional charge of Chalcolithic predatory animals representations, we will conduct an automatic sentiment analysis on ancient texts (Sumerian literature, Vedic texts, and Pyramid Texts from the Old Kingdom). We will use a simple “bag of words” approach and already existing sentiment lexicons and run our analysis on two levels: contextual assessment of sentiments at text level, and evaluation of direct determinants (attributes). This method will help us put forward a new manner of constructing speculative theories of the Cucuteni-Trypillia population’s attitude and perception of predatory animals.

**135 SHAPING TECHNO-TRADITIONS AT THE EMERGENCE OF THE NEOLITHIC BETWEEN SW ASIA AND CENTRAL EUROPE**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Neolithic, Farming, Technology, Tradition, SW Asia, Balkans  
**Session organisers:** Bogdana Milic (Spanish National Research Council (IMF-CSIC)) – Michael Brandl – Sonja Kačar (Austrian Archaeological Institute, Austrian Academy of Sciences) – Clare Burke (Department of Archaeology, University of York) – Emma Baysal (Department of Archaeology, Bilkent University)

**SESSION ABSTRACT**

This session explores the dynamics of technological change and the shaping of traditions in Early Neolithic commu-nities across the vast region between Southwest Asia and Central Europe between the 10th and 6th mill. BC. It aims to investigate how technological practices evolved in response to local developments, external influences, the spread of innovations, and shifting socio-economic contexts at the emergence of agriculture. By examining these factors, the session highlights the diverse ways communities engaged with and adapted to their environ-ments. As communities across Upper Mesopotamia, the Levant, Anatolia, Aegean, Balkans and Central Europe transitioned to agriculture, they developed a mosaic of lifeways. These ranged from fully domesticated econo-mies to hybrid strategies integrating hunting, gathering, and managing wild resources. We aim to discuss how technological traditions were shaped within these varied contexts based on their cultural affinities, and therefore call for contributions to address the topic from the perspective of different materials, including lithics, pottery, bone, personal ornaments, building techniques, among others. Themes include the mechanisms of technolog-ical transmission, the influence of innovations on reshaping traditional practices, the impact of inter-regional interactions on technological developments, and the resilience of communities in maintaining and adapting their technological traditions amidst cultural and environmental challenges. We welcome presentations that explore how early Neolithic groups balanced new agricultural practices with established methods of resource acquisi-tion, revealing the socio-cultural and ecological factors that guided their technological choices. By highlighting case studies and patterns of change, the session seeks to uncover the varied and dynamic nature of techno-cul-tural landscapes during this period, illustrating that technological adaptations were diverse, flexible, and deeply

interconnected with broader economic, social and ideological systems.

CONTRIBUTION ABSTRACTS

748. LOCAL DEVELOPMENTS IN FLOOR AND ROOFING TECHNOLOGIES AT THE EARLY SEDENTARY VILLAGE OF BONCUKLU, CENTRAL ANATOLIA

**Contribution format:** Oral  
**Contribution authors:** Aroa Garcia-Suarez (Spanish National Research Council) – Mónica Alonso Eguiluz – Yannick Devos – Luc Vrydaghs (Vrije Universiteit Brussel) – Douglas Baird (University of Liverpool)

Architectural surfaces are both a reflection of cultural traditions and technological choices, and a scenario for the representation of social roles and identities. At the onset of sedentary life, extensive processes of transformation in the economic, social and symbolic spheres of human groups permeated architectural manifestations through time, resulting in a complex interplay of continuity and change in traditional architectural practices. This research focuses on the high-resolution examination of floor and roofing technologies at the early sedentary village of Boncuklu (ca. 8,400-7,800 cal BC), in Central Anatolia. The microscopic study of undisturbed stratigraphic sequences of living surfaces, accumulated domestic residues and collapsed roofing has allowed the identification of local developments in floor materials, maintenance practices and techno-cultural transmissions throughout the Neolithic occupation of the settlement. Surfaces in the earliest buildings display build-ups of fuel-rake-outs formed by highly fragmented charred plant fragments and phytoliths compacted under vegetal platforms overlaid by a cover of grasses. Later buildings are characterised by a marked division of domestic space into dirty and clean areas, the latter manifested as carefully prepared marl plasters whose maintenance varied significantly between households. Deposits of collapsed roofing have revealed a construction recipe that combined calcareous sediments with grasses and reeds. Results highlight the development of distinctive local building practices as dictated by a complex combination of ecological adaptations and both social and cultural conventions at Boncuklu, with white floor plasters signalling the emergence of highly codified, symbolically-charged building traditions.

209. MAKERS’ INTERACTIONS: CUMULATIVE ACTION, GESTURE AND RECYCLING IN ANATOLIAN EARLY NEOLITHIC ORNAMENTS

**Contribution format:** Oral  
**Contribution authors:** Emma Baysal (Bilkent University)

Wear, recycling and adjustment of ornaments were common in the early Neolithic of western Asia. Sometimes these practices were focused on prolonging ornament use, but in other cases there was an ongoing process of making and transformation. In such a sequence of events, we see the contributions of different ‘makers’ who took part in a communal activity that was temporally and likely spatially diverse. The dynamic nature of these objects throughout their life course makes the use of conventional typologies challenging. This paper takes a detailed look at how the communities of the early Neolithic in southwest Asia engaged with the material objects associated with the human body through long-term relationships as part of the identity making of this transitional period of prehistory. The examples come from the microscopic study of ornaments with prolonged making processes from the early sedentary site of Boncuklu Höyük in central Anatolia. The results of two detailed case studies show the sequence of production/adaptation engagement with the artefacts and track the changing form and aesthetics through their life histories. The artefacts are contextualised within the wider technological practices of the period to think about how aesthetics and value might have been perceived by the early Neolithic communities of Anatolia.

1400. OF CONNECTIVITY AND INDIVIDUALITY: NEOLITHIC GROUPS ACROSS LAKE URMIA BASIN, NW-IRAN

**Contribution format:** Oral  
**Contribution authors:** Judith Thomalsky (German Archaeological Institute)

The process of neolithization in the Iranian highlands appears highly heterogeneous. While the intramountainous valleys of the Zagros and its fringes count as one of the domestication centers and thus one center of neolithization in the world, wide parts of the Central Plateau remained virtually untouched by this new lifestyle for more than 2000 years. This “data gap” is commonly explained by possible external factors, such as insufficient environments for plant/animal management, or geomorphological factors (such as heavy sedimentation) that may have blurred the actual archaeological record. But also other factors can be considered between the two “extremes” of “positive” and “negative” evidence. As a case study, this contribution will present new investigations on neolithization processes in NW-Iran. The Lake Urmia Basin in NW Iran, appears so far as a region where “neolithic techniques” likewise occurred suddenly and in form of a fully developed package at the transition

of the 7th-6th mill. BCE. Before this time horizon, it is commonly presumed, the region was not sustainable for the “new economy” (plant cultivation). Our new research instead lets us describe a patchwork of highly-adaptive socio-economical strategies, clearly not matching the common concept of sudden appearance and rapid diffusion of a “package”. Specific aspects of behaviour and materiality point to SE-Anatolia, the Upper Euphrates region as well as to S-Caucasian Neolithic groups and the Northern Iranian Plateau describes different social and technological backgrounds, which can be disentangled by a socio-cultural conception of simultaneous connectivity and individuality.

2315. BROKEN PATTERNS AND COMMON THREADS - LITHIC TECHNOLOGIES AT THE ONSET OF THE NEOLITHIC FROM THE FERTILE CRESCENT TO BALKANS

**Contribution format:** Oral  
**Contribution authors:** Bogdana Milic (Spanish National Research Council (CSIC)) – Michael Brandl (Austrian Archaeological Institute (ÖAI))

The emergence of Neolithic lifeways between Southwest Asia and the Central Balkans (10th–6th millennium BC) unfolded across diverse environmental and cultural landscapes, shaping distinct technological traditions. Given this vast geographic and ecological diversity, variability in lithic production is expected. However, can we identify common technological responses among these regions—Zagros, Levant, Anatolia, Aegean, and the Central Balkans—as early farming communities adapted to socio-economic transformations? Were there shared approaches in blade-making techniques, skill transmission, or raw material preferences that reflect broader cultural behaviours linked to the onset of the Neolithic? While agriculture provides a common backdrop, its adoption and spread followed distinct regional trajectories. The Neolithic took root in the Fertile Crescent through independent developments, while its westward expansion introduced new contexts for adaptation. Declining reliance on hunting and new harvesting practices significantly shaped lithic production patterns. To explore these dynamics, we examine production techniques, innovation, skill transmission, and the degree to which communities engaged with or remained isolated from broader technological developments and exchange networks. We also acknowledge Epipaleolithic and Mesolithic influences, given the fragmentary nature of pre-Neolithic evidence, which often leads to broad cultural assumptions from isolated cases. Neolithic communities developed different procurement and consumption strategies, often involving huge amounts of exotic material despite distances. Across this vast area, materials such as Anatolian, Melian, or Carpathian obsidian, Balkan flint, and Levantine purple flint were consistently integrated into lithic economies, raising questions about long-distance connections and persistent preferences for non-local resources despite abundant local alternatives. This challenges assumptions of a shared Neolithic model, highlighting the role of raw material constraints, cultural traditions, and environmental factors in shaping distinct local responses. Finally, we critically challenge simplified models that emphasize uniformity while overlooking how local traditions, resilience, and cultural affinities shaped Early Neolithic identities.

1182. TRACING PATTERNS OF INNOVATION AND TRADITION. A COMPARATIVE STUDY OF NEOLITHIC STAMPS FROM THE BALKANS TO ANATOLIA

**Contribution format:** Oral  
**Contribution authors:** Elisabeth Weissensteiner – Barbara Horejs (Austrian Academy of Sciences | University of Vienna)

Neolithic stamps, also known as pintaderas, are small objects decorated with geometric designs, most commonly crafted from fired clay. Found across sites in Southeast Europe and Southwest Asia, they were likely used to repeatedly apply motifs by printing or impressing on surfaces. Their precise function remains enigmatic, as the archaeological record lacks direct evidence of their use. However, their presence across diverse Neolithic communities suggests they were part of shared technological traditions, connecting early farmers across ever-expanding networks. Examining patterns of uniformity and variance in their production, distribution, and iconography offers insights into how these traditions evolved within distinct cultural contexts and across regions. Data collected from stamps recovered at Early and Middle Neolithic sites throughout the Balkans and Anatolia serves as the foundation of this study. Building on the crucial insights gained from decades of regional studies, this study synthesises regional research into a broader analytical framework. Statistical analyses reveal spatiotemporal patterns, motif variability, and potential functions, facilitating the evaluation of hypotheses on stamp use. A case study of stamps from Svinjarička Čuka (Serbia) integrates site-specific data with macro-scale patterns, offering deeper insights into their role in Neolithic communities. Combining quantitative analysis with qualitative interpretation, this study aims to re-examine the role and significance of Neolithic stamps as both material and visual artefacts embedded within social and symbolic networks. Contextualising the objects within extensive techno-cultural landscapes sheds new light on how communities negotiated innovation and tradition in their engagement with material culture.

771. WHOSE BOUNDARY IS IT ANYWAY? CRAFTING CHOICES, TECHNIQUES, AND CONNECTIVITY OF NEOLITHIC POTTERS IN NORTH MACEDONIA

**Contribution format:** Oral  
**Contribution authors:** Clare Burke (Dept. of Archaeology, University of York) – Elen. Stojanova Kanzurova – Ljilja Shalamanov Korobar (Archaeological Museum of Republic of North Macedonia) – Zoran Rujak (The National Institution - Institute for Protection of Cultural Monuments and Museum in Strumica) – Pero Sinadinovski (Archaeological Museum of Republic of North Macedonia) – Darko Stojanovski (Dept. of Prehistory and WANA archaeology, Austrian Archaeological Institute) – Blagoja Kitanovski (Archaeological Museum of Republic of North Macedonia)

North Macedonia is an important region for understanding the spread and cultural expression of agricultural groups during the Neolithic. It lies at a crucial intersection, linking pioneer regions in Anatolia and the Aegean with those in Southern and Central Europe, including the significant Vardar-Morava River valleys which likely played a vital role in facilitating the movement of people across these areas. Archaeological evidence reveals the establishment of early settlements across various Macedonian regions by agricultural groups, with pottery assemblages displaying distinct typological and stylistic features that suggest specific cultural and chronological boundaries. However, there is a lack of detailed information on the techniques and materials used in pottery production—key aspects of learned behaviour that could offer critical insights into the spatial and chronological distribution trends of major pottery types, their relationship to cultural identity and the transmission of technological knowledge. This paper will present results of an integrated analytical programme utilising traditional typological and macroscopic methods with thin section petrography and SEM-EDS, to investigate pottery from six Macedonian sites. Utilising the conceptual frameworks of habitus and the chaîne opératoire we have been able to reconstruct the sequence of choices and practices utilised by Neolithic potters in different areas for a variety of pottery types including painted, monochrome, and incised/impresso wares. The findings demonstrate the use of primarily local raw materials in the production of pottery, with notable variations in material manipulation, alongside differences in the quality and craftsmanship of the vessels produced. However, local production also includes technical concepts shared at different sites, as well as with neighbouring regions and cultural groups such as those in Serbia, Bulgaria, and Anatolia, testifying to a wide distribution for some aspects of potting knowledge and practice.

336. EARLY NEOLITHIC TEXTILE CRAFT AT A CROSSROADS? THE STATE OF RESEARCH IN NORTH-WESTERN GREECE AND THE CASE OF MAVROPIGI, KOZANI

**Contribution format:** Oral  
**Contribution authors:** Sophia Vakirtzi (Hellenic Ministry of Culture)

The region of northwestern Greece, specifically the administrative district of Western Macedonia, is an area of a relatively dense concentration of Early Neolithic sites. As early as the 1960s, the results of the excavation at the site of Nea Nikomedeia prompted the discussion of textile production in the Early Neolithic based on artefacts that were interpreted as textile tools. Since then, the excavation of more sites in the region, dating to this chronological horizon, has enriched the archaeological record with potential evidence of textile craft. In this presentation, an overview of the state of research on the textile craft in Early Neolithic northwestern Greece will be provided, focusing on the case of Mavropigi. This site, located near the lignite mines in the region of Kozani, underwent a rescue excavation over a period of two years (2005-2006). It was radiocarbon-dated to the second half of the 7th millennium BCE. Excavators have recognized three, main phases of occupation before the abandonment of the settlement. Artefacts such as rounded, centrally pierced potsherds and clay, unpierced spools were collected from different loci of the excavated area and are studied as potential textile tools. The paper will present the preliminary results of this study and will discuss the problem of identifying textile tools in the context of the Early Neolithic. The aim of this presentation is to contribute to the research on the networks of interaction in textile technology between the Balkans, the Aegean, and Western Anatolia in the Early Neolithic.

506. THE LATE NEOLITHIC DISPILIO LOOM WEIGHTS: AN EARLY FORM OF PIRIFORM WEIGHTS IN NORTHWESTERN MACEDONIA

**Contribution format:** Oral  
**Contribution authors:** Gerasimoula Ioanna Nikolovieni (Brown University)

The Neolithic lakeside settlement of Dispilio is located in Northwestern modern-day Greece at the southern part of Kastoria Lake about 7km south of the modern Kastoria city. Long-term excavations at the site have yielded numerous buildings and a rich variety of finds. The ongoing textile tools research of the site has highlighted an assemblage of textile tools in the West sector. This paper will present the archaeological assemblage of piriform loom weights found in the Final Neolithic Building 12 of the site. The presence of piriform or other types of loom

weights in Neolithic Greek settlements is uncommon and under question. Therefore, this assemblage gives us the opportunity to research the functional characteristics of this typological category and ask questions about the technology of the loom they accompanied in the particular building. Furthermore, the study of this assemblage will enable investigating the relations of the settlement’s textile technology with neighboring areas.

16. INVESTIGATING THE APPEARANCE OF PIRIFORM LOOM WEIGHTS IN NORTHERN ITALY BETWEEN THE LATE NEOLITHIC AND THE EARLY BRONZE AGE

**Contribution format:** Oral  
**Contribution authors:** Maria Elena Bertoli (School of Humanities, University of Glasgow)

Some of the earliest evidence of textile production in northern Italy comes from the Late Neolithic (c.4000-3500 BCE) pile dwelling sites. The pile dwellings have produced some of the most important archaeological evidence of textile and fibre production and use during European prehistory since their waterlogged conditions preserve organic matter, such as textiles, balls of yarn, cords, and baskets. In the Late Neolithic pile dwelling site of Palù di Livenza (Friuli region) in North-Eastern Italy, evidence of textile production, consisting of clay spindle whorls and loom weights, was found. The earliest fabrics in Northern Italy have been recovered from the Late Neolithic settlement of Lagozza di Besnate (Lombardy region), where a small fragment of weft-twined structure was recovered. The evidence of textile production increases significantly with the beginning of the Early Bronze Age (c.2200-1600 BCE). The Early Bronze Age pile dwellings located in the area around Lake Garda, such as Lucone di Polpenazze (Brescia) and Bande di Cavriana (Mantua), have provided important evidence of spinning and weaving activities. This paper will present a comprehensive study of the piriform loom weights found between the Late Neolithic and the Early Bronze Age in the pile dwellings of northern Italy. These weights are characterised by an ovoid shape, with a single transverse hole towards the top. This typology can be linked to the European Late Neolithic tradition. Already in the advanced stages of the Early Bronze Age, piriform loom weights were replaced by ring-shaped or cylindrical weights with a large central hole, which became widespread in the Middle and Late Bronze Age.

1337. INNOVATIONS IN THE BONE INDUSTRIES: SPATULA-SPOONS IN THE EARLY NEOLITHIC BALKANS

**Contribution format:** Poster  
**Contribution authors:** Selena Vitezovic (Institute of Archaeology, Belgrade)

The introduction of the so-called “Neolithic way of life” not only brought in new technologies, but had great impact on the pre-existing ones. In case of bone industries, these innovations included new raw materials (switch from bones from wild species to the domestic animals), new manufacturing procedures (directly linked with changes in lithic industries), and new techno-types, needed for changes in economy and life styles (introduction of agricultural implements, increased needs for tools for small crafts, etc.). Some of the new techno-types in the Early Neolithic in the Balkans are considered as direct influence from the south-west Asia. The most prominent techno-type is the bone spatula-spoon, with elongated handle and elaborated bowl. These objects were carefully crafted from entire metapodial bones through several stages of cutting, scraping, grinding and burnishing. Some of them may even have decoration on them. While Anatolian examples were predominantly or perhaps exclusively made from metapodial bones of Bos primigenius, in the Balkan area Bos taurus bones prevailed. Furthermore, these objects were not simply adopted by the Early Neolithic communities in the Balkans, but also underwent come local transformations and adaptations, visible in some of their technological traits, and even more in their mode of use and overall significance. This poster will present comparative results of analyses of spatula-spoons in the eastern and central Balkans and southern Carpathian basin (present-day Bulgaria and Serbia), with focus on changes and transformations of this peculiar techno-type.

2306. BETWEEN TRADITION AND INNOVATION: EARLY NEOLITHIC HARVESTING TECHNIQUES AT CRNO VRILO SITE (DALMATIA, CROATIA)

**Contribution format:** Poster  
**Contribution authors:** Sonja Kacar (Austrian Archaeological Institute/ Austrian Academy of Sciences) – Sylvie Philibert (CNRS, Traces - UMR 5608 )

From the late 7th millennium onwards, the spread of Neolithic lifeways toward the central and western Mediterranean followed a non-linear trajectory, marked by pioneer incursions, pauses, and cultural reconfigurations. In this context, the Balkan Peninsula and the Adriatic—where technical systems transformed—represent a key region for understanding Neolithic trajectories. Crno Vriilo, a central-eastern Adriatic site in the Zadar hinterland, provides remarkable evidence of the first agro-pastoral communities of the Impressed Ware tradition. Excavated in the early 2000s by Brunislav Marijanović (University of Zadar), it revealed rectangular houses, pathways, and a rich material culture, attesting to a well-structured village (c. 5800–5600 cal BC). Among its finds, the lithic assemblage—over 4000 well-preserved artefacts—constitutes the largest Early Neolithic collection from

littoral Croatia, offering unique insights into domestic lithic production and use. Technological and functional analyses highlight tool maintenance strategies, subsistence activities, and blank selection. Lithic production at Crno Vrilo is characterized by pressure blade flaking on high-quality exogenous cherts (sourced from the Gargano Peninsula, Italy), reflecting significant socio-economic and technical investment. These blades were used both unretouched and modified into diverse tools, including sickle elements, indicating that cereal cultivation played a central role. Symmetrical trapezoidal armatures show projectile impact and evidence of recycling, while large blades, likely produced by lever pressure and imported as finished products, served various functions except for harvesting. Within this presentation, we aim to explore the Crno Vrilo technological system in its domestic context and position it within a broader perspective on Neolithisation processes in the central-western Mediterranean and the Balkans.

136 AURAL AND VISUAL INTERACTIONS IN MEDIEVAL AND EARLY MODERN SOURCES: INTERDISCIPLINARY PERSPECTIVES ON THE ARCHAEOLOGY OF SOUND

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Regular session  
Session keywords: visual and written culture, medieval and early modern sources , archaeoacoustics, archaeology of sound, interdisciplinary approaches, soundscape  
Session organisers: Zorana Đorđević (Departament de Història i Arqueologia, Universitat de Barcelona | Institut d'Arqueologia UB (IAUB), Barcelona) – Tin Cugelj (International Musicological Society Study Group Auditory History)

SESSION ABSTRACT

The archaeology of sound is an interdisciplinary field connecting archaeology, musicology, art history, architecture, literary studies, and acoustics. Traditionally, archaeoacoustic research has focused on using acoustic techniques to examine the auditory properties of historical spaces. However, the visual and textual representations of sound—indoors within sacred spaces and outdoors, where landscape features shape soundscapes—have often been overlooked. This session seeks to bring renewed attention to how sound and music were depicted in medieval and early modern iconography and written sources across various cultures and how these depictions might inform archaeoacoustic research. The session invites discussions on the portrayal of sound in medieval and early modern visual and written culture, asking questions such as: How was sound visually represented in art and iconography? How did the people of the past describe their auditory experiences? How can these sources enrich contemporary archaeoacoustic studies, and conversely, how can archaeoacoustics enhance our understanding of medieval and early modern visual and literary sources. We encourage scholars to present research that integrates the acoustics of spaces with the visual representation of sound, providing a comprehensive approach to understanding historical auditory environments. In particular, we welcome contributions that explore the interplay between aural experiences and visual elements, including architecture, religious artifacts, and illuminated manuscripts. This session will offer an interdisciplinary platform for scholars to delve into the sensory experience of sound in the medieval and early modern periods, aiming to deepen our knowledge of the historical, cultural, and sensory roles of music and sound. This session, organized by the CULT-AURAL project, is open to researchers worldwide from diverse scientific disciplines focusing on medieval and early modern cultural contexts. Selected papers will be considered for a special issue in a peer-reviewed journal, offering further opportunities for scholarly exchange and publication.

CONTRIBUTION ABSTRACTS

2463. VISUAL REPRESENTATION OF SOUND IN TREATISES

Contribution format: Oral  
Contribution authors: Jean-Christophe Valiere (Institut Pprime, CNRS UP 3346, Université de Poitiers)

The basic characteristics of sound waves have been defined since ancient times. Chrissippus (280 BC) postulated that the undulating nature of these waves was comparable to waves on the surface of water, while Aristotle (384 BC) established the principles of the directionality of waves by comparing them to the way a ball bounces, like rays of light. Epicurus (300 BC) added the need for a material support for this propagation to take place. Vitruvius (80 BC) took up the theories of the Greek philosophers and added that waves propagate in degrees, i.e. in three dimensions, unlike surface waves which propagate in two dimensions only. It should be noted that many drawings have unfortunately disappeared, such as the plates of Vitruvius. Nevertheless, the theories of antiquity persisted into the Renaissance and modern times, as can be seen from the treatises of Marin Mersenne (1588-1648) and

Anasthasius Kircher (1602-1680), which include drawings illustrating their vision of acoustic principles. It is worth noting that the Aristotelian approach, which we would now call ray theory, is the only one that is used and seems to work. Although it can explain certain focusing effects, it cannot describe the complex effects of acoustics such as spectral changes or reverberation. These, however, have long been known empirically. It was not until the end of the nineteenth century, and especially in the twentieth century, that all these approaches were reconciled.

1912. RESONATING IMAGES: THE ROLE OF CERAMIC POTS IN THE SOUNDSCAPE AND VISUAL AESTHETICS OF ST. GEORGE AT STARO NAGORIČINO

Contribution format: Oral  
Contribution authors: Jasmina Ciric (University of Kragujevac Faculty of Philology and Arts)

This paper explores the dual role of the ceramic pots embedded in the façades of the Church of St. George in Staro Nagoričino (1317/18). Traditionally, these pots have been believed to serve an acoustic function, contributing to the church's acoustics during liturgical performances. However, their primary role is visual, serving to accentuate the architectural and auditory potential of the interior space. The façade's brickwork mirrors the interior message conveyed through the monumental frescoes, particularly the Mocking of Christ fresco on the northern wall, which features musicians with wind and percussion instruments. This inclusion hints at a performative or liturgical soundscape. The study examines whether the ceramic pots, embedded in the northern and southern façades, are strategically positioned not only to enhance sound but also to visually emphasize the church's acoustic potential. By analyzing the spatial layout and the integration of resonators within the context of the frescoes, this paper interrogates the intentional role of sound in the church's design. This approach situates the study within a broader interdisciplinary framework that combines archaeoacoustic research with art historical analysis. Ultimately, the paper seeks to deepen our understanding of how the Church of St. George at Staro Nagoričino, as one of the prominent endowments of King Milutin (1282-1321), engages with both sound and visual art, creating an immersive sacred experience. By considering the interplay between visual decoration and acoustic resonance, this research contributes to the broader field of sacred architecture and performance, shedding light on the sensory dimensions of medieval religious spaces.

689. THE SOLDIER-PRIEST AND HIS GILDED HARP: GLEANINGS ABOUT THE HARP IN 16TH-CENTURY SPANISH AMERICA

Contribution format: Oral  
Contribution authors: Egberto Bermudez (Universidad Nacional de Colombia, Bogotá)

In 1578 a ‘gilded harp’ was sold in Santafé (present day Bogotá, Colombia) and purchased by Antonio de Sequeira, a Portuguese adventurer who had served as soldier against French and English pirate attacks in Cartagena and Riohacha (Northern Coast of Colombia) and who, having become a priest around 1575, was acting as such in Ibagué (150 km east of Bogotá) a commercial entrepot between the territories of present-day Colombia, Ecuador and Peru. In the very few existing documents about him, Sequeira is praised for teaching music and the playing of instruments to the local youth, those instruments include keyboard ones and possible the harp. Through historical, organological and iconographic evidence, this paper examines what kind of harp could have been the one he purchased in 1578, its construction, sound and playing techniques. It also attempts at placing this instrument and its music in the context of Spanish colonization and Christianization of Amerindian and African populations, marked by competition, confrontation and violence in a period of growing economic and political globalization.

541. THE PORTRAYAL OF SOUND IN 14TH CENTURY “LA DIVINA COMMEDIA” BY DANTE ALIGHIERI

Contribution format: Oral  
Contribution authors: Eva Gjorgjievska (Goce Delcev University)

Apart from being an exemplary medieval and religious poet, the literary tradition recognizes in Dante Alighieri a guardian of the rich treasury of the Italian language, a moralist, a traditionalist, a committed poet who sings about his Florence ... But Dante’s “Divine Comedy” can also be read through the sensorial discursiveness of the text, which, by evocation of sounds, smells, and colors, makes him alluring, despite the frequent hermeticity or elitism of its expression. In this article, we will specifically explore the evocation of sound, in combination with color, gustatory metaphors, olfactory sensations, tactile perceptions and, in general, the emotional character of the poetic text, in order to compare all aspects of the sensation that Dante’s poetics presents. The sounds in the poetic text change gradually as Dante passes through Hell, Purgatory and Paradise and are associated with differently intonated images and stories. On the one hand, the strong suggestiveness of poetic expression will be considered through the investment of sensory perceptions in the text (sounds, smells, sights, ...), and on the other hand, the poetic figures that emphasize the imaginary activation in the reading process will be considered (synesthesia, allegory, onomatopoeia, etc.). We can conclude that in the “Divine Comedy”, what Virgil is for Dante, is Dante for the reader, that is, a guide through the three spheres of the otherworldly, or a guide in a cathartic

experience that aims to bring him out purified and renewed. We are talking about a strong involvement of the reader in the text by processing the sensory experiences through the figures of speech, which in turn are transformed into poetic experiences.

1977. SILENT NARRATIVES: SILENCE AS A METHODOLOGICAL TOOL IN SOUND STUDIES RESEARCH

Contribution format: Oral  
Contribution authors: Tin Cugelj (University of Nottingham | IMS Study Group Auditory History)

In researching historical sounds, auditory environments, and sonic events, the sound itself foregrounds as the main object of historical research. Encoded within narratives as a relic of written sensory culture, within music as a symbol of ordered sound, or on records and tapes in their true, yet altered form, the variety of recorded sounds reveals much about the sound itself, communities centred around it, its listeners, and, ultimately, its creators. However, with such prioritisation of the “audible past”, there is a concurrent, often unintentional creation of a variation of the confirmation bias that privileges audible or documented sounds over silences and the “unheard”, stemming from several intertwined factors such as archival priorities, technological limitations, cultural concep-tions of relevance, scholarly focus on the discursive, and power dynamics. Drawing on the interdisciplinary scholarship from cultural history, auditory history, and sound studies, and featuring a curated selection of primary sources (courtesy treatises, diary entries, iconography, music), this paper focuses on foregrounding silence as an active cultural signifier and a critical tool in the investigations of the sonic past. It asks and tries to answer several questions: what can silence tell us about past communities, their habits, and their preferences? How does silence encapsulate cultural values, and how are these expressed? Can silence, ultimately, be heard in the histor-ical research. Through recognising silence(s) as valuable data, expanding the archives, and an interdisciplinary approach to sound history, we can foreground silence as a methodological tool for the spaces of the past. In that way, this paper will challenge sonocentrism and the acoustemological approach and explore the possibilities of the novel “silence as a method” approach that could unearth new analyses and interpretations of the past, and yet unheard sonic narratives.

1314. THE THEOTOKOS AND THE \*AXION ESTIN\*: FRENCH TRAVELERS’ PERCEPTIONS OF MARIAN DEVOTION ON MOUNT ATHOS (16TH–20TH CENTURIES)

Contribution format: Oral  
Contribution authors: Jean-Michel Sourd (Independent Researcher | Alma Mater Studiorum University of Bologna)

This study examines the impressions of French-speaking travelers—including pilgrims, scholars, artists, and diplomats—regarding Marian spirituality on Mount Athos, focusing on the veneration of the Theotokos (Mother of God) and the \*Axion Estin\*, a foundational Orthodox hymn tied to a 10th-century Marian apparition. Spanning the 16th to 20th centuries, the analysis draws on a corpus of understudied narratives, from Pierre Belon du Mans (botanist to François I) to 19th-century luminaries like Chateaubriand, Lamartine, and Pierre Loti, as well as lesser-known accounts by missionaries or ecclesiastic. (Placide De Meester, Stanislas Neyrat) and scholars (Victor Langlois, Amand de Mendieta). The paper unfolds in three stages. First, it maps travelers’ documentation of Athonite frescoes, icons, and liturgical practices linked to the Theotokos, interrogating how Catholic observers interpreted Orthodox rituals (e.g., night liturgies, fasting). Second, it analyzes descriptions of the \*Axion Estin\*’s celebration, probing whether visitors connected its emotional resonance to French Marian traditions (e.g., Notre-Dame de Lourdes) or framed it as exotic. Third, it critiques colonialist and Romantic biases in 19th-century accounts while exploring how travelers mediated Athonite spirituality through their cultural and theological lenses. By intersecting religious history, travel literature, and intercultural studies, this research reveals. 1. Post-revolutionary France’s perception of Athos as a bastion of Orthodox “otherness,. 2. The Theotokos as a symbolic bridge between Catholicism and Orthodoxy. 3. Shifting narratives—from Romantic exoticism to contemporary ecumenical dialogue.

137 BEYOND THE CARTESIAN DIVIDE: ALTERNATIVE ONTOLOGIES IN ARCHAEOLOGICAL EPISTEMOLOGY

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Regular session  
Session keywords: Ontology, Dualism, Materiality, Cognition, Epistemology, Multisensorial  
Session organisers: Michael McCabe – Merlijn Veltman (Leiden University) – Edoardo Vanni (Università per Stranieri di Siena) – Nicky Schreuder (Leiden University)

SESSION ABSTRACT

This session invites papers that re-evaluate the foundational epistemological and ontological assumptions in archaeological practice, particularly those stemming from Enlightenment thinking and Cartesian dualism. Building on (but not limited to) frameworks such as Assemblage theory, Material Engagement Theory, posthu-manism, and relational ontology, we aim to explore alternative models that emphasise materiality, embodiment, and the multisensorial dynamics of human-object interactions. These paradigms offer archaeologists innovative tools for interpreting artefacts, fostering interdisciplinary dialogue, and reassessing traditional approaches such as Style, Typology, Diffusionism, Dualistic constructs (Nature/Culture, Mind/Body), Site-Centric Analysis, and Linear Progression Models. Contributions are encouraged that challenge traditional classifications in material culture studies, moving beyond nationalist and ethno-cultural narratives toward non-dualistic epistemologies that foreground new perspectives on human-nonhuman relationships, artisan agency, and environmental influ-ences on material culture. Through these discussions, we seek to critique the legacy of Enlightenment biases in archaeology and open avenues for a more holistic and integrative understanding of the past. Papers are welcome on broadly applicable case studies, such as the transmission of craft knowledge, the social lives of artifacts, ritual practices, or the impact of environmental conditions on material production and use; as well as theoretical contri-butions tackling ontological or epistemological shortcomings within the field. Submissions employing innovative methods—such as sensory analysis, XRF analysis, experimental archaeology, and interdisciplinary approaches to memory and temporality—are also encouraged. The goal is to create a platform for dialogue that reimagines the boundaries of archaeological knowledge, fostering reflexive, integrative approaches that transcend dualistic thinking and promote a more inclusive, dynamic understanding of archaeology.

CONTRIBUTION ABSTRACTS

481. ART AS COGNITION: CONSIDERATIONS ON THE ENGAGEMENT OF MIND, BODY AND ART IN BUILD-ING THE WORLD OF (LATE) REPUBLICAN ROME

Contribution format: Oral  
Contribution authors: Nicky Schreuder (Leiden University)

Especially during the last decade, stimulating perspectives have been explored concerning the fundamental relationality of cognition and material culture. In such an understanding, tools, artefacts and the environment are all constituent in the creation of knowledge and our becoming – our cognition. Artistic expressions such as painting or statuary are much less taken into account, with some notable exceptions made for prehistoric craft. This paper will therefore specifically examine the role of art of a later period to explore how such approaches might be fruitfully applied to a widening scope of material sources. The aim is to help further understand the role of non-humans in cognitive processes and matters of social-cultural becoming and change. Specifically, first century BCE domestic wall paintings from Pompeii and its environs are chosen to consider their role as cogni-tive extensions in the rapidly changing society of late Republican Rome. Much scholarship on Pompeian frescoes has focused on semiotic approaches and interpretations leading to connections to social status. As such, the fres-coes are generally understood as representational manifestations of power; the embodiment of values, or they are assumed to have provided fitting backdrops for certain social actions in the space they adorn. The frescoes are read and deciphered on the basis of what the image show: the matter is passively imbued with predefined meaning. But by approaching the paintings as part of (extended) cognition, I contend that they have been more formative for social action and experiences than often assumed, and that art is as much an expression of the mind while also being an integral part of it. Art, then, acts together with other bodies to create the perceived world.

626. HEART[AND MIND]-IN-HAND. EMOTION IN EVOLUTION OF MIND: EMERGENCE OF THE ‘SUPERNATURAL’ IN THE EUROPEAN PALEOLITHIC

Contribution format: Oral  
Contribution authors: Mathew Burnett (Center for Cognitive Archaeology (UCCS) | University of Colorado at Colorado Springs)

Most of us would admit that our emotions permeate our existence on the planet; they did also, we can assume, for our hominin ancestors. I utilize Material Engagement Theory (MET), Extended Emotion Theory (ExE), and cutting-edge affective neuroscience to assemble archaeological evidence into a story of emergence, within the caves of the European paleolithic, of the earliest cognitive ancestor of the ‘supernatural’ concept and, thus, religiosity; it’s a story that starts with a subtle but persistent hominin emotional response to what might seem an innocuous item of cave art, the hand stencil. I first complete two critical tasks in setting the stage. The first is flipping the common ExE ontology on its head (or, rather, into reverse) – that is, before using emotions to make ‘sense’ of the world (the standard notion), I suggest that we must first use the world to make ‘sense’ of our emotions. The second is dismantling David Lewis-Williams’ “shamanic” explanation of the emergence of the ‘supernatural’ concept in

the European paleolithic, as his account has long held a strong (but not strongly defensible) explanatory grip on this topic. I then proceed with a story of recursive engagement of body, brain, emotion, and the material world (i.e. the ‘affective cognitive ecology’), tracing the hand stencil’s significance in the material record from accidental discovery, to enactive material ‘beacon proto-sign,’ to ‘fetishized sign,’ to composite component in Europe’s first proto-therianthropic image and then, finally, to projected metaphor in the fantastical integral therianthrope ‘sorcerer’ paintings of Trois Freres; thus, also, in the process, the birth of the concept of ‘supernatural’ in the mind of the paleolithic hominin, precursor to full religiosity.

**1132. SHAPES AS A DRIVING FORCE IN HUMAN COGNITIVE EVOLUTION: EVOLUTIONARY NEUROBIOARCHAEOLOGY, A CO-TRANSDISCIPLINARY APPROACH**

**Contribution format:** Oral  
**Contribution authors:** Simon Maistriau (Université Libre de Bruxelles) – Michae. Mccabe Iii (Universiteit Leiden)

Human cognitive evolution is intrinsically linked to our engagement with the material world. Challenging traditional dualistic frameworks, I propose that shapes serve as cognitive scaffolds, shaping neural development, perception evolution, knowledge transmission, and the emergence of inventive expression. Evolutionary Neurobioarchaeology, a co-transdisciplinary field, integrates archaeological data, neurobiological mechanisms, and epigenetic processes to examine how natural shapes influence human cognitive evolution. This approach demands an epistemological shift and the dismantling of traditional disciplinary boundaries, fostering researcher-driven inquiry and collaboration both within and across research teams. The theoretical framework emphasises the significance of natural and environmental shapes, proposing that the inherent forms of the natural world, ranging from the curve of a riverbed to the fractal patterns of a tree, play a fundamental role in spatial cognition and learning, as well as the neuronal organisation. The present study aims to analyse the interaction between the morphology of artefacts, neural plasticity and the intergenerational transmission of epigenetic modifications playing a role in the human cognitive evolution. This analysis will seek to uncover the profound entanglement of human cognition with the material world, thereby challenging the duality put forward by Material Engagement Theory and Neuroarchaeology. Furthermore, Evolutionary Neurobioarchaeology places significant emphasis on ethical considerations and non-invasive research methodologies. By promoting a conscientious approach to research, this novel discipline seeks to facilitate a more nuanced comprehension of human evolution, emphasising the interconnectedness of humans, other species, and the material world. This co-transdisciplinary approach, integrating innovative methodologies and theoretical frameworks, has implications for understanding the emergence of symbolic thought, technological innovation, and co-evolutionary dynamics between humans and their environment. Ultimately, it proffers a non-dualistic perspective on human evolution, challenging traditional assumptions and promoting a more integrated view of human experience.

**2341. DOES CLAY REMEMBER? EMBODYING CREATIVITY, SENSORY ENGAGEMENT AND TACIT SKILL IN EARLY IRON AGE ETRUSCAN CERAMIC PRODUCTION**

**Contribution format:** Oral  
**Contribution authors:** Michael Mccabe (Leiden University)

This research investigates the role of embodied cognition in shaping ceramic production among Etruscan artisans during the early Iron Age. Focusing on the pivotal study areas of Vetulonia, Poggio Civitate, and Chiusi, the project examines how sensory experiences and tacit expertise inform creative production processes, and it foregrounds the river Ombrone as a dynamic agent that distributes cognition across these regions. Initial analyses reveal that ceramic production was far more than the application of predetermined techniques; it was a continuously evolving dialogue between potters and their materials. Locally sourced clays and tempers responded to the artisans’ tactile manipulations in ways that were deeply attuned to subtle variations in environmental conditions. In this context, the Ombrone effectively extended the cognitive reach of Etruscan artisans. Its influence linked the embodied practices at Vetulonia, Poggio Civitate, and Chiusi, forging connections among embedded repertoires that transcended localised production methods, enriching their material interactions and contributing to an extended cognitive landscape. Crucially, this landscape functioned as both a conduit for innovation and as an entanglement with memory, as artisanal knowledge—embedded in gesture, material affordances, and environmental cues—was preserved and mediated over time. This work foregrounds ceramic production as an adaptive, context-sensitive process. At these sites, artisans drew on immediate, tactile feedback and the inherent properties of their materials, revealing a form of creative cognition that emerges through the relationship between mind, body, tool, and environment. By situating craft practice within its full ecological and embodied context, this study challenges reductionist interpretations of ancient technology and offers a nuanced perspective on the innovative processes underpinning early Iron Age Etruscan ceramic production.

**1002. BEYOND ISOLATIONISM: EXTENDING RELATIONAL ONTOLOGY TO MEMORY BASED ON EARLY BALTIC COUNTING PRACTICES**

**Contribution format:** Oral  
**Contribution authors:** Dominykas Barusevicius (Vilnius University)

This paper extends relational ontology to memory based on a new hypothesis concerning mnemonic techniques—counting in action—in the Eastern Baltic (2nd–1st millennium BC). It is proposed that such isolationist ontologies as Cartesianism and hylomorphism structure subject-object or form-matter as distinct analytical units and binary oppositions. As a result, memory can be defined as a subject’s inner faculty to forget and remember, operating solely via forms—mental representations of past experiences. Although this definition of memory provides a pervasive and fruitful explanation, the process of counting in action suggests otherwise. The hypothesis states that Baltic mnemonic techniques emerged as counting in action, manifesting through gesticulations with small clay figurines. This is supported by evidence of the expansion of Near Eastern counting practices using clay tokens beyond their geographical origins, argued by means of chronological correspondences, analogies between figurines and tokens, indications of cross-cultural exchanges, and an archaeological case found in Lithuania. The Near Eastern counting nature of Baltic clay figurines implies that the gesticulation of figurines served as a form of memorization—recording and tracking quantities of objects in either administrative, vital, or transactional processes. Given that memorization operates through the manipulation of material objects, isolationistic definition that limits memory to human mentality is challenged. Based on these considerations, relational ontology can be extended to memory. By emphasizing mutual engagements between humans and material objects, this perspective suggests that fixed distinctions and mental representations cannot comprehensively determine memory. Depending on various networks of relations, memory emerges in new and ever-changing forms of practical operations. Therefore, this paper not only introduces new archaeological evidence on the emergence of mnemonic techniques in the Eastern Baltic and the expansion of Near Eastern counting practices beyond their geographical borders, but also challenges isolationism and highlights the relational potential of memory.

**1105. TECHNO-POLITICS AND THE SENSORY ORGANISATION OF FORMATIVE POTTERY PRODUCTION IN THE ATACAMA DESERT, CHILE (3000-1000 BP)**

**Contribution format:** Oral  
**Contribution authors:** Claudio Wande – Mauricio Uribe (University of Chile)

Sensory assemblages in archaeology have been recognised for their potential to address the political dimensions of the past. In this work, we propose an intersection of technological studies and a sensory approach to pottery technologies in the Atacama Desert to explore the lived and embodied experiences of the transition to a Formative/Neolithic world. The Formative Period in Tarapaca, northern Chile, has been a key moment for debates on social evolution, complexity, and inequality. Unlike linear, progressive, typological, and economic Neolithic perspectives, current proposals suggest that a cosmological transformation took place, generating new relationships between human groups, non-human agents, raw materials, elements, and resources in the driest desert in the world. A particularly eloquent material manifestation of these transformations was pottery technology. We propose an approach to technology as a set of practices that structure and reproduce social worlds, but also as a stage for intentionalities, tensions, and negotiations. This implies inserting the discussion of technologies into politica. fields. From this techno-political perspective, we explore perceptions and sensory experiences, as they mediate the relationship between actors (artisans) and technological practices. Since what can be perceived, sensed, felt, and practised is structured within specific social, aesthetic and political assemblages, understanding these dimensions is key to comprehending the diversity of actors, their possibilities of action, experiences, and intentionalities within particular socio-political structures. Through traditional ceramic analyses, combined with a visual and tactile sensory approach, our study shows that these ceramic technologies materialise two social strategies practised (closed and open ceramic recipes) to generate ideas and sensations of apparent equality through pottery work. This, in turn, helped reconcile personal and communal experiences, sensations, and perceptions of the transformations and inequalities resulting from the agreements and tensions of living in a newly formed Formative/Neolithic social world.

**750. HOW TO (DIS-)ASSEMBLE YOUR TYPOLOGY: REVISITING THE “DOLPHIN-AMPHORA EARRINGS” FROM FUNERARY CONTEXTS IN CENTRAL ASIA (200 BCE - 100 CE)**

**Contribution format:** Oral  
**Contribution authors:** Merlijn Veltman (Leiden University)

The “dolphin-amphora earrings”, found in funerary contexts in Bactria (Central Asia) from 200 BCE - 100 CE, have traditionally been considered through cultural and processual lenses. They have become part of an archaeological typology, in which they are grouped together on the basis of their morphological features (i.e. an amphora-like body with dolphin handles). This has had major repercussions for their interpretation in funerary contexts.

Invariably, the earrings are placed into representational categories: “Greek” or “elite”. The burials they are found in are interpreted through similar frameworks. However, typologies are only one part of the assemblage that is each distinct “dolphin-amphora earring”. Crucial differences in the form of each dolphin-amphora earring point towards diachronic relations pervading their assemblages. This paper addresses the problematic nature of the restrictive typology imprinted upon these earrings. Using assemblage thought as a theoretical framework, this contribution will revisit the earrings as assemblages, laying bare the multiple-object that is the “dolphin-amphora earring”. From this perspective, novel, diachronic interpretations of the earrings as more-than-representative and more-than-typological emerge that provide invaluable knowledge of the earrings’ funerary context and Bactria as a whole in 200 BCE - 100 CE.

**2296. ARCHAEOLOGY, BIAS, AND THE POLITICS OF THE PAST: UNDEFINING THE DISCIPLINE FOR THE PRESENT**

**Contribution format:** Oral  
**Contribution authors:** Kalani Heinz (California State University, Northridge) – Robyn Price (Brown University)

“Those that fail to learn from history are doomed to repeat it.” - Winston Churchill. This oft repeated assertion, that studying history lets us prepare better for the futures we desire, assumes the existence of a neutral past that all people accept as true, regardless of where they are from or who they are. The past, however, is not an objective reality. Rather, it is a constructed narrative shaped by incomplete datasets, selective interpretations, and the needs or expectations of particular audiences. Archaeologists play a pivotal role in producing these narratives, yet standard methodologies often obscure the biases inherent in interpretation, reinforcing exclusionary and/or reductive views of History. This paper interrogates how lived experience—including trauma, implicit bias, and cultural investment—shapes both the reception and production of historical knowledge, influencing how archaeology is mobilized in the present. By examining case studies such as the misinterpretation of gender/sex in burials or pedagogical interventions that highlight embodied learning, this paper considers how archaeology can move beyond static, materialist frameworks to engage more reflexively with the politics of knowledge production. It argues that archaeology must not only acknowledge its role in shaping modernity but also take responsibility for the repercussions of its narratives, particularly in how they inform contemporary crises. Drawing from relational ontology, ethnic studies, and anti-racist, queer, and trauma-informed approaches, this paper advocates for an archaeology that embraces multivocality, complexity, and plurality. By undefining archaeology—challenging its limits as a discipline concerned only with material traces of the past—we can foreground the co-production of past and present, revealing archaeology as an active, political practice that can foster more honest and inclusive understandings of history. Rather than resisting complexity, archaeology must engage with it, recognizing discomfort as central to reimaging its role in the modern world.

**707. AGENCY, AFFECT, AND AGENCEMENT: KEEPING THE ‘HUMAN’ IN ‘POSTHUMAN’ ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Ewan Coopey (Macquarie University, School of Humanities)

Many critiques levelled against posthumanist and new materialist archaeologies share a concern for the supposed loss of human agency—something only recently brought back into the centre of archaeological interpretation. This is important to address, for, in the face of the various environmental, social, and political crises wracking the world, we cannot afford to work from ontologies which lose sight of the impacts of human action. Equally, though, we must embrace epistemological stances that look beyond the anthropocentric legacy of enlightenment thinking and engage with the more-than-human nature of the past and present. The posthumanist turn, however, is not the ‘end’ of human agency in archaeology, but rather the expansion of our understanding of it and the inextricable more-than-human and material dimensions of its emergence. I argue this by drawing upon tenets of assemblage thinking, such as the core concept of agencement (‘assemblage’) first developed by the philosophers Gilles Deleuze and Felix Guattari, along with other concepts adopted and adapted by contemporary assemblage theorists, such as affect (the capacity to impact and be impacted). These concepts are used to craft a framework which understands agency—and what it means to act—as an immanent capacity that emerges within agencements (heterogeneous arrangements of materials and relations). I then use this framework to unpack the human and more-than-human affects and agencies at play in the creation and dedication of a 1st century CE Romano-Dalmatian funerary stela. In doing so, I demonstrate how posthumanist archaeology can bring us to dynamic reconstructions of past worlds which move beyond the human, without abandoning the capacity for human action.

**738. ALL DESCARTES’ FAULT.DISAMBIGUATIONS AND ONTOLOGICAL REJECTIONS IN CONTEMPORARY THEORETICAL ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Edoardo Vanni (University for Foreigners of Siena)

In recent decades, at the centre of theoretical debate in the so-called humanistic disciplines has been the dualism between subject and object, between objective reality and the subject of representations of the world. A criticism in essence of the Cartesian theoretical operation of the division between *res extensa* (external, objective reality) and *res cogitans* (thinking subject). The object of criticism thus seems to be Descartes, so much so that this new theoretical season is also called post-Cartesian. But is it really all Descartes’ fault? From a philosophical point of view, the genealogy of guilt (let’s call it that) is more complicated than one might think. Matters become more complicated when we drop the ontological discourse within this separation of Cartesian origin, into the discipline of archaeolgy. The latter is particularly indicative for exploring the disciplinary and theoretical implications of this new turbo-ontological season precisely because of the privileged relationship that archaeology intacts with materiality at different levels. Is this elephantiasis of ontology really, as Walter Benjamin already suggested, proof that the only philosophy that has won is phenomenology? Instead, this article intends to propose a different genealogy and possible innovative developments for archaeology and perhaps (also) for philosophy.

**139 PROFESSIONAL ARCHAEOLOGY, ETHICS AND SOCIETY: THE EUROPEAN FRAMEWORK**

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Regular session  
**Session keywords:** Professional archaeology, Ethics, Society, Community, Ethical Code  
**Session organisers:** Alessandro Garrisi (Associazione Nazionale Archeologi) – Ros Ó Maoldúin (Institute of Archaeologists of Ireland | Rubicon Heritage) – Franziska Lehmann (DArV - Deutscher Archäologen Verband) – Kai Salas Rossenbach (Inrap)

**SESSION ABSTRACT**

The practice of professional archaeology has developed along distinct paths in different European countries, yet all face similar challenges in upholding ethical standards and maintaining professional integrity. Ethics plays a fundamental role in ensuring high-quality archaeological work and fostering positive relationships between archaeologists, society, and stakeholders. However, when economic pressures lead to compromised ethical standards, the resulting poor-quality work damages not only client relationships but also the public’s trust in archaeology as a profession. Archaeological work encompasses far more than data collection – archaeologists interpret the past for contemporary audiences, shape cultural policies, and help communities engage with their heritage. Yet the field now faces the dual challenge of developing new ways to communicate archaeology’s value to stakeholders while establishing clear ethical guidelines for professional practice. This session explores ethical challenges in contemporary European professional archaeology, specifically examining: - The impact of economic pressures on archaeological work quality and professional standards; - Ethical considerations in relationships between archaeologists, developers, authorities, and local communities; - Professional responsibilities in public engagement and cultural heritage management; - Ethical implications of incorporating Artificial Intelligence in archaeological work; - Implementation and adherence to ethical codes in archaeological practice. Through comparing practices across Europe, this session aims to define core principles of professional archaeology and establish guidelines for maintaining ethical standards while ensuring sustainable professional practice.

**CONTRIBUTION ABSTRACTS**

**1678. THE DIFFERENCE BETWEEN ETHICAL AND NON-ETHICAL: REFLECTION AND PROPOSAL**

**Contribution format:** Oral  
**Contribution authors:** Aglaia Margani (ANA Associazione Nazionale archeologi)

Ethics can be defined as a set of principles and values underlying social, cultural, and professional behaviors, which are inevitably reflected in every social aspect. In the field of professional archaeology the regulatory developments of the last decade in Italy and much of Europe are relevant. These have led to the creation of appropriate professional profiles, which see the archaeological discipline no longer linked solely to academic research, but also to the world of work on par with other work activities born many years earlier. For this reason, the time seems ripe to analyze the working methods and tools of the sector that finally focus on issues such as: the responsibility of knowing how to communicate one’s work in a transparent and accessible manner; the dissemination of good working practices within safe and non-discriminatory work environments; the commitment to report illegal activities concerning cultural heritage even in the event of armed conflict; the spread of a fair culture of compensation appropriate to one’s work duty. These issues are added to much more discussed topics in archeology, like the ethics of archaeological research (given the unrepeatability and destructiveness of archaeological excavation) wich has always questioned the various possible alternatives to extensive excavation, considering

the latest achievements of preventive archaeology. It is proposed to highlight the salient elements of European professional archaeology starting from the regulatory frameworks of some states and then taking inspiration from european companies/institutions/trade associations in the sector already equipped with a code of ethics, such as the EAA, ANA, CNR, ICOM, NVvA (Nederland), IAI (Ireland) and asking for the involvement of existing professional associations, which have not yet adopted real codes of ethics, such as ANACT (France), in order to think and share a single and unequivocal code of ethics for good practice of professional archeology in Europe.

645. ETHICAL CHALLENGES AND PROFESSIONAL PRACTICES IN PREHISTORIC ARCHAEOLOGY. A COMPARATIVE STUDY WITH A FOCUS ON GREECE

**Contribution format:** Oral  
**Contribution authors:** Marie Pyrgaki (Université Paris I, Panthéon-Sorbonne | Hellenic Open University)

This paper explores the ethical challenges and integrity issues encountered by professional prehistoric archaeologists in various European contexts. It focuses on Greece and provides comparative insights from Italy, the United Kingdom, Germany, and France. It shows how economic pressures can lower the quality of archaeological work, harm ethical standards, and strain relationships with stakeholders and the public. Case studies highlight the complexities between archaeologists and developers, stressing the need for ethical negotiations during infrastructural development. Additionally, this paper presents public engagement initiatives aimed at fostering community connections to heritage, along with examining the ethical implications of integrating artificial intelligence in archaeological research. It provides a critical evaluation of different ethical codes, particularly those in Greece and the broader framework offered by the European Association of Archaeologists (EAA). By synthesizing these insights, the study defines core principles for professional prehistoric archaeology, aiming to establish comprehensive guidelines to uphold ethical standards and promote sustainable practices that enhance the credibility and societal relevance of the discipline.

1455. THE CULTURAL PRACTITIONERS IN THE SPACES AND TIMES OF CONTEMPORARY SOCIETY

**Contribution format:** Oral  
**Contribution authors:** Claudia Pizzinato (University of Cà Foscari) – Raffaella Bortolin (—)

Accelerated change has now become a constant in contemporary society: the new space-time coordinates of current living force us to reinterpret the role of cultural heritage practitioners in relation to the rapid changes currently taking place. While it is true that historical events influence our journey, it is equally true that each individual contributes their own story to the historical narrative of these events: what perspective, then, opens up for those who reconstruct this narrative in a time and space accelerated by technological advancement? For some time now, we have also talked about “singularity”, a versatile term that in technology is used to describe the moment when AI surpasses human intelligence, irreversibly changing society. “Singularity” thus indicates an epochal turning point, in which cultural heritage practitioners, seen as primary interlocutors in historical reconstruction, are called to rethink their actions in relation to technological contributions and the new dimensions that space and time have assumed in the contemporary world: the cultural heritage practitioners can no longer limit themselves to being an expert of the past but must inevitably commit to designing the present, to firmly claim the importance of saving roots as the only way to avoid dangerous deviations. Conversely, many decisions at the global level seem slow and sometimes ineffective, still causing numerous disparities, even in terms of the management of cultural heritage and the role that some professions exercise or could exercise. The Faro Convention, for example, adopted in 2005 by the Council of Europe, but ratified by Italy only in 2020, has not yet been truly implemented. Many of its provisions are now outdated by the succession of events, so much so that it too would need to be updated in its fundamental principles.

2022. “STRATIGRAPHIES AND RELATIONSHIPS: NEW MEANINGS, MATERIAL INTERCONNECTIONS AND COMMON GOODS”

**Contribution format:** Oral  
**Contribution authors:** Cristiana Teveroni (—)

In society, what is returned to us as cultural heritage? What distances and proximity create or dissolve relationships between ancient things, the archaeologist and communities? The archaeologist creates value in his work by asking questions of the material remains of the past to give us knowledge: it is the gaze, in fact, that manages to effectively decipher not only ancient things, but also and especially our present as a true stratigraphic cross-section. Archaeology certainly discovers objects, but even more, it recomposes lost realities, recognizing their evanescent or invisible traces, interpreting and making perceptible what has been lost. Distance and proximity are two complementary aspects of the long lifespan of objects and only knowing how to interpret their material history through archeology gives us physical, stratigraphic, functional and spatial relationships. For this reason, it is urgent to overcome the disciplinary dimension and highlight the role of professionals who work with the

public, communities and society in search of an ethical and civil role that gives meaning to archaeological work. Only in this way can archaeology become a common good, a heritage of citizenship and social utility through the involvement of communities and research on contexts and territories. Understanding and addressing the challenges of modernity requires working in a participatory and transparent way to collect, preserve, study, interpret, and contribute to human and social justice, to protect the well-being and memory of future generations by guaranteeing equal rights and access to wealth for all.

1375. OPEN ARCHAEOLOGY - OPEN SOCIETY CROSSROADS

**Contribution format:** Oral  
**Contribution authors:** Pavlos-Stylianos Megalooikonomou (National Technical University of Athens) – Athina Chroni (National Technical University of Athens | Hellenic Ministry of Education, Religious Affairs and Sports)

The integrity of cultural heritage sites and their continuing authenticity are fundamental concerns, particularly as the notion of heritage embraces also traditions, as well as everyday life. Nevertheless, our cultural memory is permanently damaged irretrievably, given that cultural disasters, are quite repetitive. Consequently, developing methodologies for safeguarding cultural collective memory, demands digitization, public awareness, community and stake-holders involvement, as well as open access and linked open data. The Faro Convention on the Value of Cultural Heritage for Society/The Council of Europe 2005, constitutes among, other charters, the leading one under the perspective of opening up to the society and restoring the democratic dimension of the cultural process. In this framework, the notion of open archaeology becomes more and more visible, thus proposing new types of methodologies and co-operations. Outlining the emerging cultural heritage management framework has become an urgent priority, in order to redefine the contemporary archaeologist’s framework, whether it concerns field work or laboratory work processing.

1954. ARCHAEOLOGY AND PROFESSIONAL ETHIC IN THE AGE OF AI

**Contribution format:** Oral  
**Contribution authors:** Rossella Atlante – Alessandro Garrisi (Associazione Nazionale Archeologi)

Technology is part of our lives: it influences every aspect and also impacts the way we work. The challenge of the present concerns the embedding of AI in professional work. This can represent a real revolution, which requires in-depth ethical reflections. How can we bring this technology into the world of professionalism without being overwhelmed? AI can and must be a technological support, while the responsibility of judgment and evaluation must be left to humans. The quality of the AI product must also be ensured. Every innovation is initially greeted with a certain scepticism, but this should not limit its use. Rather, it should lead to the development of ethical procedures that guarantee its sustainable and responsible use. There are different aspects to keep in mind when talking about the use of AI in professional activity. The intellectual property of the contents from which the AI draws to produce its responses is one of these. As well as the originality of the archaeologist’s work: if he uses AI in his study, how truly original can his work be defined? These are just some examples of topics that will be presented for public discussion: not conclusions, but a starting point for future developments.

142 PLANT POWER: INTERDISCIPLINARY APPROACHES TO THE STUDY OF NON-FOOD PLANT RESOURCES

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** plant dyes. medicinal plants, fibres, archaeobotany, interdisciplinary approach, ethno-botanical research  
**Session organisers:** Cristina Ambrosioni (University of Padua) – Anit. Radini (University College Dublin)

SESSION ABSTRACT

Throughout human history, plants have been essential not only as food sources but also as integral components of culture, influencing daily life and community practices worldwide. Their roles extend to providing fuel, crafting materials, and spiritual significance. The study of plants in material culture remains underexplored within archaeology, often due to a lack of methodologies. This session aims to investigate the captivating realm of non-food plant resources, concentrating on four primary areas: plant dyes and fibres, medicinal plants, and the aromatic qualities of incense and resins, along with the potential uses of smoke for preservation and hygiene. We will begin with an exploration of plant dyes and pigments, which have been employed to colour textiles and artifacts. These natural hues have enhanced clothing and have also expressed social status and cultural identity. Participants will

discover the historical importance of various dye plants, their extraction methods, and traditional dyeing techniques. Next, we will focus on wild and domesticated plant fibres, which have been crucial in the development of early fabrics and textiles, showcasing local ingenuity in utilizing available resources. The session will then shift to medicinal plants, connecting cultural heritage with contemporary scientific understanding. We will highlight the significance of ethnobotanical research in uncovering the healing potential of diverse plant species and how traditional medicinal practices influence modern applications of plants and smoke. Lastly, we will delve into the world of incense and resins, revered not only for their fragrances but also for their roles in spiritual and ritual contexts. We invite contributions across various disciplines, including archaeology, archaeobotany, chemistry, and biology, to examine materials from prehistory to the Middle Ages and across cultures. This interdisciplinary approach seeks to reveal historical practices while enhancing our understanding of well-being and craftsmanship, ultimately uncovering the overlooked narratives of everyday plant resource applications.

CONTRIBUTION ABSTRACTS

2220. TEXTILE PLANT POWER: TRACING PLANT FIBRE TECHNOLOGIES ACROSS EUROPE

**Contribution format:** Oral  
**Contribution authors:** Margarita Gleba (University of Padua)

Since the Palaeolithic, plants provided the resources for string, yarn and fabric. The transition from wild plant fibres to domesticated species is associated with the appearance of major technologies such as spinning and loom weaving in many parts of the world. On the other hand, the change from splicing to spinning plant bast fibres such as flax took place millennia after the domestication and establishment of both technologies for different types of materials. Drawing on research accumulated to date, this paper aims to trace, in broad strokes, the major technological transitions in the use of textile plant fibres in prehistoric Europe and compare them with the contemporaneous developments across the world. I propose that multidisciplinary approaches are necessary in order to investigate the archaeology of textile plant fibres holistically, including structural analysis of extant fabrics, microscopy of fibres, archaeobotanical studies of processing debris, seeds and pollen, tool investigations, and experimental archaeology.

1928. READING BETWEEN TEETH: THE IDENTIFICATION OF PLANT REMAINS USED IN CRAFTS IN ANCIENT HUMAN DENTAL CALCULUS

**Contribution format:** Oral  
**Contribution authors:** Anita Radini (School of Archaeology, University College Dublin)

Dental calculus is a deposit on tooth enamel, formed by the mineralisation of dental plaque that was not removed. It is well known that, while forming, dental plaque captures a great variety of particles within its matrix, including starch, fibres, minerals, pigments and biomolecules. A lot of attention has been given by scholars on the study of ancient diets using debris in calculus. It is also very well known that a number of crafts materials can be recovered from the mineralised matrix of dental calculi. This paper focuses on the potential and limitations of using micro remains of plant materials found in calculus that is not the result of deliberate consumption of plants as food. The paper will discuss finds from the 4th to the 18th century AD from England. The results from over 250 individuals consisting of plant material used for textile, dyes and basketry will also be discussed based on biological sexes and contrasted with other osteoarchaeological parameters. and It will address potential, limitation and a research agenda for the future.

1798. EXPLORING THE MATERIALS AND AESTHETICS OF MONOCOTS IN SCOTTISH HISTORIC AND PREHISTORIC FABRICS, CORDAGE, AND BASKETRY

**Contribution format:** Oral  
**Contribution authors:** Nysa Loudon (University of Glasgow)

In recent years, more attention and research has been paid to the identification of non-domesticated fibrous plants within prehistoric fabrics and cordage such as tree basts and lesser studied herbaceous basts such as nettle and hop (e.g., Miettinen et al., 2008; Bergfjord and Holst, 2010; Suomela et al., 2022). Alongside this growth in the identification literature, there is also growing research in the identification and technical analysis of prehistoric plant-based basketry in Europe (e.g., Herrero-Otal, Romero-Brugués and Piqué Huerta, 2021; Martínez-Sevilla et al., 2023; Andonova-Katsarski, 2024). Within this context of research, there regions are ripe for re-examination of fibrous plant materials for fabric, cordage, and basketry. This paper will compare prehistoric and folk use of monocots such as grasses (Poaceae), sedges and bulrushes (Cyperaceae), and rushes (Juncaceae) within Scotland in technique, botanical taxa used, and sensory details collected during the course of the author’s PhD research. Historic folk and ethnographic information from the Highlands and Islands of Scotland cite the use of grasses, like marram grass (*Ammophila arenaria*), as key materials in traditional basketry. However, materials research

surrounding the techniques of monocots within fabric, cordage, and basketry in prehistoric and folk historical Scotland requires further attention. Examples of these fibrous objects from Oakbank Crannog, Loch Tay (Iron Age) and various Bronze Age burials and votive deposits within the Highlands and Islands will be compared to a selection of monocot-based objects within the Am Fasgadh Collection at the Highland Folk Museum. Monocots, while often not considered as readily for fibrous plant objects in identification studies, turn out to be not only useful for the creation of fine and strong domestic and basketry items in late 19th to early 20th century Scotland but for the creation of fine fabrics and fringes in prehistoric domestic and burial contexts as well.

1834. AN ARCHAEOLOGICAL STUDY AND DOCUMENTATION OF THE NATURAL DYES USED IN THE PRODUCTION OF THE TUTANKHAMUN TEXTILE COLLECTION

**Contribution format:** Oral  
**Contribution authors:** Islam Shaheen (Sapienza university of Rome)

There are three primary sources of knowledge regarding ancient Egyptian textiles: depictions of textile production, written descriptions, and surviving textiles, which are the main focus of this research. Tutankhamun is widely known for the luxurious and beautiful objects found within his tomb, discovered by Howard Carter in 1922. The textiles discovered in Tutankhamun’s tomb provide a fascinating glimpse into the nature and extent of a pharaoh’s wardrobe during the New Kingdom. This collection is among the most important pieces of ancient Egyptian textiles. The tomb contained hundreds of textiles and cloths, many of which were dyed, found tied around the necks of statuary and stored in large chests. Some of the textiles were simple rolls of cloth, while others were part of elaborate ceremonial robes adorned with embroidery. The dyes have never been studied, and their manufacturing process remains unknown. The study will therefore apply multidisciplinary methods to understand the manufacturing techniques of the collection for the first time. These findings will help further investigate the dyes, and this approach to studying them will provide new insights into 18th Dynasty textiles. The research focuses on the history of dyes from Tutankhamun’s textiles to understand the significance of the dyes used in his textiles, which will generate substantive and new information about ancient Egyptian textile production, particularly those used by and during the rule of Tutankhamun. Understanding the dyeing technology will further our understanding of social, political, and religious ideology, as well as technical innovations in textile manufacturing, spinning, and dye recipes and application.

1383. FROM WEEDS TO REMEDIES : ETHNOGRAPHIC AND ARCHAEOBOTANICAL PERSPECTIVES FROM NEOLITHIC NORTHERN GREECE

**Contribution format:** Oral  
**Contribution authors:** Evanthia-Stefania Kourti (Université Paris 1 Panthéon Sorbonne | EUR ArChal | UMR 7041 ArScAn | LabEx DynamiTe, Groupe de Travail “Risques”)

Foraging wild plants has long been integral to human subsistence, but their exploitation extends beyond food consumption. An ethnographic study in the mountainous region around Olympus, Greece, explored contemporary plant foraging practices, revealing the continued use of species often labeled as “weeds” in regional archaeobotanical literature. Informants, selected for their expertise in plant foraging, provided insights into species collected, foraging and preservation techniques, and their various uses. A list of 15 species was drafted, nine of which also appear in Northern Greek Neolithic sites. The most commonly reported uses were dietary—primarily in times of famine—and medicinal. Medicinal plants were consumed as herbal teas, eaten, or steamed, with the fumes either inhaled or applied to affected areas. Their selection was largely based on ancestral traditions, treating ailments ranging from infertility and dysmenorrhea to kidney pain and muscle cramps Most identified species were herbaceous plants, along with seeds, flowers, and trees (boiled bark wood). To further investigate the potential link between these ethnographically recorded uses and their presence in Neolithic contexts, a multi-proxy analysis was designed. Botanical microremain analysis was selected for its precision in detecting plant use on artifact surfaces. We employ a combination of phytolith and starch grain analysis, comparing archaeological samples to a reference collection of both archaeobotanically identified and ethnographically documented species. Additionally, experimental data will assess microremain dispersal in open-air cooking and/or plant-processing areas, helping to refine interpretations of archaeological findings.

739. ORGANIC COMPOUNDS IN IBERIAN IRON AGE SUBTERRANEAN RITUALS: A MULTI-ANALYTICAL APPROACH

**Contribution format:** Oral  
**Contribution authors:** Sonia Machause López – Gianni Gallello – Yolanda Carrión Marco – Marc Valls Mompó – Francesc Esteve-Turrillas (University of Valencia)

Plants played a key role in ancient ritual practices. However, their recovery and study were often overlooked in 20th century excavations. Last analyses of preserved plant remains, along with iconographic evidence have

provided valuable insights into their significance in some societies like in the Iberian Iron Age (6th - 1st centuries BC). Calyx vessels have been related to Iberian Iron Age caves rituals (5th-2nd BC), being employed as containers or as lamps. However, few works were investigating use and content in this ceramic typology. To push forward in this direction a multi-analytical study on a pottery base sherd from a calyx-form vase found at Sima de l'Aigua (València, Spain) was developed. The sherd keeps necked eyes visible incrustations of charcoal, ashes and unidentifiable residues on its surface. The implemented methodological approach consisted, first in carrying out botanical identification of charcoals remains to determine plant species, followed by gas chromatography analyses to identify the presence of organic compounds in ashes and identifiable residues. Finally, the chemical data were cross-referenced with bioarcheological evidence, and the archaeological record, confirming the presence of rosemary and beeswax. These substances may have been offered or used as fuel to lighten specific parts of the ritual space. Consequently, for the first time beeswax incrustation mixed with charcoal is identified inside a ceramic vase, providing new insights into the Iberian cave ritual practices.

**47. AROMATIC PLANTS USED FOR PERFUMES’ AND COSMETIC’S CREATION IN THE AEGEAN PREHISTORY: MINOAN AND MYCENAEAN PERIODS**

**Contribution format:** Oral  
**Contribution authors:** Angeliki Liveri (Independent)

This paper presents aromatic plants and flowers which were used to create perfumes (aromatic oils) and cosmetics (ointments etc.) in Ancient Greece, focusing in the Minoan and Mycenaean periods. Names, ingredients and preparation’s methods will be discussed. References in written sources (tablets of the Linear script, Homer etc.) will be compared to and combined with archaeological evidence; e.g. perfume’s workshops, especially in Crete and Peloponnese, perfume vases and occasionally their remains, representations of plants and flowers. The use of plants, flowers and perfumes in religious and everyday life will also be examined. For example, they were offered to the gods, but they were also used by people for the care, beautification and perfumement of houses, palaces, sanctuaries or other places, as well as the body. Raw materials or finished products (aromatic oils) were imported and exported. There was exchange with neighboring peoples (e.g. Egyptians or others from Asia Minor and the Near East). This article aims to present and classify the perfumes of the Minoans and Mycenaeans, depending on the plants, their method of preparation, trade and other factors. In this way, we will follow the beginnings and the development of ancient Greek perfumery and cosmetology. The simple and limited perfumes and cosmetics of the prehistoric era multiplied in subsequent periods and reached perfection during the Hellenistic era.

**511. BEYOND BREWING: THE FORGOTTEN USES OF HOPS IN TEXTILE AND PAPERMAKING**

**Contribution format:** Poster  
**Contribution authors:** Hana Lukesova (University Museum of Bergen)

Hops (*Humulus lupulus* L.) is an ancient perennial plant native to the Northern Hemisphere and a member of the *Cannabis* family (*Cannabaceae*). While best known for its essential role in beer brewing, its history reveals a far broader range of applications. Archaeological evidence suggests that hops have been utilized since at least the 6th century AD in Europe, not only as a brewing ingredient but also for medicinal, antibacterial, and textile purposes. Traditionally, hops were used as a sleeping aid and for antibacterial treatments. Hops straw served as bedding material and pillow stuffing. Less widely recognized is its role in textile and papermaking. In medieval Norway, farm owners were required to cultivate a set number of hop plants, a legal obligation that persisted in Sweden from 1414 to 1860. Since only female flowers are used in brewing, vast amounts of plant material were left unused, making it likely that people sought alternative ways to repurpose the leftover stems, including extracting their bast fibres. This study explores the historical diversity of hops beyond its primary use in brewing. It also highlights the challenges in distinguishing hop fibres from those of hemp (*Cannabis sativa* L.), another bast-fibre plant from the same botanical family. By examining the overlooked secondary applications of hops, this research aims to shed light on its broader cultural and economic significance and contribute to discussions on sustainable resource use in historical and modern contexts.

**856. THE CONSERVATIVE PROCESS OF MINERALIZATION FOR TEXTILES**

**Contribution format:** Poster  
**Contribution authors:** Clara Belletti (Università Cattolica di Milano)

In this paper, the focus is on the conservation process of textile elements through mineralization; various aspects of the process will be analyzed. The study will examine how much of the original artifact is preserved and how much is lost during the conservation process due to the metals involved. Additionally, the paper aims to explore which characteristics of the textile artifact are altered by mineralization, how these changes occur, and how much it is possible to predict this conservation process in order to reconstruct the original characteristics of the element before it was deposited in the soil. Another key point is to identify which types of metals enable this conservation

process of mineralization and how it varies between different metals. Indeed, it is possible that different metals influence the success of the process in different ways, leading to varying outcomes. Lastly, the paper will investigate the biological and climatic factors of both the micro-environment and the macro-environment that may affect the process, as well as the anticipated timeline for the completion of mineralization.

**1607. BAST CORDAGE FROM THE SUSZ HOARD - A SMALL ITEM, A BIG SURPRISE**

**Contribution format:** Poster  
**Contribution authors:** Magdalena Przymorska-Sztuczka (Archaeological Museum in Biskupin)

Archaeological textiles from the 1st millennium BCE in Poland are relatively scarce and products made of tree bast are even rarer than fabrics. The archaeological finds contain a limited scope of evidence for the production and use of bast cordage during this period in today’s Poland. Tree bast fibres are only evidenced from northern Poland and have been preserved largely in association with metal objects. These were found only in a few locations, for example, Żelazo, Kaliska and Jodłowno. But recently, the remains of bast cordage were identified among the metal artefacts from a Late Bronze Age hoard from Susz in north-eastern Poland, which is the richest collection of bast cordage that has been found in the region to date. The Susz cordage was analysed for a production technique and fibre identifications. Radiocarbon dating was used to determine the chronology of the cordage and to place the Susz hoard more firmly within the context of the North European Bronze Age.

**2078. INVESTIGATING PLANT EXPLOITATION IN ANCIENT MESOAMERICA BEYOND FOODSCAPES**

**Contribution format:** Poster  
**Contribution authors:** Clarissa Cagnato (Ca’ Foscari University of Venice)

Deciphering the complex ways in which plants were used and thought of in the past is tricky but unquestionably enriches our understanding of these societies. This poster presents a selection of archaeobotanical data– mostly in the form of carbonized macrobotanical remains (e.g., seeds, fibers) and to a lesser extent microbotanical evidence (phytoliths)– that have been recovered in diverse ancient Mesoamerican contexts (Maya and Teotihuacan). The focus is on taxa that are not typically known for their edibility but instead might be better known for their use in domestic contexts but also for their medicinal properties, in particular among contemporary Maya communities who still practice traditional medicine. Other plants might have been also used for their mind-altering virtues or aromatic qualities, as in the case of tobacco but also flowers. By weaving together archaeological, epigraphic but also ethnobotanical and ethnohistorical data, the poster seeks to highlight the multitude of ways in which pre-Hispanic societies broadly integrated the vegetal world into their lives.

**143 INTIMATE SPACES, EVERYDAY LIVES: ARCHAEOLOGIES OF DOMESTICITY, HABIT, AND HOME**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Domestic, Dwelling, Intimacy  
**Session organisers:** Tania Casimiro (NOVA University of Lisbon) – Maij. Helamaa (University of Turku)

**SESSION ABSTRACT**

From the faint outlines of a kitchen hearth to the worn floors of a bedroom, domestic spaces offer a privileged vision into the rhythms, aspirations, intimacy, and complex social dynamics of everyday life. This session invites archaeologists to explore the material worlds of the home and its role as a site of consumption, ritual, labour, and identity-making. We aim to bring together scholars who study the subtleties of domestic habits and social interactions, examining how people shaped their surroundings—and were shaped by them—in ways both intentional and routine. We encourage contributions that investigate all facets of life within domestic spaces across cultures and time periods: the objects of daily use, patterns of consumption, evidence of care or neglect, and the small, repetitive actions that speak to larger social trends. Topics may include (but are not limited to) the archaeology of meals and food preparation, child-rearing and gendered labour, sensory and embodied experiences of home, and the relationship between private and public realms within households. Through this session, we hope to stimulate conversations on the varied material landscapes of domestic life and open new windows onto the intimate worlds that are so often hidden in the grand narratives of the past. We will explore the social, economic, and emotional dimensions of domestic archaeology, seeking to debate the complexities of what it means to make, inhabit, and maintain a home.

559. ARCHAEOLOGY OF UNWANTED: WASTE MANAGEMENT AS EVERYDAY ACTIVITY OF LBK SETTLEMENTS

**Contribution format:** Oral  
**Contribution authors:** Daniel Pilar (Institute of Archaeology of the Czech Academy of Sciences, Prague | Department of Archaeology, Charles University, Faculty of Arts) – Martin Janovský (Department of Archaeology, Charles University, Faculty of Arts) – Lenka Lisá (Institute of Geology of the Czech Academy of Science)

The reconstruction of everyday life in Early Neolithic households has long been a subject of research. Within the Linear Pottery Culture (LBK; 5500–4900 BC), numerous studies have explored food processing, the organization of production activities within settlements, and the socio-economic dynamics of individual households. However, studying these aspects is inherently challenging and often subject to considerable uncertainty. One specific activity, however, stands out as particularly well-documented in settlements and that has been an integral part of the daily life of human communities since the Palaeolithic: waste management. In sedentary societies, waste management is a necessary habit that leads to the cultivation of houses and their surroundings. Thus, Neolithic communities unconsciously shaped patterns of waste through their cultural tradition, which today can provide a closer look at how different types of waste were perceived, how they arranged the settled space, or the extent to which different communities were similar in these behaviours. This paper presents multidisciplinary study of waste management at selected LBK settlements in Central Europe. At these sites, the structure of artefacts and ecofacts in waste deposition areas was analysed. These data have been combined with geoarchaeological analyses (OSL, EMMA analysis, pXRF) that significantly extend our understanding of prehistoric waste deposition. The results show that waste management in the settlements was diversified. They also show that across sites there were cultural patterns in how waste was handled and where it was deposited in the settlement space. This study thus provides insights into the routine disposal practices of Neolithic settlements and highlights how these behaviors influence the interpretation of archaeological assemblages.

1297. SHARED TRADITIONS, INDIVIDUAL LIVES: RETHINKING CHALCOLITHIC ROUNDHOUSES

**Contribution format:** Oral  
**Contribution authors:** Victor Klinkenberg (Archaeological Research Unit, University of Cyprus)

Houses from the Cypriot Copper Age (or Chalcolithic) exhibit a fascinating uniformity in shape and layout. Although it is generally assumed that multiple buildings were combined to form composite households, each structure typically features a central hearth and a segmented, plastered living space that together evoke a domestic norm. Their construction was a long-term, labour-intensive process—likely a communal endeavour—and the deliberate burning of some buildings during abandonment appears as a public spectacle. Owing to their high visibility in the archaeological record, these dramatic phases have long been used to characterize the Chalcolithic house and to support models of settlement dynamics and social organization that emphasize egalitarianism and communal identity. Research at the Chalcolithic site of Palloures, however, has revealed stratified floor levels and extensive post-abandonment habitation layers within ruined buildings. Over time, a monumental structure was repurposed as a shed, while the site of a ritual conflagration later functioned as a toilet. These findings introduce important nuances to our understanding of these buildings and reveal how they were used and valued by their inhabitants throughout their long use-life. In this presentation, I will discuss the tension between the outward, communal expression evident in the uniform design of Chalcolithic roundhouses and the unique, dynamic use phases recorded within individual structures. Drawing on insights from micromorphology and detailed stratigraphic analysis, the aim is to examine how shared cultural norms intersect with individualized everyday practices, revealing a more complex and nuanced picture of domestic life in the Chalcolithic period.

1790. EVERYDAY LIVE BEHIND THE WALLS OF A CHALCOLITHIC HOME AT TELL YUNATSITE, SOUTHERN BULGARIA

**Contribution format:** Oral  
**Contribution authors:** Victoria Haleva (Sofia University “St. Kliment Ohridski”)

The home can be seen as a reflection of its inhabitants. The organization of domestic space, although largely determined by practical and cultural aspects, always has a touch of identity. The daily domestic activities in a prehistoric house can only be interpreted through the material remains that we uncover. The time is the second half of the 5th millennium BC (Late Chalcolithic period), and the place is Tell Yunatsite, located on a low river terrace in the Upper Thracian plain, surrounded by mountains on three sides. The favorable location presupposes the long-term habitation of the region and turns it into a contact zone between different cultures. This presentation focuses on two almost completely excavated consecutive buildings, and attempts to gain insight into the

daily lives of the inhabitants through an analysis of the interior (structures, artifacts, vessel). The similarities and differences between the two buildings are explored – the use and distribution of space, specialized areas related to food storage and preparation, domestic rituals, wall decorations, etc. Particular attention is paid to the ceramic complexes in both buildings, as a source of multifaceted information. The distribution of the different categories of vessels in the domestic space is explored. A different view is given on the symbolism of the decoration, related both to the function of the vessels and to the aesthetic preferences of the inhabitants. The analysis and comparison of the two successive buildings raises questions about the similarities and differences between them – the continuity and the identity-making. This presentation proposes some possible answers to these questions.

2240. HOUSEHOLD, COMMUNITY, AND THE CONSTRUCTION OF DOMESTIC SPACE IN LATE BRONZE AGE NON-PALATIAL SETTLEMENTS OF MAINLAND GREECE

**Contribution format:** Oral  
**Contribution authors:** Sarah Hilker (University of North Carolina at Chapel Hill)

Many activities of daily life occur in and around houses; yet, the buildings themselves are part of daily life as well. Residential buildings and intervening spaces are settings for quotidian activities, and they are social spaces, creating an architectural framework for social engagement. In doing so, residential buildings not only result from and reflect social structures and processes, they play an active role in shaping how social relations are constructed, performed, maintained, and (re)negotiated. The physical construction of houses, therefore, is one facet of the complex social dynamics of everyday life. In this paper, I use case studies from Late Bronze Age Mainland Greece to identify and discuss ways in which Late Helladic (Mycenaean) domestic architecture from non-palatial settlements indicates choices and aspirations of families in engagement with their communities. In particular, I suggest that decisions regarding location, plan, and material must balance the needs and resources of the household with those of the community and what is considered socially acceptable. Additionally, the act of building a house may be a socially constructive aspect of daily life, at least for a time, either by directly involving other members of the community or as a process that is performed within and in front of the wider community. Longer term maintenance and renovation may then be seen as further repetition or reinforcement of the social position of the household within the wider social group.

1124. LIFE BEYOND AND BETWEEN WALLS: A GLIMPSE INTO A MIDDLE BRONZE AGE HOUSE

**Contribution format:** Oral  
**Contribution authors:** Nóra Szabó (HUN-REN Research Centre for the Humanities Institute of Archaeology) – Gábor Szilas (BHM Aquincum Museum and Archaeological Park)

Detecting individual roles, household tasks, daily routines, and personal movements is an extremely complex and challenging task in archaeology, especially when we are dealing with prehistoric phenomena. Current research approaches this issue from two main perspectives: by analyzing the community (activity zones of settlements, spatial organization), and through scientific analyses (bioarchaeology, soil samples, etc.). The Middle Bronze Age of the Carpathian Basin provides an excellent starting point for such investigations, as the communities using the Vatia ceramic style developed a highly complex settlement network. This network included tell, fortified and hilltop sites, as well as smaller and larger open settlements. In the Danube region and its surroundings, several large, single-layer settlements have already been analyzed in terms of their activity zones (e.g., Budajenő – Hegyi-szántók, Budapest, District III, Királyok útja 291–295). However, unlike the nearby tell settlements, no well-reconstructed post-built structures have been identified at these sites. In recent years, excavations have begun within the administrative boundaries of Budapest, directly adjacent to the Danube riverbed, revealing a new Middle Bronze Age settlement comprising several hundred features (Budapest, III. Folyamőr utca (former BUSZESZ)). Among the discoveries, a structure of a building dating to this period was also identified. During the excavation of its approximately forty-centimeter-thick collapse layer, remains of the roof and walls, multiple renewed floor levels, fireplaces, as well as the structural layout of the supporting beams and wall posts were documented. In our presentation, we aim to reconstruct the daily lives and activities of the individuals associated with this house by analyzing its spatial organization and related features (fireplaces, pits), the artifacts found within, the results of archaeobotanical studies, and the overall internal structure of the settlement (active zones, peripheries, ritual spaces, boundaries).

1686. COOKING POTS FROM THE INDIGENOUS SETTLEMENT OF C. DA SAN BENEDETTO IN CALTABELLOTTA (AG)

**Contribution format:** Oral  
**Contribution authors:** Antonio Barbera (Independent)

This contribution will present in detail the ceramic finds for cooking and preparing food found during the excavation campaigns in the indigenous center of C. da San Benedetto in Caltabellotta (AG). The settlement in the

6th century. BC, especially in the second half, shows various contacts with the Greek world of colonies. Then destroyed at the beginning of the 5th century. B.C. , with more sporadic attendance in the 5th century. B.C. Among the domestic environments, corners dedicated to cooking food have been identified, with inside those vases used in the kitchen by indigenous cultures. In particular, there are numerous pots of different types, but baking trays and cooking plates have also been found. Comparisons with the contemporary indigenous world of central-west-ern Sicily will also be taken into consideration. In order to attempt to reconstruct the methods and habits of the indigenous people in the archaic period through ceramic forms.

**330. CREATING, MAINTAINING AND DESTROYING: DOMESTIC RITUALS IN THE NORTHWESTERN EUROPEAN IRON AGE**

**Contribution format:** Oral  
**Contribution authors:** Maël Benallou (Ghent University)

Ritual depositions have long intrigued archaeologists, particularly in funerary contexts and hoards, which have historically received the majority of scholarly attention. In recent decades, however, depositions found in domes-tic sites have begun to receive greater recognition. These domestic depositions differ significantly from those in traditional ritual contexts in terms of the materials used, their treatment, and their locations. Existing research often focuses on either superficial regional overviews or detailed single context analyses, making it difficult to identify broader, overarching patterns. Therefore, a more systematic, large-scale study is needed to validate previous findings and better understand the general trends in domestic depositions across regions. This presen-tation will focus specifically on domestic depositions within building plans of the Somme-Meuse-North Sea region during the Iron Age. The methodology involves a comprehensive literature review, incorporating both grey literature and published sources, followed by a systematic object analysis. The study considers two scales: the context scale, which examines the type, location, and formation of depositions, and the object scale, focusing on object types, materials, and potential special treatments. By combining these analyses, the study uncovers new patterns while confirming previously known characteristics, thereby offering deeper insights into the cultural significance of these domestic depositions.

**427. QUOD BONUM, FAUSTUM, FELIX, FORTUNATUM, SALUTAREQUE SIT - ROMAN FOUNDATIONAL RITUALS AT MIROBRIGA, A SMALL TOWN IN LUSITANIA (PORTUGAL)**

**Contribution format:** Oral  
**Contribution authors:** Daniel Andrade (CHAM – Centro de Humanidades. NOVA/FCSH - Universidade Nova de Lisboa | CIDEHUS - Universidade de Évora) – José Quaresma (CHAM – Centro de Humanidades. NOVA/FCSH - Universidade Nova de Lisboa) – Martim Lopes (URV - Universitat Rovira i Virgili | CHAM – Centro de Humanidades. NOVA/FCSH - Universidade Nova de Lisboa) – Raquel Guimarães (ERAAUB/IAUB - Universitat de Barcelona | CHAM – Centro de Humanidades. NOVA/FCSH - Universidade Nova de Lisboa) – Paulo Calaveiras – Cristiana Ameixinha (CHAM – Centro de Humanidades. NOVA/FCSH - Universidade Nova de Lisboa)

Mirobriga, a small Roman town near the coast of present-day Portugal, has been excavated since the early 1800s due to its archaeological potential (having been left abandoned since Late Antiquity). During several of these excavations, a curious archaeological phenomenon has been recorded. Archaeologists have found small ceramic bowls, containing sometimes avian bones or eggshells, purposefully deposited inside cavities in the bedrock, with the bottom facing up. Archaeological research has reported eight cases of this ritual at several buildings, whose functions varied from commercial to residential, usually dated to the second half of the 1st century AD. Having the TabMir project excavated one of these ritual contexts at the site in 2024, our research team has decided to compile the information presented at Mirobriga and draw parallels. At a local level, the only similar case is Sines - a Roman port town connected directly to Mirobriga, by an 18-kilometer road - where two identical bowls have been unearthed, in the same configuration, and bearing avian bones. In Portugal, although the same type of bowl is commonly found both in domestic and funerary sites, the same ritual does not appear to have been recorded. Similar rites (although not identical) were found as close as the Roman villa of Freiria and the town of Conimbriga, with other recorded cases throughout the Mediterranean. An attempt is made to curtail the religious meaning of these foundational rituals, comparing the archaeological record to historical sources on private reli-gious affairs in the ancient Roman Empire. By doing this, we hope to better understand the beliefs of the people who inhabited Mirobriga.

**1349. GUARDING AND LIVING IN THE ENSLAVER’S HOME: THE DOORKEEPER (OSTIARIUS) IN THE HOUSES OF POMPEII**

**Contribution format:** Oral  
**Contribution authors:** Francesca Lapasta (University of California, Berkeley)

In the Ancient Roman world, enslavers often appointed enslaved members of their household to serve as door-keepers who would monitor movement both into and out of the house. These doorkeepers not only labored but also lived within the homes of their enslavers. Moreover, the doorkeeper was explicitly linked to certain spaces in the house, sometimes quite literally: ancient sources describe enslaved doorkeepers being chained to the house itself. The role of the enslaved doorkeeper, or ostiarius, is thus a paradoxical one which displays both the trust placed in enslaved people by their enslavers, as well as the level of control enslavers had over the lives of the enslaved. This presentation explores the experiences of Roman doorkeepers through an investigation of the rooms in which they may have lived and labored. With a focus on the well-preserved architecture and domestic assemblages from Pompeii in Southern Italy, I identify all potential doorkeepers’ rooms in the city based on their location in the house and affordances for monitoring movement. Spatial analysis reveals that particular neigh-borhoods have higher concentrations of these architectural spaces, suggesting a greater occupation with security on the part of certain groups of enslavers. Alongside the citywide view, I conduct an in-depth investigation of two case studies that allow for an integration of the small finds, fixtures, decorations, and graffiti from individual rooms. The decorations and fixtures indicate enslavers’ preferences and mechanisms for employing labor, but the enslaved people who occupied these spaces are also represented. Through tracing aspects of doorkeepers’ rooms which enslaved people could have influenced more directly, like small finds and graffiti, this presentation also offers insight into how doorkeepers left their mark on the material world of the houses that were both their homes and the locus of their degradation and enslavement.

**1925. STITCH AFTER STITCH: CONTEXTUALISING METAL THIMBLES FROM TALLINN, ESTONIA**

**Contribution format:** Oral  
**Contribution authors:** Monika Reppo (Tallinn University)

Although thimbles are tools of the oldest regulated trade in Estonia and the Baltics, tailoring, they were not limited to professional use and are found from various domestic contexts across medieval and post-medieval Tallinn. However, their presence in Estonian archaeological material is generally mentioned only in passing, if at all. A decent collection of these evocative objects has accumulated over the decades but has remained largely unstudied. Now, a preliminary overview of collected artefacts from Tallinn has been obtained. Can the (rela-tively) well-studied historical backgrounds of plots and properties in Tallinn provide crucial context beyond the archaeological dimension and typology? What type of domestic contexts are thimbles found from? Who used these objects? How to ascertain whether they were an everyday object, treasured possession, or tools of a trade that extended beyond the confines of one’s home? Is it even possible? This paper examines the places and spaces that 14th–19th-century thimbles have been found from and their use in medieval and post-medieval Tallinn based on archaeological finds and archival records.

**1006. ARCHAEOLOGICAL MATERIAL AND THE INDIVIDUALS OF A HOUSEHOLD – A CASE STUDY FROM AN 18TH CENTURY NORDIC TOWN**

**Contribution format:** Oral  
**Contribution authors:** Maija Helamaa (University of Turku | Muuritutkimus Ltd.)

Recent large-scale urban excavations in Turku, Finland offer the possibility to combine extensive and accurate archaeological contextual data with detailed information about the inhabitants of the area, derived from written sources. This paper focuses on annually taken population registers which have been preserved in Turku archives as a continuous series, starting from the 1750s. Archaeological material tends to be a complex amalgamation of various events, usually formed during a long period. Compared to these census lists, an archaeological unit, even accumulated in situ, may contain the material culture of dozens of people, some of whom have lived in the area for decades, and some perhaps for only one year. For an archaeologist, studying these lists of inhabitants was an eye-opener. First, it is rare that the precise location of archaeological data can be so accurately connected to the written records concerning a certain housing unit. Secondly, if such information is available, the status of the house is often described by the socio-economic features of its owner. However, every household has been given their own row in the census lists. Families of different sizes and unmarried occupants have been denoted together with their apprentices, maids, mothers-in-law et cetera; all of whom were members of the same house-hold, at least according to the tax authorities that have produced these registers. In this paper, I ask how much do we consider a diverse range of people when we try to interpret material culture. Are they even traceable through archaeological research? And is this kind of individual-oriented approach useful or is it unnecessary?

1506. CERAMICS AS RESISTANCE: IMPORTED AND INDIGENOUS CERAMICS FROM SOUTHEASTERN LIBERIA, WEST AFRICA AS TOOLS OF ANTICOLONIAL RESISTANCE AND AGENCY

Contribution format: Oral  
Contribution authors: Megan Crutcher (Texas A&M University)

As Africa’s first Black Republic and only one of a few nations never colonized by Europeans, Liberia is a unique and special case study of the mechanisms of anticolonial resistance and agency in the Atlantic World. It was settled by free African Americans and Afro-Caribbeans in the nineteenth century, though not without push-back from Indigenous people. Southeastern Liberia is home to coastal fishing communities that date back to the fifteenth century and earlier. One of the Indigenous groups that call southeastern Liberia home are the Kru, who became famous for contracted wage labor aboard European ships and in European ports across the colonial maritime world. However, at home in southeastern Liberia, the Kru resisted colonization efforts both from Europeans and later from the Liberian settlers. The first archaeological project in this region, the Kru Coast Heritage Initiative, conducted excavations from 2023-2025 of over 1000 artifacts related to this long history of wage labor and resistance. This paper investigates the nearly 700 of these artifacts which were ceramic pottery, the majority being Indigenous coarse earthenware. These ceramics, combined with historical and ethnographic evidence, are important sources of information about Indigenous maritime lifeways, diet, practices, and trade. They were used by men and women for preparing and storing food, carrying water, and processing palm oil. But they are also symbols of resistance through the lens of domesticity. Most of the ceramics unearthed come from domestic midden contexts and kitchen hearths, sites of intimate production, consumption, labor, and identity. Regardless of context, though, Indigenous ceramics are markedly more present and important than imported ones. As such, while they are not necessarily suggestive of a centralized resistance movement, they demonstrate the internal, domestic, even gendered, everyday practices of resistance carried out within households at a small site in Liberia, West Africa.

1639. INTERPRETING DOMESTIC SPACE USE OF AGRO-PASTORAL ETHNOGRAPHIC SETTLEMENTS IN BOTSWANA

Contribution format: Oral  
Contribution authors: Keelie Rix – Abel Ruiz-Giralt (Pompeu Fabra University) – Malebogo Mvimi (GAES Univ of the Witwatersrand) – Jordi Ibañes-Insa (Geo3bcn CSIC) – Stefano Biagetti (Pompeu Fabra University - ICREA)

This paper reports the initial results of an ongoing current investigation within the framework of the project CAMP (ERC CoG 2022, CAMP-101088842) which aims to investigate anthropogenic sediments of archaeological sites using portable X-Ray Fluorescence (p-XRF) that will allow for the generation of provide qualitative and quantitative geochemical data. The main objective of the implementation of p-XRF is to identify human activities through chemical signatures (anthropic markers) in the anthropogenic deposits from ethnographic settlements — inhabited and abandoned — and archaeological sites. By sampling known ethnographic sites some conclusions may be drawn on the expected elemental distributions of known use areas which may later be used to interpret patterns in ephemeral archaeological pastoral sites. The analytical setup involves analyzing hundreds of ethnographic samples from traditional agro-pastoral inhabited and abandoned BaKalanga sites collected in Maitengwe, (Northern) Botswana using the built-in calibrations of commercial pXRF devices (in this case the GeoExploration calibration implemented in the Bruker CTX portable benchtop analyzer). The results from these analyses will form the basis interpretation on what chemical patterns can be related to different activity areas within and around domestic spaces. A comparative study between the anthropic signals detected at active ethnographic settlements and uninhabited settlements may indicate how site abandonment can affect chemical signals.

1170. IDENTIFYING FINGERPRINTS IN THE PROTOHISTORY OF ASTURIAS (SPAIN): INITIAL CONSIDERATIONS BASED ON PALEODERMATOGLYPHICS IN THE CAMPA TORRES HILLFORT COLLECTION

Contribution format: Poster  
Contribution authors: Elena Lastra-Alonso (University of Oviedo) – Fernando Rodríguez Del Cueto (University of Oviedo)

Many spaces and daily activities during Prehistory have been influenced and were performed by women. Despite this fact, the search for information in this regard has not been a concern for traditional historical research. However, continuous scientific advances have occurred in recent decades thanks to the gender and women’s studies. Our only source of information about the prehistoric societies is the material culture, with many constraints to gather easily data for understanding the social complexities and dynamics of everyday life. Nevertheless, several scientific disciplines are currently being applied allowing us to overcome these limitations. In our research we use a very specific methodology: the analysis of paleodermatoglyphics. This method was applied to the Iron Age materials of Campa Torres hillfort, in Asturias (Spain). As is well known we can find paleodermatoglyphics in

different raw materials used as pigments or clay. Their analysis allows us to identify the owner of that fingerprint, making it possible to estimate their age and sex. This is a good way for a precise approach to daily activities associated with women and children: the so-called “maintenance activities”. Among them, ceramic or loom weights production as well as the building of houses using wattle and daub techniques, could leave traces of the use of fingers and, occasionally, fingerprints. Accordingly, with this proposal we seek to share the initial findings resulting from the assessment of the material analysed over the past two years of research. Thus far, this ongoing review has made it possible to examine a total of 3233 fragments of daub and 920 shards of handmade ceramics, which constitutes the number of remains analysed up to this point. The results obtained to date have been highly insightful, providing valuable date on the identity of the makers of these clay remains.

144 OPEN SCIENCE IN TEXTILE ARCHAEOLOGY EDUCATION: BRIDGING RESEARCH, OUTREACH, AND ENGAGEMENT

Session theme: 4. De nobis fabula narratur: archaeological practice and a profession in flux  
Session format: Workshop  
Session keywords: Textile Archaeology, Science Communication, Open Science Educational Resources, Museum, Open Access  
  
Session organisers: Margarita Gleba (University of Padua) – Hana Lukesova (University Museum of Bergen)  
Session speakers: Tereza Štolcová (Institute of Archaeology, Slovak Academy of Sciences) – Karina Groemer (Natural History Museum, Vienna) – Francisco Gomes (University of Lisbon) – Ronja Lau (Ruhr-University Bochum) – Islam Shaheen (Sapienza University of Rome) – Yaqi Yan (University of Padua) – Orsolya Zay (Institute of Hungarian Research, Eötvös Loránd University)

SESSION ABSTRACT

Textile archaeology provides unique insights into ancient cultures, economies, and technologies while broadening the accessibility of interdisciplinary knowledge. Interdisciplinary research has been fully integrated into archaeological textile studies for several decades, reaching topics such as environmental studies, ancient economics, and ancient innovations that contributed to today’s technologies. The education potential of textile history and archaeology is acknowledged by many textile researchers, who are often engaged in educational activities in museums, school classrooms, and public engagement events. While multiple resources on the science of archaeology in general and regional archaeologies exist, there are few that address textile archaeology. As part of its mission to contribute to open science through the sharing of data, tools, and methodologies, the EAA Community for Textile Archaeology and Conservation (ComTex) is proposing a workshop to share the best practices in textile archaeology science communication and to develop a suite of Open Science Educational Resources (OSER) for elementary, middle and high school students, by bringing together textile archaeologists, museum curators and educators from across Europe. The first part of the workshop will focus on identifying the drive stakeholders (who is the audience), and their specific needs. The second part will discuss the best practices in communication to non-academic audience, which may be useful in a museum, exhibition and public engagement event context (how to engage the audience). The third part will have three interdisciplinary groups of participants, consisting of diverse representatives in the fields of textile research, as well as colleagues from the EAA Communities, working to propose concrete activities for the three school age groups, including the lists of the resources necessary. The proposed strategies and resources will be trialed by the participants and interested engaged stakeholders following the EAA meeting and resources made available in Open Access if trials are successful.

145 STONE CLOCKS: DIACHRONY MARKERS AMONG HUNTER-GATHERER LITHIC ASSEMBLAGES

Session theme: 1. On artefacts and beyond  
Session format: Discussion session  
Session keywords: Hunter-gatherers, Formation processes, Temporal relationships, Lithic assemblages, Refits, Spatial analyses  
  
Session organisers: Santiago Sossa-Ríos (Universitat de València) – Alejandro Mayor (Universitat d’Alacant) – José Ramón Rabuñal – Diego Lombao (Universidade de Santiago de Compostela) – Javier Sánchez-Martínez (Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour (ICArEHB))

SESSION ABSTRACT

Studying the archaeological lithic record has provided large amounts of data and interpretations on hunter-gatherer population lifeways. Typically, temporality in lithic studies is drawn from absolute dating methods of the stratigraphic units containing the assemblages. However, this approach does not consider the timespan differences between geological and anthropogenic processes, implying a vague image of human behaviours derived from the simple aggregation of artefacts. Despite this, lithic remains themselves hold the potential to generate intra-assemblage temporal frameworks based on their own features, and the information obtained from these high-resolution analytical frames has proved to be closer to the representation of their production dynamics, occupation patterns, or economic behaviours. In order to address this issue, this session seeks to highlight the value of lithic assemblages, not as static evidence of human activity but as cumulative records of behaviours, capable of informing on multiple dimensions of the temporality of hunter-gatherer practices. By focusing on the internal clockworks of lithic assemblages, this session will cover all the works based on lithic studies and hunter-gatherer groups, with the aim of investigating the temporal relationships in the archaeological record through methods applied on stone tools for the identification of diachrony. Therefore, we welcome contributions dealing with the relationship between hunter-gatherer lithic records, regardless of their chronology, and their spatiotemporal dimension. Topics of interest include lithic refitting or raw material unit analysis as a way to reconstruct production sequential activities; the role of recycling or reclaiming behaviours; the characterisation of technical shifts as potential markers of diachrony; the integration of lithic studies with archaeostratigraphic or spatial methods to refine units of analysis; the overlap of use-wear traces; or any other approaches focusing on the main topic.

CONTRIBUTION ABSTRACTS

2410. HIDDEN IN STONES: A DISCUSSION ON TEMPORAL CONCEPTS

Contribution format: Oral  
Contribution authors: Santiago Sossa-Ríos (University of Valencia)

The study of lithic assemblages has significantly contributed to our understanding of hunter-gatherer behaviour, yet the role of time in these analyses remains a persistent challenge. The disparity between geological and anthropogenic timescales results in a homogeneous view of past behaviours, masking the nuances of human action embedded in thousands of artefacts. This well-known problem has given rise to numerous methodological applications that have allowed us to reduce the palimpsest effect and the spatio-temporal scale of analysis. However, when these units of analysis are characterised and the events that make them up are related to each other, we risk conflating certain definitions when referring to “time”. Acknowledging this is crucial to reassess key concepts such as time itself, as well as others like synchrony, diachrony, and contemporaneity within the context of hunter-gatherer archaeology. An in-depth review of these notions not only enhances our understanding of temporal dynamics but also plays a fundamental role in preventing misinterpretations that may arise from an unbalanced reading between the lithic record and the resulting scale. This contribution aims to critically examine these concepts and their implications for lithic studies, advocating not only for methodologies that enhance temporal resolution in archaeological contexts but also for a broader ontological consensus on the nature of these temporal categories. In particular, we will focus on archaeostratigraphy combined with lithic variables as a means to explain these issues. By integrating approaches such as lithic refitting, raw material unit analysis, and archaeostratigraphy, and revisiting the different notions of “time” that can be extracted from various cases, we can move towards a more dynamic understanding of site formation processes. Addressing these issues will foster a more refined discourse on the role of time in lithic analysis, challenging static interpretations and enhancing our ability to reconstruct past lifeways while mitigating analytical biases.

1007. ACCESSING SPATIOTEMPORAL DYNAMICS IN LITHIC ASSEMBLAGES THROUGH INFORMATIC TECHNOLOGIES: HIGH-RESOLUTION ANALYSIS OF ABRIC ROMANÍ, MIDDLE PALAEOLITHIC, (CAPELLADES, BARCELONA, SPAIN)

Contribution format: Oral  
Contribution authors: Filippo Zangrossi (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’Història i Història de l’Art) – Diego Lombao (GEPN-AAT, Dpto. Historia, Facultade de Xeografía e Historia, USC | Centro de Investigación Interuniversitario das Paisaxes Atlánticas (CISPAC)) – M. Addressing the temporality of biological, social and behavioural processes remains a central topic in archaeological research. Traditionally, the diachronic relationship between humans’ activities has been established through sequences of stratigraphic units based on geological layers. However, due to their different timespan, geological level often encompasses a long series of anthropic activities, enhancing the necessity to develop new methodologies to discern the spatiotemporal dimensions of human processes. The study of the lithic technology allows researchers to bypass the low resolution of archaeological palimpsests applying a wide range of analyses, as vertical distribution, spatial analysis, refitting sequences, use-wear, recycling of stone tools, and post-depositional alterations, among other. In this context, information technology provides several instruments for high-resolutions analysis, from Geographic Information Systems (GIS) to 3D modelling and to Machine learning. In this study, we propose a novel approach based on the 3D technology to address the spatiotemporal dimensions in lithic assemblages. The aim is to investigate the accumulation patterns in terms of vertical distribution and superimposition of artifacts or groups of them. An automatic yet incomplete protocol is developed in the R statistical environment, combining 3D modelling, geometric and statistical analysis, and graph theory, to process spatial and technological information collected during the excavation and the analysis of the lithic record. The protocol is applied to Middle-Palaeolithic site of Abric Romaní (Capellades, Barcelona, Spain), specifically at the Level M, which dates to 54.5 ka BP. It shows the presence of a high number of lithic artifacts of different raw materials, especially with a high number of refits. This study highlights on one hand the high potential of information technology and statistics to develop new methods for the archaeological research, on the other hand the necessity of high-resolution analysis for the dissection of palimpsests and to address the temporality in formation processes.

668. FIRE-BRANDED OCCUPATION HISTORIES: EXPLORING SPATIOTEMPORAL PALIMPSEST FORMATION AND SITE OCCUPATION DYNAMICS THROUGH THE ANALYSIS OF BURNT LITHIC DISTRIBUTIONS

Contribution format: Oral  
Contribution authors: José Ramón Rabuñal (Universidade de Santiago de Compostela | Centro de Investigación Interuniversitario das Paisaxes Atlánticas (CISPAC)) – Javier Fernández-López De Pablo (Universidad de Alicante | Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico (INAPH))

Fire alteration of archaeological remains is a common subject of interest in the study of hunter-gatherer sites, providing insights into key aspects such as the controlled use of fire, site structure, or the impact of wildfires. In particular, fire alteration of lithic remains has served as an indicator of various processes, ranging from post-depositional thermal alterations to recycling behaviours. From an intra-site spatial distribution perspective, burnt lithics —whether they were exposed to fire at the time of deposition or later— along with their relationship with preserved combustion features and other combustion-related evidence (e.g., burnt clasts, charcoal, rubefaction), serve as valuable proxies for identifying combustion-related events and defining activity areas. This work examines the Mesolithic Unit IV of the El Arenal de la Virgen open-air site (Alicante, Spain), characterized by two occupation phases (9.3–9.1 and 8.6–8.3 k cal BP) and well-preserved spatial properties, as a case study illustrating the potential of focusing on the distribution patterns of fire alteration in lithic scatters for understanding site formation processes and occupation dynamics. Moran’s I spatial autocorrelation analyses on the relative frequency of fire alteration in different artifact classes revealed evidence of latent hearths, dismantled combustion features, and asynchronous superimposed activity areas, highlighting the cumulative nature of the palimpsest. By interpreting these burning patterns within their spatial and behavioural contexts, we provide refined insights into site structure and occupation dynamics. These findings suggest that the site was subject to recurrent short-term reoccupations by small, highly mobile groups, rather than serving as a prolonged residential camp.

2358. EXPLORING IMPLICATIONS OF TECHNOECONOMIC VARIABLES ON REFINING SPATIOTEMPORAL FRAMES: A CASE STUDY FROM THE EL PASTOR ROCKSHELTER (ALCOI, EASTERN IBERIA)

Contribution format: Oral  
Contribution authors: Alejandro Mayor (Universitat d’Alacant) – Santiago Sossa-Ríos (Universitat de València) – Carolina Mallol – Cristo Hernández (Universidad de La Laguna)

Archaeostratigraphic and spatial approaches allow us to establish analytical frameworks that group measurable variables within a spatiotemporal scale closer to that in which past human behaviours developed. However, these frameworks may have certain intrinsic limitations due to various factors that must be considered, such as the density of the record used as a sample or the postdepositional processes it may have undergone throughout its history within the archaeosedimentary deposit. In this sense, utilising determinate information sources of a

technoeconomic or behavioural character can help to observe certain patterns that aid reaching a greater degree of confidence regarding spatiotemporal interpretations. To explore this idea, we examine here the case of Unit V of the El Pastor rock shelter (Alcoi, eastern Iberia), where an archaeostratigraphic and spatial analysis has been conducted based on its Neanderthal lithic assemblage. This study identified a knapping area characterised by the concentration of lithic refits of different types of flint. However, the temporal interpretation of this concentration was limited to indicating the recurrence of knapping events. In this communication, we aim to analyse this record through raw-material sourcing and lithic technology to assess whether a higher degree of differentiation can be established between the distinct knapping events represented by each refitting set.

1008. THE ROLE OF RESOURCE AVAILABILITY IN SHAPING LITHIC TECHNOLOGICAL BEHAVIOR: INSIGHTS FROM SAHB EL GHAR 3 (AÏN BENI MATHAR, MOROCCO)

**Contribution format:** Poster  
**Contribution authors:** Diego Lombao (Universidade de Santiago de Compostela, Grupo de Estudos para a Prehistoria do NW Ibérico -AAT | Centro de Investigación Interuniversitario das Paisaxes Atlánticas (CISPAC)) – Juan I. Morales (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’Història i Història de l’Art) – Hassan Aouraghe (Université Mohammed Premier) – María Soto (Madrid Institute for Advanced Study. Casa Velázquez | Universidad Autónoma de Madrid. Departamento de Prehistoria y Arqueología) – Mourad Farkouch (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’Història i Història de l’Art) – Hicham Mhamdi – Mohamed Souhir (Université Mohammed Premier) – Abdelkhalek Lemjidi (Institut National des Sciences de l’Archéologie et du Patrimoine (INSAP)) – Robert Sala-Ramos (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’Història i Història de l’Art) – M. Gema Chacón (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili, Departament d’Història i Història de l’Art | Seminari d’Estudis i Recerques Prehistòriques (SERP), Universitat de Barcelona | Institut d’Arqueologia de la Universitat de Barcelona (IAUB) | Museum National d’Histoire Naturelle (MNHN))

Sahb el Ghar 3, an open-air archaeological site discovered in 2018, is located in the Swiwina Plain, 15 km from Aïn Beni Mathar, Morocco. Spanning 8 km<sup>2</sup> on river alluvial deposits, the site is situated in a region rich in Neogene chalcedony, a resource extensively exploited during the Pleistocene. Lithic materials were systematically collected over a 20 m<sup>2</sup> area, precisely documented using a total station. The assemblage comprises 674 artifacts, primarily made on chert (673) with one limestone piece. Wide flakes, with platform thicknesses averaging 9–10 mm and simple platform preparation, dominate. Cortical flakes indicate the presence of early reduction stages, while retouched tools are scarce (n=2). The management of core convexities is evident through the presence of plunging and core edge flakes, complemented by rejuvenation flakes. The core assemblage highlights the application of flexible knapping strategies depending on the type of blank used (cryoclasts, blocks, and flakes). Initial testing cores on nodules or cryoclasts show unipolar or orthogonal strategies, while cores on smaller blanks show bifacial recurrent Levallois exploitation. Volumetric bifacial systems occasionally produced elongated products, though systematic laminar production was absent. Although direct dating is not available, the technological characteristics of the lithic assemblage and the absence of tanged points and bifacial foliate elements situate Sahb el Ghar 3 within the Middle Stone Age (North African Mousterian). This analysis highlights the interplay between resource availability and technological flexibility at Sahb el Ghar 3. Adaptive strategies relied on abundant local resources, minimal platform preparation, and the use of core edge flakes for convexity management, which are resource-intensive in terms of raw materials. The coexistence of Levallois, bifacial, and unipolar reduction systems demonstrates technological versatility, while limited retouch and opportunistic raw material use reflect a pragmatic, need-based approach, offering valuable insights into Middle Stone Age adaptive behaviors.

146 MULTI-DISCIPLINARIAN METALWORK: COMBINING ARCHAEOMETALLURGY WITH CULTURAL HISTORY

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Session with keynote presentation  
**Session keywords:** Archaeometallurgy, Experimental Archaeology, Metals & Metalwork, Multi-disciplinarian Studies, Typology & Technology, Wear & Tear  
**Session organisers:** Michael Neiß (Lund University: Department of Archaeology & Ancient History | Aarhus

University: UrbNet) – Sebastian Wärmländer (Stockholm University: Department of Archaeology & Classical Studies) – Olga Zagorodnia (The British Museum: Department of Scientific Research) – Elisa Maria Grassi (The National Research Council: Institute of Cultural Heritage) – Martin Miño (The Monuments Board of the Slovak Republic)

SESSION ABSTRACT

Archaeometallurgy is a multidisciplinary field, where researchers from different fields come together to answer a range of different questions related to ancient metalworking. While there are numerous ways to investigate metal objects, many breakthrough studies involve a combination of different approaches. This session aims to illuminate how one can combine the metallurgical analysis of ancient objects with other investigation strategies, such as typological analyses or historical studies, to clarify the cultural significance of artefacts. Our particular focus lies on the interplay between different practices: Does the original idea for your study derive from a historical text, from typological sequencing or from some unexpected observation that you made when you were analysing the material composition of ancient objects, examining their technical aspects, mapping traces of wear and tear or when you were replicating something by experimental means? And, in what way does this original observation generate the need for a multi-approach that bridges different disciplines. As the aim of the session is to provide instructive examples of the interplay between different means of investigation, our session welcomes papers concerning all time periods and regions. Furthermore, we encourage contributions from advanced students and young researchers. EAA Session #146 will be held in a hybrid format at regional meeting hubs across Europe, combining the benefits of both in-person and digital participation. Contact the session organiser to set up your own meeting hub in collaboration with ARCMET.

CONTRIBUTION ABSTRACTS

2515. KEYNOTE: DECODING SLAG: INSIGHTS INTO IRON SMELTING AND FORGING FROM EXPERIMENTAL AND ARCHAEOLOGICAL DATA

**Contribution format:** Oral  
**Contribution authors:** Ragnar Saage (University of Tartu)

Most archaeologists working in the field or archaeological collections have come into contact with slag – a common byproduct of ironworking. However, it is not always easy to identify the process it originates from, especially for people who are not specialised in archaeometallurgy. In order to provide helpful insights to all the aforementioned people, this keynote presentation will examine various aspects of slag, with a focus on slag produced during bloomery iron smelting and forging. In line with the session’s theme, experimental, analytical, and archaeological data will be integrated to gain deeper insights into past iron smelting practices and the decisions made by smelters and smiths. The first part of the presentation will highlight the significance of slag in bloomery iron smelting, exploring its formation and structure. Experiments with different bog ores from Estonia have consistently shown that the key factor in the smelting process is the ability to control the formation of liquid slag within the furnace. Next, the challenges of distinguishing smelting slag from smithing slag will be discussed. While the formation processes of these slags differ, chemical analyses often reveal them to be compositionally indistinguishable. Consequently, the shape of the slag, which is influenced by the cavity in which it solidified, may serve as a more reliable distinguishing factor. This will lead to an examination of furnace and forge designs. Finally, the presentation will explore advanced methods for maximizing the informational value of slag through metallographic and elemental analyses. Metallographic analysis provides insights into the conditions under which slag formed, while a combined approach using SEM-EDS, LA-ICP-MS, and statistical analysis enables provenance studies. This will be illustrated through a recent study covering most of Estonia, offering a model for provenance analysis in relatively flat landscapes with diverse bedrock geology.

2521. KEYNOTE: CAN QUANTITY MAKE UP FOR QUALITY? TRENDS IN THE MATERIAL COMPOSITION OF NON-FERROUS METAL ARTIFACTS IN SOUTH MORAVIA (CZ) FROM A DIACHRONIC PERSPECTIVE

**Contribution format:** Oral  
**Contribution authors:** Matej Kmosek (Institute of Archaeology of the Czech Academy of Sciences, Brno)

This keynote lecture explores changes in metal production and use in South Moravia (Czech Republic) through a long-term perspective, emphasizing the value of large-scale scientific analysis in archaeology. The findings help us understand how metal artifacts were made, what materials were used, and how these changed over centuries. They also contribute to broader discussions on historical metallurgy beyond the region. By analyzing the elemental composition of non-ferrous metal artifacts, researchers can track long-term developments in metalworking. This presentation introduces a dataset of over 12,500 measurements taken using portable X-ray fluorescence (pXRF), a non-destructive method that allows for quick analysis of metal objects. The artifacts examined come

from metal detector surveys and date from the Eneolithic period to the Modern period. This extensive dataset provides valuable insights into how the composition of metal objects evolved over time. The main goal of the study is to identify patterns in the use of metal alloys and trace elements within a specific region. The results reveal both expected and surprising trends, including changes in copper alloy use and the influence of new technologies and trade networks on metal composition. A key aspect of the research is comparing pXRF surface measurements with more precise methods, such as bulk energy dispersive X-ray fluorescence (ED-XRF) and inductively coupled plasma mass spectrometry (ICP-MS) analysis. This comparison helps assess how reliable pXRF is for studying archaeological metals, weighing the advantages of a large dataset against the higher accuracy of laboratory-based techniques.

457. TIN AGE: THE PREHISTORIC CASSITERITE MINING AND BRONZE PRODUCTION IN EAST KAZAKHSTAN

**Contribution format:** Oral  
**Contribution authors:** Evgeny Vodyasov – Olga Zaitceva (East Kazakhstan technical university)

Our report will focus on the features of the East Kazakhstan center for prehistoric tin mining and bronze production. The research combines archaeological and landscape 3D scanning methods to investigate ancient tin mines and geochemical methods (XRF, SEM-EDS) for metallurgical analysis of Bronze Age objects, ores and slags. We will present new data and briefly discuss three aspects. The first question is related to the chronology of the emergence of tin metallurgy and identifying the traces of mining activity in the earliest period. The next problem is related to the calculation of mining volumes. Discoveries and results of three-dimensional scanning of mines allow us to call East Kazakhstan one of the largest centers of cassiterite mining in the world, but it is difficult to reconstruct the actual volumes of tin mined accurately. Finally, we would like to discuss the non-linear development of alloying techniques. New XRF and SEM-EDS investigations of slags, ingots, bars, metals, and ore samples have revealed a complex picture of metallurgical traditions that do not fit evolutionary models. Our preliminary results show that the Bronze Age alloying techniques did not develop linearly, replacing one another, but existed synchronously within one epoch and even one workshop.

605. UNVEILING ORIGINS OF BRONZE AGE COPPER AND TIN: CHEMICAL AND ISOTOPIC INSIGHTS FROM THE PALACE AND ROYAL TOMBS OF QATNA

**Contribution format:** Oral  
**Contribution authors:** Daniel Berger (Curt-Engelhorn-Zentrum Archäometrie Mannheim) – Simon Herdt (Pfahlbauten-Museum Unteruhldingen) – Peter Pfälzner (University Tübingen) – Andreas Wittke – Ernst Pernicka (Curt-Engelhorn-Zentrum Archäometrie Mannheim)

As part of the Collaborative Research Center 1070 at the University Tübingen, c. 60 copper-based metal artefacts from the renowned Bronze Age settlement of Qatna (Tell Mišrife), Syria, have been analysed using a combination of chemical and lead, copper and tin isotope analysis. The majority of these objects originates from two tombs in the Royal Hypogeum, Nos. I and IV, located within the palace, and primarily comprises spearheads and arrowheads, along with various objects from other contexts in the palace. Most artefacts consist of bronze with more than 5% tin and low lead contents below 0.2%. The copper used is exceptionally pure with arsenic being the only element present at elevated concentrations. Within the inventory of the tombs, there are groups of objects exhibiting highly similar chemical patterns, which are also reflected in isotopic clusters of lead and copper. Some data suggest a production of several artefacts from the same batches of metal, while other indicate the use of specific metal stocks. The high number of objects of the same type and with identical or very similar composition may indicate their exclusive production for funeral purposes rather than originating from everyday use. The copper isotope composition varies significantly, indicating the use of a wide range of mineral species. Lead isotope ratios largely correspond to those of Anatolian and Greek copper mineralisations, though additional sources were also used, possibly including the Deh Hosein copper-tin mine and mines in Cyprus. Tin isotope compositions vary as well, with distinct clusters being indicative of different tin sources used for specific groups of objects. While the exact location of the tin mines remains unidentified, comparisons with data of earlier and contemporary artefacts from the broader region are proving insightful.

1137. THE CRUCIBLE OF FIRE: THE DEVELOPMENT OF METALLURGICAL CERAMICS IN THE BRONZE AGE AEGEAN

**Contribution format:** Oral  
**Contribution authors:** Magda Giannakopoulou – Athina Nikolopoulou (University of Athens, Department of Archaeology)

The exploitation of metals began in the Aegean as early as the end of the Neolithic period. Fragments of metallurgical ceramics and specifically crucibles, related to smelting, have been dated as early as the 5th mil. BC at

Promachon-Topolnitsa at Serres, in Northern Greece. During the Early Bronze Age, smelting was mainly conducted in ceramic furnaces, such as the characteristic conical or bowl-shaped furnaces of the Cyclades. On the other hand, crucibles were used mainly in secondary processes, such as melting or alloying, at numerous sites such as Kastri or Daskaleio in the Cyclades. Although typologically crucibles of primary and secondary processes can be similar, the analytical examination of the ceramic body and the attached slag can shed light into this question. In the following periods of the Middle and Late Bronze Age crucibles have been located in various, such as Lefkadi on Euboea and Ag. Stefanos in the Peloponnese. This paper aims to study the use of metallurgical ceramics in the prehistoric Aegean, by focusing on changes in their typology and affiliated processes throughout the Bronze Age and among the different areas, investigating both the technological choices and the intertwined social aspects of the Aegean communities, that lead towards rejection, preservation, adaptation, or innovation.

182. A PALIMPSEST OF METAL PRODUCTION: JAFFA FROM ANCIENT TIMES TO THE EARLY 20TH CENTURY

**Contribution format:** Oral  
**Contribution authors:** Matasha Mazis (Technical University of Darmstadt) – Alexander Fantalkin (—)

This paper synthesises field research, textual sources, and archaeometric data to examine the development of local metal production in the Eastern Mediterranean port city of Jaffa throughout its documented past. Recent archaeometric studies have revealed evidence of different types of metalworking in the ancient urban complex dating from the Bronze Age to the early modern period. Combined with archaeological and textual analyses, Jaffa’s industrial history can now be contextualized within the broader regional dynamics. We examine key questions such as the timing and nature of the metalworking activities, the scale of production—whether for local consumption or export—and the technological developments and continuities over time. We approach Jaffa’s metallurgical story as a type of ‘palimpsest,’ with successive layers of activity and transformation—from its role in Phoenician trade networks, to its integration into the industrial and urban growth of the early 20th century—reflecting both continuity and change in the city’s metal-working practices.

2205. IN THE FOOTSTEPS OF ANCIENT MINERS: EXPERIMENTING WITH BONE MINING TOOLS AT GREAT ORME MINES, UK

**Contribution format:** Oral  
**Contribution authors:** Olga Zagorodnia (British Museum) – Harriet White (Great Orme Mines)

Bone tools are found in the toolkits of mining sites over a wide area during the Bronze Age and are often linked to ore mining. This study examines bone tools used at the Great Orme copper mines in North Wales, a significant Bronze Age site that was mined approximately 3000 to 4000 years ago. Over 35,000 bone tools, fragments, and flakes have been recorded at Great Orme, with cattle bones being the most common. Most of these tools were made from ribs and long bones. A total of 650 well-preserved samples were analysed microscopically, with three analysed by micro XRF. At least five functional types of tools were identified. The tools considered here include those used for mining (around 80% of the study sample). Human and non-human modifications causing fractures and surface damage were observed. These include impact notches, flake scars, cut marks, polish, single or grouped scratches and grooves, pits, and microsteps. Use-wear observations were confirmed by experimental data. The experimental work involved creating tools from cattle long bones and ribs – boiling, defleshing, fracturing, and splitting them; fire setting to soften the rock; and using pointed and rib tools in mining activities, including splitting rock and scraping. The results of the experiments allowed us to develop diagnostic criteria for identifying common manufacturing modifications and use-wear features in artefacts used for ore mining. It was found that bone pointed tools are as effective as metal ones, though they were used primarily on softer rock. Additionally, negative impressions left in the rock from tool use were recorded, providing reliable and effective comparisons to the Bronze Age tool marks preserved at Great Orme Mines. The comparative information presented here is of great value for the study of bone tool collections and mining activities at other prehistoric mining sites across Eurasia.

2111. A THOROUGH LOOK AT THE BRONZE ARTEFACTS. AN ATTEMPT FOR CLASSIFICATION OF METAL ARTEFACTS FROM HALLSTATT PERIOD USING LIBS

**Contribution format:** Oral  
**Contribution authors:** Corina Bors (National History Museum of Romania) – Monica Dinu (National Research Institute for Optoelectronics INOE2000)

The objects discovered by archaeological excavation and field research can originate from different geographical areas, being brought by long-distance trade, or because of exchange of prestigious gifts or (less often) migrations of ancient groups of populations. Thus, certain such objects may have (at first glance) a similar appearance, and (sometimes) even close chemical composition (the same chemical elements, in similar proportions). This study is focused on discrimination of the metal archaeological objects, which are typologically similar, using

multivariate analysis on the spectral data obtained mainly by Laser Induced Breakdown Spectroscopy (LIBS). The spectral data obtained were processed using advanced methods of statistical analysis and then grouped according to similarities, in this manner obtaining a detailed classification of the objects extracted by archaeological excavation (or from other random discoveries) based on the elemental composition of the original material. The archeological objects discussed in this study belong to a very important discovery made a decade ago, in Romania, Transylvania region, on sites located on the middle Mureş Valley at Tărtăria – Podu Tărtăriei Vest (the hoards Tărtăria I and Tărtăria II). Based on the preliminary studies, considering the materials they are manufactured of, they are grouped in 2 major categories: bronze artifacts – torques, „glasses type” brooches (fibulae), other various types of brooches (fibulae), various type or bracelets, phalerae – most probably costume accessories, phalerae – harnesses accessories etc. and iron artifacts – weapons and tools. For the moment, the two bronze and iron hoards uncovered by preventive archaeological excavation at Tărtăria (Alba County, Romania) remain the largest assemblages from the Middle Hallstatt period and raise a series of questions about the provenance of certain artefacts, thus “traditional” study and non-invasive investigations were made in order to understand better the structure, meaning and origin of these votive (?) metal finds.

**1054. WIELDING THE SWORD: METAL, BONE AND IVORY CRAFTSHIP AND THE VALUE PLACED ON WEAPONS IN IRON AGE IBERIA**

**Contribution format:** Oral  
**Contribution authors:** Marta Blasco Martín (Universitat de València. Departament de Prehistòria, Arqueologia i Historia Antiga) – Lucía Soria Combadiera (Universidad de Castilla La-Mancha. Departamento de Historia, Área de Prehistoria) – Marianne Christensen (Université Paris 1 Panthéon-Sorbonne) – Consuelo Mata Parreño (Universitat de València. Departament de Prehistòria, Arqueologia i Historia Antiga)

In this paper, we present the results from the project Attaching and decorating: Sword hilts in the Iberian Age (CIGE/2023/76. Conselleria de Educació, Cultura, Universidades y Empleo. Generalitat Valenciana, Spain), which focuses on the study of sword hilts recovered from the eastern seaboard of the Iberian Peninsula between the 5th and 3rd centuries BC. The remains of the hilts in question were made from hard animal materials and were often decorated with vegetal and geometric motifs created by inlaying metal threads into the material. Given that these composite pieces were made by combining different raw materials (iron, bronze, bone and/or ivory), they had to be analysed using multiple approaches: macro and microscopic exploration, archaeological drawing, archaeometric analysis, radiological study and contexts of discovery (settlements or necropolises). We reflect on the people who made these pieces and the high degree of craftship required for their production (metallurgical craftspeople), as well as on the socioeconomic status of the individuals who wielded them. Swords from the Iron Age II Period that preserve the remains of bone or ivory handles are limited in number and speak of shared craftship, valuable raw materials and status linked to warfare. Some of the questions we seek to answer are: do the hilts have formal similarities between them? What value did their bearers place on them? And lastly, why do they predominantly appear in funerary spaces?

**495. BRONZE COINAGE OF ELEA/VELIA: INVESTIGATING METAL PROVENANCE THROUGH GEOCHEMISTRY AND LEAD ISOTOPES**

**Contribution format:** Oral  
**Contribution authors:** Isabella Ercoles (La Sapienza University - Department of Earth Sciences | CHNet, INFN-LNGS)

This study investigates the geographic provenance of 100 bronze coins from the Greek colony of Elea/Velia (Southern Italy), dating from the 4th to the 1st century BC. Chemical and lead isotope analyses were conducted at the CHNet of the Laboratori Nazionali del Gran Sasso-INFN using ICP-MS and TIMS techniques. The aim of this research is to investigate the major elements (in wt%) and trace elements (in ppm) in coin alloys, alongside lead isotope ratios, to establish a reliable metal provenance and explore the geochemistry of the associated mining districts. Ternary diagrams, used to visualize major element concentrations (in wt%) across four distinct coin emissions, reveal consistent trends: Cu ranges between 100% and 75%, Pb remains mostly below 20%, and Sn is consistently under 10%, with Athena/Tripod samples showing near-zero Sn levels. Exceptions include two coins which exhibit lower Cu (~50%) and higher Pb (~40%). Sn proves to be the most discriminating element among the emissions. For trace elements (2% of the total alloy), multi-element diagrams, commonly employed in geological studies, were experimentally applied. Normalized to continental crust values, concentration patterns align with lead isotope-based provenance assignments and show similar trends for the main mining districts of Aegean Greece and southern Spain. A key distinction is the higher variability in Greek deposits, particularly in Zn, and to a lesser extent, Co, Ni, As, Ag, and Sb. My research demonstrates how archaeometallurgical techniques can supplement numismatic and archaeological methods to reconstruct ancient socio-cultural networks and economic interactions, such as metal supply sources and trade routes, in the Mediterranean area.

**1948. FORGING CONNECTIONS: ARCHAOMETALLURGICAL CHARACTERIZATION AT THE PHOENICIAN SITE OF CERRO DEL VILLAR (MÁLAGA, SPAIN) IN ITS REGIONAL CONTEXT**

**Contribution format:** Oral  
**Contribution authors:** Carmen Alañón – Xosé-Lois Armada Pita (Institute of Heritage Sciences (Incipit-Csic)) – Ignacio Montero Ruiz (Institute of History (Cchs-Csic)) – José Suárez Padilla (University of Malaga) – Pau Sureda (Institute of Heritage Sciences (Incipit-Csic))

The abundance and variety of metalliferous resources in the Iberian Peninsula have been extensively documented, with evidence of their early exploitation dating back to the 5th millennium BC. However, from the 9th and 8th centuries BCE onwards, metal production experienced a significant increase, coinciding with the interactions between local communities and Phoenician settlers. These contacts enabled technological adaptations for the new demands of intensive exploitation. Within this context, new metallurgy innovations have been recorded in the first Phoenician colonies established on the Bay of Málaga, such as La Rebanadilla and Morro de Mezquitilla. This practice extended to native communities like Acinipo or Castillejos de Alcorrín. In the 8th century BCE, the Phoenicians founded Cerro del Villar, one of the largest colonies in southern Iberia, located on an island surrounded by the estuary of the Guadalhorce River (Málaga). This settlement plays a key role in understanding Phoenician colonization dynamics and their interactions with local communities in the Málaga hinterland. Results of elemental and isotopic composition analyses of copper- and lead-based objects, production remains and Pb-Zn-Ag rich ores are presented in this study. Samples were collected during the new archaeological fieldwork at Cerro del Villar (2022–2024), as well as the prospection campaign in the mines of Llano de la Plata (Alhaurín de la Torre, Málaga). The new excavations are being conducted by an interdisciplinary team led by the University of Málaga and including contributions from Spanish universities (Seville, Cádiz, Córdoba, and Jaén) and international institutions (Marburg, Germany; Chicago, USA). Archaeometallurgy research is being carried out within the framework of the MedAtMetals Project (INCIPIT-CSIC). This research offers new insights into metallurgical interactions between Phoenicians and local communities in southern Iberia during the first millennium BCE, contributing to a better understanding of the colonial historical process.

**586. MATERIALS CHARACTERIZATION OF COPPER CAST COINS FROM TEKTTHA, NAOGAON, BANGLADESH, USING WDXRF AND SEM-EDS: A WINDOW INTO EARLY HISTORIC COINAGE**

**Contribution format:** Oral  
**Contribution authors:** Tamanna Jahan (University of Ferrara) – Sabiku. Naher (Jahangirnagar University) – Bulbul Ahme. (Jahangirnagar University) – S.M. Tareque Abedin (Jahangirnagar University)

The present research integrates the numismatics and archaeometallurgical studies of sixteen copper coins from Tekttha, a recently discovered early historic site in Parshim Raghunathpur, Porsha Upazila, Naogaon, Bangladesh. The study encompasses typological classification, chemical composition, and minting processes. Numismatic attributes such as shape, weight, dimension, and symbols indicated that the analyzed coins belong to the earliest uninscribed cast copper coin classes, which were circulated from the 3rd century B.C. to the 1st century A.D. The elemental analysis using wavelength dispersive X-ray fluorescence (WDXRF) spectroscopy shows extremely high chemical and mineralogical homogeneity in selected studied coins, which have more than 90% copper content. Sn and Zn were found, traces of common alloying elements, which are indicative of very limited or no alloying. In contrast, P, Ca, As, Cl, K, and Mn are probably due to soil contamination. However, the presence of sulphur and iron suggests that sulphur-rich copper ores, such as chalcopyrite, possibly have been used. To further investigate the metallography and surface modifications of coins studied, scanning electron microscopy coupled with energy dispersive spectroscopy (SEM-EDS) was employed. SEM images of selected coins show homogeneous metallic cores with lead phases and corroded holes. The α-copper grain structure indicates proficient casting and cooling techniques by the minting authorities. The absence of twin-grain structures suggests that symbols were engraved through a cold working process. Beyond metallurgical characterization, this study demonstrates the value of integrating scientific and typological analyses to reconstruct ancient coin-making practices. By bridging archaeometallurgical data with numismatic classification and historical context, this research underscores the need for a multidisciplinary approach to better understand early monetary systems and technological choices in Bengal.

**329. DISCOVERY OF RESIDUAL SURFACE TREATMENT ON A KNEE FIBULA: FIRST EVIDENCE OF THE SILVER DEPLETION TECHNIQUE BEYOND THE NORIC-PANNONIAN LIMES?**

**Contribution format:** Oral  
**Contribution authors:** Cenek Foucek (Institute of Archaeology of the Czech Academy of Sciences, Brno)

This study presents the discovery of a residual silver-like surface layer on a Germanic knee fibula from the second century AD. The observed layer is hypothesized to result from depletion silvering, a technique in which base

metals are selectively leached from a silver-copper alloy, leaving behind an enriched silver surface. To test this hypothesis, an experimental approach was undertaken. Samples with the same composition as the fibula were subjected to a series of etching processes using vinegar, a commonly available acidic agent in antiquity. The experiment successfully replicated a silver-enriched layer, demonstrating that silver depletion techniques could have been used outside the Roman Empire. To analyze the material composition and surface modifications, tabletop XRF was used to determine the alloy’s elemental composition, while SEM-EDS provided high-resolution documentation of the silver-enriched surface layer. Additionally, CIELAB color space measurements were conducted to quantify the color difference between the original alloy and the silver-enriched surface, objectively assessing the visual changes resulting from the depletion process. This finding provides new insights into Roman-period metalworking techniques and suggests the possibility of a broader application of silver depletion methods beyond Roman coinage production.

**278. CERRO DE LOS ALMADENES, SEGOVIA, SPAIN: FIRST RESULTS OF THE METALLURGICAL LATE ROMAN SITE**

**Contribution format:** Oral  
**Contribution authors:** Anna Sdralia – Mercedes Murillo-Barroso (University of Granada) – Juan Álvarez-García (Autonomous University of Madrid) – Mariano Ayarzagüena-Sanz (University of Castilla-La Mancha) – Gonzalo Lozano (Geological and Mining Institute of Spain (IGME, CSIC))

Cerro de los Almadenes, located in Segovia, Spain, stands as a significant metallurgical site from the Late Roman period, distinguished by the excavation of ten metallurgical furnaces arranged in two NW-SE rows of five furnaces each. The rows are seven meters apart from one another, while the furnaces are separated between them by a distance of 2.4 meters. Remarkably enough, both rows were built symmetrically. Furthermore, grinding stones, fragments of broken furnaces, and different types of slag are evident both in excavated layers and on the surface levels. The nearby slagheap indicates the great production of the site, the size of which by the end of the 19th century was estimated of approximately 560.000 tons of metallurgical slag. The site has a continuous use from the Roman period to the Late Roman period, and the slag remains seem to belong to both periods. Macroscopic and typological studies prove to be limited, hence we decided to apply analytical techniques to address the technological characteristics and the different possible productions taking place in the Cerro de los Almadenes. This study examines 122 metallurgical remains, including slag, furnaces and grinding stones, to elucidate their technological characteristics of the site. Employing X-ray fluorescence (XRF), optical microscopy, and scanning electron microscopy (SEM), we analyze the microstructure and chemical composition of these metallurgical remains. The results aim to shed light on the metallurgical practices and technological changes employed at Cerro de los Almadenes, contributing to a deeper understanding of the copper production and processing during this transitional period.

**1126. A WARRIOR OR A METALLURGIST? ON THE INTERPRETATIONAL POSSIBILITIES OF ARCHAEO-METALLURGY COMBINED WITH PHYSICAL ANTHROPOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Martin Mino (Monument Board od Slovak Republic) – Jozef Petrík (Technical University Košice) – Marta Ďuricová (Stredoslovenské múzeum Banská Bystrica) – Eva Petrejčíková – Jana Gaľová – Soňa Kalafutová (University of Prešov) – Peter Ďurica (Municipality of Letanovce)

The Avar Khaganate was a decisive political power in the heart of Europe during the early Middle Ages. Inside the archaeological context, it is renowned for the graves of archers, often with their mounts. They define the culture as an image of a roaming horse-archer warrior in popular narratives. Recent DNA analyses of whole burial sites have pushed the knowledge of the culture much further. They contribute not only to the question of physicality but also to cultural inheritance and broader relationships. Yet there is a chance that archaeo-metallurgy, in cooperation with physical anthropology, might still have some news to ring. These would affect both the technological level and the similarities between the social and cultural levels, too. Can they even stir the popular warrior narrative? The paper tries to answer via the evaluation method of the physical features of a buried armed individual and archaeo-metallurgical analysis of his accoutrements together with the slags from his surroundings. Confrontation of the results with other data in a broader spatial and chronological frame might bring some answers on the possibility of wider application.

**1849. GEOCHEMICAL TRACING OF VIKING IRON AND THE MIGRATION PATTERNS OF NORSE POPULATIONS CROSS THE NORTH ATLANTIC**

**Contribution format:** Oral  
**Contribution authors:** Jean Milot – Thomas Birch – Rasmus Andreasen – Christian Tegner (Aarhus University, Department of Geoscience, Denmark)

Iron was a crucial resource in Viking society, essential for crafting everyday tools, durable weapons, and rivets for shipbuilding. This metal is therefore intrinsically linked with the migration of Scandinavian populations and the expansion of Norse culture. The availability of iron and expertise in its metallurgy were vital concerns of the time, raising important questions about the sources of iron for Norse settlements, and its circulation across the Baltic and North Atlantic regions. The prevailing model suggests that Viking iron was almost exclusively produced in the Scandinavian homelands, with its distribution extending to all other Norse territories. However, the discovery of numerous Viking Age iron production sites in Iceland, with an output exceeding local needs, challenges this model and indicates a more complex production and distribution. By combining archaeometallurgy and geochemistry, the MSCA VIPICE project aims to identify the distinct signature of Viking iron production in Iceland compared to wider Scandinavia and to investigate its circulation across the North Atlantic region. Preliminary results indicated a clear difference in the elemental composition between smelting slags from Iceland and Scandinavia, and less radiogenic Sr isotope signature in the Icelandic slags. Subsequently, our results show that the trace element composition of slag inclusions trapped in Icelandic iron blooms matches that of Icelandic slags, which confirm the specific signature of iron from this territory. Based on typological observation, trace elements and Sr isotope analyses will be conducted on iron artefacts used locally to further distinguish iron from Iceland and Scandinavia. This multi-proxy approach will then be applied to archaeological objects brought to Norse settlements in Greenland and Newfoundland to investigate the presence of Scandinavian or Icelandic iron. Integrating archaeology and Earth sciences, this multidisciplinary project will offer valuable insights into the iron trade networks and migration patterns of Norse populations across the North Atlantic.

**1783. PXRF ANALYSIS OF A VIKING AGE HOARD OF BROOCHES FROM ŠLIKTINĖ, LITHUANIA: COMPARING THE SURFACE TO THE MECHANICALLY CLEANED CORE**

**Contribution format:** Oral  
**Contribution authors:** Egle Rimkiene (Kretinga museum) – Marcus Roxburgh (Insitute of Baltic Region History and Archaeology, Klaipėda University)

In 1971, one of the largest Viking Age hoards of metal artefacts ever found in Lithuania was discovered near the outskirts of the small village of Šliktinė. The discovery was made accidentally during soil excavation in the marshy valley besides a small stream. In total 82 artefacts dating to the 9th–10th centuries AD were recovered during the subsequent archaeological survey. The assemblage includes brooches, bracelets, belt fittings and buckles, then also iron weapons such as daggers, swords and spearheads. Current research supports the hypothesis that the marshy valley at Šliktinė possibly served as a place for ritual deposition, where the artefacts were deliberately sacrificed in wetland environment. Until now, the artefacts from the Šliktinė hoard had not been examined using portable X-ray fluorescence spectrometry (pXRF). For this study a selection of 37 brooches was made. We then deployed pXRF firstly in a non-invasive exploration of the chemically altered outer surfaces. Then 10 of the brooches were selected and mechanically cleaned, so that measurements of the cores could be taken. The analyses revealed significant differences between the corroded outer surfaces and the original compositions. This comparison offers the opportunity to better interpret original Cu-alloy composition from objects deposited in acidic, low oxygen wetland environments. Also as a result of this analyses, some differences and similarities in metal composition were observed according to brooch typology. This analysis provides a multi-disciplinary perspective on Viking Age brooches discovered in the Šliktine hoard.

**1193. INTERTWINING PATHS. THE CASE STUDY OF THE PREGOLA RELIQUARY AND THE ROLE OF ARCHAEO-METALLURGY IN UNRAVELLING EARLY MEDIEVAL TRANS-EUROPEAN CONNECTIONS**

**Contribution format:** Oral  
**Contribution authors:** Elisa Grassi (CNR - Institute of Heritage Science) – Conor Newman (University of Galway) – Eleonora Destefanis (Università del Piemonte Orientale) – Cormac Bourke (Independent) – Anna Gannon (St Edmund’s College, University of Cambridge)

The research project presented here, still in its early stages, started with the recent discovery of an early medieval reliquary of Irish manufacture in Italy, not far from the Bobbio abbey where St. Columbanus is buried. Comparable artefacts from Italy are extremely rare, and none comes from an archaeological site. The object is a composite piece comprising metal plates and decorative components attached to a yew box. The research approaches it from several perspective, including liturgy, art history and a comprehensive archaeometallurgical investigation, trying to retrace the complex sequence of modifications, and addressing a range of questions

concerning where, when and why these alterations to the structure and appearance of the reliquary occurred. The data provided by these investigations will help in shedding light upon relevant cultural topics, in particular that of cultural transfer in an age of transition: despite the political fragmentation of Early Medieval Europe, the Mediterranean regions remained connected with the areas on its northern shores. Christianity was one of the main elements that united north, south, east and west in these formative centuries, propelled by the movements of saints, pilgrims, relics and treasures. Material goods and immaterial objects (among which the relics and the cult of saints) were constantly transferred between these areas, sometimes in modified form. Researching the origins of the transferred elements and the process of transmission that linked the different areas and cultures will provide elements to further our understanding of such a complex cultural-historical context.

332. EARLY MEDIEVAL IRISH RINGED PINS: A CASE STUDY

**Contribution format:** Oral  
**Contribution authors:** Julie Perez (UCD School of Archaeology | UMR 5608 - TRACES- TERRAE, Université Toulouse 2 Jean Jaurès)

Ring pins or ringed pins are common metal dress fasteners in Early Medieval Irish material culture, and their use throughout pre-and Viking Age Ireland offers a fascinating case study to explore various aspects of the past, particularly metallurgy practices and the production processes of copper-alloy artefacts. These objects provide a valuable lens through which to examine cultural transfer, the evolution of production techniques, and the stylistic changes that occurred over time. This pilot study seeks to characterise the production traces found on ringed pins to gain a deeper understanding of how these objects were made. By integrating macro- and micro-observations with experimental archaeology, the research investigates the manufacturing techniques of a copper-alloy, unfinished loop-headed pin found at Moynagh Lough, a pre-Viking habitation site. This project contributes to broader archaeological discussions surrounding artefact production processes, skill transmission, and the lived experiences of ancient societies. Using experimental archaeology, this study not only reconstructs technical practices but also broadens perspectives for exploring the relationship between material properties, craftsmanship, and societal organisation in early medieval Ireland. My research is based on an interdisciplinary methodology to replace the artefacts in their historical and geographical contexts, tracing their evolution through time and space. Understanding the relationship between the Irish and the Scandinavians is primordial to appreciate the context of production centres of this period. This presentation will highlight the initial findings of my PhD research.

1518. DAMAGE AND REPAIR OF SCANDINAVIAN MIGRATION PERIOD BRacteATES

**Contribution format:** Oral  
**Contribution authors:** Nancy Wicker (University of Mississippi)

Many of the over 1000 Scandinavian gold bracteates of the Migration Period (5th–6th century CE) have been damaged and repaired. These small (approx. 2–3 cm diameter) disks, originally based on Roman medallions, were made by striking with a one-sided bracteate technique rather than as a typical two-sided coin. The resulting objects are thinner than Roman-type coins, and each typically had an edge wire soldered onto the rim of the piece both to strengthen and further decorate it. Each had a loop soldered onto the gold disk so that the bracteate could be suspended on a cord or chain for use as an amulet or marker of identity. These loops and edge wires of bracteates often were damaged or lost. In this paper, I will examine correlations of bracteate damage and repair with various typological or iconographic features, and also with various find contexts. Repairs of bracteates most often consist of extra plates or patches that serve as reinforcements on the reverse of the attachment of the suspension loops. Such repairs do not affect the visibility of the imagery on the obverse of the pieces, and a somewhat damaged or worn bracteate could have been considered still “functional” and worth repairing. Yet some heavily damaged examples must have been melted down to make new, more fashionable ornaments. In particular, I have observed that bracteates discovered in hoards often are nearly pristine, whereas those discovered in burials frequently reveal careful repairs.

1051. WEAR AND TEAR? OR SIMPLY THE WAY IN WHICH BRACELETS ARE MEANT TO BE WORN

**Contribution format:** Oral  
**Contribution authors:** Audrone Bliujiene (Klaipėda University, Institute of the Baltic Region History and Archeology) – Eglė Rimkienė (Kretinga Museum) – Evaldas Babenskaskas (Free lancer archaeologist)

The aim of this contribution is to describe the sash-shaped bracelets that were worn in abundance in the 11th-12th centuries AD by the Lithuanian seaside settlers. The bracelets discussed here are mostly found in female cremation graves and are sometimes placed in burial pits as additional offerings. This contribution analyses more than 50 such bracelets, combining the circumstances of their discovery in archaeological contexts, the analysis of their metal composition, the investigation of the technical aspects of their production process, the ornamentation

and special straight upright engravings on the inner surface and cuts at the ends of the bracelets. These marks were deliberately made by the jewellers who worked on the bracelets during the production process. Bracelets were worn in pairs of three to six bracelets on each hand, and each bracelet weighs between 70 and 90 grams. Engravings and cuts could be the jeweller’s “instructions”, showing the order in which the bracelets should be placed on the arm so that they would be comfortable to wear, pairs of bracelets reveal the esthetic value of geometrical patterns and probably symbolic meaning. The elemental composition of the copper alloys of these bracelets was determined by XRF and ICP-MS. Bracelets were made of copper alloys common in Early Medieval times. Combining all the analyses, three copies of the bracelets were made. They confirmed that the idea behind the cuts and notches on the bracelets was that the jewellery in question should be worn correctly, so that the meaning of the bracelet was revealed to the wearer. These bracelets testify to communication between jewelers and workshops and to the transmission of knowledge in the region where these bracelets were common.

349. A PATTERN OF BOG IRON ORE DEVELOPMENT IN LITHUANIA (A CASE STUDY FROM THE TRANS-NEMUNAS REGION)

**Contribution format:** Oral  
**Contribution authors:** Andra Simniškytė-Strimaitienė (Lithuanian Institute of History, Department of Archaeology) – Aušra Selskienė (Center for physical sciences and technology) – Vidas Pakštas (Center for Physical Sciences and Technology)

From prehistoric times until the 19th century, locally sourced bog ore was used for iron reduction in Lithuania, although the occurrences of the ore itself in archaeological contexts are infrequent, the deposits of the raw materials, that were used in the past, are not known, and the (neo)formations have not been localized or geologically mapped. For several years now, the need for ore materials has emerged during iron smelting experiments, which has prompted more intense searches for deposits and has also provided the opportunity to study the model of bog iron ore formation, based on the algorithm that different morphologies of mineral deposits represent different development stages, with bog iron soils (unstable form) being the first phase, hard concrete layers the very last (Thelemann, 2017). Bog iron ore development is important to understand the methods of exploiting mineral sources and the technological aspects of metallurgy in the past, and the study of neoformations can guide the interpretation of an archaeological context through an experimental approach. This presentation aims to establish a preliminary pattern for bog iron ore development in Lithuania using a case study and to assess how it corresponds with the established model of bog iron ore formation. Research is being conducted in the Trans-Nemunas region, where various types of information (written records, cartographic materials, toponymy, abundant slag findings) testify to the intensive bog ore extraction and iron production activities in the past. The methodology includes field surface survey and shovel-pitting, lab investigation, and experimental iron smelting. Based on these data it is intended to define the characteristics of the deposit concerning the landscape features to understand the prerequisites and mechanisms that could have conditioned the exploitation and usage of bog iron ore in the past.

29. CASTING MONUMENTAL BRASS STATUARY DURING THE RENAISSANCE: THE CASE OF THE “SCHWARZE MANDER” IN INNSBRUCK, AUSTRIA

**Contribution format:** Oral  
**Contribution authors:** Marianne Mödlinger (University of Innsbruck) – Bastian Asmus (Labor für Archäometallurgie) – Marc Gener-Moret (Centro Nacional de Investigaciones Metalúrgicas (CENIM-CSIC))

The 28 “Schwarze Mander” are undoubtedly among the most magnificent monumental copper-alloy statues of the Renaissance. Commissioned by the Holy Roman Emperor Maximilian I for his funeral monument at the beginning of the 16th century, they were completed more than 30 years after the Emperor’s death. For the first time, by using approaches techniques and procedures developed for archaeometallurgy, the chemical composition of these statues and the various parts from which they were made have been identified by non-invasive XRF analysis. In addition, original manuscripts and letters exchanged between Maximilian I and the various artists were analysed. Taken together, this provides an initial assessment of the complex production process and the challenges faced by the artists in creating the statues. In the near future, the aim is to reconstruct the workshops involved in the production of the statues, to characterise the materials used in the production of the statues, to re-learn foundry processes from past traditions, to understand the role of the statues in the context of Maximilian’s genealogical self-fashioning and, finally, to identify the original appearance and possible coatings of the brass statues.

385. NONDESTRUCTIVE SEM-EDS ANALYSIS OF SILVER AND GOLD HAIR-RINGS FROM THE EARLY BRONZE AGE FROM YAMBOL REGION, BULGARIA

**Contribution format:** Oral  
**Contribution authors:** Todor Valchev (Historical museum - Yambol)

The second half of the 4th millennium BC marks the beginning of one of the most dynamic and interesting periods in Balkan history – the Bronze Age. This is a time of migrations of people, transfer of technological know-how, exchange of ideas and innovations, and cultural influences. Around 3100 BC, large groups of migrants of the so-called Yamnaya culture appeared on the Balkan Peninsula. These people were nomads who originally lived in the North Black Sea area. The communities of the Yamnaya culture crossed the Stara Planina Mountain and reached the valley of the Tundzha River. The terrain in the Tundzha River watershed is level to rolling. Abundant water and mild climate offered optimal natural conditions for the newcomers. With the bringers of Yamnaya culture also appeared the first silver jewels. The aim of this report is to present results from the nondestructive SEM-EDS analysis of the 3 golden and 21 silver spiral hair-rings from the Early Bronze Age. The jewels are found in the main and secondary graves of 13 burial mounds in Lower and Middle course of Tundzha River. Spiral hair-rings were worn on the most visible places in the human body – the face. They are symbols of the prestige and presented the social position of their owner in ancient society.

**350. DATING GOLD OBJECTS NON-INVASIVELY: ELECTROCHEMICAL ANALYSIS OF THE 7TH/8TH CENTURY RUPERTUS CROSS FROM SALZBURG, AUSTRIA**

**Contribution format:** Poster  
**Contribution authors:** Marianne Mödlinger (Universität Innsbruck) – Laura Osete Cortina (Universität Innsbruck | Universitat Politècnica de València) – Antonio Doménech-Carbó (Universitat de València) – Maria Teresa Doménech-Carbó (Universitat Politècnica de València)

The Rupertus Cross, a processional cross from the later 7th century or the beginning of the 8th century, probably comes from a workshop in Northumbria, England and reached Salzburg, Austria under Bishop Virgil. It is the most monumental crux gemmata of the first Christian millennium. Made of maple, the wooden cross was covered with gilded copper sheets. The cross was originally decorated with 38 enamel discs, of which only nine remain. In 1998, a likely fragment from the cross was found during excavations at Bischofshofen parish church (Austria). The electrochemical analyses presented here are intended to determine whether this fragment actually belongs to the cross, whether it is of the same date, and whether some other analysed fragments of the cross can be linked to later restorations. We aim to obtain answers to these questions by voltammetric analysis (VIMP: voltammetry of immobilized particles methodology) of several areas of the cross. First analyses, already, show that the data are consistent with the attribution of the Bischofshofen fragment to the original cross.

**1187. ECHOES OF THE CARPATHIANS: THE ROLE OF IMPORTS AND IMITATIONS AMONG THE EARLIEST SWORDS OF THE NORDIC BRONZE AGE**

**Contribution format:** Poster  
**Contribution authors:** Bart Cornelis (Curt-Engelhorn-Zentrum Archäometrie | Eberhard Karls University of Tübingen) – Andreas Wittke – Daniel Berger (Curt-Engelhorn-Zentrum Archäometrie)

The Early Nordic Bronze Age I (1700 – 1500 BC) is a pivotal period in Northern Europe due to the transition from the late Neolithic to upcoming metal using societies. This period is marked by innovation and change, made apparent by the appearance of refined bronze artefacts that draw upon originals from the Carpathian Basin in Southeastern Europe belonging to the Hajdúsámson-Apa type. Prime examples of this North-South connection are the first ‘full-hilt swords’ in Northern Europe, that are likely imported. Moreover, these imports were locally imitated with similar forms and decorations, but the casting technique differed from their precursors. As a result, potential imports from south-eastern Europe can be typologically distinguished yet archaeometallurgical support can still be expanded upon. The poster presents an in-depth archaeometallurgical analysis that was performed within the framework of an ongoing research project ‘Origin, development and technology of the Bronze Age blades of the ‘Sögel-Wohlde-Kreis’. The project studies the development of metallurgy in Northern Europe, using a multi-proxy approach based on a combination of chemical (EDXRF) and lead-isotope analyses, supported by copper and tin isotopic studies (MC-ICP-MS). The study presents new archaeometallurgical data of Nordic full-hilt swords, such as the swords from Torupgårde and Dystrup, that can now be directly compared to their Carpathian counterparts. Chemical and lead-isotope data suggest distinct archaeometallurgical differences between the Nordic and Carpathian swords that can point to local Nordic manufacture versus imports. For example, the sword from Torupgårde appears to have chemical and lead-isotopic signatures nearly identical to a sword from the Hajdúsámson hoard suggesting that the imports may be more closely related to their Carpathian counterparts than initially assumed.

**151 “BY THE VEHEMENCE OF FIRE”: EXPLORING MATERIAL CULTURE THROUGH COLOUR**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Session with keynote presentation  
**Session keywords:** colour, archaeological science, pyrotechnology, glass and ceramics, metals and pigments, production technology  
**Session organisers:** Maria Kaparou (Institute of Nuclear and Particle Physics, NCSR ‘Demokritos’) – Nelly Kladouri (Hellenic National Archaeological Museum | Institute of Nuclear and Particle Physics, NCSR ‘Demokritos’) – Ariadni Kostomitsopoulou Marketou (MF Norwegian School of Theology, Religion and Society)

**SESSION ABSTRACT**

From the earliest controlled flames to the vibrant hues of ancient artefacts, pyrotechnology has played a crucial role in human expression and cultural evolution. Colour has often been linked to specific pyrotechnological skills that influenced trade dynamics, status, and cultural or ritual symbolism. This session will explore how ancient civilisations harnessed the power of fire across various crafts, examining the interplay between colour and material culture in pyrotechnological products, including, but not limited to, glass and vitreous materials, metals and alloys, ceramics, and pigments. We seek to discuss not only the technical achievements of the past, but also the symbolic meanings, social practices, aesthetic and economic values that shaped the ancient world toward enhancing our understanding of how craft production influenced colour perception and vice versa. Our focal points include the Mediterranean world, Europe, and the Near East, following a transhistorical approach up to the Late Medieval period. We encourage inter- and cross-disciplinary contributions that investigate the operational sequences (chaîne opératoires) and technological choices involved in colour selection, manipulation, fabrication and transformation. Topics of interest include archaeometric studies on the physicochemical processes of colour per se or its development depending on the very material, as well as studies on its history and archaeology and illuminate aspects of its perception and cultural significance in ritual practice, identity, and social status.

**CONTRIBUTION ABSTRACTS**

**2530. KEYNOTE: CRAFTING COLOUR IN CERAMIC AND GLASSY PIGMENTS. DECODING THE ALCHEMY OF FIRE**

**Contribution format:** Oral  
**Contribution authors:** Eleni Aloupi-Siotis (THETIS Authentics Ltd)

The practice of combining different clays and mineral pigments (e.g., ochres, umbers) to decorate ceramics was widespread across the ancient world. From China and Mesopotamia to Anatolia, the Balkans, mainland Greece, the Cyclades, Cyprus, and even as far as Indian and Mayan cultures, black and red decoration on pale backgrounds was a common stylistic choice. These colours emerged through firing as a combined effect of kiln atmosphere and temperature, typically not exceeding 950-1000°C. Some vessels, fired at only 650-700°C, can only marginally be classified as ceramics. In the 6th century BCE, Athens saw the rise of black-figure and later red-figure ceramics, distinguished by their durable, intensely coloured black ceramic glaze. Simultaneously, in China, protoporcelain techniques emerged, paving the way for highly fired ceramics that influenced global ceramic traditions. This paper explores key decoration techniques in ancient pottery and the technological development of synthetic glassy pigments across different cultures. The iron reduction process in Athenian black glaze, the use of Egyptian blue and other pigments in polychrome Attic vases, and the cross-fertilization of ceramic and painting techniques—analogueous to the Renaissance maiolica tradition, where painters’ pigments and ceramic decoration intersected—highlight the circulation of materials and knowledge among artisans across time and artistic disciplines.

**242. MULTIVALENCE OF BLACK ON ATTIC RED-FIGURE POTTERY**

**Contribution format:** Oral  
**Contribution authors:** An Jiang (Independent Scholar)

Since the Bronze Age, ancient Greeks have long manipulated the colors of their ceramics both in the processes of firing and decorating for diverse purposes of cultural expression. Among the several colors preferred by the Greeks, black is essential in their pottery production, which eventually culminates in the perfection of the black-glaze pottery and the black-figure pottery during the sixth century B.C. For the latter, the contrast between black figures and the light-color background was achieved by a complex three-step firing process. During the last quarter of the same century, by reversing the technique, the Attic ceramists created red-figure pottery which soon

became fashionable and sought after throughout the Mediterranean for the subsequent two centuries. On Attic red-figure pottery, the color of black, despite largely receding to the background, remains indispensable and multi-valent in expressing some of the most significant characteristics of the ancient Greek cultural identity. In fighting scenes, black is used symbolically on warriors to evoke the darkness of fate that is permeating in the Homeric poetry. In certain ritual scenes, black is deliberately used on sacrificial animals. Such a visual sign is probably meant to represent the enagismos to the black goddess, an important cultic practice known especially in the Peloponnese. Black is also closely associated with certain deities, such as Demeter Melaina and Erinyes who are related to the underworld. Moreover, on a social level, black is emphatically adopted to indicate people in mourning and in a lower social status. This paper examines the multivalence of black as revealed from the decoration on Attic red-figure pottery, which illuminates crucial aspects of the perception of black in ancient Greek culture.

**1937. ISLAMIC GLAZED CERAMICS FROM MÉRTOLA (PORTUGAL). AN ARCHAEOMETRIC STUDY OF METALLIC LUSTRE GLAZED WARES**

**Contribution format:** Oral  
**Contribution authors:** Stamatina Nikologianni (Institute of Nanoscience and Nanotechnology, N.C.S.R. Democritos, Athens) – Massimo Beltrame (Hercules Laboratory, University of Evora)

The largest collection of Islamic metallic lustreware glazed ceramics of the Gharb al-Andalus (Western Iberia, during the Islamic period), has been discovered in Mértola (Portugal). This collection dates from the second half of the 11th century until the early decades of the 13th. The fragments belong to a set of metallic lustreware ceramics produced during the time of the Seville Abbey dynasty (in the second half of the 11th century) and in the Almohad era (12th and 13th centuries). Typologically, these fragments are quite diverse, including pots, small jars, cups and plates. Of this set, approximately half have a golden and reddish decoration with a very distinctive brightness, primarily applied closed shapes. The remaining half exhibits a more yellowish-golden colour, commonly found on open forms but also occurring i. closed ones. In all instances, the golden decoration is quite fragile, leading to its deterioration i. several pieces, where only small traces are visible. The samples from Mértola were studied alongside lustreware glazed ceramics from Coimbra (Portugal) and Calatrava, la Vieja (Spain) to enable a comparative analysis of provenance and production technology of metallic lustre ceramics. This approach aims to provide deeper insights into the technological practices responsible for the various lustre colours observed in these ceramic samples using archaeometric methods.

**406. MAIOLICA FROM THE “WELL OF WONDERS” (ORVIETO, ITALY): EXPLORING MEDIEVAL CERAMIC TECHNOLOGY AND COLOR PRODUCTION**

**Contribution format:** Oral  
**Contribution authors:** Elisabetta Gliozzo (Dept. of History, Archaeology, Geography, Fine and Performing Arts, University of Florence) – Danilo Leone – Vincenzo Valenzano (Dept. of Humanities, Letters, Cultural Heritage and Educational Studies, University of Foggia)

The excavation of the “Well of Wonders” at Campo della Fiera in Orvieto has yielded a remarkable collection of ceramic materials that provide direct evidence of different phases of the maiolica’s production process. Among these finds are numerous biscuit-fired ceramics, over 600 well-crafted maiolica pieces attributable to at least two distinct production periods— one in the 13th-14th centuries and the other in the 15th-16th centuries —defective maiolica that were discarded, production waste and a significant number of maiolica pieces that are entirely blackened. In line with the session theme, this study focuses on reconstructing the technological cycle of maiolica production, with particular attention to the role of fire in determining color variations and surface transformations. A comparative analysis of materials from different periods will reveal possible technological evolutions and continuities in raw material selection, pigment application and firing methods. A critical aspect of this study concerns the numerous maiolicas that exhibit a completely black and glossy surface. This phenomenon raises key questions about whether their appearance resulted from specific firing conditions—such as a high-temperature reducing atmosphere—or post-depositional factors related to their burial environment. Archaeometric analyses, including polarized optical microscopy, scanning electron microscopy, electron microprobe and inductively coupled plasma mass spectrometry have been used to identify the specific materials and methods used in the production process, providing insights into the technological capabilities and artistic practices of the period. By examining the intricate relationship between fire, color technology and production methods, this study enhances our understanding of the craftsmanship of medieval ceramists from Orvieto and nearby regions and advances knowledge of ceramic technology, production and trade in medieval Europe.

**1498. SHADES OF BLUE AND GREEN IN MYCENAEAN GLASS FIRING: THE CASE OF VOUDENI**

**Contribution format:** Oral  
**Contribution authors:** Maria Kaparou (Institute of Nuclear and Particle Physics, NCSR ‘Demokritos’ | Institute of Nanoscience and Nanotechnology, NCSR ‘Demokritos’)

Glass was a highly valued material in Mycenaean times, embodying both technological achievement and profound symbolic meaning. The deep cobalt blue, achieved through the inclusion of cobalt oxides, closely resembled lapis lazuli, associated with divine favor and elite status in the ancient world. Copper blue glass, with its vibrant turquoise hue, likely evoked the natural elements of the sea and sky, central to Mycenaean cosmology and identity. These materials were not mere decorative elements but carried social and ideological significance, while their crafting required advanced pyrotechnological expertise. The Mycenaean cemetery of Voudeni, in use for roughly 500 years (1500-1100 BCE), offers a compelling case study for examining the role of cobalt and copper blue glasses in funerary practices. The site includes 78 carved tombs and the ruins of a prehistoric settlement, possibly identified with ancient Mesatis. Most tombs were carved in circular, square, horseshoe, or quadrilateral forms, with domed chambers of varying sizes, often housing multiple burials. The largest tombs, such as numbers 4 and 75, likely belonged to officials or lords, reflecting the community’s hierarchy. Grave goods included vases, jewelry, tools, weapons, and utensils, indicating the prosperity and trade connections of the locals. The discovery of glass beads and inlays highlights their association with both elite and non-elite burials, symbolizing status and likely serving as offerings or protective charms respectively. These artifacts reflect the Mycenaeans’ cultural narratives, blending technological innovation with symbolic meaning. By integrating Voudeni’s material evidence and analytical data with bibliographic insights, the cultural and pyrotechnological significance of cobalt and copper blue glasses becomes clear, underscoring their role as carriers of meaning in Mycenaean society.

**1916. GLASS TECHNOLOGY AT THE SERVICE OF THE DEAD. BLUE GLASS JEWELLERY AND ORNAMENTS IN MYCENAEAN BURIALS**

**Contribution format:** Oral  
**Contribution authors:** Kalliopi Nikita (Ephorate of Antiquities of East Attica, Hellenic Ministry of Culture, Greece)

This work deals with the occurrence of blue glass jewellery and ornaments in burials of Mycenaean Greece during the principal Mycenaean period, namely 14th-13th centuries BC. This is the time when standardised forms of glass beads, plaques and ornaments principally in shades of dark blue, light blue and turquoise were produced in large numbers at the Mycenaean palatial workshops and were widely distributed throughout the Aegean. Emphasis is placed on glass assemblages found in the broader region of Attica. The blue glass jewellery found in the tholos tomb at Menidi and in the chamber tombs at Spata are representative examples owing to their outstanding quality and great quantity. A comparative study with published blue vitreous ornaments from contemporaneous cemeteries in Attica such as Athens, the Athenian Agora, Brauron, Varkiza-Vari, Voula-Alyki, Kalamaki, Eleusis will facilitate a more comprehensive discussion on the morphology, dating, spatial distribution and provenance of blue glass jewellery in the broader region of Attica. The range of glass colours and bead forms, the diversity of decorative designs on the moulded relief plaques as well as the modes of their stringing and arrangement in association with their burial deposition are presented and assessed. The paper aims to elucidate the role of vitreous jewellery as burial offering intended for the ritual of dressing and ornamentation of the dead in conjunction with the distinctive predilection for the use of cobalt and turquoise blue glass by the Mycenaeans.

**941. ORGANISING GLASS CULLET BY COLOUR AT THE ROMAN MANUFACTURING DISTRICT OF SPOLVERINO, TUSCANY (IT)**

**Contribution format:** Oral  
**Contribution authors:** Thomas Derrick (Macquarie University)

The Roman site of Spolverino (Alberese, IT) sits within the Maremma National Park in southern Tuscany. Nestled on the bank of the River Ombrone, the site has been identified as a centre for manufacturing and reuse. Across various phases, evidence suggests activities such as agricultural processing, a communal kitchen, metalworking, bone-working, attempted lime-burning, and glass cullet collection. A nearby maritime villa (Umbro Flumen) and sanctuary to Diana Umbronensis share construction methods and point towards a concerted structuring of the productive zone in the mid to late Roman empire. Over 7000 fragments (14kg) of Roman glass cullet have been identified from two rooms in this complex, including a suite of furnaces (but with no evidence of working waste). It seems possible that the site’s proprietors thought to create glassworking kilns to process glass waste in the same way that metal was being worked into ingots next door. However, as glass cullet can be used directly by glassworkers and remained a tradeable good, the ‘workshop’ instead focused on the curation and distribution of glass cullet. This paper examines the spatial organisation of this cullet through the archaeological record and aims to investigate parallels elsewhere in Italy and further afield.

1267. TECHNOLOGY, PROVENANCE AND COLOURS OF BYZANTINE GLASS BRACELETS FROM THE 11TH–12TH CENTURY BRANIČEVO AND MORAVA (SERBIA)

**Contribution format:** Oral  
**Contribution authors:** Roman Balvanovic (Vinča Institute of Nucelar Sciences) – Žiga Šmit (Jožef Stefan Institute | Faculty of Mathematics and Physics, University of Ljubljana, Slovenia) – Igor Sylachev (Institute of Nuclear Physics, Almaty, Kazakhstan | Institute of Nuclear Physics, Almaty, Kazakhstan) – Milica Marić-Stojanović (National Museum Belgrade) – Dragana Spasić-Đurić – Teodora Branković (National Museum Požarevac) – Riccardo Avanzinelli (Dipartimento di Scienze della Terra Università degli Studi di Firenze)

Glass bracelets were a popular decorative item across the Byzantine Empire from the 10th to 12th centuries, with multiple production centers identified. The 11th –12th century Byzantine towns of Braničevo and Morava in Serbia are particularly noteworthy due to their extensive collections of these bracelets, suggesting that the region was an important production hub. These bracelets were made from three types of flux: natron, plant ash, and evaporitic mineral soda. While the natron and plant ash glass exhibit characteristics typical of Levantine origins, the mineral soda glass comes from natron sources likely located in Anatolia. Black bracelets produced of natron glass were colored using high concentrations of iron in an oxidizing furnace environment. In contrast, black bracelets made from plant ash, mixed plant ash, and evaporitic mineral soda contained lower iron levels and were produced in a reduced furnace atmosphere. Cobalt-blue bracelets were colored with a cobalt pigment, which appeared in two distinct variants: one with high zinc content, resembling the cobalt-zinc colorant used in contemporary Islamic plant ash glass, and another with low zinc content, sourced from a different cobalt ore. The bracelets were categorized based on their shape, color, cross-section, and decorative elements into several types: Monochromatic bracelets – undecorated and available in various cross-sections; Spirally twisted bracelets – available in both monochrome and polychrome designs; Painted bracelets – featuring decorative painted elements; Profiled bracelets with transverse ribbing. Dark blue was the most common color, followed by light blue, light green, and turquoise, while dark green and black were less frequently found. Blue bracelets, being the most common, were likely the cheapest and widely available. However, it is important to consider the popularity of the color blue in Byzantine society at the time. Rarer turquoise and black bracelets were probably more expensive, indicating a wealthier clientele.

901. AS LONG AS IT’S BLUE: CRAFTING ARSENICAL COPPER IN THE BRONZE AGE BALKANS

**Contribution format:** Oral  
**Contribution authors:** Miljana Radivojevic (UCL Institute of Archaeology) – Thil. Rehren (The Cyprus Institute) – Maja Kuzmanović (Independent) – Meghna Desai (The Cyprus Institute)

Copper metallurgy in the Balkans is famous for its massive copper metal implements circulating this area throughout the 5th millennium BC. The first known copper alloy, arsenical copper, occurred in the Balkan Late Chalcolithic cultures by the end of this period. However, very little evidence is found related to the production of this alloy, and the lack of findings is commonly ascribed to the slagless nature of the early metal extraction process. Here we present copious evidence on the earliest documented arsenical copper smelting in the Balkans, from two sites in Serbia and Croatia, dated to the mid-4th millennium BC. Exceptionally well-preserved crucibles, slags and a few metal artefacts offer a rare insight into the technology of smelting and working arsenical copper in this part of the world. After the completion of our mineralogical, compositional, microprobe and provenance analyses, we argue raw materials for smelting arsenical copper come from a very rich and colourful mixed oxidic ore, available locally. The enrichment of crucible slags with specific transition metals such as Mn, Zn and Fe, together with the occurrence of fayalite and delafossite in several slag areas, confirms the smelting of an original ore charge rather than the re-melting of pre-existing metal smelted previously elsewhere. Since arsenical copper was preferred during much of the Late Chalcolithic/Early Bronze Age in the Near East and contemporary cultures in central Europe, this research is of wide-ranging relevance to our understanding of the early stages of copper alloy metallurgy in Eurasia.

1548. METALLURGICAL TECHNOLOGY AND THE AESTHETICS FOR RITUAL DEPOSITION IN THE SANCTUARIES OF TEGEA, GREECE (9TH–7TH CENTURIES BCE)

**Contribution format:** Oral  
**Contribution authors:** Nelly Kladouri (Hellenic National Archaeological Museum | Institute of Nuclear and Particle Physics, N.C.S.R. “Demokritos”) – Vana Orfanou (Ludwig-Maximilians-Universität München (LMU)) – Andreas Germanos Karydas (Institute of Nuclear and Particle Physics, N.C.S.R. “Demokritos”)

This study investigates the relationship between metallurgical technology and aesthetics within the context of ritual deposition, highlighting how ancient metalworkers were motivated not only by functional needs but also by the visual properties of metals. It focuses on the colour of copper alloys, which held ritual and social significance, as seen in the early adoption of gold-like metals and the specific hues of tin bronzes. Previous studies have demonstrated that minor compositional variations in Cu-As-Sn alloys can cause significant colour shifts: high tin content produces golden to silvery hues, whereas arsenic results in reddish to pink and eventually silvery tones. To investigate these patterns, 247 artefacts from four sanctuaries in Tegea, Arcadia, Greece (9th–7th centuries BCE), were analysed using micro-X-ray fluorescence spectrometry (micro-XRF), and their compositions were correlated with published experimental colorimetric data to reconstruct their probable original colours. The analysis revealed that the pins, rings, and sheets of the assemblage fell within distinct compositional ranges. The pins exhibited a more consistent alloy composition, suggesting stricter material control. The findings indicate a strong correlation between alloy composition, colour, and function, underscoring the role of aesthetics in ancient metallurgical practices. The persistence of specific alloy compositions, especially in pins, suggests a deeply rooted cultural tradition. Ultimately, this study highlights that aesthetic concerns, particularly colour, significantly influence the production and utilisation of copper alloys in ancient metallurgical practices.

996. ATRAMENTUM: CRAFTING CARBON-BASED BLACK PIGMENTS IN THE HELLENISTIC AND ROMAN WORLDS

**Contribution format:** Oral  
**Contribution authors:** Ariadne Kostomitsopoulou Marketou (MF Norwegian School of Theology, Religion and Society)

Among the colourants produced through pyrotechnological processes, one stands out as the direct outcome of fire: carbon-based black. Depending on the production process and starting materials, carbon-based black pigments can be divided into three categories: chars, cokes, and flame carbons, all of which were used as colourants in the Graeco-Roman period. Even though the production of carbon-black pigments mostly depended on commonly available materials and a seemingly simple process, ancient literary sources indicate the existence of an organised production and trade for (at least some of) these pigments. The production of an artificial carbon-based black pigment as described by Vitruvius, for example, is a rather complex pyrotechnological process that required specialised craft-knowledge and permanent workshop installations: a built structure lined with polished marble and interconnected to a furnace via vents. In this way, the soot produced by the carbonisation of the starting materials in the furnace could be directed into the structure, where it was deposited on the marble walls before being carefully collected to be used in painting or writing (De arch. 7.10). At the same time, alternative options for carbon-based black pigments are described, such as chars produced by burning a range of starting materials that would result in black pigments of various qualities. Given the importance of carbon-based black pigments in ancient polychromy, painting, and writing, this paper examines archaeological evidence of carbon-black production and reviews contemporary literary sources describing their manufacture and use in the Hellenistic and Roman periods. In turn, archaeological and literary evidence are compared to archaeometric analyses on paintings and manuscripts. In doing so, this paper’s aim is two-fold: a) to contribute to our understanding regarding the organisation of the production, circulation, and use of these materials and b) to identify methodological advances and challenges linked to the characterisation of carbon-based black pigments.

937. ROLLING WITH THE CHANGES: THE ADVANTAGES OF FIRING EGYPTIAN BLUE AS PILAE (PELLETS)

**Contribution format:** Oral  
**Contribution authors:** Hilary Becker – Jeffrey Pietras (Binghamton University (SUNY)) – Gregory Smith (Newfields, Indianapolis Museum of Art)

An innovation in the production of Egyptian blue occurred by at least the Hellenistic period when the pigment was made into small individual balls before firing rather than large blocks or bowl shapes that had been used in the millennia before. A recent study Kovalev et al. stated, “the transition from cakes to pellets may mark a technological innovation or reflect changes in the organization of the EB chaîne opératoire; the reason for this change remains unclear and needs further investigation” (Kovalev (2023)). What might be the reasons for this morphological change? For all of the experiments on Egyptian blue since the late 19th century, no study has explored the production advantages and disadvantages of shaping Egyptian blue into the large block shapes utilized in the Bronze age compared with the later ball shapes. At first glance, forming Egyptian blue into balls seems less efficient since rolling material into balls takes time, material can be lost, and fewer can fit into a crucible. However, making large blocks of Egyptian blue takes care to prepare, including allowing time for the large blocks to air dry before firing. Furthermore, the crucibles were commonly destroyed while removing the block after firing because they become fused. Since the balls make less contact with the sides of the crucible, they can be more easily freed without damage. The ability to reuse the crucibles would have been an added economical advantage. This study will review what experimental firings demonstrate about the differences in preparing and firing

the larger shapes compared with smaller ones. Archaeological evidence of Egyptian blue, such as a cake from Amarna with scoring marks, as well as large groups of Egyptian blue balls that are found together in agglomerated “lingots” will be assessed for further evidence of the production and firing processes.

**1817. VASES FROM THE GRUPPO DI VANTH: ANALYSIS OF THE CHEMICAL COMPOSITION OF PIGMENTS AND THE SYMBOLISM OF THEIR COLOURS**

**Contribution format:** Oral  
**Contribution authors:** Marína Zubajová (Masaryk University) – Letizia Ceccarelli (Politecnico di Milano | Masaryk University) – Roberto Paolini (Independent)

A group of red-figure vases from Orvieto, the s-c. Gruppo di Vanth, is dated to ca. 320–300 BC and contains approximately 12 vases. They are stored in museums in Orvieto, Chiusi and Palermo, but most of them are not on display. A brief description of some of them was given by Beazley (1947), some of them have been studied in more depth from an iconographic point of view (eg Dragoni 2006), but the whole group has never been systematically studied and published and that is the main goal of the authors. The contribution will mainly focus on their “materiality”, which is the technology of applying pigments after firing, as some of them have red and blue pigments on the handles, a rather unique technique. Furthermore, the paper will include chemical composition (pXRF) of the pigments, fabrics and black gloss analysis to determine whether the vases, attributed to this group, were produced by the same workshop, possibly in Orvieto. Therefore, to determine the group’s workshop not only on a stylistic but also on a scientific basis, it will be analyzed other vases produced in Orvieto. In addition, the contribution will present a reconstruction of the original appearance of the unpreserved parts of some vases. Hence, a part of the project is experimental: the ancient technologies will be reproduced aiming to reconstruct amphora No. 2645, which is quite known in terms of iconography, but no one has ever deeply studied its “materiality” and thus its original overall form, or how it was created and painted. The frieze depicts a journey to the underworld and the paper will also deal with the symbolism of the colours of the pigments and the plastic decoration of the handles and their relationship to the scene on the frieze.

**1296. JUST A KIND OF BLUE: THE PRESENCE OF LAZURITE IN 17TH-19TH CONTEXTS FROM CACHEU, GUINEA-BISSAU**

**Contribution format:** Oral  
**Contribution authors:** Rui Gomes Coelho (Department of Archaeology | Durham University | UNIARQ - Centro de Arqueologia da Universidade de Lisboa) – Maria Da Conceição Freitas (IDL - Instituto Dom Luiz, Universidade de Lisboa) – Ana Manhita – Mafalda Costa (HERCULES Laboratory | University of Évora) – Sara Simões (UNIARQ – Centro de Arqueologia da Universidade de Lisboa) – João Pedro Tereso (Associação BIOPOLIS - InBIO | UNIARQ – Centro de Arqueologia da Universidade de Lisboa) – Cláudia Oliveira (Associação BIOPOLIS - InBIO) – Sónia Gabriel (Laboratório de Arqueociências (LARC) - Património Cultural, IP | Associação BIOPOLIS - InBIO | UNIARQ - Centro de Arqueologia da Universidade de Lisboa) – Ana Maria Costa (Laboratório de Arqueociências (LARC) | Património Cultural, IP | Associação BIOPOLIS-InBIO | IDL - Instituto Dom Luiz, Universidade de Lisboa | UNIARQ - Centro de Arqueologia da Universidade de Lisboa)

In this paper we present the results of the analyses of i) blue pigment particles and ii) the two blue hues observed in a painted wall fragment, collected from the excavation of an early modern trade house in Cacheu, Guinea-Bissau. The site’s occupation started in the late 15th or early 16th centuries as part of a newly formed Portuguese colonial settlement. It was a residential building and trade house until the 1970s. It is located about 50 meters West of what was likely the first parish church. It currently hosts the Memorial of Slavery and the Slave Trade. The samples were collected from well-established stratigraphic contexts excavated in the yard of the building. The contexts were dated back to the 17th-18th (pigment particles) and 19th-20th centuries (wall fragment).The samples were analysed with micro X-ray diffraction (μ-XRD), a non-invasive method, allowing us to identify the crystalline phases of materials present in both samples. Both the pigment particles and the two blue hues observed in the wall fragment were identified as lazurite, indicating the use of lapis lazuli or its synthetic and cheaper alternative ultramarine, which was first developed in 1828. The context’s chronology suggests that the pigment particles found are of natural origin. Lapis lazuli and the blue pigment extracted from it were one of the most expensive materials used in the palette of early modern Western painters. Its intense blue and fine texture gave the pigment a special place in artistic practice.The presence of lazurite and the source of the painted wall fragment in the context found at the Memorial of Slavery is still under debate.

**1523. NEGATIVE PAINTING ON NEOLITHIC POTTERY: INTERACTION OF COLOR AND SPACE**

**Contribution format:** Poster  
**Contribution authors:** Olga Bajcev (Institute of Archaeology, Belgrade)

Negative painting is a distinctive decorative technique that emphasizes a unique approach to perceiving and utilizing color and space. In negative painting, a design is not created by painting the motif itself, but rather by applying the paint to the surrounding or „negative“ areas. For instance, instead of painting a spiral motif itself, the artist applies paint around the shape, allowing the unpainted surface—either the raw vessel or a slip coating—to define the form. This creates a visual effect where the design appears to emerge naturally from the negative space. This paper investigates examples of the negative painting technique on the Early Neolithic pottery from sites in Serbia (6200-5400 BC). The study focuses on the selection and combination of paints, the chaîne opératoire of the painting process, and the artisans’ level of technical skill. This technique demanded a distinct approach to both planning and execution, setting it apart from other painting methods observed in the Early Neolithic of the Central Balkans. The resulting designs present a creative twist on traditional styles. While examples of negative painting are relatively rare, they provide valuable insights into early aesthetic cognition. The use of negative painting suggests that Neolithic potters perceived color and space as interconnected elements, actively engaging in their interplay. They understood that the slip’s color was not merely a backdrop for decoration but an integral part of the design itself. In other words, they recognized that “empty” or unpainted areas were not simply voids but essential, active components of the composition. This reveals an early understanding of figure-ground organization, where subject and background work together to create a harmonious whole, illustrating a sophisticated grasp of positive and negative space in art.

**1601. DARKNESS VISIBLE: EXPLORING THE ORGANISATION OF IA GLASS BEADMAKING THROUGH TYPOLOGY-COMPOSITION LINKS OF PHOENICIAN-TRADED BLACK GLASS BEADS FROM PORTUGAL**

**Contribution format:** Poster  
**Contribution authors:** Valentina Loncaric (HERCULES Laboratory, University of Évora | IN2PAST Associate Laboratory for Research and Innovation in Heritage | Dept. Earth and Environmental Sciences, KU Leuven) – Mafalda Costa (HERCULES Laboratory, University of Évora | IN2PAST Associate Laboratory for Research and Innovation in Heritage) – Ana Margarida Arruda (UNIARQ - Centre for Archaeology of the University of Lisbon, School of Arts and Humanities) – Patrick Degryse (Dept. Earth and Environmental Sciences, KU Leuven)

Studies of Iron Age glass beads are usually approached from either a typological or technological/provenance study perspective. While typology-based research allows for the discussion on consumer-based phenomena like identity, status and symbolism, technological and provenance studies offer insights into long-distance trade and glassmaking technology. However, the reconstruction of the glass bead chaîne opératoire is severely hindered by the dearth of evidence of beadmaking/glassworking centres. While the current consensus among researchers is that IA glass found in Europe was synthesised in a limited number of primary glassmaking centres in the Eastern Mediterranean and Mesopotamia, many questions regarding the organisation of beadmaking remain shrouded in darkness. These include the number, size, and location of beadmaking workshops, their dependency on and links to certain primary glassmaking centres, and autonomy in secondary glassmaking, i.e. colour modification and/or glass mixing and recycling. Since direct evidence of beadmaking workshops for the period of Iron Age is lacking, one possibility is to explore the links between bead typology and glass composition – with special emphasis on the colourant fraction as an indicator of secondary glassworking – to understand the structure of the glassmaker-beadmaker-consumer network. This poster presents the results of a semi-quantitative pXRF analysis of a large assemblage of Phoenician-traded black-appearing glass beads from Vinha das Calicas 4. The results are compared with previously published LA-ICP-MS data to confirm if the observed relationship between three black-appearing bead types and different colourants persists on the site assemblage. While visually identical, different iron-based colourants were used to produce specific bead types found on the site, suggesting that the people of Vinha das Calicas 4 obtained their beads from at least two different beadmakers or production series.

**152 ARCHAEOLOGY OF STONE SARCOPHAGI AROUND THE MEDITERRANEAN DURING ANTIQUITY: CURRENT RESEARCH AND APPROACHES**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** (stone) sarcophagi, Mediterranean area, funerary contexts, craftsmanship, methodology  
**Session organisers:** Daniel Morleghem (La Sapienza university (Roma)) – Laura Nazim (Ruhr-Universität Bochum) – Katharina Meinecke (Universität des Saarlandes)

SESSION ABSTRACT

From Antiquity to the present day, the stone sarcophagus has been an ostentatious and costly funerary container. It is very often carved from a quality stone (marble in particular) and sculpted with geometric, plant, animal or anthropomorphic motifs, either as single isolated ornaments or depicting scenes from daily life or mythology. But a large proportion of sarcophagi, which are difficult to quantify at present because they have hardly been studied, are carved in local stone rather than in noble marble, often without any particular ornamentation and in different stages of manufacture. Today, sarcophagi are no longer studied solely from the social, iconographic, artistic and commercial point of view that marked the 19th and 20th centuries. For more than two decades, researchers have been taking an increasing interest in the strictly artisanal aspects (tools and cutting techniques), the presentation and visibility of the object within the funerary space, social differences and various local production centres. Even the simplest examples are gradually becoming part of the regional corpus, so that we can better understand the economy (in the broadest sense) of this particular object, as well as its role as a social and identity marker. The aim of this session is to provide an overview of recent and current research on stone sarcophagi in the Mediterranean during Antiquity. We invite contributors to present their case studies and discuss the following points in particular: - their approach(es) to the sarcophagus as a craft, artistic, funerary and economic object; - the criteria used to establish a corpus; - the place of sarcophagi among other contemporary funerary containers (for example, terracotta and lead - sarcophagi, as well as stone or terracotta urns); - the contextualization of sarcophagi inside the burial space; - the question of recognizable social differences among sarcophagus burials in a common context.

CONTRIBUTION ABSTRACTS

1344. THE MYTHOLOGICAL SARCOPHAGI FROM SOUTHERN ETRURIA: AN INTRODUCTION TO THE CORPUS AND CURRENT PROBLEMS OF INTERPRETATION

**Contribution format:** Oral  
**Contribution authors:** Valeria Riedemann (University of Washington)

To date, scholars have focused on studying funerary myths in Etruria from the perspective of tomb painting and Hellenistic urns (Steuernagel 1998; De Angelis 2015), leaving the unique corpus of mythological Etruscan sarcophagi in a marginal position. Examples of this indifference towards Etruscan sarcophagi are found in recent wide-scope publications where there is no entry for sarcophagi in the art category (Macintosh-Turfa 2013; Naso 2017; Bell and Carpino 2016). Furthermore, studies of myths on Roman sarcophagi emphasise the thematic heritage from the Greek tradition, often ignoring this geographically closer antecedent (Zanker and Ewald 2012; Russenberger 2015; Allen 2022). This paper examines the corpus of painted and carved stone mythological sarcophagi that have come to us –17 exemplars created over fifty years (350-300 BC), all from southern Etruria (Van der Meer 2004). Their findspots (Tarquinia, Tuscania, Vulci, and one example from the Orvieto area) acknowledge the particularities and the uniqueness of this type of funerary monument regarding their stylistic differences and iconographic choices, suggesting the presence of workshops operating locally and regionally (Riedemann Lorca, forthcoming). This research provides a background for the production of mythological sarcophagi in Southern Etruria, specifically focusing on the exemplars from Tarquinia, two of which are from the same tomb (Tomb of the Partunu). The results contend the long-established scholarship tradition to approach these monuments often from iconographic and iconological perspectives, leaving aspects of agency, market choice (i.e., stone and wooden sarcophagi; Weber-Lehmann 2007) and their use in the context of the family tomb insufficiently explored. Finally, this study briefly acknowledges the current state of these monuments in museums worldwide alongside their accessibility and relevance to researchers and the general public.

489. FROM THE ETRUSCAN CHISEL TO THE EUROPEAN MOUSE: INVENTORY AND TECHNICAL STUDY OF ETRUSCAN STONE SARCOPHAGI

**Contribution format:** Oral  
**Contribution authors:** Daniel Morleghem (La Sapienza, University of Rome)

In Southern Etruria, from the 8th to 6th centuries BC, stone sarcophagi were found in small numbers (around 70) in a limited number of necropolises (Bisenzio, Populonia, Tarquinia, Veio); even more similar examples were found in neighbouring Falisco territory. Between the 4th and 2nd centuries BC, the use of sarcophagi became more widespread (around a thousand examples), particularly in the territory of the city of Tarquinia, but also in Cerveteri, Chiusi, Perugia, Orvieto and Vulci. Until recently, researches have focused on decorated, inscribed and generally of good quality sarcophagi, only from the point of view of art history; the reference publication on the subject remains that of Herbig of 1952 (updated in 1974 [Goethert] and 2004 [van der Meer]), even though numerous discoveries have been made since then. As part of an MSCA post-doctorate, a complete inventory of Etruscan stone sarcophagi has been launched, with the aim of listing and documenting all examples - decorated or not, inscribed or not, those of good workmanship as well as the coarsest - of this particular craft production.

Each chest and lid is described morphologically, typologically, technically, ornamentally and petrographically on the basis of existing bibliography and iconography, or by direct observation wherever possible. Visual examination (traceology) of the blocks and selective photogrammetric surveys provide a wealth of information enabling us to reconstruct the “chaîne opératoire” and their temporalities, from the extraction of the blocks to the realisation of a decoration and/or inscription in the workshops or within the tomb itself. It appears so that the Etruscan sarcophagus is not a finished object from a workshop, but can undergo numerous transformations between its acquisition and use, and sometimes even beyond. All of the data is recorded in GIS which can be used to generate thematic or chronological maps, which are currently lacking.

357. LOCAL STONE SARCOPHAGI FROM THE “REGIO INSUBRICA”

**Contribution format:** Oral  
**Contribution authors:** Samuele Cambianica (Universität Zürich, Institut für Archäologie. Fachbereich Klassische Archäologie | Università di Pisa, Dipartimento di Civiltà e Forme del Sapere)

In the prealpine lakes region in the northwestern Transpadana, several monolithic sarcophagi made of local stone, generally dating to the Imperial and Late Antique periods, have been found. These monuments have smooth outer surfaces, lids in the shape of displuviate roofs, and unprofiled coffins. In some cases, they bear inscriptions either in open field or within a tabula ansata. Since the first decade of the 21st century, these previously overlooked funerary monuments have begun to attract scholarly attention. Archaeologists have recognized them as a distinct type of sarcophagus – alongside architectural sarcophagi and “Truhensarkophage”, which are considered characteristic of northern Italy – and have referred to them as “sarcofagi a cassa rettangolare liscia”. In most cases, these sarcophagi are currently found in contexts of reuse, with their provenance unknown. Many remain unstudied or unpublished, and their frequent reuse and relative mobility suggest that numerous additional exemplars have yet to be identified. The scarcity of images and inscriptions that distinguishes this production, combined with the limited data on their archaeological contexts, induces to concentrate the study of these sarcophagi on aspects beyond those traditionally investigated for this class of monuments. These include formal features and their relationship with the material from which they are made, considerations regarding the intended placement, modes of observation and communication, issues concerning the aniconic character of the monuments, and their utilitarian reuse in later periods. Recently, these sarcophagi have been the subject of studies on their typology, production groups, and epigraphic readings using digital techniques. The paper aims to provide an overview of the sarcophagi from this region, evaluate the current state of research, and discuss possible directions for future studies.

1507. AB-U HAYAT QUARRY: A LOCAL MARBLE RESOURCE AND ITS CONTRIBUTION TO SARCOPHAGUS PRODUCTION IN ROMAN EPHEOS

**Contribution format:** Oral  
**Contribution authors:** Vasiliki Anevlavi – Walter Prochaska (Austrian Archaeological Institute, Austrian Academy of Sciences)

The hinterland of Ephesos was one of antiquity’s most significant marble extraction regions, supplying the city with its signature white marble. This research focuses on the Ab-u Hayat quarry, a small yet distinctive source known for its durable and coarse-grained marble. Previous analyses confirm that Ab-u Hayat marble was primarily utilised for sarcophagi production during the early Imperial period, with the peak of activity dated to the 1st century AD. Notably, the Octagon sarcophagus represents an exception, dated to the 2nd half of the 1st century BC. A combination of petrographic and geochemical methods was employed to analyse multiple artefacts, including lids and chests from Ephesian sarcophagi. Techniques included macroscopic observation, ICP-MS trace element analysis, and stable isotope ( $\delta^{18}\text{O}$ ,  $\delta^{13}\text{C}$ ) evaluation, alongside statistical analyses (discriminant analysis). These data were compared against an extensive database of approximately 5,700 geological samples from quarries in Ephesos and prominent sarcophagus production centres such as Prokonnesos, Aphrodisias, and Dokimeion. The results reveal a significant reliance on this local marble source, underscoring the quarries’ central role in the economic and cultural development of Ephesos. This sourcing pattern enriches our understanding of material provenance and ancient trade dynamics, presenting new perspectives on marble use and distribution in the Eastern Mediterranean.

123. IMAGE, TEXT, AND BODY: RECONCILING MODES OF REPRESENTATION ON AND WITHIN SARCOPHAGI OF ROMAN TYRE

**Contribution format:** Oral  
**Contribution authors:** Nicholas Aherne (University of Groningen)

For centuries Roman sarcophagi have captured the attention and imagination of scholars. Despite the last four decades witnessing significant advancements in the interpretation of sarcophagi iconographies, disproportionate

focus remains on mythological and figurative marble sarcophagi which compose a small proportion of the empire-wide corpus; their immediate funerary context is often neglected. This paper contributes to filling such gaps by breaking disciplinary boundaries through a holistic and contextual study of the sarcophagi of Roman Tyre. Methodologically, it is inspired by Meinecke (2014) Sarcophagum posuit, Newby (2018) The Grottarossa Doll and her Mistress, and my doctoral research which comprises a catalogue and analysis of the stone, lead, terracotta, and wooden sarcophagi of Phoenicia, specifically, their ritual function. Tyre yields some exceptionally well-preserved contexts, permitting a comparative analysis of ‘image’, ‘text’, and ‘body’. Whilst most of the sarcophagi and their decoration date to the second and third centuries AD, nearly all their inscriptions belong to later phases of use in the fifth and sixth centuries AD. The burials per sarcophagus average 12 but reach the high 30s. How does such evidence alter our interpretation of the sarcophagi? What does it mean for their functionality when several individuals were represented by a single imago or nomen? And how did this shape the way the living commemorated the dead? Another novel facet of this paper is that ‘image’ and ‘text’ transcend the exterior surfaces of the sarcophagi to encompass the interiors. Objects, such as, coins, lamps, figurines, and jewellery, deposited as grave goods, possess iconography and inscriptions that represent and commemorate the dead. Some objects exhibit a cultural consumption, similar to the sarcophagi themselves, and others, a seemingly contrasting one. Thus, this paper explores to what extent the sarcophagi and their contents with differing materialities and audiences operated toward the same end in funerary ritual.

1110. SENSING DEATH: LATE ANTIQUE SARCOPHAGI IN THEIR RITUAL CONTEXT

**Contribution format:** Oral  
**Contribution authors:** Alexis Gorby (University of Oxford)

The traditional approach to sarcophagi places an emphasis on iconography, which in turn, emphasizes the visual experience of the objects. However, recent contextual approaches to sarcophagi indicate many sarcophagi were invisible or partially visible. How do we reconcile this emphasis on iconography while many of the images could not be seen? This bias towards understanding sarcophagi as primarily visual objects is an invention of modern historiography due to the decontextualization of the objects. Rather, by placing sarcophagi back into their original ritual and burial context, the multisensory nature of the objects is revealed. By examining the textual, bioarcheological, and epigraphic evidence of late antique sarcophagi, the senses of smell, sound, and touch become a vital part of how the objects were experienced. Moreover, how this multisensory experience of sarcophagi was interpreted by the audience, or in other words the material socialization of the objects, indicates funerary rituals were not fully-Christianized during this period despite the change in iconography. As multisensory objects, the role of sarcophagi in funerary rituals went beyond providing a visual reflection of the Christian ideal of a beatific afterlife and salvation. The smells, sounds, and touch of sarcophagi helped dictate and structure normative behaviours and emotional responses during funerary rites. These behaviours and responses did not always align with the theological ideal of what a Christian funeral should be. In placing sarcophagi back into their ritual context, a more nuanced understanding of late antique funerals and death emerges.

2303. (RE)CONTEXTUALIZING ETRUSCAN SARCOPHAGI

**Contribution format:** Oral  
**Contribution authors:** Laura Nazim (Ruhr-Universität Bochum)

The so-called Late Etruscan stone sarcophagi, whose beginnings date back to the mid-4th century BC and which were produced for around 200 years, mainly in southern Etruria, are characterized by their coffins decorated with figural reliefs or paintings that cover a range of different topics. The lids can also take various forms: in addition to the roof lids, the life-size figures, which either lie flat on their backs or sideways and represent the deceased, are the norm. Since the early excavations of the 19th century, numerous Etruscan chamber tombs with sarcophagi burials have been discovered. However, due to the methods and interests of that time, the focus was almost exclusively on the sarcophagi defined as ‘important’ back than. These mainly include those examples with figurative narrative decoration, which were treated as isolated art objects. While these sarcophagi were scattered throughout the world in private and public collections, the graves were either not documented at all or only insufficiently, and knowledge of the contexts was lost. Although modern research is now including the known hypogea of various families, the locations of individual sarcophagi are still unknown, or their graves are not being researched due to earlier looting and destruction. These contexts in particular can provide important information about the socialization with other forms of burial, the positioning of the individual sarcophagi in the burial chamber or differences in the custom of burial in family graves. The aim of the lecture is to provide an overview of Etruscan burial contexts from the 4th to 2nd century BC. On the basis of individual graves, it will be exemplified which potential for answering questions regarding the hierarchization and social position of individuals within a gens can be gained from the contexts, and which social differences and groups can be determined.

390. THE TRAVERTINE SARCOPHAGI AT HIERAPOLIS OF PHRYGIA: FORMS, PRODUCTION, AND DISPLAY

**Contribution format:** Oral  
**Contribution authors:** Anna Anguissola (University of Pisa | Accademia Nazionale dei Lincei, Centro Interdisciplinare Linceo Giovani)

During the peak of its economic and cultural prosperity in the 2nd and 3rd centuries CE, the roads leading to Hierapolis of Phrygia (Turkey) were lined with hundreds of tombs, making them a defining feature of the urban landscape. Thousands of travertine sarcophagi and hundreds of marble ones are dispersed throughout these funerary areas, many still in their original positions and accompanied by related objects and inscriptions. This paper presents the preliminary findings from seven seasons of fieldwork aimed at cataloging the sarcophagi of Hierapolis, as part of the Italian Archaeological Mission. It focuses specifically on approximately 1,500 travertine sarcophagi from the northern necropolis, the largest of Hierapolis’ burial sites. The paper begins by exploring the understanding, function, and economy of sarcophagi, linking the surviving artifacts with the funerary inscriptions from the same contexts. It also addresses the challenges of creating a comprehensive corpus from such a large number of finds and considers how this collection can serve as a methodological framework or a point of comparison for other sites. Finally, the paper examines a small group of around 100 travertine sarcophagi with figural motifs. The study of their form, typology, and style in relation to marble sarcophagi reveals general trends in Hierapolis’ funerary displays and highlights specific features of travertine production. This medium seems to have allowed greater flexibility in the selection of subjects, often linked to the professional sphere. These examples provide insight into the practices of sculptors who likely worked with both materials, adapting to their patrons’ needs and frequently transferring typologies and forms between travertine and marble. The burial grounds of Hierapolis offer unique perspectives on workshop practices, technologies, and the social dynamics of the imperial Greek East, shedding light on how personal and social identities were negotiated in the funerary sphere.

538. SARCOPHAGUS PRODUCTION IN ROMAN UPPER MACEDONIA: LOCAL WORKSHOPS, IMPORTED TRADITIONS, AND TRADE DYNAMICS

**Contribution format:** Oral  
**Contribution authors:** Ines Ferjan (University of Edinburgh)

This paper examines the diverse production models of Roman-period sarcophagi in Upper Macedonia, with particular focus on the interaction between local craftsmanship and imported sculptural traditions. Drawing on archaeological evidence, the study explores the role of Thessaloniki as a trade hub and the extent to which local workshops adapted to or incorporated external artistic influences. Through the analysis of marble provenance – currently approached primarily at a macroscopic level - carving techniques, and workshop practices, the research identifies three principal models of sarcophagus production. The first model encompasses fully imported sarcophagi, which arrived in Upper Macedonia as finished products, often produced in major Mediterranean workshops and transported via established trade networks. The second model examines part-worked imports, which reached the region in a roughed-out state, allowing local sculptors to complete the final carving and decoration. This process enabled a degree of customisation while maintaining the prestige of high-quality imported marble. The third model focuses on locally crafted sarcophagi, produced entirely from local material, reflecting how Macedonian artisans adapted external stylistic influences. To provide a broader perspective, the study also incorporates comparisons with selected sarcophagi from the neighbouring province of Moesia Superior, where similar production models are observed. By highlighting workshop variability, the role of itinerant craftsmen, and the economic mechanisms underlying sarcophagus distribution, this study provides a more comprehensive understanding of funerary art, consumer-driven economic decisions, and production organisation in Upper Macedonia during the Roman period.

153 DYNAMICS OF GREEK COLONISATION: CURRENT RESEARCH AND NEW PERSPECTIVES

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Regular session  
**Session keywords:** Italy, fieldwork, museum, settlements, artefacts, conservation  
**Session organisers:** Lieve Donnellan (The University of Melbourne) – Marco Stefano Scaravilli (Direzione Regionali Musei Nazionali Calabria)

SESSION ABSTRACT

The dynamics of Greek colonisation have been much discussed over the last decades. Increasingly, it is understood that it has not been the uniform process that is described in ancient sources. Recent archaeological investigations

have added much more depth and complexity to the discussion. Especially the presence of native populations and complex trajectories towards urbanisation and the role of the economy have come to the front. The aim of this session is two-fold: provide an opportunity to discuss specific case studies from Italy and Sicily as well as invite discussions from other regions to offer a comparative perspective. We specifically encourage participation from different institutional participants to open dialogues between research and conservation, legislation and other relevant aspects. Through discussion of specific case studies between different institutional partners and researchers about current research, results and their historical significance, we hope to provide perspectives for future research and heritage conservation related to sites of Greek interaction overseas.

CONTRIBUTION ABSTRACTS

706. THE PLAIN OF GIOIA TAURO SURVEY: THE CHORA OF MEDMA (2018-2024)

**Contribution format:** Oral  
**Contribution authors:** Lieve Donnellan (University of Melbourne)

A new project to conduct a systematic ceramic survey in the Plain of Gioia Tauro was launched in 2018 with the Free university of Amsterdam. During the consecutive years, with different institutional partners (Aarhus University and University of Melbourne), different parts of the Plain surrounding Ancient Greek Medma were investigated. This paper will present some preliminary results concerning settlement evidence and other human activity, which can be dated to the Neolithic up until Medieval times. The main period of focus is the transition between the Final Bronze Age/Iron age and the traditional date of arrival and consolidation of Greek colonists in the mid-to late 7th century BCE. The archaeological record testifies to a gradual centralisation, a phenomenon that has been generally observed in Greece and Italy, however, the date appears to be later than would normally be expected. The discussion will also highlight methodological issues, mainly due to severe interventions in the subsoil, such as drainage and resource exploitation.

91. SETTLEMENT HISTORY AND DYNAMICS IN THE PLAIN OF GIOIA TAURO FROM AROUND 1000 TO 250 BCE

**Contribution format:** Oral  
**Contribution authors:** Anna-Elisa Stümpel – Lieve Donnellan (University of Melbourne)

In this contribution, we present preliminary results from LiDAR data analyses of the Plain of Gioia Tauro (PGT) project. The PGT project is concerned with the settlement history in the plain from around 1000 to 250 BCE. Since past research largely focused on Greek migration (‘colonisation’) and non-local Greek material culture, many aspects are poorly understood and results regarding local urban trajectories and processes of settlements in the plain are unilaterally Greek. The research of our contribution aims at gaining a more detailed, objective, and holistic understanding of the urbanism of settlements in the PGT in the long-term. For doing so, publicly available raw LiDAR data has been collected from the Italian Ministero dell’Ambiente e della Sicurezza Energetica and visualised as Analytical Hillshade (AHS), Multihillshade (MHS), and Skyview Factor (SVF). These visualisations are used together with satellite imagery for effectively surveying the plain remotely in a GIS environment. Focus has been put on areas in the vicinity of known sites, natural features, and marginal areas in the terraced hilly inland of the PGT, which have sustained fewer intensive anthropic alterations. Future work, however, will verify these areas more systematically. Thus far, the LiDAR analysis has yielded positive results in identifying sites of potential historical and archaeological interest dating to the above outlined timeframe. It was possible to recognise a range of features and areas, such as structures of edifices, burial grounds, and features built without (durable) building materials (e.g., canals and earthworks), previously unknown to archaeological research. Some of these appear to be related to a particular period, such as possible apsidal Iron Age huts. Others possess a less unambiguous chronology while detections need to be generally groundtruthed. Concluding, LiDAR data constitute a powerful addition to archaeological research, but there are shortcomings too, such as assessing the chronology of features.

135. THE CERAMICS OF THE PLAIN OF GIOIA TAURO: UNRAVELLING ECONOMIC DEVELOPMENTS UNDER THE 1ST MILLENNIUM BCE

**Contribution format:** Oral  
**Contribution authors:** Viktor Linusson (The University of Melbourne)

The Melbourne surveys in the Plain of Gioia Tauro (PGT: 2018–2024, Calabria) have distinguished an intensively used chora of the Greek-style settlement of Medma. Our survey finds even out previous excavation biases leaning towards non-Indigenous and urban sites, and therefore constitute important means with which to reconstruct economic developments in this coastal plain. However, since the survey record is low-density and contains few diagnostic potsherds, any ceramic analysis needs to concentrate on its best-preserved parameter: clay fabrics.

This paper first delivers a petrographic identification of the ceramics from a selection of PGT sites dating to the Early Iron Age 1 to the Hellenistic period (c. 10th–3rd centuries BCE), contributing new hypotheses on local ceramic production organisation. Separately, consumption dynamics are explored for each site. The results aid not only the broader project to reconstruct settlement patterns in the Plain but provide new insights into human mobility and exchange networks in southwestern Calabria.

2188. MAPPING ANCIENT MEDMA: SURVEYS, LEGACY DATA INTEGRATION, AND REMOTE SENSING FOR THE URBAN TOPOGRAPHY

**Contribution format:** Oral  
**Contribution authors:** Marco Stefano Scaravilli (Direzione Regional Musei Nazionali Calabria) – Rodoldo Brancato (Università Federico II di Napoli)

This presentation aims to discuss the preliminary results of the archaeological mapping of Medma, a sub-colony of Locri located within the territory of Reggio Calabria (Italy). The project integrates remote and proximate sensing techniques with a systematic reassessment of archaeological legacy data, including historical photographs, satellite imagery, and UAV photogrammetry, to reconstruct the urban topography of the ancient polis. Medma’s known archaeological record is fragmented, consisting of disiecta membra, such as sections of its urban plan, residential quarters, sacred areas, and necropoleis, primarily from the Classical and Hellenistic periods. Central to this effort is the extensive magnetometry survey conducted in 2022, covering 10 hectares within the archaeological park. This survey provided essential geophysical data to complement the legacy datasets. By systematically digitizing and georeferencing the available data in a GIS environment, the research addresses critical aspects of Medma’s urban layout, the extent of the built environment, and the topographical alignment and coherence of its city walls. The integration of these methods offers new insights into the spatial organization and development of the ancient city, facilitating a more comprehensive understanding of its historical significance.

2000. STATUETTES AND THE DIVINE. NEW LIGHT ON THE CULT OF MEDMA’S “CALDERAZZO” SANCTUARY THROUGH THE SYSTEMATIC STUDY OF TERRACOTTA OFFERINGS

**Contribution format:** Oral  
**Contribution authors:** Ágnes Bencze (Pázmány Péter Catholic University)

In the framework of a collaboration started in 2017, the international research group named “Cercoloc” (Pázmány Péter Catholic University - Accademian Nazionale dei Lincei - École Française de Rome), began a project consisting in the systematic documentation and study of the terracotta offerings unearthed between 1909 and 1913 on the site of the largest sanctuary of ancient Medma, the one located in the district named “Contrada Calderazzo”, Rosarno (Calabria). Practically we have taken over the intriguing but extremely difficult task of the systematic publication of all figural terracottas provenant from Paolo Orsi’s “great favissa”. The project is carried out in a close collaboration with the Soprintendenza ABAP responsible for the territory and with the Museums in charge of the conservation of the finds (Museo Archeololgico Nazionale di Reggio Calabria, Museo Archeologico di Rosarno). In the current state of the work the number of items (fragments and some complete specimens) catalogued for the period which goes from the last decades of the 6th century to the third quarter of the 5th century BC, reaches beyond 4.000 pieces and already gives a much richer and more complex view of the repertory, than it was believed in the past. In the course of the documentation work we also recognized and reconstructed a nearly life-size terracotta statue of Athena Promachos, buried together with the smaller statuettes on the same site.

1437. AT THE HEART OF A NEW COMMUNITY: THE NECROPOLIS OF MÉTAUROS IN THE 7TH CENTURY BCE

**Contribution format:** Oral  
**Contribution authors:** Clara Maria Hansen (University of Vienna)

Building on the detailed study of two sectors of the necropolis (Canerossi and Musumeci plots), this paper examines the earliest funerary documentation of Métauros, present-day Gioia Tauro (c. 700-580 BCE). In the early generations, the Métauros community adopted a unique funerary ritual that blended allogenic elements with local traditions. This fusion is also reflected in the material culture, where locally typical objects coexist with non-local items from Greece and the eastern Mediterranean, highlighting the community’s full engagement in broader Mediterranean exchange and interaction dynamics. While similarities can be found in other newly established western communities such as Pithekoussai and Mylai, the funerary practices of Archaic Metauros are notably distinctive, serving as a clear example of the complex interplay between continuity and change in response to Mediterranean mobility. This paper explores the intersection of local tradition and increasing mobility of people, goods, and ideas during the 7th and early 6th centuries BCE. By asking how earlier local tradition may have been preserved within the frame of the funerary sphere and how this was impacted by the reception of new objects and practices, this study offers a highly granular and bottom-up perspective on how the processes

of ‘Greek Colonization’ were negotiated at the local level.

1465. RITUALS IN CHANGE: BURIAL PRACTICES IN LATE ARCHAIC AND EARLY CLASSICAL MÉTAUROS

Contribution format: Oral  
Contribution authors: Bettina Bernegger (KU Leuven, University of Melbourne)

The use of the Métauros necropolis spanned over two centuries. While most known burials date to the Early Archaic period (700-580 BCE), a notable group of tombs belongs to the late Archaic and early Classical periods (c. 580-480 BCE). During this time, the communities of the Calabrian poleis experienced significant historical changes: the largest and most influential poleis developed monumental forms and consolidated territorial control, achieving full city-state status. These social and political transformations are mirrored in the funerary practices of the Métauros necropolis: in this period, the local community gradually abandoned many traditional burial customs in favor of the rituals practiced in the major poleis of Locri Epizephyrii and Reggio, thus reflecting its growing involvement within the rapidly evolving social and political dynamics in the region. Drawing on the evidence from the Canerossi and Musumeci plots, this paper examines the role of Métauros in the shifting social and political dynamics of the early Classical period and their impact on ritual behaviours and funerary representations of community and local identity. In doing so, Métauros serves as a link in the understanding of smaller communities in the Greek world of Southern Italy and how connectivity can be understood through archaeological funerary studies.

1920. MÉTAUROS (GIOIA TAURO, RC): RITUALS AND FUNERARY REPRESENTATIONS OF A MEDITERRANEAN COMMUNITY OF THE EARLY 1ST MILLENNIUM BCE

Contribution format: Oral  
Contribution authors: Francesco Quondam (Universität Wien) – Alessandra Sperduti (MuCiv - Museo delle Civiltà)

The necropolis of Métauros (present-day Gioia Tauro, RC) represents the most significant funerary context of the Archaic period in Calabria: between 1973 and 1984, over 1,200 tombs were excavated, dating from the early 7th to the early 5th century BC. Still largely unpublished, the necropolis has been the subject of a research project since 2022, led by the University of Vienna (MAP - Métauros Archaeological Project), focused on the study and complete publication of the Archaic necropolis contexts. Métauros serves as one of the most intriguing examples of Mediterranean mobility dynamics during the early first millennium BC: identified as a Greek polis in later Roman-written sources, the settlement likely emerged from both long- and short-distance migrations, with a strong orientation towards Mediterranean trade, fueled by the rapid growth of trading hubs in the Lower Tyrrhenian basin, where just a few generations earlier the community of Pithecusa (Ischia) had settled. The necropolis of Métauros reveals a dynamic context with strongly original features. While it shares certain ritual expressions with other newly-formed communities, such as nearby Sicilian Mylai, it autonomously manifests its own distinctive identity and cultural dynamics. In coordination with the subsequent work of Hansen and Bernegger, this paper aims to provide a general overview of the Archaic necropolis based on a comprehensive review of the excavation documentation and the study of approximately one-quarter of the investigated tombs. Special attention will be given to the integration of archaeological and anthropological data, with the aim of offering an integrated reconstruction of the ritual systems in relation to the gender and age of the deceased, both synchronically and in their diachronic variations.

1815. ENTANGLED BY DRINK: FEASTS AS LOCI OF SOCIAL INTERACTION AND TRANSFORMATION AMONG WESTERN SICILIAN COMMUNITIES IN THE FIRST MILLENNIUM BCE

Contribution format: Oral  
Contribution authors: William Balco (University of Wisconsin-Milwaukee)

Local Sicilian populations were exposed to new ideas, behaviors, and material culture during the first millennium BCE. Mercantile exploits, political interventions, and military campaigns, among other events, entangled local and foreign populations, irreversibly transforming all involved. One behavior crosscutting all these events was feasting. Feasts were loci of displays of wealth, power, prestige, and identity, reinforcing extant social norms while accommodating and adopting new ones. Consequently, changes to feasting behaviors, hardware, food, and drink reflect choices by individuals living among socially entangled communities. This paper explores commensal hardware, the vessels used during the feast, recovered at Sicilian population centers occupied during the Late Iron Age and Archaic periods. These vessels attest the incorporation of new concepts of what was considered “proper” participation in the feast. The incorporation of Aegean and Levantine commensal vessels at indigenous Sicilian sites was followed by the adoption of vessels incorporating combinations of Aegean, Levantine, and indigenous Sicilian forms and decorations. These vessels redefined displays of wealth, power, prestige, and identity. Exhibiting such vessels, through active use or static display, visibly communicated status to other participants

at the feast. This suggests a transformation of indigenous Sicilian feasting behaviors in response to the complex social entanglements resulting from the establishment of Greek colonies and Phoenician emporia. Consequently, feasts were loci of both social interaction and transformation, incorporating and displaying new and modified social norms reflective of redefined cultural identities.

824. POWER AND COEXISTENCE ON ISSA: ANALYZING GREEK-INDIGENOUS RELATIONS ON THE ISLAND OF VIS IN THE EASTERN ADRIATIC

Contribution format: Oral  
Contribution authors: Filip Budic (Department of History, University of Zagreb)

Greek engagement with the Eastern Adriatic emerged relatively late compared to other Mediterranean areas. While sporadic evidence appears from the 6th century BC, more substantial interaction between Greek traders and local populations is discernible from the 5th century BC onward. A significant focal point for this contact along the eastern Adriatic coast was the island of Vis within the central Dalmatian archipelago. Diodorus Siculus (XV, 13, 4) attributes the founding of the settlement of Issa to the Syracusan tyrant Dionysius I during the 4th century BC. The precise establishment date remains uncertain, with scholarly opinions diverging. Some, relying on historical sources, posit a founding date in the early 4th century BC, while others, based on archaeological finds, suggest a later date. The Greek settlement on Vis occupied a strategically advantageous bay in the Adriatic. Unlike the neighbouring island of Pharos, where written sources detail a rapidly escalating conflict between Greek settlers and the indigenous population (Diod. Sic. XV, 14, 1-3), the initial interactions between Greeks and natives on Vis remain obscure. Scholarly discussion on this topic typically centres on limited epigraphic and archaeological evidence. The fate of the pre-existing Iron Age indigenous population across the remainder of the island requires further investigation. Vis is a relatively small island (about 90 km2), with limited fertile land that occupies only one-tenth of the entire area. This suggests that the Greeks required control of the entire island to participate in Adriatic trade networks effectively, but also raises numerous questions concerning local agricultural strategies and the nature of Greek-native relations. A recent field survey has indicated a longer period of coexistence between Issa and hillfort settlements than previously assumed. Vis Local History Museum, established this year, offers significant potential for future research into the Greek and native presence on the island.

1493. COLONIES, CAVES AND WORSHIP IN NORTH AEGEAN

Contribution format: Oral  
Contribution authors: Fotis Georgiadis (Ephorate of Palaeoanthropology - Speleology, Hellenic Ministry of Culture)

Excavations and research projects of the last decades made new data available and opened new discussions on Greek colonisation of north Aegean. Traditional assumptions have been challenged and new perceptions were introduced. In the course of this ongoing discussion, it is now widely accepted that the archaeological record reflects the complexity of the settlement patterns and the multiplicity of the agents involved. Although the presence of imported pottery does not equate to the presence of settlers, and the written sources on colonisation are fragmentary and usually significantly later than the facts they refer to, the practice of Greek cult rituals is undoubtedly indicative of the presence of Greeks on the north Aegean coast. The role of religion and extra-muros sanctuaries in the phenomenon of colonisation has been discussed with regard to the colonies of Italy and Sicily. The foundation of extra-muros sanctuaries, such as cult-caves, has been interpreted as a means of appropriation of the territory, a signifier of the possession of the previously foreign land. Recent research carried out in cult-caves in the northern Aegean has provided new evidence supporting the conclusion that the establishment of archaic sanctuaries in caves, where Greek religious practices were performed, took place in certain cases within the first generations of the colonial settlement. The paper will discuss specific case studies of cult-caves in north Aegean and their association with the relevant colonies.

520. MISSING PARTS, MISSING ANSWERS: CASE STUDY OF BURIALS FROM THE SANCTUARY VIKTORIVKA - I IN UKRAINE

Contribution format: Oral  
Contribution authors: Daria Hemberzhevsk (Petro Mohyla Black Sea National University)

The archaeological site of Viktorivka–I is a significant Greek cultural complex located on the right bank of the Berezan Estuary in Ukraine’s Mykolaiv region. It comprises two main parts, which were active during the Late Archaic, the Classical, and the Early Hellenistic periods — a sanctuary in the northern part of the site and a settlement in the southern one. The sanctuary stands out for its unique construction, featuring ash mounds and ash pits set within artificially dug complex pits carved into the bedrock. Evidence from its construction and materials suggests that the sanctuary was dedicated to the cults of Demeter and Apollo. In Ash Pits No. 1 and No. 2, dated to the mid-6th to early 5th century BCE and late 4th to early 3rd century BCE, respectively, eight burials

were uncovered, including three paired burials. The individuals ranged in age from 6–8 to 50–55. The remains display injuries from sharp and blunt objects, as well as possible arrow wounds. However, their most striking feature was the possible dismemberment: missing skulls, chopped limbs, and partial or complete absence of limbs. One paired burial was arranged in a “package” formation. All burials, except for a child’s, lacked grave goods; the child’s burial contained vessel fragments and a stone pendant possibly linked to the Yamna culture (3600–2300 BCE). Two theories exist regarding the burials: one is that the ritual complex was built over an older burial ground (possibly a mound), while the other suggests that the burials are contemporary with the sanctuary and may represent human sacrifices. In either case, findings indicate atypical behaviour for the bearers of ancient Greek culture. This could point to either a rite of neutralization of earlier burials or the human sacrifice of community members(?), as part of a ritual practice unknown for centuries.

896. MEDMA AND ITS URBAN LAYOUT; NEW DATA, PROBLEMS, PERSPECTIVES

**Contribution format:** Poster  
**Contribution authors:** Gianluca Sapio (Ministry of Education)

The last organic work on the Locrian sub-colony of Medma dates back to 1981; since then numerous archaeological investigations have followed one another especially on the plateau of the ancient city with scientifically planned excavation campaigns, but largely with data obtained from occasional work. A comprehensive rereading of this information today certainly allows us to enrich with new pieces the “mosaic” of knowledge on the topography of the ancient city. The contribution will illustrate some preliminary data from unpublished works that will allow us to reread some scientific problems that are still open; in particular: 1) the shape of the ancient city, with its limit on the plateau towards the east, in the area of the current Cucchiararo district and along via Medma, the relic of a probable ancient longitudinal axis that crossed the whole of Pian delle Vigne; 2) the spatial organization of the area between the Calderazzo streets and the sanctuary of the former municipal slaughterhouse (in the modern town corresponding to the streets Sorrentino, Medma, Omero, Erodoto and Talete, piazza Paolo Orsi and Rion. Europa); this sector must certainly have been one of the most monumental sectors of the ancient city.

2467. CRYPT 631 FROM VOLNA-1 NECROPOLIS: COMPLEX APPROACH TO THE ANALYSIS OF GREEK-BARBARIAN RELATIONS IN EARLY HELLENISTIC PERIOD IN THE BOSPORUS

**Contribution format:** Poster  
**Contribution authors:** Tatiana Shvedchikova – Irina Saprykina – Nikolay Sudarev (Institute of Archaeology RAS)

In 2016-2018, the Volna 1 necropolis was studied on the territory of the Taman Peninsula due to salvage excavations. The necropolis and the associated settlement of Volna 1, appeared at the very beginning of the Greek colonization of the region during the so-called «great Greek colonization». In total, more than 1,200 burials were studied, belonging to different periods, starting from the 6th century BC. Collective burials in adobe crypts were atypical for a burial site. One of them, crypt 631, which can be associated to the 30s of the 4th century BC - the first quarter of the 3rd century BC, contained the skeletons of 11 people and also the outstanding composition of the burial inventory. The vessels typologically can be attributed to the works of the Athenian workshop II9, the find of a gold crown is unique. Analysis of the chemical composition of non-ferrous metals of the accompanying inventory items with traces of blacksmith finishing showed that the bronzes used are most likely based on the use of repeatedly remelted non-ferrous scrap metal, including conventionally “Greek”. Isotopic analysis of the ratios of  $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ,  $^{87}\text{Sr}/^{86}\text{Sr}$  of bone tissue for 7 individuals from the burial was carried out. The range of values of bioavailable strontium can be designated as the interval 0.709146–0.709545. Taking into account the background indicators of the ratio of strontium isotopes, it can be concluded that the individuals show similar values and can be considered local residents. The indicators of young men are excellent, which can be interpreted as a non-local indicator. The results of the comprehensive study are important for understanding the Greek-barbarian relations (the process of mixing/assimilation of the population) during the late classical – early Hellenistic period in the Bosphorus. Funded by RNF № 23-18-00196

154 ARCHAEOLOGY BENEFITTING PEOPLE AND PLACES: WHAT WORKS? WHAT’S BEST? WHAT NEXT? SHARING SUCCESSES, LEARNING LESSONS AND EXPLORING IDEAS

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Regular session  
**Session keywords:** Public benefits, Archaeology, Community engagement, Best practice, Social value  
**Session organisers:** Jesús Fernández Fernández (University of Oviedo) – Francesco Ripanti (University of

Birmingham) – Carenza Lewis (University of Lincoln)

SESSION ABSTRACT

It is an exciting time to be interested in the social value of archaeology, as ways in which archaeology and archaeologists can benefit wider society are becoming increasingly wide, encompassing health, education, knowledge, skills, community, economy, environment and more. An important way to increase these benefits is by sharing effective practice, emerging insights and new ideas. This session, organised by the EAA Public Benefits of Archaeology Advisory Committee, calls for papers on initiatives that aspire to, and/or are succeeding in, benefiting people and places through archaeology. Bringing together the widest possible range of experiences, insights and ideas into one EAA session will enable anyone and everyone interested in the public benefits of archaeology draw on the wealth of knowledge, ideas and insights that exists in the EAA ‘hive mind’. The aim is to help make future initiatives the best they can possibly be. This session welcomes presentations on projects, programmes and proposals of any style, shape or form, whether these have already taken place, are currently being delivered, or are envisioned for the future. Papers offering insights, inspiration and cautionary tales are all welcome, as are papers offering wider conceptual overviews of the opportunities and threats facing archaeology as a publicly beneficial practice in the future. We are particularly keen that papers should represent experience from all parts of Europe, and are interested in papers that seek to elicit best practice in as many different contexts as possible.

CONTRIBUTION ABSTRACTS

419. HERITAGE TRAIL: IDEA TO REALITY, THE SUCCESS AND CHALLENGES

**Contribution format:** Oral  
**Contribution authors:** Alexandra Latham (Arcadis Consulting Limited)

The opportunities community archaeology provides are well established, within this, there is a role for heritage organisations to support local authorities and clients in taking ownership and developing the local archaeological resources for example by creating heritage trails. The commercial cultural heritage team within Arcadis Consulting (UK) Ltd was commissioned to create and implement a heritage trail around a small town in Wales (UK). The client had announced their intentions for the trail in their Town Regeneration Master Plan. Arcadis and our client recognised the importance of the economic impact and the social value of archaeology in connecting local people and visitors to the town’s heritage. The presentation will focus on the lessons learned during the development of the trail which included the examination of the material previously used and the technologies and resources that were used to support inclusion, site accessibility and challenges of the proposed trail. Some of the lessons learned included working with and managing the client and stakeholder expectations, what assets to include, use and re-use of display boards, feasibility and practicality of assets and the route, operating when resources are constrained, working within the client’s scope, local economics and providing a free experience. The trail has now gone live, and initial feedback from some participants has highlighted where improvements can be made such as the legibility and readability of the map, developing better information about the assets and increasing awareness of the trail.

1974. THE VALUE OF OUTDOOR HERITAGE: A CULTURE AND HERITAGE CAPITAL FRAMEWORK FOR THE HISTORIC ENVIRONMENT

**Contribution format:** Oral  
**Contribution authors:** Callum Reilly (National Trust) – Tatiana Cantillo Garcia – Aditi Samant Singhar (University of Exeter)

The rural landscape is characterised by the entanglement of nature and culture. The simplistic association between rurality and nature, however, has tended to obscure the contribution of cultural heritage to the landscape. Moreover, the use of natural capital approaches partially subsumes the value provided by cultural heritage, potentially overlooking the trade-offs in managing nature and heritage jointly. Although these approaches have enabled a quantitative understanding of the benefits provided by natural aspects of the environment, no equivalent framework has been firmly established for cultural heritage. Within the discourse on heritage values, economic value can be considered a particular form of social value and is therefore apt for inclusion alongside cultural approaches. This paper will explore how an economics-based approach could improve our understanding of the contribution of outdoor cultural heritage towards delivering public benefits, drawing on the AHRC/DCMS-funded Valuing Outdoor Culture and Heritage Capital project. The project brings together economists and heritage professionals to develop a framework for assessing and enhancing the value of cultural heritage in outdoor environments. We propose a systematic framework enabling the more precise description of outdoor heritage stocks and the benefits they provide for individuals and wider society. This ‘taxonomy’ has been co-developed with involvement of professionals from the historic environment sector and tested through intervention-based experiments conducted in the Lake District World Heritage Site and the South Downs National Park in England.

The framework will provide new methodologies to disentangle the value of outdoor culture and heritage assets from that of the ‘natural environment’. It is expected that this will be a useful mechanism for identifying, quantifying and communicating to stakeholders the public benefits delivered by outdoor cultural heritage. More fundamentally though, it provides a robust decision-making tool for heritage management, enabling the benefits of heritage to be delivered more effectively and equitably.

**160. EXPLORING COMMUNITY PERSPECTIVES ON MARITIME CULTURAL HERITAGE IN SOUTHEASTERN LACONIA**

**Contribution format:** Oral  
**Contribution authors:** Athanasia Papadimitriou (Ionian University)

This paper examines the relationship between the local community and cultural heritage in Southeastern Laconia, focusing on key sites such as Pavlopetri, Ancient Asopos, and several shipwrecks in the area. With the use of ethnographic research and systems theory, the study explores how, and to what extent, the community is involved, aiming to propose a framework for sustainable cultural management that is adapted to the historical context of the region. Through targeted questionnaires and interviews, the study investigates the community’s awareness of underwater archaeological sites, their comparison with terrestrial sites and the degree of local involvement in the management of underwater heritage. Additionally, it examines the perceptions of relevant authorities, the social and economic impact of maritime archaeological heritage and future aspirations for enhancing community participation while integrating local perspectives into a holistic management framework for these cultural assets. A primary focus of this research is the connection between underwater heritage and local identity. It suggests that empowering the community through active participation can build stronger bonds with these sites. By addressing practical challenges and promoting collaborative strategies, the study highlights the potential of a community-centered approach for the sustainable preservation and promotion of underwater cultural heritage. In conclusion, this study contributes to the broader field of heritage management by presenting Southeastern Laconia as a case study. It demonstrates how local participation, when combined with archaeological and historical contexts, can support sustainable and effective practices for the conservation of cultural heritage.

**862. BUZZWORD TO BENCHMARK - HOW THE PRIVATE SECTOR IS ADAPTING TO SOCIAL VALUE AND THE IMPLICATIONS ON HERITAGE WORK**

**Contribution format:** Oral  
**Contribution authors:** Emilia Zelewicz – Jack Doyle (Arcadis Consulting Limited)

Social Value is becoming increasingly prominent within the UK corporate sphere. Arcadis Consulting (UK) Ltd must adapt to growing client demand for Social Value, driven by government legislation like the 2012 Social Value Act and PPN 06/20, which mandate a 10% weighting for Social Value on government contract bids. This demand also reflects the increased valuing of local community needs and the impacts of climate change and energy transition infrastructure. This trend is mirrored in the heritage industry. This paper reviews the adoption of Social Value within the UK’s heritage sector, tracing its evolution since 2016 when Professor Sian Jones noted that “scientific and aesthetic values still eclipse social values.. Arcadis is embedding Social Value into its operations, transitioning it from a ‘nice to have’ to a core value. The annual Arcadis research project for new graduates has contributed to the business’s understanding and strategy for Social Value delivery; which this paper draws on. The Cultural Heritage Team at Arcadis is adapting to this changing environment. This paper will explore how a multi-disciplinary organisation integrates Social Value in procurement and project delivery, the role of heritage, and how heritage work can be central to Social Value delivery. CIfA has emphasized the social value of archaeology in terms of knowledge, placemaking, wellbeing, and inclusivity. The next step is addressing sustainability and net-zero targets. This paper will highlight how future heritage initiatives must adopt a sustainability focus to enhance public benefits, and foster connections between our past and future. Finally, the paper will analyse the development of Social Value practice within the commercial heritage sector, considering digital tools to measure social impact, community valuation of heritage, and the importance of amplifying community consultation during the planning stages to meet sustainability and net-zero targets while fostering connections between the past and future.

**1076. IS OUR WORK BENEFICIAL FOR THE TERRITORY? REFLECTIONS ON OUR KNOWLEDGE TRANSFER PRACTICES**

**Contribution format:** Oral  
**Contribution authors:** Paloma Sánchez-Broch – Margarita Fernández Mier – Jesús Fernández Fernández (Universidad de Oviedo)

Since 2014, the LLABOR-Social Landscapes research group at the University of Oviedo (Spain) has developed various knowledge transfer experiences. Through diverse activities implemented in different contexts and aimed

at various audiences, our goal is to socialize and create channels for the co-construction of knowledge, seeking to ensure that our research provides a public benefit to the places where archaeological research take place. We know that archaeology and heritage have great potential as innovative tools for the management and social and economic development of rural areas. However, we still do not know the impact of our proposals on the territory and its inhabitants. Recently, we have implemented a line of work for reflection and analysis of the influence of our work and the communities we collaborate with: neighbours, schoolchildren, teachers, among others. In this communication, we intend to share our impact evaluation strategies, with which we seek to develop a replicable model in different contexts, understand and self-evaluate our practices, and find innovative and effective solutions for heritage education.

**1795. COMMUNITY ARCHAEOLOGY IN THE TRIQUETRA PROJECT - CASE STUDY OF THE BRONZE AGE SETTLEMENT IN SMUSZEWO (POLAND)**

**Contribution format:** Oral  
**Contribution authors:** Agata Byszewska-Lasinska (National Institute of Cultural Heritage, Poland)

One of the main challenges of archaeology is to meet social expectations and needs. According to L. Smith heritage is a cultural practice and a social process , in which through acts of reminiscence, we begin to understand and engage with the present. The key is to use the archaeological knowledge to create people’s relationship with heritage in the present. The way to do this is sharing and disseminating knowledge about archaeological heritage primarily by engaging various local community groups around the topic of heritage. Activities within the framework of community archaeology help people understand and respect archaeological heritage, which results into more effective protection of its resources. The benefits are mutual - involvement of the local community allows to build or strengthen existing intra-community ties, discover their cultural identity, strengthen the group through intergenerational activities, which is especially important nowadays. In my paper I would like to present how these theoretical assumptions are put into practice by implementing the project Triquetra - Toolbox for assessing and mitigating Climate Change risks and natural hazards threatening cultural heritage- we are conducting activities to disseminate knowledge about the archaeological site - the Bronze Age settlement in Smuszewo (Poland) among local residents and authorities, schools and organizations. I’d like to present the activities undertaken over the past two years to build interest in archaeology from the ground up, to convey knowledge to the local community about the site, its importance and value, about the relationship between climate change, human activities and the preservation of heritage. The purpose of our activities is to make people aware that the actions taken to counteract the harmful effects of climate change and protect archaeological heritage are actions to strengthen the integrity of the community.

**2404. EXPLORING HISTORY TOGETHER: USING MUSEUM ARCHAEOLOGY TO CONNECT GENERATIONS AND FOSTER CULTURAL ENGAGEMENT**

**Contribution format:** Oral  
**Contribution authors:** Kristina Birkelund (The Museum of Cultural History, University of Oslo)

This project aims to engage children (around age 10 and teens) and their parents through archaeology, promoting understanding and tolerance through interactive museum experiences. By facilitating direct interaction with archaeological artifacts, we aim to enrich their understanding of culture and history through various engaging methods. The program includes workshops, observations, and interactive activities that enable children and families to learn, discuss, and create using the museum’s collections. One activity involves writing “historical journals,” where children can record their observations, thoughts, and drawings about the artifacts they encounter. This allows them to reflect emotionally and consider potential historical scenarios associated with the artifacts. A key component of our activities is historical reconstruction assignments, where children use fragments of artifacts to determine their original form and recreate small scenes from past lives. Imagining and playing out these scenarios helps children better visualize how people lived. Another activity involves children and families developing interview questions for the artifacts, imagining what stories the objects might tell if they could speak. Planned artifact-making workshops provide opportunities for children to create simple objects. A thematic museum quest encourages children to explore and interpret artifacts from different historical periods, fostering critical thinking and discovery. Collaboration on mini-projects allows children to work collectively, sometimes with parental involvement, to deepen their understanding of historical contexts and societal values. I expect that these activities will help children develop a deeper appreciation for history and life, while learning important values like tolerance and teamwork. This project demonstrates how archaeology can serve as a bridge across generations and cultures, fostering connections and mutual understanding. Through these creative and interactive methods, I aim to cultivate lifelong curiosity and respect for cultural heritage in all participants.

1079. WELLBEING AND DISPLACED COMMUNITIES IN GREECE: THE VALUE OF HERITAGE INTERVENTIONS

Contribution format: Oral  
Contribution authors: Francesca Ruzzetta (University College London)

Heritage has a still understudied potential to bring out connections among people, objects, spaces, and knowl-edges. I argue that these connections, facilitated by heritage interventions, can improve health outcomes for displaced people (asylum seekers and refugees). I frame ‘heritage interventions’ as a form of psychosocial inter-vention, i.e. ‘any program that incorporates techniques that aim to reduce psychosocial distress by reducing anxiety and depression and increasing social activities’ (Bessell and Moss, 2007). My research embeds itself in a growing body of scholarship that suggests that participating in artistic and heritage-based activities has positive health outcomes. Heeding Professor Burgess’ call to expand the ‘evidence base to highlight the mental health benefits of participation in community-led interventions where the focus may be on topics than mental health’ (2020, 119), I organised focus groups where, together with my displaced participants, I co-designed heritage-fo-cused interventions (visits to archaeological sites, museums, and other heritage-based activities). During these activities, we were joined by selected local community members. Assessing the impact of heritage-based activ-ities on displaced people’s wellbeing is challenging—as is the case with any non-clinical health intervention. To address these challenges, aided by cultural mediators, I followed a participatory research approach, and I deployed mixed evaluation methods. The inherent transdisciplinarity of my research—social geography, mobility studies, critical heritage, and the latest research on psychosocial interventions—provides refined tools to understand the efficacy of heritage-based interventions. I view heritage interventions as a form of welfare; whilst not combat-ing all the root causes of displaced people’s marginalisation (structural racism, disparity of access to resources and opportunities, linguistic barriers), they help weave a local community’s social fabric, thus building support networks, crucial to displaced people’s survival. In this contribution, I will present the preliminary results of my research with displaced people in Thessaloniki, one case study of my doctoral research.

2439. ACHIEVING LASTING BENEFITS: TACKLING CHALLENGES IN ARCHAEOLOGY-BASED WELLBE-ING INTERVENTIONS

Contribution format: Oral  
Contribution authors: Francesco Ripanti (University of Birmingham)

Archaeological engagement through site visits and landscape exploration offers documented benefits for physical and mental wellbeing, from improved physical health to enhanced cognitive function. The potential of archaeology as a social service for vulnerable groups has been demonstrated through initiatives like ‘ArcheologicaMente’ and ‘ΑρχαιοΛογικά’, implemented in Italy and Cyprus as part of the ‘Linking Community Archaeology and Wellbeing in the Mediterranean’ (LOGGIA) research project. These programs, which engaged mental health unit users and the Huntington’s community, employed participatory approaches to measure archaeology’s impact on commu-nity wellbeing. While quantitative and qualitative data analysis revealed significant positive outcomes, it also highlighted the need for sustained engagement to achieve lasting benefits. Through a comparative review of LOGGIA’s findings and of similar European initiatives, this paper identifies key structural, institutional, and practical barriers that limit the benefits of archaeology-based wellbeing interventions. The ultimate goal of this contribution is to offer recommendations for overcoming these obstacles, contributing to the growing discourse on archaeology’s role in health and wellbeing.

1993. PREHISTORIC ARCHAEOLOGY IN SPANISH EDUCATION: ANALYSING GAPS BETWEEN RESEARCH AND SCHOOL CURRICULA

Contribution format: Oral  
Contribution authors: Andrea García-Basanta (Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid) – Juan Ignacio Morales (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Departament d’Història i Història de l’Art, Universitat Rovira i Virgili) – Francesca Romagnoli (Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid)

The Spanish educational system presents the contents of the subjects that set the curricula in the different cycles of basic education (6-18 years). Prehistory, understood as the historical period spanning from the origin of hominins in the Palaeolithic era to the Metal Ages, prior to Romanization, is a broad topic that is scattered across differ-ent subjects. However, the topics covered in school on prehistory are limited, and the content is often outdated and descriptive, excluding a social lecture of archaeological data. There is a “gap” between scientific research and education which leads to a delay in the implementation of contents and major issues that can contribute to the actual debates in our society (migrations, climatic change, social care, etc.). This is causing misinformation, a marginal role of humanities in scientific debates and its social perception, and hindering the expected social impact of archaeological research. Our current project is aimed at understanding the social impact that Palaeolithic

research has on the education in Spain analysing the contents of prehistory in schools and the possible biases between them and the updated archaeological knowledge. The first step includes (i) the analysis of which themes are considered founding of prehistory in the educational curricula; (ii) the providing knowledge about these subjects in school books; and (iii) the biases that prevent on one side the upgrading of contents and on the other the inclusion of themes and perspectives that could improve the social impact of prehistoric research in current social challenges. In this paper we present some examples, and we discuss the impact of the detected delay in the inclusion of scientific research in schools, how it limits the relevance of humanities, including archaeology, and perspectives in this project to develop a systematic quantitative method to measure the impact of archaeo-logical research and heritage.

1636. THE ARCHAEOLOGY OF ANTHROPOCENE MATERIAL CULTURE IN ANTARCTICA: ENVIRONMENTAL IMPACTS AND PUBLIC BENEFITS

Contribution format: Oral  
Contribution authors: Jesús Fernández Fernández – Jesús Ruiz Fernández – Paloma Sánchez Broch – Mirella Ochoa Álvarez (Universidad de Oviedo)

Pollution is a global issue significantly affecting marine and terrestrial ecosystems, including remote regions. In recent decades, archaeology has developed a research avenue examining these pollutants as material culture of the Anthropocene, enabling analysis of their origin, impact, and cultural significance. This study aligns with this perspective, focusing on seaborne debris accumulation and distribution on Byers Peninsula, Antarctica. The project aims: (1) to archaeologically analyze drift matter on Antarctic beaches and (2) to raise awareness about the link between daily human activities and environmental degradation in these ecosystems. Firstly, during the 2025 field campaign, archaeological surveys were conducted on Byers Peninsula using transects, geolocation, and drone-based photogrammetry. The collected drift matter has been analyzed in the laboratory to determine its age, origin, material composition, and ecological impact. Preliminary results identify patterns of drift matter accu-mulation and distribution in the study area, indicating the materials originate from various sources. Variations in drift matter density and composition have been documented in relation to environmental factors and oceanic dynamics. These findings provide an initial understanding of drift matter as chronological markers and their role in transforming the Antarctic landscape. The discoveries confirm the increasing presence of waste in pristine areas like Byers Peninsula, highlighting the need for global strategies to mitigate its impact. Secondly, various types of exhibitions, both physical and virtual, are being developed alongside the project to disseminate results and raise awareness. Furthermore, an innovative system to assess public impact using artificial intelligence is being implemented, opening new avenues in public science and climate change communication. Collectively, this underscores archaeology’s potential not only as a discipline studying the past (including the most recent) but also as a science engaged with current challenges, generating public benefits through knowledge, awareness, and action to address today’s environmental issues.

341. EXCAVATING THE PAST, SHAPING THE FUTURE: SUCCEEDING AS AN ARCHAEOLOGIST IN A CHALLENGING JOB MARKET

Contribution format: Poster  
Contribution authors: Ivana Mirkovic (IMT School for Advanced Studies)

Being an archaeologist often conjures images of excavations and the romanticised adventures of Indiana Jones. The reality, however, is far more complex. It demands long-term dedication, adaptability, and networking to build a strong foundation for systematic research and critical thinking. Even after years of such work, archae-ologists face no guarantee of stable employment. This poster explores how combining archaeological expertise with other fields can open up new and sustainable career paths. Based on my experience across six countries and nine universities, I share examples of interdisciplinary engagement, including the European Forum Alpbach in Austria and the Western Balkans Youth Partnership. These experiences show that archaeologists can success-fully contribute to other social sciences and activism, expanding job opportunities without leaving archaeology. To provide a clearer picture of where archaeologists are employed across Europe and the UK, the DISCO proj-ect results are used in a table illustrating the percentage distribution of employment across different sectors. In conclusion, the poster emphasizes the need for an interdisciplinary approach to archaeology – both within universities and among archaeologists themselves in countries where employment opportunities are scarce – as the only sustainable way to overcome challenges of the job market in the field.s

156 BEYOND THE ALPS: NEW FRONTIERS IN SOUTH EUROPEAN WETLAND ARCHAEOLOGY

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Wetland Archaeology, Southern Europe, social dynamics, high precision chronology, environmental resilience  
**Session organisers:** Mirco Brunner (University of Bern) – Giulia Di Giamberardino (Sapienza University of Rome) – Martin Hinz (University of Bern) – Marcello De Vos (University of Groningen) – Raquel Piqué Huerta (UAB Barcelona) – Adrian Anastasi (Institute of Archaeology, Academy of Sciences of Albania)

SESSION ABSTRACT

Archaeological research across Southern Europe and the Mediterranean is uncovering a wealth of waterlogged archaeological sites, offering insights into prehistoric lifeways, environmental and social dynamics over millennia. We invite papers that examine these new and established sites as essential archives, complementing the well-studied UNESCO-listed lake-dwelling sites north of the Alps. These northern sites have shaped narratives of prehistoric settlement and resource management; however, the sites south of the Alps are expanding our understanding of prehistory’s richness and diversity. This session welcomes contributions bringing fresh perspectives to wetland archaeology south of the alps through innovative methods, including bioarchaeological, paleoenvironmental, and material culture analyses. With their extraordinary preservation, wetland sites offer an unmatched glimpse into the full spectrum of material remains from past lifeways — revealing insights that dryland sites can rarely, if ever, provide. Studies using bioarchaeological analyses might provide critical insights into ancient diets, subsistence strategies, and responses to climatic shifts. Furthermore, we invite research that examines the role of wetlands in social practices and settlement processes, including evidence of early agricultural practices and settlement patterns that predate and complement the northern Alpine findings, as well as studies revealing how wetland landscapes supported forms of human interaction highlighting the social importance of these environments. This session encourages contributions with high-precision dating method helping to contextualize environmental and human factors. They reveal how communities adapted to environmental shifts with innovative responses. We aim to position southern wetland sites as dynamic complements to their northern counterparts, highlighting the diversity of prehistoric resilience strategies and their potential to illuminate cultural transitions, population movements, and adaptive responses. This session aims to foster dialogue on the significance of South European wetlands, prompting discussions on cross-regional comparisons, conservation, and the integrated protection of wetland landscapes as essential elements of Europe’s cultural heritage.

CONTRIBUTION ABSTRACTS

1799. EXPLORING PREHISTORIC SETTLEMENTS IN THE LACUSTRINE ENVIRONMENT OF LAKE BANYOLES (SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Raquel Piqué (Universitat Autònoma de Barcelona) – Jord. Revelles (Institut Català de Paleoecologia Humana i Evolució Socials | Universitat Rovira i Virgili) – Rut Geli Mauri – Guillem Mauri Galí – Joan Mayoral Peñalva (Centre d’Arqueologia Subaquàtica de Catalunya) – Xavier Terradas Batlle (Consejo Superior de Investigacioens Científicas) – Carlos Sánchez García (Universidad Autónoma de Madrid) – Antoni Palomo Pérez (Universitat Autònoma de Barcelona)

The lacustrine environment of Lake Banyoles (Spain) has played a crucial role in shaping our understanding of Neolithic occupations in the North-east of Iberian Peninsula. Extensive archaeological investigations at the site of La Draga have provided exceptional evidence of early farming communities (ca. 5300-4700 cal BC), thanks to the remarkable preservation of organic materials in this lakeside settlement. Recent systematic terrestrial and underwater surveys, core drillings, stratigraphic analyses, and fortuitous discoveries across the lake’s surroundings have yielded new data, offering a broader perspective on human activity beyond La Draga. These research efforts, supported by multiple radiocarbon dates from different areas around the lake, provide valuable insights into the dynamics of human settlement and landscape use over time. By integrating these diverse lines of evidence, this study deepens our understanding of prehistoric occupation patterns in the Lake Banyoles area and contributes to broader discussions on human-environment interactions in lacustrine settings in the Mediterranean region.

1311. WHAT REMAINS? THE CURRENT STATE OF LAKE ALBANO AND THE VILLAGGIO DELLE MACINE THROUGH PAST INVESTIGATIONS AND NEW ANALYSES

**Contribution format:** Oral  
**Contribution authors:** Giulia Di Giamberardino – Andrea Conte (Sapienza - Università di Roma)

The Villaggio delle Macine, located on the shores of Lake Albano, about 25 km southeast of Rome, is a wetland settlement dating back to the period between the Early and Middle Bronze Age. It is considered one of the most imposing pile-dwelling villages in Central Italy. Discovered by chance in 1984 by divers Angelo Capri and Riccardo Bellucci of the Gruppo Latino Ricerca Subacquea (G.L.R.S.), the site was subsequently investigated through a series of underwater surveys authorized by the Superintendence. Over the following decade, research led to the identification of archaeological materials and evidence of prehistoric occupation in various areas of Lake Albano, many of which remain understudied. In 2001, a drastic drop in the lake’s water level allowed for the first dryland excavations, led by Micaela Angle, at the Villaggio delle Macine site. However, the current state of the previously identified areas remains uncertain due to the progressive deterioration of the archaeological record. Recently, the study of artifacts stored at the Museo Civico di Albano has allowed for a new chronological hypothesis for one of the identified occupation areas, while also highlighting the site’s vulnerability to weather conditions, recreational activities, and illegal excavations.The use of advanced analytical technologies, such as spatial analysis, in contexts where new investigations cannot currently be carried out — or, as in the present case, in sites discovered under different preservation conditions and lacking adequate documentation — offers the opportunity to extract new information from materials that have so far remained uninterpretable. Such approaches make it possible, for instance, to estimate the degree of stratigraphic erosion or to identify the possible functions and chronological phases of specific areas. This study proposes a critical reassessment of data and finds from past surveys, which, if suitably reanalysed, can contribute to a comprehensive re-evaluation of the known archaeological framework.

2407. ALMOST SOUTH OF THE ALPS: THE PILE-DWELLING SITE ON KAPUZINERINSEL, LAKE WÖRTHERSEE – A KEY DISCOVERY IN AUSTRIA’S ALPE-ADRIA REGION

**Contribution format:** Oral  
**Contribution authors:** Marie-Claire Ries (University Innsbruck) – Andrea Seim (University Freiburg)

The inner-alpine basin of Klagenfurt is located along the fluvial axis of the southeastward-flowing Drava River in the southernmost reaches of the Austrian Alps. It contains numerous large lakes with substantial potential for modern transdisciplinary research. However, key periods, such as the emergence of sedentary life and the early phases of metallurgical resource exploitation at the onset of the Copper Age, remain largely underexplored to this day, positioning Carinthia on the periphery of contemporary archaeological discourse. Recent underwater archaeological surveys at Lake Wörthersee led to the discovery of a previously unknown pile-dwelling site on Kapuzinerinsel, an island in the center of the lake, featuring multiphased, waterlogged remains linked to the Kanzianiberg-Lasinja culture and groups with furrowed-incised pottery from the 4th millennium BC. Underwater excavations in autumn 2024 provided an initial in-depth insight into the site’s features. The systematic documentation and sampling of over 100 well-preserved wooden piles across a 21 m² area now form the basis for the first high-resolution dendrochronological analyses, contributing to precise dating and contextualization of the site. These structures represent some of the oldest known wooden architectural remains in Austria, raising key questions regarding their function—mobility, representation, and/or fortification—due to the site’s unique insular location. This pilot study addresses significant gaps in Austrian prehistoric research by providing critical new data on settlement history. The findings have far-reaching implications for understanding local chronological developments, societal dynamics, architectural innovations, and human-environment interactions. Furthermore, the study advocates for a broader integration of Austria’s Alpe-Adria lakescapes as a key region bridging the gap between Southeastern Europe (the Balkans) and the well-studied lake-dwelling sites north of the Alps.

313. ARCHAEOLOGICAL WOOD FROM ŠPICA PILE-DWELLING SITE, SLOVENIA

**Contribution format:** Oral  
**Contribution authors:** Mojca Jančar (Terarhis) – Katarina Čufar – Maks Merela (Biotechnical Faculty, Department for Wood Science and Technology, University of Ljubljana) – Anton Velušček – Elena Leghissa (ZRC SAZU, Institute of Archaeology, Ljubljana)

In 2009 and 2010, the rescue archaeological excavations at the Špica prehistoric pile-dwelling settlement in Ljubljana, situated on the northern part of Ljubljansko barje, Slovenia, unearthed remains of wooden architecture. Approximately half of the wooden piles were well preserved, while the other half were already very decayed due to the environmental impacts. Numerous finds from the Late Copper Age, i.e. most likely from the middle of the 3rd millennium BC were found. Among the finds are numerous pottery vessels and other objects, closely resembling finds attributed to the Ljubljana culture, known from contemporary pile-dwellings on the Ljubljansko barje.The wooden remains underwent various analyses, including wood identification, dendrochronology, wood

processing techniques and spatial distribution studies of the piles. The dendrochronological analysis established felling dates for the wood between 2522 and 2406 BCE. Due to the time span of the available reference chronologies, it was not possible to date the wood eventually felled before or after 2659 – 2366 BCE. It is very likely that the wooden structures were constantly repaired and reconstructed and that the Špica dwelling probably existed for longer than the dating span suggests, i.e. probably also after 2366 BC. The integration of wood analyses with ongoing archaeological artefact studies and multi-proxy paleo-ecological research has improved our understanding of the chronological framework of the Špica site.

1997. LIN 3 IN TRANSITION: EXTENDING OUR VIEW OF THE LONG NEOLITHIC HORIZON ON LAKE OHRID

**Contribution format:** Oral  
**Contribution authors:** Martin Hinz (Institute of Archaeological Sciences, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern) – Adrian Anastasi (Institute of Archaeology, Academy of Sciences of Albania, Tirana, Albania) – Mirco Brunner (Institute of Archaeological Sciences, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern) – Krist Anastasi (Institute of Archaeology, Academy of Sciences of Albania, Tirana, Albania | Laboratoire de Recherche HiSoMA, Université Lumière Lyon 2) – Maxim Yermokhin – Andrej Maczkowski (Institute of Archaeological Sciences, University of Bern) – Ilirian Gjipali – Rudenc Ruka (Institute of Archaeology, Academy of Sciences of Albania, Tirana, Albania) – Sönk. Szidat (Department of Chemistry, Biochemistry and Pharmacy, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern) – Albert Hafner (Institute of Archaeological Sciences, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern)

Recent excavations at Lin 3, a lakeshore settlement on Lake Ohrid’s Albanian shore, continue to refine our understanding of early Neolithic communities in the southwestern Balkans. Previous work under the EXPLO project established the site’s stratigraphy, material culture, and its role in the transition from the Early to Middle Neolithic. However, questions regarding its structural development and chronology remain, which the 2025 campaign aims to address. Building on the 2023–2024 seasons, the latest investigations focus on two objectives. First, a new trench will connect previously excavated on-land areas, enhancing the spatial and stratigraphic framework. Second, underwater excavations are expanding toward the shore to examine the relationship between the settlement and its extensive palisade complexes (ca. 4400–4000 BCE). This integration of terrestrial and submerged contexts aims to clarify domestic architecture associated with these palisades and explore whether similar structures existed in the earlier settlement horizon (ca. 5800–5700 BCE). On-land excavations previously identified two main settlement phases, tentatively dated to ca. 5800 and 5700 BCE via dendrochronological wiggle matching. The 2025 campaign seeks to refine these dates and clarify occupation sequences. A key focus is the distribution of Impressed Ware, present in lower layers but absent in upper ones. If confirmed, Lin 3 may offer the first precise dating of this ceramic tradition’s decline within a 100-year margin—crucial for Neolithic typochronology in Albania and beyond. Beyond ceramics, new excavations are expected to yield further evidence of wooden architecture, lithic and ornamental finds, and potentially human remains. By synthesizing stratigraphic, artefactual, and dendro-chronological data, this research enhances our understanding of how early farming communities in the region organized domestic life, adapted to environmental changes, and navigated cultural transformations.

1719. LAKE MALIQ REVISITED: FRESH PERSPECTIVES ON NEOLITHIC SUBMERGED SETTLEMENTS AT FORMER LAKE MALIQ, ALBANIA

**Contribution format:** Oral  
**Contribution authors:** Mirco Brunner (Institute of Archaeological Sciences, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern) – Adrian Anastasi (Albanian Institute of Archaeology, Department of Prehistory, Academy of Sciences of Albania) – Anastasi Krist (Laboratoire de Recherche HiSoMA - Histoire et Sources des Mondes Antiques, Université Lumière Lyon 2) – Andrej Maczkowski (Institute of Archaeological Sciences, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern) – Matthias Bolliger (Archaeological Service Canton of Bern) – Martin Hinz (Institute of Archaeological Sciences, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern) – Sönke Szidat (Department of Chemistry, Biochemistry and Pharmacy, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern) – Ilir Gjipali (Albanian Institute of Archaeology, Department of Prehistory, Academy of Sciences of Albania) – Albert

Hafner (Institute of Archaeological Sciences, University of Bern | Oeschger Centre for Climate Change Research (OCCR), University of Bern)

As part of the ERC-EXPLO project, settlement horizons at Lakes Ohrid, Prespa, and Kastoria have been precisely dated using dendrochronology and radiocarbon methods. The exceptional preservation of these waterlogged lakeside sites provides insights comparable to UNESCO World Heritage sites in the Alpine region. This study presents the first absolute dating of settlement phases from submerged prehistoric sites on the former Lake Maliq, located in Albania’s Korçë Plateau. Excavations at Dunavec, Maliq, and Sovjan reveal well-preserved waterlogged cultural layers and wood from prehistoric structures, highlighting their archaeological significance. Until now, these sites lacked precise absolute dates. Through the ERC-EXPLO project, we have addressed this gap by generating the first absolute dates for these settlements using dendrochronology and radiocarbon methods. This paper focuses primarily on the sites of Dunavec, Maliq, and Sovjan, situating them within the broader context of sites dated thus far in the framework of the project. The main focus of our paper is on the Dunavec site. Over 50 years after the first excavations an Albanian-Swiss team revisits the waterlogged Neolithic site of Dunavec, a crucial site in eastern Albania’s Korça Basin. The new excavations shed new light on the stratigraphic complexities already indicated by previous studies. Exceptional organic preservation was observed approximately 8.5 meters below the surface, allowing the documentation of ceramics, lithic artifacts, and wooden architectural elements. First dendrochronological and radiocarbon dating pinpoint the construction of these structures to the beginning of the 53rd century BC, with a modelled end-date range between 5287 – 5272 cal BC (95.4 %).

154. REINTERPRETATION OF BRONZE AGE UNDERWATER SITE “PRESPA 1”: A MULTIDISCIPLINARY APPROACH BASED ON ARCHAEOLOGICAL DATA, ABSOLUTE CHRONOLOGY, AND ENVIRONMENTAL CHANGES

**Contribution format:** Oral  
**Contribution authors:** Adrian Anastasi (National Institute of Archaeology - Academy of Sciences of Albania) – Kristi Anastasi (Laboratory HiSoMA, University Lumière Lyon 2)

The Bronze Age underwater site in Great Lake Prespa represent a crucial yet understudied archaeological resource, providing valuable insights into past human-environment interactions. Initial surveys conducted in the early 2000s by the Institute of Archaeology in Tirana, and more extensive research undertaken after 2013 within the framework of the “Underwater Archaeological Map of the Albanian Coastline” project, led to the identification of the “Prespa 1” site. Originally hypothesized to belong to the pile-dwelling typology, similar to those discovered in the Maliq and Ohrid lakes, recent findings challenge this interpretation. Emerging evidence increasingly supports the hypothesis that this site was originally terrestrial and was subsequently submerged due to significant climatic and hydrological transformations. The reinterpretation of the site requires a multidisciplinary research approach that integrates archaeological data, absolute dating methods, and paleoenvironmental indicators to achieve a refined chronological and environmental framework. Through the application of innovative methodologies and detailed analyses, this study aims to provide a comprehensive understanding of site dynamics, adaptive strategies, and the broader socio-environmental context in which these communities operated. A thorough reassessment of the “Prespa 1” site will contribute to a deeper understanding of Bronze Age habitation patterns, human responses to environmental change, and inter-community interactions across the region. These results will improve our knowledge of prehistoric adaptation strategies and landscape transformation processes, offering new insights into the complex interaction between human activity and environmental dynamics in the Bronze Age Balkans.

1976. ELUSIVE ORE DEPOSITS IN ALTERED LANDSCAPES: IDENTIFYING POTENTIAL BOG IRON ORE DEPOSITS EXPLOITED IN THE PAST

**Contribution format:** Poster  
**Contribution authors:** Tena Karavidovic (Institute of Archaeology, Zagreb) – Tomislav Brenko (Faculty of Mining, Geology and Petroleum Engineering, University of Zagreb) – Tajana Sekelj Ivančan (Institute of Archaeology, Zagreb) – Sibila Borojević Šoštarić (Faculty of Mining, Geology and Petroleum Engineering, University of Zagreb)

Bog iron ores were utilized for iron production from prehistoric times until the early modern period across Europe. In the southern Carpathian Basin, specifically in the alluvial plain of the Drava River in northern Croatia, there are over 150 archaeological sites with surface evidence of iron production activities. Some sites have been excavated, and provenance studies indicate that iron was produced from local bog iron ore during Late Antiquity and the Early Middle Ages. Bog ores are renewable resources; they are sedimentary deposits that form in lowland wetland environments. A suitable environment for the formation of these ores includes gley soils associated with alluvial sands, characterized by variable redox potentials and a constant flow of groundwater near the surface, which is saturated with iron (Fe2+) ions. Analyzing the properties and deposits of these ores can enhance our

understanding of the natural mechanisms that influenced resource management and utilization in the past, as well as the technological adaptations related to available resources. However, in-depth research into historical bog iron ore deposits is challenging due to factors such as complete exploitation, degradation, and limited regeneration or development. These challenges are primarily caused by land reclamation efforts and their subsequent impact on the environment. This research examines the potential for the development of bog iron ore deposits, their formation mechanisms, and predicts the spatial distribution of geological formations. This is based on several geoarchaeological case studies conducted in the lowland areas of the Sava and Drava River Valleys. Data on the potential occurrence of these deposits is compared with archaeological records of iron production sites to better understand the dynamics of landscape use, resource availability, and exploitation.

157 FISHING TECHNIQUES IN RIVER AND FRESHWATER ENVIRONMENTS OF NORTHERN EUROPE

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Discussion session  
Session keywords: Fish traps and netting, Prehistoric and historical fishing practices, Traditional fishing techniques, Northern Europe  
Session organisers: Christopher Fredrik Kvæstad (Stavanger maritime museum) – Satu Mirjami Koivisto (Museum Lolland - Falster)

SESSION ABSTRACT

This session will delve into traditional and historical fishing techniques specific to the freshwater and riverine environments of Northern Europe, using archaeological evidence and ethnographic records to illustrate these practices. We invite papers that examine diverse methods of fish trapping, netting, and line fishing, exploring how these techniques reflect technological advancements, dietary practices, and cultural values across various regions. Emphasis will be placed on identifying regional and chronological variations, dating techniques, and embedding these practices within broader subsistence strategies and environmental adaptations. Our goal is to foster a comprehensive understanding of fishing’s historical importance, particularly how techniques evolved to adapt to the unique freshwater ecosystems across Northern Europe. Additionally, this session will consider how fishing practices shaped local economies, reinforced cultural identities, and promoted sustainable resource use. Interdisciplinary contributions that integrate perspectives from archaeology, anthropology, and environmental science are encouraged to enrich this exploration and expand our understanding of Northern European freshwater fishing traditions.

CONTRIBUTION ABSTRACTS

263. DEEP ROOTS OF LAKE FISHING IN THE NORTH: STONE AGE FRESHWATER FISHING TECHNIQUES AND THE USE OF ORGANIC RAW MATERIALS

Contribution format: Oral  
Contribution authors: Satu Koivisto (Museum Lolland-Falster | University of Turku/Archaeology) – Jenni Suomela (University of Helsinki/Craft studies) – Mia Lempiäinen-Avci (University of Turku/Biodiversity Unit)

Waterlogged archaeological sites in Northern Europe provide unique insights into prehistoric fishing techniques and material culture, especially with regard to equipment made of organic materials that rarely survive in dryland contexts. Here, we explore freshwater fishing methods using nets and traps in Stone Age contexts in Boreal Fennoscandia, focusing on the use of locally available organic raw materials, such as tree bast, wood and bark, in their manufacture. The rare preservation of organic materials at waterlogged sites allows a detailed analysis of the crafting and construction of fishing gear and their uses. Our findings from the lake site of Järvensuo 1 in southwest Finland (c. 6000–2000 cal BCE) from the Mesolithic and Neolithic demonstrate the multiple uses of tree bast fibres from species such as lime and willow, which were crafted into cords and nets. Wooden fish traps made of flexible pine laths and supporting wooden elements demonstrate deep knowledge of aquatic environments and fish behaviour. Ethnographic parallels help us to reconstruct these fishing techniques and assess their efficiency in past subsistence economies. By examining organic fishing gear in the broader ecological and cultural context of Northern Europe, our study advances the understanding of past subsistence practices and resource exploitation in lacustrine environments. Our findings also contribute to wider discussions of technological adaptations to northern environments, the sustainability of prehistoric fishing practices, and the role of organic materials in early fishing traditions and material culture.

27. MORE THAN FISH: ON THE SOCIAL LIFE OF A CHALCOLITHIC FISHING TOOL

Contribution format: Oral  
Contribution authors: Svein Nielsen (Stavanger maritime museum)

Long-distance distribution of exotic goods in prehistory are often approached in archaeology as evidence of trade, however the occurrence of practical implements across past cultural borders begs the question: Was trade conducted exclusively by ‘travelers’ or ‘traders’, or could contact and exchange of ideas and objects across cultural borders also be engaged through other social identities? This paper focuses on a specific freshwater fishing tool – the osseous toggling harpoon – and its distributions in Europe during the 5th and 4th millennium BCE. From its origin in the lower Danube region (late Vinča Culture, 4850-4500 BCE), the toggling harpoon and its associated technological armateur, developed for riverine fisheries, spread within a wide cultural region (Gumelnița, Cucuteni-Trypillia, Sredny Stog), before arriving in south-central Europe, Scandinavia and the eastern Baltic during the time of the Funnel Beaker Culture (4100-2800 BCE). What social mechanisms allowed the wide distribution of fishing technologies in the Chalcolithic? Which factors structured the ‘biased’ distribution of the toggling harpoon technology? This paper explores these questions by comparing its distribution to contemporary and associated evidence of long-distance trade, and by analyzing aspects of the ‘design grammar’ of toggling harpoons within this wide area.

1019. FISHING HISTORY IN LAKE ERTENIS, NORTHWESTERN LITHUANIA

Contribution format: Oral  
Contribution authors: Tomas Rimkus (Vilnius Academy of Arts | Klaipėda University) – Giedrė Piličiauskienė (Vilnius University) – Kęstutis Peseckas (Lithuanian Institute of History)

Lake Ertenis is one of the many areas in western Lithuania that have been completely drained and turned into wetlands for agricultural purposes. The first archaeological finds discovered here were found during the draining of the lake’s basin and the straightening of one of its outlets. Newly discovered sites have shown good preservation of Stone Age organic artefacts, which therefore led to several archaeological excavations in the 20th century. They have uncovered osseous, flint and pottery artefacts and animal remains dating to the hunter-fisher-gatherers and the first husbandry societies. Wooden structures, various types of net weights and fish remains have been found, indicating that fishing took place here. In 2023 and 2024, archaeological investigations in the surroundings of the former Lake Ertenis were resumed. Investigations at several selected sites have added to the data on fish consumption and fishing techniques from the end of the Mesolithic to the Bronze Age. In addition, the laboratory research has re-evaluated artefacts and structures found in the 20th century that are potentially related to fishing in the lake. In this paper we report comprehensive data on the fishing activities in Lake Ertenis from the Stone Age to the end of the Bronze Age. The types of artefacts, the analysis of the wooden structures and the zooarchaeological data are presented.

1875. STONE-BUILT FISHING WEIRS IN SULDALSLÅGEN, SOUTHWEST NORWAY

Contribution format: Oral  
Contribution authors: Christopher Fredrik Kvæstad (Stavanger maritime museum)

This paper explores the long history of salmon (*Salmo salar*) fishing in Suldalslågen, Southwest Norway, focusing on how historical records provide insights into prehistoric fishing practices. The earliest documented evidence of salmon fishing dates back to 1592, referencing the use of lyster (fish spears), while later sources describe the widespread use of stone-built weirs (sløer) to trap salmon during their migrations. However, archaeological findings and environmental reconstructions suggest that similar techniques may have been in use long before written records, forming part of a continuous fishing tradition in Northern Europe. By examining medieval statutes, tax records, and ethnographic sources alongside archaeological evidence, this study investigates how fishing technologies evolved in response to environmental and social factors. The ownership and regulation of salmon fisheries, documented from the 17th century, reflect the increasing economic and political significance of these resources. In 1739, local authorities attempted to downplay the extent of salmon fishing to avoid taxation, despite external reports confirming its large-scale nature. Such conflicts hint at long-standing traditions of managing and exploiting riverine fisheries, potentially rooted in prehistoric practices. Through an interdisciplinary approach combining archaeology, historical sources, and environmental analysis, this paper situates Suldalslågen’s salmon fisheries within broader Northern European freshwater fishing traditions. By using historical records as a lens to explore prehistoric fishing strategies, the study highlights the enduring nature of riverine subsistence practices and their role in shaping local economies, cultural identities, and sustainable resource use across millennia.

158 UTILITARIAN CERAMICS IN THE MEDITERRANEAN DURING THE FIRST MILLENNIUM BCE. SIMPLE, FUNCTIONAL, AND OFTEN OVERLOOKED

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: Mediterranean ceramics, Mediterranean archaeology, cooking pots, utilitarian ware, ceramic production, food preparation and consumption  
Session organisers: Vicky Vlachou (Aristotle University of Thessaloniki) – Isabelle Algrain (Université libre de Bruxelles)

SESSION ABSTRACT

This session aims to shed light on the often overlooked yet central role of utilitarian ceramics in the Mediterranean region during the first millennium BCE. Plain and cooking ware represent a common find in most archaeological contexts, providing insight on regional production and consumption habits. The variety of their shapes, sizes and fabrics is consistent to the multiple roles they were assigned throughout antiquity. While much attention has been given to finely decorated pottery, plain ware, cooking and storage pots actually constitute large ceramic assemblages found on most archaeological sites. The session invites papers that explore the production, distribution, and use of these functional ceramics in domestic, funerary, and religious contexts. Contributions may examine issues such as material sourcing, manufacturing techniques, trade, and exchange networks—often underestimated due to the assumption that these ceramics did not travel or were not widely commercialized. Additionally, discussions on the social and cultural significance of these utilitarian objects, despite their often low aesthetic value, are welcome. Issues related to the development of specific shapes and their chronology, as well as associations between regional productions may greatly add to the discussion and better understanding of the production and use of utilitarian ceramics. Cross-craft approaches related to technological aspects, production spaces and/or consumption habits are equally relevant. By focusing on plain and functional pottery, this session seeks to highlight how these objects can provide insight into the socioeconomic structures, technological developments, intended choices and uses, as well as everyday experiences of ancient populations. It also aims to encourage new methodologies and approaches in studying utilitarian ceramics, promoting a holistic (where possible) understanding of the ceramic record beyond the more commonly studied decorated wares.

CONTRIBUTION ABSTRACTS

1643. SIMPLE AND OVERLOOKED, BUT UNAMBIGUOUS – COOKING WARES FROM THE LATE BRONZE AGE SETTLEMENT AT ADA TEPE IN EASTERN RHODOPES

Contribution format: Oral  
Contribution authors: Yana Dimitrova-Taseva (National Archaeological Institute with Museum at the Bulgarian Academy of Sciences) – Clare Burke (Department of Archaeology, University of York) – Elena Marinova (Laboratory for Archaeobotany, Baden-Württemberg State Office for Cultural Heritage)

The Late Bronze Age pottery from the goldmine and settlements at Ada Tepe near Krumovgrad in the Rhodope Mountains is one of the most comprehensive dated assemblages in modern day Bulgaria. The pottery has been thoroughly studied from typological and technological perspectives providing important insights into the daily lives of the community, with vessels for dining, storage and cooking. Importantly, sherds relating to some vessel types (e.g. baking pans) are not found in all of the excavated contexts in the settlement, which aids the interpretation of the features and the nature of the activities that were undertaken in different structures. This presentation will discuss the Hilltop pottery, focusing on cooking vessels. While the cooking jars are found in all excavated features in all Late Bronze Age phases, the flat baking trays appear in the Hilltop settlement complex from the 14th to 12th centuries. They are not found in any other pottery complex from the 2nd and 1st millennium BC in Rhodope Mountains, thus raising questions of their identification at sites. While the function of the vessels was primarily determined based on their size and shape, as well as an analysis of potential sooting patterns on cooking vessels, further palaeobotanical analysis was conducted on the site (i.e. the identified food-crust fragments speak of bread preparation on-site) to suggest that most of the identified cereal crops could have been used to prepare porridges or flatbread, pointing to the introduction of new baking techniques during the Late Bronze Age. To complement the typological and functional analyses, macroscopic analysis and thin section petrography has demonstrated that these vessels were produced locally, with a correlation between raw material clay paste recipes and vessel type that indicate some aspects of raw material choice were related to the size, type and intended function of the vessel.

894. WHAT DOES “THRACIAN” POTTERY LOOK LIKE? STUDIES OF THE EARLY IRON AGE CERAMIC ENSEMBLES FROM ANCIENT THRACE, BULGARIA

Contribution format: Oral  
Contribution authors: Julia Tzvetkova (Sofia University St. Kliment Ohridski) – Georgi Nekhrizov – Nadezhda Kecheva – Nataliya Ivanova – Veronika Gencheva – Iveta Kirilova (National Archaeological Institute with Museum, BAS)

The use of ethnonyms for defining ceramic ensembles has always carried risks in archaeology. This is the case of the term “Thracian pottery”, used mostly in old school historiography but still appearing in some recent studies as a synonym for the handmade pottery from the (Early) Iron Age Thrace. This has sometimes led to the incorrect assumption that the presence of handmade pottery – even only plain undecorated sherds – automatically indicates a Thracian ethnic presence across different periods in the region north of the Aegean. One major reason for this confusion is that all EIA pottery from Thrace is handmade. Despite Bernhard Hänsel’s important study in 1976, no modern comprehensive work has reassessed the topic, and few excavated sites provide detailed stratigraphic sequences. This lack of data makes it difficult to analyze pottery styles, chronological development, and regional specifics. The Gluhite Kamani rock-cut complex in the Eastern Rhodope Mountains offers a valuable opportunity to reassess EIA pottery. The site stratigraphy covers the transitional period from the late LBA and continues through the EIA. A current project (KII-06-H80/6-07.12.2023, BNSF-funded) focuses on processing this ceramic ensemble, aiming to create an online database with a standardized classification system for the EIA pottery from Thrace. The database covers Southeast Thrace, Bulgaria. So far, two main pottery groups can be distinguished: handmade fine ware (tableware) and coarse ware (plain ware, kitchenware). Fine ware features distinctive forms, decorative styles, and decoration techniques that disappeared after the 6th century BC, while coarse ware is not chronologically sensitive in terms of forms and decoration, some of which remain consistent over a broader time and geographic range. Therefore, if the term “Thracian pottery” is to be used, it should apply specifically to EIA fine ware from Thrace rather than being a broad, misleading label.

1136. MUNDANE CERAMICS: A CASE OF OVERLOOKED HANDMADE POTTERY FROM IRON AGE NORTH-EASTERN GREECE

Contribution format: Oral  
Contribution authors: Peli Plika – Manolis Manoledakis – Trisevgen. Papadakou – Eleni Mentessidou – Anastasia Basakyrrou (International Hellenic University)

The site of Trapeza Neo Rysio-Kardia is an Iron Age settlement (ca. 9th-6th c. BCE) on a flat-topped hill near Thessaloniki, northern Greece. The excavation by the International Hellenic University has revealed complex compounds of rooms following a regular plan, and a great number of finds, most notably large quantities of pottery. In this presentation we wish to focus on a certain type of handmade pottery, which exhibits typological and technological characteristics that diverge significantly from the rest of the assemblage, such as their consistent spherical form with a restricted mouth and strap handles. The distribution of sooting clouds and in some cases the carbonized remains of food in the interior indicate that at least many of them were primarily used as cooking vessels. Here, we would like to discuss the technological and typological characteristics, including an attempt to estimate the range of their sizes as a proxy for the size of the groups of people intended for. Moreover, we shall discuss their occasional incised decoration, which is unique to this particular type of pottery and exhibits a standardized and repetitive range of motifs. Lastly, we would like to outline the future prospects for analytical research that would help address the questions arising from this study. These rather overlooked vessels are presented as a cohesive group for the first time, highlighting the different pottery traditions operating simultaneously in terms of construction techniques, materials, and potential functional differentiation, and are placed within the wider context of the Iron Age in the region.

247. COOKING IN EARLY IRON AGE THASOS

Contribution format: Oral  
Contribution authors: Maguelone Bastide (École française d’Athènes)

Early Iron Age on Thasos island is a period wealthy of a great variety of influence, from North-West, North and North-East Aegean. How does this diversity reflect on the cooking practices? Few attention has been paid to the diversity of the EIA cooking wares of the region: tripod pots, handmade jars or basins rely each on specific craft knowledge and might be associated with different cooking practices. We will present the first results of our new study of the EIA ceramics from the settlement of Limenas, Thasos, tracking the cooking practices through morpho-stylistic and technological analysis of the sherds. Our study, which firstly aimed at reassessing the chronology of the settlement, led us to notice a significant heterogeneity of the cooking wares in use during the Protogeometric and Geometric periods on this site. This heterogeneity stands in sharp contrast to the homogeneity of the ware in use in the Parian colonial settlement created at the same place in the first half of the 7th c.

A detailed study of these wares could help us understanding the specificity of the precolonial settlement and the originality of its social organisation.

2209. COOKING IN CYCLADIC POTS: CERAMIC TRADITIONS AND TECHNOLOGICAL INNOVATIONS FROM THE EARLY IRON AGE TO THE LATE CLASSICAL PERIOD

Contribution format: Oral  
Contribution authors: Vicky Vlachou (Aristotle University of Thessaloniki)

Cycladic cooking pots have received only very little attention in scholarly research, and indeed only small assemblages have been studied and published from the Cyclades. Still in every case, a local production has been argued for cooking pots and devices, one linked to local pottery traditions while following technological innovations common within the wider Aegean region and a number of sites in the Western Mediterranean. Placing the focus on the cooking pots from the island on Tenos, the production and use of these containers shall serve as a proxy for detecting cooking and pottery traditions specific to the Cycladic islands. The progressive elaboration of cooking pots and devices in the Cyclades, allows us to approach small insular communities by considering the local productions, similarities and differences among the islands and equally shared (or not) habits and cooking practices. On the other hand, our discussion shall evolve around the assumed ritual use of these vessels, presumably involved in religious festivals and cultic performances within the context of the late Archaic and Classical cities. The published finds from an early sanctuary area and the new material from the late Archaic and Classical necropolis of Xobourgo on Tenos shall serve as a case study.

2117. COOKING FOR THE GODS: UTILITARIAN CERAMICS IN GREEK SANCTUARIES

Contribution format: Oral  
Contribution authors: Isabelle Algrain (Université libre de Bruxelles)

While figured pottery from Greek sanctuaries has been widely studied, utilitarian ceramics, particularly those used in the preparation and consumption of food, have received less attention, yet their study offers valuable insights into ritual practices in these sacred spaces. This paper will explore how utilitarian ceramics, particularly cooking and food-consumption vessels, can reveal significant aspects of food-related rituals in Greek sanctuaries. By examining the diverse types and uses of these ceramics, we can better understand their role in sacred spaces and religious practices. To explore these themes in greater depth, the paper will use the recent discoveries from the South Complex of the sanctuary of Despotiko (Cyclades) as a case study, where a large assemblage of locally produced ceramics has been uncovered. These vessels were used for food preparation, serving, and consumption, as well as cooking with shapes such as chytrae and lopades. While often regarded as ‘functional’ and less aesthetically significant than decorated pottery, these ceramics are fundamental to understanding culinary practices and social interactions within the sanctuary, particularly in relation to activities that may have occurred inside its hestiatorion, a space designed for communal meals.

1445. STORING IN THE CYCLADES: THE LATE GEOMETRIC AND ARCHAIC PITHOS IN ANDROS, TENOS AND MELOS

Contribution format: Oral  
Contribution authors: Myrto Kokkalia (University of Oxford)

Pithoi, although largely understudied, offer the potential to provide valuable information regarding regional storage practices, intra-site social dynamics, and wider economic networks. This project explores the role of storage pithoi in the Cyclades during the Late Geometric and Archaic periods (8th–5th centuries BC), focusing on decorated and plain pithoi from the islands of Andros, Tenos, and Melos. Through a macroscopic visual analysis of both published and unpublished material, the typology, technology, and decoration of storage jars are investigated. Manufacturing techniques, production localities, workshop specialisation, and distribution patterns are recorded, while ethnographic comparisons provide insights into traditional potting methods. Beyond their technological analysis, this study also examines the function and significance of pithoi in their diverse finding contexts, including domestic, public, industrial and cultic spaces. Their spatial organisation is plotted, alongside their capacity, size and quantity, offering insights into the economic and socio-political implications of storage, including surplus control, risk management strategies, wealth accumulation, and self-sufficiency.

1319. PRODUCTION AND CIRCULATION OF REDDISH COARSE WARE JARS IN EARLY IRON AGE ETRURIA: A CASE STUDY FROM DUNA FENIGLIA

Contribution format: Oral  
Contribution authors: Giulia Deimichei (Archaeometry Research Group, University of Tübingen) – Elena Marrocchino (Università degli studi di Ferrara, Dipartimento di Scienze dell’Ambiente

e della Prevenzione) – Efraim Andreidakis (Archaeometry Research Group, University of Tübingen) – Francesca Ciccarella (Università degli studi di Ferrara, Dipartimento di Studi Umanistici) – Baptiste Solard (Archaeometry Research Group, University of Tübingen) – Lionello Morandi (Archaeometry Research Group, University of Tübingen | Department of Civilisations and Forms of Knowledge, University of Pisa) – Massimo Cardosa (Museo diffuso della Comunità Mancianese (Manciano, GR) | Centro Studi Preistoria e Archeologia (MI)) – Fabio Rossi (Museo della preistoria della Tuscia e della Rocca Farnese (Valentano, VT) | Centro Studi Preistoria e Archeologia (MI)) – Silvia Amicone (Archaeometry Research Group, University of Tübingen | Institute of Archaeology, University College London)

Reddish coarse ware jars represent a widely distributed class of functional ceramics found between the Final Bronze Age and the Early Iron Age in Etruria (modern Tuscany and Latium, central Italy). These vessels have been discovered primarily at coastal sites and are traditionally associated with salt production. However, this interpretation remains contested among scholars, and the function of these vessels, together with the role of the coastal sites where they were found, remains debated. This paper presents the results of a study on pottery from the site of Duna Feniglia (Orbetello, central Italy), dated to the late 9th to early 8th century BCE. Excavations at Duna Feniglia primarily retrieved fragments of reddish coarse ware jars, along with structural remains likely associated with some type of production installations. To investigate raw material procurement, production technology and circulation of these vessels, we applied an integrated archaeometric approach—including ceramic petrography, X-ray fluorescence, and X-ray diffraction—on 65 pottery samples. Additionally, we analysed geological samples from the surrounding area and compared the Duna Feniglia data with a broad set of ceramic samples from other Etrurian sites. Our results indicate considerable variability in petrographic fabrics, revealing significant differences in raw material selection and processing. This heterogeneity of the ceramic pastes suggests that the assemblage may either represent outputs from multiple production places across Etruria or reflect a natural variability of local raw materials. By exploring these technological choices, this study aims to provide insights into exchange networks and the role of these utilitarian vessels in coastal economic activities.

861. SHEDDING LIGHT ON THE ANCIENT SETTLEMENT OF KARABOURNAKI: THE LAMPS

Contribution format: Oral  
Contribution authors: Konstantina Tsonaka (Aristotle University of Thessaloniki)

The present paper examines the lamps from the ancient settlement of Karabournaki in Thessaloniki, located on the top of a mound at the edge of the promontory on the Thermaic Gulf. Part of the mound is now submerged under the sea level. Despite the lack of epigraphic evidence, the site is identified with the harbor of ancient Therme, the most important settlement before the establishment of Thessaloniki in the late 4th century BCE. Since 1994, when the Aristotle University of Thessaloniki began the systematic excavation of the site, around 400 inventoried lamps have been brought to light. Most are in a fragmentary or partial state of preservation, with a few complete examples. The vast majority of the lamps are wheel-made, with a limited number being handmade. Chronologically, they range from the Late Iron Age to the Classical era, while a few findings from the Roman period suggest a possible continuous habitation activity. The bulk of the recorded material is dated to the Archaic period, which coincides with the settlement’s peak period during that time. This becomes of particular interest when considering that lamps in northern Greek region appear sporadically from the 6th c. B.C., with an increasing trend during the 5th c. B.C. The imported lamps from the major pottery centers of this period (Attica, Corinth, Eastern Greece, Ionia) dominate, although local products are also present. The study of the lamps at Karabournaki aims to enhance our understanding of this coastal settlement and its inhabitants, as well as its connections with the rest of the known ancient world.

2124. MORE THAN JUST CLAY AND LEAD? REPAIRED UTILITARIAN VESSELS FROM HELLENISTIC KALAUREIA

Contribution format: Oral  
Contribution authors: Sara Eriksson (UC Berkeley)

An assemblage excavated at the Sanctuary of Poseidon at Kalaureia on the Greek island of Poros contained several ceramic fragments from plain and cooking ware vessels that were once repaired using lead clamps. Despite evidence of repaired vessels like these showing up on ancient sites across the Mediterranean in contexts from different time periods, little work has been dedicated to this find category. In a close study of successful and failed attempts to repair utilitarian vessels using lead, I think through how the repairs might have been done, who might have done them, and what the reason for repairing might have been. What archaeologists perceive as the main object of analysis is not necessarily the same as what an ancient Greek person would have seen. To us today, a pot repaired with lead is still primarily a pot. The lead repair is just an attribute, assumed to have played

a secondary role in the clay-lead assemblage. I ask what becomes visible if I assume that what emerges from a broken pot and a lead clamp coming together is something more than just pieces of lead and pieces of ceramic. What agential capabilities did the lead have, and how would they have changed the capabilities of the vessel? While the decision to mend the vessel is taken by a human, adding the lead clamp makes new non-human agential powers emerge – and not just in the way the humans using the pots might decide or believe. The clay, the lead, other ingredients added to the repair during the process, as well as the contents of the vessel all have a say in what the new assemblage becomes and how it acts.

1642. SNAP-SHOTS FROM 280 BCE ETRURIA. UTILITARIAN POTTERY IN THE FORTRESS OF ROFALCO

**Contribution format:** Oral  
**Contribution authors:** Chiara Martina Papa – Elisa Abbondanzieri (Sapienza Università di Roma) – Orlando Cerasuolo (Parco Archeologico di Cerveteri e Tarquinia, Ministero della Cultura) – Tania Freixas Roig (Grup de Recerca en Arqueologia Protohistòrica - Universitat de Barcelona) – Luca Pulcinelli (Soprintendenza Archeologia Belle Arti e Paesaggio dell’Umbria, Ministero della Cultura) – Martina Sabbatini (Università degli Studi di Torino) – Lorenzo Somma (Independent) – Marta Valerio (Università degli Studi di Firenze | Università degli Studi di Torino)

It was the winter of 280 BCE when the Roman conquest of the territory of Vulci was concluded. The conquest results were dramatic and even the small fortress of Rofalco (nowadays in the municipality of Farnese, VT), after only 50 to 70 years of life, was set on fire, destroyed and abandoned. The archaeological excavations, conducted since 1996 inside the imposing defensive walls, have brought to light warehouses, functional buildings, cisterns, and, above all, houses. Numerous stratigraphic contexts, sealed under burnt layers, have yielded objects related to daily life, in particular tools and vases. The fine pottery (e.g. bucchero, plain or overpainted black glaze pottery, figured pottery) allows us to both pinpoint the date of the fortress’ foundation and destruction and also to show how the upper classes represented themselves. But how did Etruscan soldiers, their families, and servants live in the 4th-3rd century BCE? What were their homes like? How did they store food? What did they eat and how did they cook? The utilitarian ceramics of Rofalco allow us to answer these and other questions. A vast sample of ceramic shapes will be presented: some very common (e.g. plates, cups, basins, saucepans, lids, jars, doli, jugs, amphorae), others rather rare (honey-pots, vases for breeding dormice, etc.). The quantitative and dimensional analyses performed on this sample will be discussed to address issues such as standardization, while a study of associations and distribution will lead to the interpretation of household vs. communal/centralized production and consumption. The analytical investigation of the findings allows us not only to get closer to the daily life of the last Etruscans, but also to define indicators and associative patterns useful to understand the buildings’ function in archaeological contexts.

159 FROM BONES TO BELIEFS: HUMAN RESILIENCE IN THE MULTI-FAITH MEDIEVAL ISLAMIC MEDITERRANEAN

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Osteoarchaeology, Activity and diet, Migration and mobility, Health and disease, Social interactions  
**Session organisers:** Jared Carballo Pérez (Universitat Autònoma de Barcelona) – Michelle Alexander (University of York) – Jesús Brufal Sucarrat (Universitat Autònoma de Barcelona)

SESSION ABSTRACT

Between the 7th and 16th centuries, the Mediterranean regions under Islamic rule were dynamic and multi-faith landscapes where Muslim, Christian, and Jewish communities coexisted, interacted, and adapted to significant social and environmental changes. This session seeks to explore human resilience during this period by examining human remains from archaeological contexts across culturally diverse societies. By integrating bioarchaeological evidence—including osteological and biomolecular data— with social theoretical approaches, we aim to understand how individuals and communities responded to transformations such as agricultural innovations, urbanization, shifts in social structures, and environmental challenges. We encourage contributions that employ interdisciplinary methods to investigate aspects like health, diet, physical activity, migration patterns, and the complexities of interfaith interactions—whether through peaceful coexistence or conflict—. This session invites to integrate studies of human remains with archaeological findings and historical sources to reconstruct the lived experiences of these societies. By delving into the ways people adapted biologically and culturally in multi-faith

contexts within Islamic governance, we hope to shed light on the mechanisms of resilience that allowed these communities to navigate and thrive amidst change. This platform offers an opportunity for researchers to share insights and methodologies that enrich our understanding of the interconnectedness of human remains and beliefs in the Medieval Mediterranean, contributing to a more nuanced narrative of this pivotal historical period.

CONTRIBUTION ABSTRACTS

858. THE FIRST BIOARCHAEOLOGICAL STUDY OF A MEDIEVAL CEMETERY IN NORTH AFRICA: THE EARLY ISLAMIC MAQBARA AT KACH KOUCH (MOROCCO)

**Contribution format:** Oral  
**Contribution authors:** Hamza Benattia Melgarejo (Universitat de Barcelona) – Jared Carballo Pérez (Universitat Autònoma de Barcelona) – Meryem Benerradi (Institut national des sciences de l’archéologie et du patrimoine (INSAP)) – Jorge Onrubia Pintado (Universidad de Castilla-La Mancha) – Youssef Bokbot (Institut national des sciences de l’archéologie et du patrimoine (INSAP))

Islamic archaeology in North Africa has been overwhelmingly written from the perspective of monumental archaeology, prioritising the study of large settlements while neglecting the relevance of human remains for the study of the Early Medieval period. This paper presents the results of research at the Early Islamic maqbara at Kach Kouch (cal. 992-1210 AD). The strategic location of the site, at the west end of Mediterranean Africa, near the Strait of Gibraltar, indicates its hitherto unrecognised significance within a wider exchange network connecting Western Rif communities with the rest of the region. The site once stood in the borderlands of two early Islamic states: the Nakkour and the Idrisid Emirates. Previous research carried out in the area has demonstrated an early Islamic presence in the region, probably under the influence of the city of Tigisas, one of the most important early Islamic settlements of Mediterranean Morocco. The cemetery comprises the remains of at least 31 individuals interred in pits excavated on the geological level, in right lateral decubitus position with the heads pointing southwest and the feet pointing northeast in line with Islamic practices. The study of the human remains has offered some interesting data. More than half of the burials belonged to preadults, which implies a high child mortality. The analysis of the bone markers suggests that some of these individuals suffered malnutrition and endured hard activities related with agricultural practices and handicraft which led, in some cases, to the development of diseases such as osteoarthritis or caries. This study provides the first reference dataset for Medieval Islamic bioarchaeology in North Africa and contributes to broader discussions on health, mobility, and funerary practices in Early Islamic western Mediterranean and North Africa.

2083. RELIGIOUS PERSISTENCE: BIOARCHAEOLOGICAL PERSPECTIVES OF THE MINORITY RURAL MOZARABIC COMMUNITY OF TÓZAR (GRANADA)

**Contribution format:** Oral  
**Contribution authors:** Michelle Alexander (University of York) – Jared Carballo-Pérez (Universitat Autònoma de Barcelona) – Sylvia Jiménez Brobeil – Luca Mattei (Universidad de Granada)

The rural site of Tózar offers a unique opportunity to examine the persistence of Christian Dhimmi communities under Islamic political rule. This community endured the process of social reconfiguration and cohabitation processes that shaped the settlement patterns of the western mountains of Granada during the 9th-12th centuries CE. Excavations at Tózar have identified more than one hundred rock-cut anthropomorphic tombs with Christian funerary ritual burials. Radiocarbon dating (14C) confirms the use of the necropolis from at least the 10th to the early 13th century. This community challenges the traditional belief the majority of the Al-Andalus Mozarabs were expelled in the first half of the twelfth century. Osteological analysis of 74 excavated individuals reveals a high frequency of sub-adult burials and indicators of physiological stress such as enamel hypoplasia, cobra orbital and periodontal disease. We further applied a multi-isotopic approach incorporating analysis of carbon (δ13C), nitrogen (δ15N) and oxygen (δ16O) of 42 individuals representing non-adults (n=10) and adults (n=32) to explore diet, supply and food production, as well mobility in this minority Christian rural community. δ13C and δ15N data for the human population is interpreted with a contemporaneous animal baseline (n=32) from the adjacent settlement, and isotopic results are further placed in the context of available data from Late Roman-Medieval communities from Andalucia, which indicates that Mozarab diet was comparable to Late Roman diet rather than that of the Medieval Muslim populations published so far. The (δ16O) data suggests the presence of some individuals who may be non-local, which extends the historical interest in this community. The bioarchaeological research, together with the material evidence from the settlement, contribute to discussions on Islamization and cultural adaptation in al-Andalus, demonstrating how multi-disciplinary approaches can illuminate identities that remain invisible in written sources.

1432. MEDIEVAL SICILY: A GENETIC JOURNEY

**Contribution format:** Oral  
**Contribution authors:** Aurore Monnereau (BioArCh, University of York | Globe Institute, University of Copenhagen) – Martin Carver (BioArCh, University of York) – Alessandr. Molinari (Università degli Studi di Roma Tor Vergata) – Camilla Speller (BioArCh, University of York | University of British Columbia) – Nathan Wales (BioArCh, University of York)

The medieval period in Sicily saw successive regime changes, from Byzantine to Aghlabid, Fatimid, and finally Norman and Swabian rule. While historical accounts provide invaluable perspectives on these events, archaeological data offers a complementary avenue to understand the impacts on daily life, especially for communities away from the political centre. We aim to explore the local impacts of these transitions through a multidisciplinary analysis of human remains notably from one particular site, Segesta, western Sicily dating back to the Norman Period. By combining radiocarbon dating, genome-wide sequencing, isotopic data, and archaeological records, we investigated individuals buried in adjacent Muslim and Christian cemeteries. This presentation will particularly focus on the ancient DNA analyses, which followed state-of-the-art methods. Ancient DNA was extracted from petrous bones, long bones, and teeth. Double-stranded libraries were built and a whole-genome sequencing approach was used. Initial analyses confirm ancient DNA sequences and reveal variable DNA preservation. Genome-wide data revealed genetic differences between the Muslim and Christian communities, with no evidence of admixture, yet continuity in aspects of life like diet. The absence of admixture observed at Segesta raises the question of whether this is a particular case or a broader trend across the island, highlighting the importance of obtaining more data from this region during this period to improve accuracy. The success of the project encourages further investment in multiproxy-analyses to enhance our understanding of the demographic and cultural transformations in medieval Sicily and beyond. This presentation is based on research conducted by the SICTRANSIT team, including Aurore Monnereau, Alice Ughi, Paola Orecchioni, Richard Hagan, Helen M. Talbot, Efthymia Nikita, Derek Hamilton, Petrus Le Roux, Alessandra Molinari, Martin Carver, Oliver E. Craig, Camilla F. Speller, Michelle M. Alexander and Nathan Wales.

261. COMPARING LIVING CONDITIONS OF ISLAMIC AND CHRISTIAN COMMUNITIES THROUGH HUMAN OSTEOARCHAEOLOGY IN DUCHY OF GANDIA (VALENCIA, SPAIN – 13TH-16TH CENTURIES)

**Contribution format:** Oral  
**Contribution authors:** Daniela Lorente (Universitat de Valencia | British Association Forensic Anthropology | British Association for Human Identification)

This presentation outlines the general approach of my ongoing PhD project, along with its initial unpublished results. The project focuses on the osteoarchaeological study of human remains from various Islamic and Christian cemeteries in La Safor, Valencia (Spain). The objective is to provide bioarchaeological data from these communities for comparative analysis. The individuals’ analyses will focus on their biological sex, age at death, height, pathologies, and stress markers from an anthropological perspective. This study aims to provide detailed insights into these populations’ quality of life and health. In a later stage, carbon and nitrogen isotope analyses of bone collagen will enhance our understanding of their dietary habits and agricultural practices. This research will offer a new archaeological perspective on the current historiographical discussions about the role of the Muslim population within the agricultural and economic systems dominated by feudal Christian society in the Duchy of Gandia between the 13th and 16th centuries. During this period, the landscape saw the expansion of irrigation crops and the cultivation of sugar cane, developments closely linked to the Islamic communities. This transformation helped turn the Duchy of Gandia into one of the wealthiest domains in Western Europe during the 16th century. The researcher will then incorporate the results into a wider debate, which considers similar analytical evidence for the case of medieval Islamic and Christian societies in the immediately preceding Mediterranean Iberian region, strengthening the discussion of continuity and change in health, diet, and labor-related stress of these populations.

798. DEATH AND LIFE WITHIN THE CITY WALLS: NEW PERSPECTIVES FROM THE MAQBARA OF MADINAT BALAGHÍ (PLA D’ALMATÀ, CATALONIA)

**Contribution format:** Oral  
**Contribution authors:** Andrea Collado Padilla – Jared Carballo Pérez – Helena Kirchner Granell (Universitat Autònoma de Barcelona)

Recent excavations at the medieval Islamic cemetery of Pla d’Almatà (Madinat Balaghí, Catalonia) are providing new perspectives on the health, lifestyle, and social structures of this urban population. Preliminary bioarchaeological examinations highlight a range of adult and subadult remains, often preserved in their original right-lateral position facing southeast in accordance with Islamic burial rites. Despite this standardized orientation, some individuals exhibit taphonomic alterations, including evidence of re-deposition and grave reuse, suggesting complex

post-burial processes. Early paleopathological analyses reveal variations in biomechanical and metabolic stress markers. Some remains display evidence of moderate physical activity—reflected in enthesopathies on the upper limbs—while others exhibit indicators of nutritional deficiencies and inflammatory conditions. These findings provide insights into dietary diversity, labor organization, and overall community health in a growing Islamic urban center. Additionally, the discovery of selectively covered graves suggests evolving mortuary practices, possibly in response to changing social or economic dynamics. Although many aspects of the cemetery’s extent remain to be determined, ongoing examination of the human remains, combined with isotopic and radiocarbon analyses, is refining our understanding of health, mobility, and socio-economic exchange in this medieval hub. By integrating contextual data—such as the reuse or overlap of grave features—we aim to elucidate how communal identities and resilience strategies developed in a space shaped by agricultural activity, urban expansion, and broader regional dynamics.

464. GENOMIC INSIGHTS INTO EARLY ISLAMIC PERIOD IN NORTHERN IBERIA

**Contribution format:** Oral  
**Contribution authors:** Vanessa Villalba-Mouco (Institute of Evolutionary Biology, CSIC-Universitat Pompeu Fabra | Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM)) – Patxuka De-Miguel-Ibáñez (Instituto Universitario de Arqueología y Patrimonio Histórico-Universidad de Alicante | Hospital Virgen de los Lirios-Fisabio (Alcoi-Alicante) | Sociedad de Ciencias Aranzadi) – Roberto Risch (Department of Prehistory, Universitat Autònoma de Barcelona) – Concepción De La Rúa – Montserrat Hervella (Department of Genetics, Physical Anthropology and Animal Physiology. UPV/EHU, Bizkaia) – Carles Lalueza-Fox (Museu de Ciències Naturals de Barcelona) – Johannes Krause (Department of Archaeogenetics, Max Planck Institute for Evolutionary Anthropology, Leipzig | Max Planck Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM)) – David Reich (Department of Human Evolutionary Biology, Harvard University | Department of Genetics, Harvard Medical School, Boston, MA, UAA. | Howard Hughes Medical Institute, Boston | Broad Institute of MIT and Harvard) – Iñigo Olalde (BIOMiCs Research Group, Dept of Zoology and Animal Cell Biology, UPV/EHU, Vitoria-Gasteiz | Ikerbasque—Basque Foundation of Science | Department of Human Evolutionary Biology, Harvard University)

711 CE marks the onset of the Islamic Period in the Iberian Peninsula. Al-Andalus, the political entity that arose, was a remarkable melting pot of diverse human identities, encompassing different geographical origins, cultural traditions, and religions. While historical sources and archaeology have provided valuable insights, the extent of demographic and genetic changes accompanying the religious transformations of the society remains unclear. Here, we generated human genome-wide data using in-solution enrichment from 198 individuals from the city of Pamplona (northern Iberia), including pre-islamic archaeological sites and the 168 individuals from the Maqbara of Plaza del Castillo burial ground, one of the earliest Islamic cemeteries in Iberia dated to the first half of the 8th century CE. Our results prove the arrival of new ancestries from North Africa and the Middle East only during the Islamic period. However and despite the homogeneity of the Muslim burial rite in the Maqbara of Plaza del Castillo, we identify a mix of ancestry profiles, highlighting local ancestry as well as Middle Eastern and North African ones in mixed and unadmixed form. The preliminary results obtained from the reconstructed pedigrees at the site suggest that this cemetery represents the first few generations of intermarriage with several examples of North African/Near Eastern men and local women. We also find intermarriage among local men and local women, showing a higher level of consanguinity within this group. The study provides high-resolution demographic changes and correlates these with political shifts, shedding new light on biological interactions and the permeability of communities, which align with the social processes at play during the early Islamic rule in Northern Iberia. The study showcases an innovative approach that combines high-quality contextual and genetic data, achieved through close collaboration with experts in the field.

248. ACROSS THE BORDER. EXPLORING DIETARY PATTERNS IN NORTHEASTERN MEDIEVAL IBERIA

**Contribution format:** Poster  
**Contribution authors:** Julia Olive Busom (Universitat Autònoma de Barcelona | University of Bonn)

The northeastern area of Medieval Iberia was home to a large and stable border region between Al-Andalus and the Christian Kingdoms, known as the Upper Frontier, where Christian and Muslim communities lived together, allowing for a perfect opportunity to address lifestyle changes in form of dietary differences during childhood and adulthood. Here, we discuss the lifestyles of two populations, Balaguer, an urban Islamic necropolis, and Santa Coloma d’Àger, a rural Christian necropolis under Islamic rule (Mozarabs) through stable isotopes analysis

in both bone and dentine of osteologically well preserved individuals, which allow us to explore their dietary practices during childhood and adulthood. Furthermore, we integrate them into a larger regional picture in order to assess whether the observed differences are part of a larger trend or practices nestled in locality, and discuss whether these differences illustrate possible different choices in diet that are exclusive to certain communities according to their religious or socioeconomic status.

2277. SURVIVORS’ UNYIELDING SPIRIT IN OVERCOMING ADVERSITY: EVIDENCE OF REMODELED BONE LESIONS IN THE NECROPOLIS OF SANTA MARIA (IDANHA-A-VELHA, PORTUGAL)

**Contribution format:** Poster  
**Contribution authors:** Ana Maria Silva (CIAS - Department of Life Sciences, University of Coimbra) – Carla Ribeiro (Município de Idanha-a-Nova) – Rosa Gaspar (Medical Imaging Department, Hospital of University of Coimbra) – José Cristovão (Município de Idanha-a-Nova) – Catarina Tente (Nova University Lisbon) – Pedro Carvalho (Faculdade de Letras, Universidade de Coimbra) – Álvaro M. Monge Calleja (CIAS)

The Portuguese necropolis of Santa Maria (Idanha-a-Velha, Castelo Branco), dating largely from the 12-13th centuries, is notable for its rich historical and cultural heritage, but also due to the high prevalence of severe healed pathologies detected in the unearthed human skeletons. Twenty-seven out of the 44 adult individuals exhumed (61.36%) had evidence of having, at least, one pathological skeletal condition. This paper focuses on seven adult individuals (five men, one female and one individual of undetermined sex), which showed unusual, acute, and distinctive bone alterations to fill the scarcity of medieval historical, medical and archaeological data of this territory. After a macroscopic and imaging (X-rays and CT scans) paleopathological evaluation, several conditions were diagnosed, as osteochondritis dissecans, post-traumatic osteomyelitis, Dieterich’s or Mauclaire’s disease, osteonecrosis, healed high-energy trauma and a parosteal osteosarcoma. Most of these alterations are associated with repetitive (micro)traumas, serving as proxies to infer daily activities such as farming, hunting and cattle breeding, among others. The severity of observed trauma combined with their healing status, is not only a reflection of social and familial networks, highlighting the role of interpersonal care, but also of the resilience of these individuals facing the rudimentary medical practices at the time.

160 FRONTIERS AND INTERACTION ZONES. DISENTANGLING PROCESSES OF CULTURAL EXCHANGE IN LIMINAL AND CONTESTED AREAS

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Session with precirculated papers  
**Session keywords:** Frontiers and Interaction Zones, Material Evidence of Liminal and Contested Areas, Global Theoretical Discourse  
**Session organisers:** Calla McNamee (University of Calgary) – Salvatore Vitale (Università di Pisa) – Kathryn Reese-Taylor (University of Calgary)  
**Session discussant:** Francesco Iacono (University of Bologna)

SESSION ABSTRACT

The concept of frontiers has held connotations of places that are unknown, sparsely populated, separated from a cultural core, and open for exploration. This notion has been criticized for its western European emphasis on colonialization, as well as for underestimating the extant development and complexity of indigenous communities. As a result, archaeological theory has utilized alternative terms, particularly interaction zones, to discuss the material evidence located in-between different cultural core areas. We believe that frontiers and interaction zones are distinct concepts that can contribute to our understanding of the diversity and complexity of archaeological records. Both terms indicate areas where existing communities are exposed to the influence of features from one or more external, expanding cultural areas. How these elements become incorporated into the material assemblages of these areas is highly variable, depending on the regions’ existing complexity, the location with respect to external influences, the manner of interaction, and the agency of local communities and their leadership. In archaeological dialogues, these elements often dictate whether an area is considered a frontier or an interaction zone, yet the rationale for the designation is often lacking and the assumed boundaries or borders of the surrounding core areas are rarely discussed. Through the incorporation of archaeological research conducted globally from different temporal periods, this session seeks to stimulate theoretical discussion on the definitions and manifestations of frontiers and interaction zones. At the theoretical level, our aim is to explore the advantages and disadvantages provided by these terms in capturing and disentangling the complex processes of cultural exchange that occur in liminal zones. At the material level, we encourage the submission of case studies that discuss how culture manifests in these zones, including the contextual analysis of the formal characterization

and functional implementation of built environments, mortuary practices, ceremonial activities, and archaeological artifacts.

CONTRIBUTION ABSTRACTS

2110. EARLY NEOLITHIC INTERACTION ZONES IN BRANDENBURG, NORTH-EASTERN GERMANY

**Contribution format:** Oral  
**Contribution authors:** Sophie Schmidt (Freie Universität Berlin)

The early Neolithic in Brandenburg, North-Eastern Germany, is still badly understood. Far away from the well researched and fertile areas of the loess-belt, there are nonetheless significant material remains of Linearbandkeramik (LBK) settlers, starting at the end of the 6th mill BC. Their ceramic traditions seem to be culturally influenced from nowadays Central Germany (Saxony and Saxony-Anhalt) as well as from nowadays Poland. After the collapse of the LBK oecumene, Central Germany influenced post-LBK cultures such as Stroke Ornamented Ware culture (SBK) and Rössen culture are also present. Influences from Poland come in form of the so-called “Stichreihenkultur” (SRK), which is the Polish Stroke Ornamented Ware culture (kultura późnej ceramiki wstęgowej) and the “Guhrauer Gruppe” (Guhrau Group, grupa gorowska). The Guhrau Group shows a mixture of elements from Stroke Ornamented Ware, Rössen and Brześć-Kujawski, a Polish culture dating 4400-4000 calBC with its core region in Kujawy. A mesolithic ceramic group, the Friesack-Boberg Group, seems to form in the 5th mill BC as well. Thus, Brandenburg lies at the periphery of several neolithic phenomena while maintaining a strong hunter-gatherer presence until probably 4000 BC. It can be characterized as an interaction zone, as there is evidence of interaction between Stroke Band Pottery Culture and Rössen culture, as well as Rössen culture and Mesolithic communities. The Guhrau Group seems to be the result of prolonged and intensive contacts between people of different ceramic traditions. Mesolithic influence on Neolithic communities may be a reason for the strong hunting and fishing component in the subsistence of the early Neolithic in Brandenburg. This talk aims at developing a model of interaction and intercultural influence for the region in the 5th mill BC.

1223. DISTRIBUTIONS OF COPPER AND BRONZE TECHNOLOGICAL STYLES IN LATE CHALCOLITHIC AND EARLY BRONZE AGE CENTRAL ASIA, INTERPRETED THROUGH PASTORAL MOVEMENT

**Contribution format:** Oral  
**Contribution authors:** Rachele Bianchi (University of Toronto)

Patterns of artefact distribution in Bronze Age Central Asia, particularly from the Middle Bronze Age onwards, are frequently discussed in relation to the concept of Interaction Spheres and the role of peripheries and liminal areas. In this paper, I focus on the earlier period to argue that the Interaction Sphere concept is not useful in these temporal contexts. Instead, based on the distribution of metal objects, interaction is better explained through individual contacts during seasonal movements of pastoralists. While the socio-economic impact of pastoralism, particularly sheep grazing, is one of the more thoroughly investigated themes in contemporary ethnohistoric and archaeological landscape studies for Central Asia, the cultural implications of pastoralist practices in relation to metalworking techniques of the Late Chalcolithic and Early Bronze Age of Central Asia remain relatively understudied. I use geographical patterns of technological style, based on compositional and metallographic data collected from copper and bronze artefacts, to delineate the “metalscape” of the Late Chalcolithic and Early Bronze Age and to propose an explanatory model for such distributions, based on reconstructed seasonal pastoral mobility. I propose that pastoralists’ patterns of horizontal and vertical transhumance were instrumental in establishing and maintaining interactions across the steppes and mountain ranges of Central Asia, including technological knowledge and practices for metalworking.

1371. A TWO-WAY STREET: REVISITING CORE-PERIPHERY INTERPRETATIONS USING HIGH RESOLUTION SUBSISTENCE DATA FROM A NORTHERN ARIZONA HINTERLAND

**Contribution format:** Oral  
**Contribution authors:** Calla McNamee (University of Calgary) – Alan Sullivan III (University of Cincinnati) – Philip Mink II (University of Kentucky)

Archaeological discussions of frontiers have traditionally involved attempts to interpret “peripheries” with reference to the often extensive research from adjacent “core” areas. Such studies assume that our understanding of “cores” provides the most accurate picture of an area’s overall cultural characteristics, including its hinterlands. In this paper, we utilize the in-depth study of subsistence practices from a hinterland, the Upper Basin (UB) and surrounding uplands of the Grand Canyon (Northern Arizona), to emphasize how research from frontiers can illuminate gaps in our understanding of regional practices based on core data. The UB is located at the crossroads of three distinct Puebloan “cultures”, the Virgin and Kayenta Anasazi and the Cohonina. Prior to widespread perennial occupation around AD 600 by populations arriving from surrounding ‘core’ areas, the area was

largely uninhabited. Multi-decadal research by the Upper Basin Archaeological Research Project has developed archaeobotanical and paleoenvironmental evidence indicating that the area’s population relied primarily on wild resources cultivated through land management and anthropogenic burning, practices that differ from the traditional reliance on maize agriculture postulated for nearby cores. Two alternative explanations thus emerge: Is this an isolated adaptive strategy developed by populations to survive in a pristine environment? Or did the populations moving into this area have prior knowledge of these forms of resource management? We suggest that the UB populations arrived possessing pre-existing traditional ecological knowledge to manage the landscape through anthropogenic burning. While the UB populations clearly capitalized on this knowledge to ensure a stable food supply, this practice must have been utilized by nearby ‘core’ populations. In addition to demonstrating the need to reassess the existing data from ‘core’ areas, our results emphasize the need to redirect future work in ‘core’ areas to refine our understandings of what constitutes archaeological evidence of frontiers and boundaries.

**1238. THE SIGHT OF THE STRANGER: MARITIME INTERACTION AND PERFORMANCE IN THE LATE BRONZE AGE PORTS OF THE MEDITERRANEAN**

**Contribution format:** Oral  
**Contribution authors:** Angela Falezza (University of Oxford) – Francesco Iacono (Università di Bologna)

Situations of cultural encounters are increasingly recognised as crucial contexts, profoundly affecting the social dynamics and identity of people and groups. Yet the actual actions involved in these encounters and their ephemeral traces are an elusive field of enquiry that has rarely been at the centre of archaeological investigation. In this paper we attempt an assessment of the micro event-level of interaction during the 2nd millennium BC Central Mediterranean, a moment when groups and individuals with different cultural backgrounds were put in prolonged contact. In such a context, ports make optimal border zones for encounters to take place, and taking them into account can provide a useful guide for envisaging the practicalities of interaction and how these affected the outcome of encounters. This paper analyses the different stages of encounters by looking at evidence from Late Bronze Age ports in the Aegean and Central Mediterranean. Information can be obtained from the analysis of the architectural organisation of the site, naval architecture and archaeological artefacts.

**1378. CULTURAL INTERACTION, LOCAL AGENCY, AND THE FORMATION OF POLITICAL LEADERSHIP: A LATE HELLADIC IIA FEASTING CONTEXT FROM MITROU, CENTRAL GREECE**

**Contribution format:** Oral  
**Contribution authors:** Salvatore Vitale – Francesca Nani (University of Pisa)

In this paper, we focus on a Late Helladic (LH) IIA Early deposit from the area of Building H, at Mitrou, East Lokris, which included the remains of pottery vessels used during feasting activities at the site. Located at the center of the Euboean Gulf, a key passageway between the southern and northern Aegean, Mitrou was an important harbor station for collecting and redistributing goods in central Greece, thus representing an ideal site for the analysis of interaction zones and processes of cultural exchange. Our study shows that early in LH IIA Mitrou’s rising elites used two distinct imported classes in feasting events at the site in order to stimulate the greatest visual and emotional impact on the participants. These consisted of Aeginetan vessels for serving and mixing and Mycenaean shapes for drinking. While the occurrence of these prestigious imports indicates the competitive economic and cultural expansion in central Greece of workshops located at the two core manufacturing areas of these classes, namely Aegina and the northeast Peloponnese, their implementation at Mitrou shows that rising local elites used feasting ceremonies as arenas for the negotiation of status and power. Our work demonstrates that interaction zones are not simply regions in which existing communities are exposed to the impact of other expanding areas. On the contrary, they are often ideal spaces for the formation of multifaceted assemblages of practices, which local agencies can manipulate to serve their own cultural strategies. At Mitrou, the incorporation of Aeginetan and Mycenaean pottery imports in feasting ceremonies was instrumental to the development of social complexity and the establishment of political leadership.

**1700. MOBILITY IN A STATIC LANDSCAPE: THE ROLE OF ROADS IN INTERPRETING SETTLEMENT PATTERNS**

**Contribution format:** Oral  
**Contribution authors:** Jędrzej Hordecki (Department of Anthropology, Wrocław University of Environmental and Life Sciences)

Past societies, when studied as actors within settlement networks, are often perceived as highly static. Archaeologists tend to conceptualize them as mere dots on a map—dots that, by definition, lack mobility. This perspective leads to the petrification of past settlement systems and discourages the incorporation of mobility as a critical factor in their interpretation. This paper examines settlement patterns in Central Anatolia during the Iron Age. Traditionally, this region has remained at the margins of major research agendas, but in recent years, it

has begun to receive increasing scholarly attention. However, despite ongoing investigations, the settlement landscape is still largely perceived as static. This is primarily due to the enduring “dots on a map” perspective, which reduces settlements to fixed points rather than recognizing them as dynamic entities. Yet, these dots represent not only settlements but also the people inhabiting them and their interactions—both within individual settlements and across wider regional networks. A crucial yet often overlooked factor in understanding mobility and inter-settlement interactions is the role of roads and communication networks. Roads are fundamental infrastructural elements that facilitate movement and connectivity. This paper explores the potential road system of Central Anatolia during the Iron Age, employing geospatial methodologies—primarily least-cost analysis—to model possible route networks and identify key corridors of movement. By integrating this approach, the traditionally static representation of the settlement landscape is recontextualized within a framework of mobility, allowing for a more dynamic interpretation of spatial organization through both space and time. This perspective is particularly significant for understanding Central Anatolia in the Iron Age, as the connections and relationships that emerged during this period can often be traced in subsequent historical developments.

**1017. DYNAMIC TERRITORIES IN EARLY IRON AGE CENTRAL SLOVENIA**

**Contribution format:** Oral  
**Contribution authors:** Matic Zupan (National museum of Slovenia)

The Early Iron Age in central and southeastern Slovenia has been a focal point of archaeological research for over a century, revealing a landscape dominated by central hillforts and barrow cemeteries associated with the so-called Dolenjska Hallstatt cultural group. This region saw major shifts in settlement patterns and material culture after the turbulent period of the 6th century BC. Traditionally, these changes have been linked to invading Scythian communities from the east, often framing the development in binary models, such as cultural collapse versus survival of communities and a distinction between core and peripheral zones. However, only recently has this landscape been examined through the lens of dynamic spatial interactions, incorporating concepts such as frontiers and buffer zones. This case study focuses on settlement patterns, material culture and spatial organization in central Slovenia from the 6th to 4th Century BC by integrating theoretical perspectives, GIS-based analysis and archaeological evidence from fortified hillforts and burial sites. The evidence suggests a complex web of local and interregional interactions, demonstrating that local communities were not just passive recipients of external influences, but actively shaped their identities through adoption of and adaptation to cultural traits. By critically engaging with the concepts of territoriality, frontiers and interaction zones, this study challenges the traditional views and presents a more nuanced approach that acknowledges the agency of communities in navigating political pressures, economic opportunities and social transformations The case of central Slovenia highlights that frontiers were not defined by isolation but rather by ongoing negotiation, settlement dynamics and interaction. This study contributes to broader discussions on territory dynamics in European prehistory, underscoring the need to reassess conventional models of territoriality and cultural boundaries.

**2207. THE BAJO EL LABERINTO REGION: A DYNAMIC CULTURAL FRONTIER ZONE IN THE MAYA LOWLANDS**

**Contribution format:** Oral  
**Contribution authors:** Kathryn Reese-Taylor (University of Calgary) – Felix Kupprat (Universidad Nacional Autónoma de México) – Armando Anaya Hernández (Universidad Autónoma de Campeche) – Debra Walker (University of Florida) – F. C. Atasta Flores Esquivel (Universidad Nacional Autónoma de México) – Verónica Vázquez López (University College London)

While political diversity in the Maya Lowlands has been the focus of many ongoing studies, a deeper understanding of socio-cultural differences, although recognized, has lagged behind. Many have chosen to focus on various individual markers of these distinctions, including but not limited to, languages, body modifications, pottery types, architectural styles, urban layouts, religious practices, and political affiliations, whereas few studies have incorporated multiple markers of identity. Since 2011, we have conducted investigations in the Bajo El Laberinto region, which is situated in the center of the Maya Lowlands. In this paper we will introduce multiple categories of material culture that signal both local and non-local cultural affiliations. Based on our research, we infer that diverse traditions converged in this region. For example, strong relationships with the northern Yucatan, the Chetumal Bay area, the Rio Bec region, and the southern and western lowlands are evident in various categories of cultural material during the long history of occupation in this region, although the degree of affinity with each zone fluctuates through time. Therefore, we suggest that the Bajo El Laberinto area constituted a dynamic frontier zone between several distinct cultural areas in the Maya Lowlands.

968. UNVEILING THE FRONTIER SOCIETY: BURIAL PRACTICES AND SOCIAL DYNAMICS IN THE EASTERN ROMAN DANUBE FRONTIER ZONE

Contribution format: Oral  
Contribution authors: Regina Molitor (Leibniz-Zentrum für Archäologie (LEIZA))

The frontiers of the Roman Empire were not rigid barriers but dynamic spaces of cultural interaction, where societal coexistence was subject to diverse influences and required constant renegotiation. These frontiers not only served as contact zones between different cultures but also as arenas for the emergence of new social orders and power structures. This paper explores these dynamics by focusing on the frontier region of the late antique northern frontier of the Eastern Roman Empire. From the early fourth century onwards, a profound social transformation took place along the Lower Danube, a development that is particularly evident in the archaeological record through the increasing integration of weapon sets into grave goods assemblages. Contrary to traditional interpretations of these so-called “weapon graves,” which regard them as burials of migrating warriors who crossed the Danube and possibly served in Roman forces, recent archaeological investigations, supplemented by newly conducted aDNA analyses, suggest alternative explanations. These graves appear to reflect the archaeological manifestation of newly emerging local and temporary socio-political power structures, shaped within the specific framework of a frontier zone extending across both sides of the Lower Danube. Guided by the question of how these newly emerging social structures within the frontier zone can be archaeologically characterised, this paper aims not only to provide new perspectives on the dynamics and social transformation processes within this frontier zone through selected case studies but also to demonstrate how the frontier zone along the Lower Danube can be made archaeologically visible.

1061. PERIPHERAL CENTERS, CORE DEBATES. RETHINKING URBAN-RURAL INTERACTIONS IN CLASSIC MAYA SOCIETY

Contribution format: Oral  
Contribution authors: Jessica Munson (Lycoming College)

As an analytical category, frontiers have been conceived as rural and sparsely populated zones of human settlement and resource extraction. The inhabitants of frontier zones are thus portrayed as exploited and passive recipients of urban benevolence far removed from centers of power and cultural innovation. Recent studies of Classic Maya urbanism tend to reify this notion of the frontier by reducing low-density, rural settlements to hinterlands that were dependent upon or controlled by more populous and diverse urban centers. These frontier zones may have been the source of intense competition during the Late Classic period (ca. 600-800 CE) as powerful rulers sought to gain control of trade routes and access to valued commodities such as cacao and textiles, but rarely have archaeologists examined these frontier communities on their own accord. Moreover, the urban-rural framework in which these debates are embedded underscores dichotomous thinking that masks understanding variation within frontier landscapes. This paper examines settlement pattern data from the Upper Usumacinta Confluence Zone (UUCZ) as well as related architecture and ritual deposits from the site of Altar de Sacrificios, the primary center of ceremonial activity and socioeconomic interaction in this otherwise frontier region from the Late Preclassic (ca. 300 BCE) to the end of the Classic Maya period. Focusing on the occupation history and diachronic changes in public architecture and ritual activity, this paper traces the development of this small and atypical “paraurban” city whose strategic location and built environment offered varied opportunities for both local and long-distance interactions over its long history. Theoretically, this work challenges existing categorical frameworks by applying network perspectives to investigate interactions across the urban-rural interface and how those changed over time.

840. BORDERLANDS IN ANCIENT SOUTHERN ITALY. CULTURAL INTERACTIONS AMONG GREEKS, PEUCETIANS AND OENOTRIANS

Contribution format: Oral  
Contribution authors: Filippo Trotta (Università degli Studi di Bari - Dipartimento di Ricerca e Innovazione Umanistica) – Paolo Brocato (Università della Calabria - Dipartimento di Studi Umanistici) – Paola Palmentola (Università degli Studi di Bari - Dipartimento di Ricerca e Innovazione Umanistica) – Luciano Altomare (Università della Calabria - Dipartimento di Studi Umanistici) – Ginevra Coppola (Università degli Studi di Bari - Dipartimento di Ricerca e Innovazione Umanistica) – Roberto Ferretti (Independent) – Margherita Perri (Università della Calabria - Dipartimento di Studi Umanistici)

In the studies related to the Italic peoples, there is still a lack of contributions capable of providing an overall interpretation that highlights the historical-archaeological development of the Oenotrians and Peucetians cultures. Completely unexplored are the relationships established between both populations, a topic that requires a reconstruction focused on the border territories as the principal places of interaction between the two cultures. Although

archaeological research has often neglected border areas, considering them subordinate to central areas, many scholars have emphasized their significant role instead. For example, the Bradano District constitutes a territory open to multiple influences, just as the Vallo di Diano serves as a link between the Campanian-Villanovan and the Oenotrian, Lucanian, and Peucetian areas. In the northwest of Taranto, centers like Ginosa and Laterza seem to maintain a strong Peucetian connotation, while the territory of Castellaneta appears to undergo a clear process of Hellenization influenced by Taranto and Metaponto. This scenario outlines a heterogeneous situation in the border areas, which were subject to strong external influences, both indigenous and colonial. This paper presents the results of research focused on the comparison between Oenotrian and Peucetian cultures. Through the analysis of a multitude of archaeological phenomena and data, with particular attention to the peculiarities that characterize the numerous border settlements placed on both sides of the Bradano, we explore the contact between the two cultures, as well as the interaction with the neighboring Greek peoples settled in the Ionian arc.

340. COGNITIVE AND MATERIAL ASPECTS OF SARMATIAN–ROMAN RELATIONS IN THE FOREGROUND OF AQUINCUM (PANNONIA)

Contribution format: Oral  
Contribution authors: Tamás Szebenyi (University of Szeged Department of Archaeology, HU)

“Despite the distorted impressions conveyed by the antique written sources, the relationship of the Sarmatian communities and the Roman provinces of the Carpathian Basin were primarily peaceful during the nearly 400-year co-occupation along the Danube (between the 1st and 5th century AD). In the Great Hungarian Plain contact region, the greatest frequency of Roman artifacts occurs near the border zones of the ripa Pannonica where short distance trade (Grenzhandel) takes place. The recent analyses of the imported ceramic assemblage from Site Üllő 5–9 (Pest county, Northern Hungary) provides a unique opportunity with its 2971 items (3481 fragments) to study Barbarian–Roman trade relations. Although the discussed finds show an unparalleled level of heterogeneity (e.g. terra sigillata vessels, Dressel 24/Zeest 90 type amphorae, Glanztonware, lead-gazed pottery), even in the vicinity of the Pannonian limes, the presence of a strong local, Barbarian demand is clear: the ratio of coated tableware is 91,5% at Site Üllő 5–9, but it is only 1,6–8,2% in the production program of the nearby Pannonian workshops! On the other hand, the occurrence of foreign vessels from the Sarmatian culinary traditions (e.g. Roman imitations of Drag. 18/31 and 35/36 form plates) shows some degree of integration of provincial cultural elements. Furthermore, the abrasion marks on lead-glazed mortaria indicates their consistent functional use as kitchenware even in Sarmatian environment. The issue of the so called “red painted Sarmatian pottery” shows the embeddedness of Roman imported earthenware from another point of view. This vessel type clearly imitates the most popular terra sigillata forms among Sarmatians (Drag. 30, 37) and can be dated at the earliest to the declining import of Western luxury pottery (second half of the 3rd century).”

832. THE WEIGHT OF THE FRONTIER. ARCHAEOLOGICAL TRACES OF THE INTERACTION WITH THE MIGRATION BORDER IN LAMPEDUSA (ITALY)

Contribution format: Oral  
Contribution authors: Francesca Anichini (University of Pisa)

Lampedusa (Italy) is a small island in the heart of the southern Mediterranean. It has always been a strategic landing point and a military strategic outpost from the 20th century onwards. Its liminal condition defines some cultural characteristics, progressively shaped by continuous exchanges with North African (particularly Tunisian) and Sicilian cultures. Since the 1990s, Lampedusa has become a frontier, unwillingly incorporated into the geopolitical dynamics imposed by the Schengen Agreement and the concept of Fortress Europe. These dynamics have progressively reshaped European border protection policies. The island has entered the media spotlight, transforming into the “island of migration.” An archaeological investigation carried out between 2020 and 2024 has surveyed the material traces left by undocumented contemporary migrations and explored the complex relationship between the island, its inhabitants, and the phenomenon of migration. Through a series of archaeological-ethnographic fieldwork campaigns and surface surveys, researchers have catalogued and analysed objects arriving on the island, burial practices, and elements of public representation that reveal a complex interaction between residents, law enforcement and border control agencies, political actors, humanitarian workers, researchers, and people on the move. Stripped of the media spotlight on the island for years, the archaeological record becomes an eloquent and compelling witness, unveiling connections between the local and global dimensions. It opens up critical reflections on the frontier status as a determining factor both in the internal dynamics of the local community and concerning the influence of external elements and the management of intercultural interactions. The paper will provide a concise overview of the research, focusing on key elements that may offer insights in this direction.

2485. BREAKING TRADITIONS: SUDDEN CHANGE AND ABANDONMENT IN ARCHAEOLOGICAL LANDSCAPES SANCTI SPIRITUS, LOST AND FOUND

**Contribution format:** Oral  
**Contribution authors:** Iban Pinto – Sergio Escribano Rui – Agustín Azkarate Garai-Olaun (University of the Basque Country, Department of Geography, Prehistory and Archaeology)

In 2027, the 500th anniversary of the construction of Sancti Spiritus, the first European settlement built in the Southern Cone, will be commemorated. Although it was a milestone in the colonial history of the region, its significance did not lie in prolonged occupation, as it was destroyed and abandoned just two years later, in 1529. While it remains uncertain whether the 500th anniversary of its burning will be celebrated in 2029, this presentation will focus on the process of the fort’s destruction and abandonment. In this presentation, we will analyze two radical transformations within a single case study, shaped by two overlapping yet opposing spatial traditions in a contested landscape. The first transformation corresponds to the destruction of the indigenous settlement by Europeans to construct the fort. The second involves the subsequent destruction and abandonment of the fort itself and its associated structures. Drawing on more than a decade of historical and archaeological research, we will explore this dual process of remembrance and oblivion. Paradoxically, rather than fading into history, the memory of Sancti Spiritus endured until its rediscovery in the early 21st century. Today, the fort enters a new phase, one tied to the study and dissemination of its legacy.

162 TRACING LONG-TERM TRANSFORMATIONS: MULTISCALE METHODS FOR UNDERSTANDING PAST LANDSCAPES

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Regular session  
**Session keywords:** landscape , geoarchaeology, paleoecology, computational methods, paleo-environments, long-term dynamics  
**Session organisers:** Giacomo Vinci (University of Padova) – Filippo Brandolini (Massachusetts Institute of Technology | Università degli Studi di Milano) – Gabriel Servera-Vives (University of the Balearic Islands,) – Grant Snitker (New Mexico Consortium) – Sandra Garcés Pastor (University of Barcelona)

SESSION ABSTRACT

Archaeological research now leverages advanced computational tools —such as remote sensing, GIS spatial analyses, predictive modelling, and agent-based modelling— alongside traditional laboratory and fieldwork techniques. In parallel, integrated palaeoecological studies employ diverse disciplines and proxies to investigate landscape change across long timescales. These approaches encompass the analysis of pollen, non-pollen palynomorphs, sedimentology, geochemistry, charcoal, biomarkers, and sedimentary DNA. By integrating archaeological and palaeoecological data from on-site, site periphery (near-to-site), and off-site sequences, this session aims to provide insights into land use and land cover changes, revealing long-term landscape dynamics. Particular emphasis will be placed on changes in the structural and inherent characteristics of landscapes (geological, geomorphic, ecological, etc.) and the dynamic interactions between human communities and their environments. This approach will shed light on cycles of stability and change, as well as the historical trajectories of landscape evolution. To address these complex interactions, we draw upon a wide array of methodologies. This multi-scale, computationally enhanced approach not only aims to reconstruct past environments but also to propose sustainable land management practices today. By highlighting innovative methodologies and their practical applications, this session aims to advance research in environmental archaeology, historical ecology, and sustainable landscape management. We welcome methodological contributions and case studies that apply these techniques across varied regions, demonstrating the potential of combining multi-proxy techniques to reveal patterns in landscape transformation.

CONTRIBUTION ABSTRACTS

868. A GEOARCHAEOLOGICAL PERSPECTIVE ON RONDEL DITCH INFILL FORMATION AS A KEY TO UNRAVELING NEOLITHIC SETTLEMENT TRANSFORMATION AND LANDSCAPE DYNAMICS

**Contribution format:** Oral  
**Contribution authors:** Jaroslav Bartík – Katarína Adameková – Petr Škrdla (Institute of Archaeology of the Czech Academy of Sciences, Brno) – Peter Milo – Tomáš Tencer (Department of Archaeology and Museology, Fakulty of Arts, Masaryk University, Brno) – Jan Novák (Department of Botany, Faculty of Science, Charles University, Prague) – Šárka Hladilová (Department of

Geological Sciences, Faculty of Science, Masaryk University, Brno) – Jaromír Kovárník (Independent) – Martin Košťál (Department of Archaeology and Museology, Fakulty of Arts, Masaryk University, Brno)

The construction of circular ditch enclosures (rondels) is one of the most remarkable phenomena of the Central European Neolithic. In southwestern Moravia (eastern part of the Czech Republic), near the village of Mohelno (Třebíč District), three settlement areas with rondels were identified, each positioned on slight elevations above a small watercourse with distances varying from 600 to 800 m among themselves. While their presumed dating to the Lengyel culture (ca. 4900–4300 BC) was initially based on surface finds, their chronological framework is currently being refined within a multidisciplinary research project. This study integrates geoarchaeological approaches to analyze the infill deposits of rondel ditches as archives of prehistoric environmental conditions, anthropogenic activities, landscape dynamics and subsequent post-depositional processes over time. By combining soil micromorphology, sedimentology, geochemical and physico-chemical analyses, radiocarbon dating, and archaeobotanical methods, we investigate the depositional histories of rondel ‘s infills. By embedding this analysis within a broader landscape perspective, incorporating geophysical prospection and regional palaeoecological data, our research contributes to understanding transformations in Neolithic landscapes. This multi-proxy approach highlights the dynamic interactions between early farming communities and their environment, shedding light on patterns of settlement persistence, land cover changes, and site formation processes.

1696. HOLOCENE LAND COVER CHANGE IN THE PANNONIAN (EAST-CENTRAL EUROPE) FOREST STEPPE: THE ROLE OF PREHISTORIC LAND EXPLOITATION PHASES

**Contribution format:** Oral  
**Contribution authors:** Ilona Pál (ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography) – Enikő Magyari (ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography | HUN-REN-MTM-ELTE Research Group for Paleontology) – János Korponai (University of Public Service, Department of Aquatic Environmental Sciences) – Gábor Mesterházy (Hungarian National Museum, National Institute of Archaeology) – Ákos Bede-Fazekas (HUN-REN Centre for Ecological Research, Institute of Ecology and Botany | ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography) – Gabriella Darabos – Gusztáv Jakab (ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography) – András Füzesi (Hungarian National Museum, National Institute of Archaeology) – Pál Raczky (ELTE Eötvös Loránd University, Institute of Archaeological Sciences)

Pollen analytical studies of Holocene lake and mire sediments provide valuable information on past forest cover changes and help us resolving the long-debated origin of temperate forest steppes in Europe. Here we contribute to this debate via the pollen and multi-proxy palaeoecological (macrofossil, charcoal, major and trace element) analyses of a paleolake (Kokad Mire) situated in the temperate deciduous forest steppe zone of the Great Hungarian Plain (GHP). Diverse soil types and microhabitats in this area attracted arable farming communities since the Neolithic. By comparing the local archaeological record with the pollen-based land cover, vegetation composition and fire history changes, we analyze the climatic versus anthropogenic origin of the forest steppe vegetation, determine the ages of significant forest clearance episodes, and examine the relationship between paleo-proxy inferred land use and prehistoric/historic settlement density. Our results suggest that the current potential forest steppe vegetation of the eastern GHP had natural climatic and edaphic origin in the Early and Mid-Holocene, which was maintained by anthropogenic deforestation in the Late Holocene. Without human impact, forest cover should have increased likely since the Early Bronze Age. We found evidence for episodic land use during the Neolithic: Middle and early Late Neolithic (7600-7400 cal BP) coppice management and pastoral farming. Deforestation intensified from 3900 cal BP (during the Bronze Age). We demonstrated very early hemp (Cannabis sativa) cultivation between 5970–5450 cal BP (Middle Copper Age) likely attributable to eastern nomadic pastoral groups (pre-Yamnaya) who left behind several burial mounds in the region. We also showed that the lake was used for hemp retting between 2450–2000 cal BP by the local Celtic groups. The analysis of three pollen records from the GHP furthermore revealed that prehistoric cultures had different occupation intensities until the Late Bronze Age with localized forest clearances followed by afforestation.

1769. CAPTURING CHANGES - COMPLEX STUDIES AND COMPARATIVE ANALYSIS OF BARROW LANDSCAPE TRANSFORMATIONS IN THE PRECARPATHIAN AREA

**Contribution format:** Oral  
**Contribution authors:** Przemyslaw Makarowicz (Adam Mickiewicz University in Poznań) – Vitalii Rud (National Academy of Sciences of Ukraine, Kiiv) – Sorin Ignatescu (Stefan Cel Mare University of Suceava) – Ihor Kochkin (Vasyl Stefanyk Precarpathian National University

in Ivano-Frankivsk) – Vasyl Ilchyshyn (Kremenets-Pochaiv National Historical and Architectural Museum) – Krzysztof Michalczewski (Adam Mickiewicz University in Poznań) – Paweł Jarosz (Polish Academy of Sciences, Kraków) – Witold Szambelan (Adam Mickiewicz University in Poznań) – Bogdan Niculica (National Museum of Bukovina in Suceava) – Jan Romaniszyn (Adam Mickiewicz University in Poznań)

International teams have been studying barrow cemeteries in the Precarpathian area, specifically southwest-ern Ukraine and northeastern Romania, for nearly 15 years. In the Early and Middle Bronze Ages, this area was settled by communities that built barrows. These objects formed cemeteries that can span several kilometers, creating a network of barrow complexes, defined as a larger structures – barrow landscapes. Based on the knowl-edge gained during this research, it is known that these necropolises were built over extended periods of time by representatives of various successive cultural groups (the Yamna culture at the turn of the 4th and 3rd millennia BC, the Corded Ware culture in the 3rd millennium BC, and the Komarów culture in the 2nd millennium BC). Each of these periods was revolutionary in terms of funeral rites and brought new specificities to these spaces. Here, scholars from independent research teams have collaborated to compare their data from recent years. The main goal of this presentation is to conduct a comprehensive comparative analysis between the clusters of stud-ied barrow cemeteries in the Upper Dniester Area in Ukraine and the Interfluve of the Suceava and Siret Rivers in Romania. The results indicate that certain similarities, differences, and changes occurred over thousands of years in the Precarpathian barrow landscape and captured the chronological and spatial dynamics of these transformations. A wide spectrum of advanced multidisciplinary methods were used to analyze the trends (e.g. differences in funeral rituals or dietary practices) of these communities and radiocarbon analysis precisely placed these phenomena within an absolute chronology. This comparative analysis has revealed the main directions of the origin of the “Kurganization” phenomenon, and also proves that Precarpathia played an important role as a crucial area of contact between the steppe migrants and local communities.

**1963. THE ADANCATA-IMAS BARROW CEMETERY (NORTH-EASTERN ROMANIA) – CHRONOLOGICAL, SPATIAL AND CULTURAL CHANGES IN THE LIGHT OF MULTIDISCIPLINARY METHODS**

**Contribution format:** Oral  
**Contribution authors:** Bogdan Niculica (National Museum of Bukovina in Suceava) – Jan Romaniszyn (Adam Mickiewicz University in Poznań) – Sorin Ignatescu – Vasile Budui (Stefan Cel Mare University of Suceava) – Angela Simalscik (Orheiul Vechi Cultural-Natural Reserve, Republic of Moldova | Olga Necrasov Centre of Anthropological Research, Romanian Academy) – Krzysztof Michalczewski (Adam Mickiewicz University in Poznań) – Sebastian Teska (Independent) – Paweł Jarosz (Polish Academy of Sciences, Kraków) – Bartosz Żarkowski – Przemysław Makarowicz (Adam Mickiewicz University in Poznań)

Multidisciplinary methods provide previously unknown information and expand existing knowledge about the funeral rites of prehistoric communities. This also applies to barrow cemeteries, which form long chains of mounds, creating so-called ‘barrow or funerary landscapes’. The application of a multidisciplinary set of meth-ods is even more effective in areas where non-invasive methods can be confronted with excavations, as well as in regions that have not previously been explored on a large scale. The site in Adancata-Imas is an example of a necropolis where the history of barrow communities from the 3rd and 2nd millennium BC has been recorded. Within this cemetery, barrows with a complex chronology are associated with different stages of the broadly understood ‘Kurganization’ process. Despite adapting the existing funeral space, successive populations were characterized by diverse funeral rituals which are documented under the mounds. The aim of this presentation is to show the details of the transformation of the barrow landscape and ritual behaviors over time thanks to recent excavations and a spectrum of multidisciplinary methods. The Adancata necropolis has been archaeo-logically recognized for nearly 15 years. Thanks to several excavation seasons, the application of non-invasive methods (LIDAR scanning, GPR prospection, and magnetometry), palaeo-studies. and anthropological analysis, it was possible to generate greater insight into the funeral rites of the communities who used the cemetery. The new radiocarbon dates obtained also placed the Adancata-Imas site within an absolute chronology and confirmed the long-term usage of this place. The data currently obtained from Adancata-Imas represent a scientific bench-mark for this area and indicate the directions of future research of barrow landscapes in this part of Europe.

**1877. THE STORY OF AN ENCLOSED EARLY BRONZE AGE SETTLEMENT IN PLOTIŠŤĚ NAD LABEM (BOHEMIA) FROM THE GEOARCHAEOLOGICAL AND PALEOENVIRONMENTAL PERSPECTIVE**

**Contribution format:** Oral  
**Contribution authors:** Michaela Kosová (Institute of Archaeology of the Czech Academy of Sciences, Prague) – Katarína Adameková (Institute of Archaeology of the Czech Academy of Sciences, Prague | Institute of Archaeology Czech Acad Sci, Brno) – Eva Schimerová (University

of Hradec Králové) – Jarmila Bíšková (Institute of Archaeology of the Czech Academy of Sciences, Prague | Masaryk University) – René Kyselý – Petr Kočár – Vít Vokolek (Institute of Archaeology of the Czech Academy of Sciences, Prague)

In the early 1970s, excavations in Platiště nad Labem (Eastern Bohemia) revealed a unique Early Bronze Age settlement enclosed by a massive ditch with a flat bottom. This site remains the only known fortified site from the Early Bronze Age in the entire region of Eastern Bohemia. Based on the structure of the surrounding settlement network, it is evident that this site served as a central hub for the entire region. However, despite its key signif-icance, the site has neither been thoroughly analyzed nor published. In 2023, a revision excavation of the ditch was conducted to reevaluate its stratigraphy using modern geoarchaeological and interdisciplinary methods to better understand its function, chronology, and relationship with the surrounding landscape. Even today, the ditch reaches a depth of nearly 4 meters and a width of 10 meters. Its well-preserved state allowed for the collec-tion of samples not only from horizons dated to the Early Bronze Age but also from layers associated with periods following the decline of the fortifications, up until the ditch was filled in during the La Tène period. Samples from individual ditch horizons included micromorphological, geochemical, grain-size, total organic carbon, magnetic susceptibility, malacological, archaeozoological, and botanical analyses. The chronology of individual horizons is further refined by numerous radiocarbon and optically stimulated luminescence dates. By combining these methods, along with traditional archaeological ones, this contribution provides a more precise understanding of the construction and lifespan of the fortification and its role in regional social dynamics. Additionally, it offers valuable insights into ecological conditions of the site and its surroundings from the Early Bronze Age to the La Tène period.

**2329. PALAEOGEOGRAPHY AND BIOCLIMATIC CHANGES AT THE IBERIAN MEDITERRANEAN REGION (SPAIN): COVES DE SANTA MAIRA (22 – 10 KA CALBP)**

**Contribution format:** Oral  
**Contribution authors:** Vanessa Extrem-Membrado (PREMEDOC, Departament de Prehistòria, Arqueologia i H. Antiga, Universitat de València) – Salvador Pardo-Gordó (GISPRAYA Research Group, Departamento de Geografía e Historia, Universidad de La Laguna) – C. Michael Barton (School of Complex Adaptive Systems, Arizona State University | School of Human Evolution and Social Change, Arizona State University) – Adolfo Maestro González (GI-GEOFSUB Research Group, Departamento de Geología y Geofísica. C.N. IGME-CSIC) – Yolanda Carrión Marco (PREMEDOC, Departament de Prehistòria, Arqueologia i H. Antiga, Universitat de València) – Jesús F. Jordá Pardo (Departamento de Prehistoria y Arqueología, Universidad Nacional de Educación a Distancia (UNED)) – J. Emili Aura Tortosa (PREMEDOC, Departament de Prehistòria, Arqueologia i H. Antiga, Universitat de València)

In recent years, the use of GIS tools and models to reconstruct paleoclimate and paleoecology has become popular. These models have made it possible to understand the areas of distribution of plant resources and the palaeoen-vironmental changes caused by climatic fluctuations. Nevertheless, these models are built from an ecological niche that provides reconstructions at large temporal and spatial scales. But these reconstructions could gener-ate a low ecological and geographical resolution for small study areas, that, perhaps, do not reflect the reality of the available data from the sites. This is the case when comparing pollen and charcoal sequences or for the emerging lands due to the change in the coastline. In the Valencia Region (Spain), climatic and palaeoenviron-mental fluctuations associated with the transition between the Pleistocene and the early Holocene have been recorded, which generated important ecological and geographical changes that conditioned the life and interac-tions of hunter-gatherer-fisher groups. Archaeobotanical studies at some sites in the region may show possible discrepancies with the regional pollen data. This problem has been highlighted at Coves de Santa Maira, where no pollen sequence is available. This communication aims to investigate palaeoclimatic and palaeoenvironmen-tal changes at a specific site of the Valencia region, the Coves de Santa Maira site. We will use the GIS tools to compare pollen data and plant macroremains recovered from the Coves de Santa Maira. We intend to compare and understand the differences between pollen and charcoal, and to observe the possible variations that can be detected on a small scale in a mountainous environment between the fluctuations of the last Pleistocene to the early Holocene. Finally, the results will be compared with the Valencia region, including the coastal environ-ment and the emerging land areas.

823. FROM POLLEN TO PIXELS: ADVANCING GEOSPATIAL VEGETATION RECONSTRUCTION METHODS TO UNDERSTAND THE CHANGING LANDSCAPES OF SOUTHEASTERN AUSTRALIA

**Contribution format:** Oral  
**Contribution authors:** Alastair Wills – Michela Mariani – Barry Lomax – Matthew Kent (University of Nottingham) – Martin Theuerkauf (University of Greifswald) – Simon Connor (Australian National University) – Haidee Cadd (University of Wollongong) – Annika Herbert – Janelle Stevenson (Australian National University) – Peter Kershaw (Monash University)

Pollen counts are essential proxies for reconstructing past vegetation cover and understanding landscape evolution. Sugita’s Landscape Reconstruction Algorithm (LRA) has provided a method for palynologists to quantify past vegetation at the taxon level by correcting for pollen production, dispersal, and deposition biases. While the LRA provides reliable vegetation reconstructions, its assumption of vegetation pattern uniformity limits its ability to spatially define past vegetation patterns within a reconstructed area. In reality, landscapes are often highly structured, with vegetation distributed in distinct patches rather than evenly across a region. For example, in mosaic landscapes where forests are interspersed with open grasslands or where cultural landscapes have been shaped through Indigenous land management, the assumption of homogeneity does not hold. Consequently, LRA reconstructions may struggle to accurately represent past vegetation in such heterogeneous environments. Alternative approaches to the LRA methodology, such as the Multiple Scenario Approach and the Extended Downscaling Approach (EDA) address this limitation by introducing underlying landscape patterns and optimisation approaches into the reconstruction process, enabling more realistic and fine-scale geospatial vegetation reconstructions. Herein, we validate the EDA model which has not yet been applied in an Australian or the Southern-Hemispheric context. Our approach involves inputting modern pollen records and modern vegetation distribution datasets to reconstruct modern vegetation cover from the EDA which, are then validated against ground-surveyed vegetation cover. We find the EDA model is flexible, working across spatial scales ranging from extra-local (~10km radius from pollen sites) to regional, including topographically complex landscapes, such as those of Western Tasmania. These initial findings highlight the potential of the EDA to uncover the interplay between vegetation patterns driven by climate and those shaped by past Indigenous cultural land management practices. This provides a novel spatio-temporal method of understanding southeastern Australian vegetation cover change throughout the Holocene.

838. THE HUMAN HISTORY IN THE RAINFORESTS OF THE GUIANA SHIELD

**Contribution format:** Oral  
**Contribution authors:** Chendi Wang – Yujia Shi – Crystal Mcmichael (Institute for Biodiversity and Ecosystem Dynamics, University of Amsterdam) – Martijn Van Den Bel (INRAP, French Guiana.) – Nina Witteveen (Forest Ecology and Management Group, Wageningen University)

The Guiana Shield is a part of the Amazon rainforest that is characterized by relatively isolated rainforests. Compared to other Amazonian regions, little is known about the past/first inhabitants of the region. While it is hypothesized that Indigenous populations were small-scaled, the discovery of ring ditches and human-modified soils suggests intensive forest management from thriving populations in some forests. To shed light on past land use in The Guiana Shield, and the cultural heritage of Indigenous People, we investigated and compared the vegetation and fire history of two settlements in French Guiana and Suriname. To reconstruct the vegetation history of the last 1500 years, phytoliths were studied, which are silica microfossils that remain in the soils after plants decay. Charcoal has been analysed to assess the fire history. Preliminary results show people inhabited these forests during the pre-Columbian and post-colonial period, indicated by charcoal from past forest fires. Phytolith studies show that the abundance of palm species is positively correlated with human disturbances, especially for those with edible fruits. This study deepened our understanding of the historical practices of Indigenous People and their environmental interactions. Our findings highlight the long-standing and unique human-environment interactions in these remote, tropical forests of the Guiana Shield and future sustainable development.

1622. BEYOND THE CITY WALLS: A FIRST APPROACH TO THE IMPLEMENTATION OF THE ROMAN OCCUPATION MODEL IN THE NORTH-EASTERN IBERIAN PENINSULA

**Contribution format:** Oral  
**Contribution authors:** Sònia Salvia Vidal – Esther Rodrigo Requena (Universitat Autònoma de Barcelona (UAB))

In the north-east of the Iberian Peninsula, apart from Tarraco and Emporion, one of the oldest cities was the urban settlement of Iesso (Guissona, Catalonia), founded in 120 BC. With more than 30 years of research, this Roman town has become a reference point in Catalan archaeology. Despite all the archaeological interventions that have been carried out, the information concerning the earliest moments of Iesso is still partial and fragmentary. Therefore, it is necessary to achieve a more complete understanding of its development through a holistic research approach, combining the study of its initial urbanism with the occupation and management of the

landscape surrounding the town, the ager Iessonensis. In addition, the indigenous factor will be included in the analysis effectuated, taking into account the sites of pre-Roman societies in the territory. This project requires a solid methodology that allows the interpretation of the results generated by computational studies applied to the archaeological data. It will be managed by a relational geodatabase which will make possible to execute analysis from a micro scale, analysing the construction techniques of each structural unit of the buildings in the whole study area, to a macro scale, carrying out a chronotypological classification of the archaeological sites in the ager and the town. To summarize, the aim of this communication is to present the results of a first phase of research which has begun with the georeferencing and digitisation of all the structures in the territory of Iesso. Once this methodology has been applied to the ager, it will be easier to export this level of analysis to the urban context. Finally, the results will facilitate the observation of influences and transformations in these centuries of hybridisation between Iberian and Roman cultures and the implementation of the Roman model.

548. THE USEFULNESS OF ARCHAEOPALYNOLOGICAL DATA FOR THE STUDY OF PLANT BIODIVERSITY: FROM BRAIN TO THE LIFEWATCH ITALY DATA PORTAL

**Contribution format:** Poster  
**Contribution authors:** Jessica Zappa (Laboratorio di Palinologia e Paleobotanica, Università degli Studi di Modena e Reggio Emilia) – Ilaria Rosati – Andrea Tarallo (Consiglio Nazionale delle Ricerche, Istituto di Ricerca sugli Ecosistemi Terrestri) – Eleonora Clò – Cristina Ricucci – Lorenzo Braga – Anna Maria Mercuri – Assunta Florenzano (Laboratorio di Palinologia e Paleobotanica, Università degli Studi di Modena e Reggio Emilia)

The landscape sees plant biodiversity as one of its most important features. The archaeobotanical study of pollen from archaeological contexts has proven to be one of the most valuable approaches for the understanding of the landscape structure (e.g., land cover type) and evolution (diachronic transformations under human impact and environmental factors) based on detailed morphological analysis and careful interdisciplinary interpretation. In Italy, the large amount of archaeobotanical studies in the different regions and for Holocene chronologies has been collected in the BRAIN database which, by the end of 2024, includes metadata of about 900 sites and 1000 bibliographic citations (Mercuri et al. 2024: Holocene archaeo-data for assessing plant-cultural diversity in Italy and other Mediterranean region. Scientific Data 11, 520; <https://brainplants.successoterra.net/>). Notably, palynological data offer considerable detail that is relevant in archaeological, conservation and ecological research fields. For this reason, the floristic lists – which in BRAIN are linked to archaeological sites – have been structured and harmonised to be published in a dedicated sub-portal hosted in the LifeWatch Italy Data Portal, a resource for managing and sharing biodiversity and ecosystem data following the principles of Findability, Accessibility, Interoperability and Reusability. The LifeWatch Italy Data Portal exposes data and metadata using worldwide accepted standards (DarwinCore, EML 2.2.0 schema), facilitating further reuse of the BRAIN database. The BRAIN diachronic floristic lists support the scientific community of archaeologists and scholars involved in biodiversity and ecosystem research to monitor changes in the composition of the local flora and to reconstruct the mid- and late Holocene plants dynamics under anthropic and natural pressure. Changes in vegetation cover clearly testify to the millennia of human activities that transformed natural into cultural landscapes in which we live and which we are asked to preserve.

1275. AS FAR AS THE HUMAN EYE CAN SEE! GIS VISIBILITY TOOLS AND LATE BRONZE AGE SETTLEMENTS IN SOUTHERN ALENTEJO (PORTUGAL)

**Contribution format:** Poster  
**Contribution authors:** António Diniz (Universidade de Évora, CHAIA, IN2PAST | Universidade de Évora, CIDEHUS) – Miguel Serra (Câmara Municipal de Serpa | University of Coimbra, CEAACP) – Nelson Almeida (Universidade de Évora, CHAIA, IN2PAST | UNIARQ – University of Lisbon) – Enrique Cuenca (Complutense University of Madrid)

The Bronze Age in the Interior Alentejo region (South Portugal) has been the focus of attention since several casual discoveries at the end of the 19th century, followed by occasional but important surveys during the 40s to 60s of the last century and some research projects after the 80s until today. The research problems were exacerbated by the construction of the Alqueva Dam Project, which was associated with a large number of rescue archaeology works and many new data, which generated a great deal of scientific production as a way of preserving information. It is in this context that the present study is set, focusing on the ways in which Late Bronze Age sites are implanted between the territories of Beja and Serpa, a region separated by the course of the Guadiana River. From a spatial point of view, the question arises of a possible relationship between fortified and unfortified high-altitude and open lowland settlements. Through Geographic Information Systems and visibility tools, we aim to characterise possible correlations between the sites identified and frame these results in the settlement patterns discussion of Late Bronze Age inland Portugal.

1695. WOODLAND COMPOSITION AND UTILIZATION DURING THE NEOLITHIC, COPPER, AND BRONZE AGES IN THE GREAT HUNGARIAN PLAIN, EAST-CENTRAL EUROPE

**Contribution format:** Poster  
**Contribution authors:** Gabriella Darabos (ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography) – Máté Merkl (ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography | Kuny Domokos Museum) – Pál Raczky (ELTE Eötvös Loránd University, Institute of Archaeological Sciences) – András Füzesy (Hungarian National Museum) – Attila Gyucha (University of Georgia, Department of Anthropology) – Szilvia Fábián (Hungarian National Museum) – Tamás Hajdu (ELTE Eötvös Loránd University, Department of Biological Anthropology) – Gábor Csüllög – Ilona Pál (ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography) – Enikő Magyari (ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography | HUN-REN-MTM-ELTE Research Group for Paleontology)

This study investigates the floodplain woodlands and forest steppe of the Great Hungarian Plain (GHP) during prehistoric times, revealing insights into their exploitation and ecological dynamics from ca. 6000 cal BC. Previous research primarily relied on pollen records, leading to a limited understanding of the species composition. To solve this, systematic anthracological analysis was conducted on key archaeological sites spanning the Middle and Late Neolithic, as well as the Copper Age and Middle Bronze Age. The analysis focused on large volume bulk materials from long-term deposits, supplemented by pollen studies. The findings indicate that oak (*Quercus sp.*) was dominant in the region, utilized for construction and fuel. Notably, elm (*Ulmus sp.*) species were prevalent in the charcoal assemblages, particularly in the southeast GHP, where their frequency declined during the Early Chalcolithic period, suggesting a climate change or pathogen-induced decline. Compared to the lowland piedmont surface of the North Hungarian Range and the valley system of the mountains, the southeastern part of the GHP seems to be much less dominated by Ulmus and more by ash (*Fraxinus sp.*), and hornbeam (*Carpinus*) appears in charcoal assemblages from the Copper Age onwards. The study highlights significant ecological differences between the Neolithic forests of the GHP and modern Central and Eastern European steppe forests. The Cornelian cherry (*Cornus mas*) was consistently present, contributing to a distinct sub-Mediterranean-continental forest character. Additionally, discrepancies between hazel (*Corylus sp.*) representation in the pollen and charcoal records point to its potential over-representation in the pollen data. The findings underscore the GHP’s role as a vital environmental barrier, characterized by diverse ecosystems that prehistoric communities had to navigate and adapt to.

163 MAGISTERIA MINERVAE: CRAFTS AND CRAFTWORKING IN THE ROMAN MILITARY

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Roman archaeology, Roman army, Crafts  
**Session organisers:** Jason Lundock (Full Sail University) – Dajana Ehlers (Independent) – Radoslaw Karasiewicz-Szczypiorski (Polish Centre of Mediterranean Archaeology, University of Warsaw) – Ljubomir Jevtović (Institute of Archaeology, Belgrade)

SESSION ABSTRACT

This panels seeks to explore the daily lived experience of those who in and around Roman military settings through the making, use and disposal of crafts and artisan products. By examining products such as ceramics, textiles, woodworking and stone, it is possible to build a wider picture of the daily life of the soldiers, settlers and traders who formed the military communities across the empire and develop a greater appreciation of the multiplicity of activities involved in these settings. Whether for practical use or for amusement, craftworking would have played an essential role in the lives of all who called Roman military stations home and our examination of these practices within a military environment will help us develop a greater understanding of these communities as a whole. We seek papers that engage with theoretical as well as practical approaches to understanding the place of crafts within the lived experience of those who resided within, around and engaged with Roman military installations. Broad analyses of topics within craftworking as well as sites specific case studies shall be welcome contributions to this panel and its discussion.

CONTRIBUTION ABSTRACTS

56. CRAFTING THE PERFECT FIT: THE ART OF TAILORING ROMAN MAIL AND SCALE ARMOUR

**Contribution format:** Oral  
**Contribution authors:** Martijn Wijnhoven (Institute of Archaeology of the Czech Academy of Sciences, Brno)

The Roman army, with its vast size, relied on hundreds of thousands of pieces of armour to protect its soldiers. These were not merely mass-produced, they demanded considerable skill to tailor them to the human body. This paper explores the techniques employed by Roman craftsmen to adapt mail and scale armour to the contours and movements of the wearer, showcasing their ingenuity and craftsmanship. Through a systematic analysis of hundreds of archaeological finds, this study examines the balance between form and function in Roman armour design. By applying the concept of chaîne opératoire, it reconstructs the decision-making processes of Roman armourers, shedding light on the methods and considerations that shaped their work. Set within the context of military communities, this exploration offers insights into the minds of the craftsmen who created and maintained these vital tools of war. It highlights their role in ensuring the functionality and adaptability of armour. Ultimately, this presentation positions Roman armour not only as a utilitarian object but also as a testament to skilled artisanship and innovative problem-solving within the Roman Empire.

163. WEAPNRY IN GRAVES FROM THE ROMAN PERIOD (1ST-3RD C. AD). THE CASE OF PROVINCE OF THRACE

**Contribution format:** Oral  
**Contribution authors:** Kaloyan Pramatarov (National Archaeological Institute with Museum at the Bulgarian Academy of Sciences)

Throughout the Roman Empire, weapons placed in the burial context were perceived as a mark of social status and associated with males who had died at a mature age (soldiers/military administrators/veterans). Indeed, the weaponry represents a common category of objects deposited within the burial facilities in the mound necropolises in Thrace. As it concerns the latter, the graves with weapons are typical for the period in the middle of the 1st to the 3rd c. They are located in the plain regions of the province, along the main thoroughfares and in the outskirts of major cities, and relatively rarely (2nd – 3rd c.) in the mountainous areas which were characterized by strategic location and metallurgical activity during the Roman Period (the Rhodopes, Strandzha, and the area of Tran). The present report provides an overview of the finds, emphasizing the phenomenon of rich graves and the combination of weaponry with medical instruments and writing implements.

1985. CRAFTS ON THE ROMAN BORDER: UNDERSTANDING DAILY LIFE THROUGH GRAVE GOODS FROM THE CROATIAN SECTION OF THE LIMES

**Contribution format:** Oral  
**Contribution authors:** Petra Grizelj (Faculty of Humanities and Social Sciences, University of Zagreb) – Tino Leleković (Croatian Academy of Sciences and Arts)

Over the past twenty years, there has been a breakthrough in the research and understanding of the Croatian section of the Limes. Geophysical surveys and archaeological excavations have uncovered a previously unknown landscape, significantly altering perspectives on the Roman Empire’s border in Croatia. Research has mainly concentrated on geophysical surveys and trial excavations, rendering finds from settlements and fortifications relatively uncommon. Nevertheless, some contextual discoveries offer insights that connect numerous accidental finds deposited in museums to structures gradually emerging along the banks of the Danube. The most significant quantity of utilitarian artifacts originated from excavating Roman cemeteries along the limes. Investigations in Batina, Beli Manastir, Zmajevac, and Sotin have uncovered nearly 300 graves, providing valuable insights into the daily lives of the people who once inhabited the area. In accordance with contemporary customs, the graves include artisans’ objects attesting to the lives and activities of communities along the Danube in Pannonia. The lecture will highlight several significant contexts and artifacts that facilitate the reconstruction of burial rituals and offer a deeper understanding of the daily lives of the inhabitants of settlements along the Roman limes. By examining the craft-working tools in funerary contexts, we can gain deeper understanding of the role of crafts and artisans in the lives of those who lived on the empire’s frontier.

779. AMPHORA KILNS IN THE ROMAN FORT IN APSAROS

**Contribution format:** Oral  
**Contribution authors:** Natalia Lockley (Polish Centre of Mediterranean Archaeology, Univerisity of Warsaw) – Marcin Matera (Faculty of Archaeology, University of Warsaw)

The ceramic production on the territory of the Gonio-Apsaros site was first documented by Georgian archaeologists. They found a ceramic kiln in the south-western corner of the Roman fort in 1997 and dated it to the 2nd–3rd centuries. They identified it as an amphora kiln. In 2023–2024, a Polish-Georgian expedition discovered four more ceramic kilns in the same area. Three of them should be dated to the period preceding the construction of the principia in Trajan’s time. The fourth kiln was a later construction, as evidenced by the fact that it partially destroyed the western wall of the Justinian basilica’s narthex. Remains of defected amphorae were discovered in two kilns. The identical construction of the other two furnaces allows us to assume that they were also used to produce amphorae. The discoveries from Apasaros shed new light on the controversial issue of the location of production of the so-called Colchian amphorae. This problem has been the subject of lively scientific discussion for over half a century.

512. PRODUCTION OF BUILDING CERAMICS BY THE ROMAN GARRISON AT TYRAS (BILHOROD-DNISTROVSKYI, UKRAINE)

**Contribution format:** Oral  
**Contribution authors:** Radosław Karasiewicz-Szczypiorski (Polish Centre of Mediterranean Archaeology, University of Warsaw) – Oleh Saveliev (Institute of Archaeology, National Academy of Science of Ukraine) – Małgorzata Daszkiewicz (Institut für Prähistorische Archäologie, Freie Universität Berlin | ARCHEA, Warszawa)

In the first centuries AD, a Roman garrison was stationed in the Greek city of Tyras, located at the mouth of the Dniester to the Black Sea. It was a detachment (vexillatio) made up of officers and soldiers drawn from various units of the exercitus Moesiae Inferioris (Lower Moesia army). The composition of this garrison changed and one important source for the study of the chronology and periodisation of the Roman military presence in Tyras are the stamps of the military units imprinted on bricks and tiles. However, the on-site production of these stamped building ceramics has not yet been established. A Polish-Ukrainian expedition, co-directed by the authors, collected samples of stamped bricks and roof tiles from excavations at Tyras and also collected clay samples from Tyras, its vicinity, and other Roman military sites in Moesia Inferior. Provenance analyses of the mentioned samples were carried out to establish the geochemical characteristics of both the plastic and non-plastic components of each ceramic sample, and to specify their matrix type and non-plastic particles. Analyses consisted of MGR-analysis and chemical analysis by WD-XRF. Clayey raw materials apart from the analysis of the chemical composition, were als. subjected to a firing test. The analysis results were compared with the available database. The results of the physicochemical analyses have significantly enriched our understanding of the production and distribution of building materials by Roman garrisons deployed along the Black Sea coast, from the Danube delta to southwestern Crimea.

2376. PIERCING THE SHROUD – THE HANDS BEHIND THE CBM PRODUCTION IN VIMINACIUM (MOESIA SUPERIOR)

**Contribution format:** Oral  
**Contribution authors:** Ljubomir Jevtovic – Ivan Bogdanović (Institute of Archaeology, Belgrade)

CBM production was one of the major industries of the Roman Empire, employing thousands of workers. Still, very few papers examine the people behind this. Viminacium was home to the largest military production on the territory of Moesia Superior. Thus far, more than 15 kilns have been uncovered, as well as many thousands of CBM. Still, even these numerous finds provide little information about the people producing brick and tiles. In an attempt to pierce this veil, we will examine all relevant sources of information. The analysis will include general CBM production, with a special focus on Viminacium, trying to understand the process and its difficulties from the perspective of workers and managers. Following, we will examine all the relevant CBM, analyzing it for any trace of information about its makers. Finally, we will examine the usage of this material and especially its misuse. All in an attempt to gather insight into the lives of soldiers producing CBM.

930. CHRONOLOGICAL STUDY OF TERRA SIGILLATA FROM A MINING METALLURGICAL SITE: THE CERRO DE LOS ALMADENES (OTERO DE HERREROS, SEGOVIA)

**Contribution format:** Poster  
**Contribution authors:** Ainhoa Fernández Tudela (Universidad Complutense de Madrid) – Carlos Morato-Marqués (Asociación para la Difusión de la Arqueología y la Minería)

The Cerro de los Almadenes (Otero de Herreros, Segovia) is a mining and metallurgical site specialized in copper production. Investigated since 2009, its areas of exploitation, settlement, control, and administration of mining and metallurgical activities have been identified, with a broad chronology spanning various periods from prehistory to late antiquity, notably the Roman (2nd/1st century BC – 3rd century AD) and Visigothic (6th-7th century AD) eras. Recently, studies have focused on the upper part of the hill, where a main structure with military

characteristics, interpreted as a Roman castellum, has been identified. This structure likely played a key role in organizing and supervising the mining and metallurgical activities of the settlement. Among the most notable findings is a large quantity of terra sigillata fragments, reflecting strong connections with the commercial networks of the Roman Empire. The numerous potter’s marks (sigilla) identified on these materials provide valuable information about the production workshops and their distribution, with particular links to the military world. This study analyzes the ceramic typologies documented in recent campaigns, in relation to production centers and trade routes that supplied this mining and metallurgical enclave within the Hispano-Roman economic, social, and cultural system. It also evaluates the role of terra sigillata as an element of Romanization.

164 A MOUNTAIN OF ECONOMIES: TRANSDISCIPLINARY PERSPECTIVES ON MOUNTAIN ECONOMIES AND LANDSCAPE TRANSFORMATIONS FROM PREHISTORY TO CONTEMPORARY AGE

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Mountain economies, Landscape transformation, Mountain archaeology, Environmental archaeology  
**Session organisers:** Salvatore Basile (Pisa University) – Francesco Carrer (Newcastle University) – Francesca Anichini (Pisa University)

SESSION ABSTRACT

Mountain landscapes are dynamic, layered records-palimpsests, shaped by centuries of humans/non-humans interaction. Though many European mountainous regions now experience socio-economic marginalisation, leading to ecological shifts, these areas were once thriving economic hubs. The material traces of these past activities—whether in the form of pastures, chestnut groves, charcoal kilns, terraced fields, farmsteads or quarries— remain imprinted on the landscape, highlighting how people and environments have changed over time, shaping unique cultural landscapes informed by local socio-economic structures and environmental conditions. However, these traces are slowly fading, with only fragments of them lingering in landscapes and local communities’ collective memory. Analysing these evidence is essential to understanding the role of these activities in marking past and present mountain landscapes. This session invites papers that investigate the economies of mountainous regions. We encourage contributions that explore how highland practices - such as pasturing, agriculture, forest management, extraction industries etc. - contributed to local and regional economies, and how these practices were intertwined with broader socio-economic networks, including those of lowland areas and urban centres. We welcome transdisciplinary studies that promote a deeper understanding of how economic strategies have shaped both landscapes and livelihoods of local communities and whether elements of these processes may still be discernible today. Given the complexity of this topic, which involves a wide array of interconnected aspects, contributions that combine diverse methods and approaches, including methodological experimentations will be most welcome. We welcome contributions from any period or geographical context that address the following themes. -Economic activities and their impact on mountain landscapes. -Theoretical and methodological approaches to studying mountain landscapes and economies. -The relationship between mountain economies and lowland or urban economic systems. -The impact of past economies and their remnants on present-day mountain communities. Through these discussions, we aim to identify the future challenges facing mountain archaeology.

CONTRIBUTION ABSTRACTS

1161. A MOUNTAIN OF CONNECTIONS: PASTORAL SETTLEMENTS AND ROUTES IN PRE-ROMAN AND ROMAN ABRUZZO: A TRANSDISCIPLINARY APPROACH

**Contribution format:** Oral  
**Contribution authors:** Elena Scarsella (Barcelona Supercomputing Center (BSC)) – Francesca Romana Del Fattore (Newcastle University)

Transhumance is undoubtedly one of the economic activities that has contributed the most in shaping the mountainous hinterland of the Mediterranean basin over the centuries and, to some extent, it still does. Since prehistory, the seasonal movements of flocks and the long evolution of transhumance in southern Europe have given rise to pastoral landscapes characterised by unique ecosystems and networks of roads linking pastoral sites. An analysis of the origins of Mediterranean mountain pastoral landscapes is therefore crucial in understanding the

emergence and impact of transhumance in socio-economic and cultural terms, as well as the close link over time between mountains and plains. The mountainous hinterland of Abruzzo, between the ancient Sabina and Samnium, the heart of the central-southern Apennine chain, represents an excellent study area. Here, already in the Republican era, there is historical evidence of the movement of flocks over long distances, from the high pastures to the Apulian Tavoliere. However, Rome imposed its control on an already structured (although fragmented) system, reorganising it by defining a bureaucratic and fiscal system, as attested by epigraphic and literary sources. Two closely related Marie Curie projects – E-TransAp: Early Intensive Pastoralism and Transhumance in the Apennines; PaTHS: Pastoral Tracks Heading South: The evolution of droveways (tratturi) in central-southern Italy – aim to investigate the origin and evolution of transhumant pastoral practices and droveways using an innovative combination of landscape archaeology (remote sensing, microtopographic survey, machine learning, spatial statistical approaches, movement modelling, archaeological excavations), landscape history, ethnoarchaeology, geosciences and palaeobotany. An innovative approach aimed at defining standardised and replicable methodological protocols to contribute to the knowledge of pastoral landscapes, inform future policies and promote good management practices.

2298. TRANHUMANCE: FORGOTTEN MEDIEVAL FARMING PRACTICES ON THE ISLE OF MAN

**Contribution format:** Oral  
**Contribution authors:** Andrew Johnson (Manx National Heritage)

‘EARY or AEREE: an open airy place’ - this erroneous definition, from an early nineteenth-century dictionary, of the Manx Gaelic word for a shieling site demonstrates how comprehensively the medieval practice of transhumance had been lost from collective local memory. Almost two hundred years later, upland archaeology on the Isle of Man still faces challenges from the competing demands of modern land-uses such as forestry, agriculture, amenity use, rewilding and carbon sequestration, and a commonly-held assumption that the landscape lacks historical and cultural interest. The Isle of Man is a small island of 580km<sup>2</sup> lying between Great Britain and Ireland, sharing cultural affinities with its bigger neighbours whilst harbouring its own identity. Its lowland landscape remains largely rural and preserves a system of landholding which has its origins in the medieval period. In contrast, the uplands have the appearance of open moorland, whilst abandoned farms on the margins between upland and lowland reinforce the notion that this was the limit of historical farming. At similar altitude, however, lie small earthworks which limited excavation and survey have shown to be the remains of medieval settlements or shielings, once used seasonally to manage livestock grazing on common pasture. Ongoing studies - combining intensive surveys, placename evidence and investigation of routeways - now provide a clearer picture of a seasonal cycle involving the movement of animals and people to and from the hills, the creation and maintenance of stockproof boundaries, the construction of buildings for shelter and enclosures for securing livestock, and meantime bringing about significant vegetational change. The range and number of features is far greater than previously understood, on one hand demonstrating how central transhumance once was to local medieval agricultural practice, whilst on the other raising the question of how, and why, it came to be so completely forgotten.

1169. THE CHANGING ROLE OF WOODLANDS IN THE LOCAL ECONOMIES AND SOCIETIES THROUGH HISTORICAL CARTOGRAPHIC ANALYSIS (19TH-20ST C.)

**Contribution format:** Oral  
**Contribution authors:** Raffaele Voccia – Adele Repetto – Caterina Piu – Anna Maria Stagno (Laboratory of Environmental Archaeology and History, DAFIST-DISTAV (University of Genova))

This paper aims at discussing the first results of a research project aimed to analyse the historical dynamics of changes in the management of woodlands, forests and environmental resources in the Italian mountains between the 19th and 20th c. The analysis is focused on three case studies: Borzonasca (eastern Ligurian Apennines), Perarolo di Cadore (Carnic Alps), and Mercatello sul Metauro (Central Apennines) which experienced different socio-economic trajectories, providing a significant framework for understanding the relationship between the economic and productive organization of local communities and the changes in the relationship between husbandry and silvicultur. in relation to the establishment of the forestry regime, since the promulgation of the “Codice Forestale” in 1822 and then with first Italian Forestry Law in 1877. The examination and comparison of a series of historic maps produced during this timespan, through the cartographic filtering, allowed to reconstruct the changes in the vegetation cover and land organisation, highlighting discontinuities, with particular reference to the disappearing of scattered trees (thus wooded pastures) during the 19th c. and the growth of new forest formations since the half of the 20th c. Then, archaeological surveys aimed to verify continuities in vegetation cover, as well as more in general, to identify material traces of past practices to manage environmental resources in present landscape (paths, terraces, pastures, wooded pastures, water regimentation etc.). The interdisciplinary approach, which combines landscape archaeology, environmental history, and geospatial analysis, allows the contextualization of the historical dynamics of tree resource management, offering new perspectives for interpreting contemporary mountain landscapes.

1892. MULTIFUNCTIONAL LANDSCAPES IN THE SIERRAS SUBBÉTICAS OF CÓRDOBA: THE CASE OF ZUHEROS FROM AGRARIAN ARCHAEOLOGY PERSPECTIVE

**Contribution format:** Oral  
**Contribution authors:** José Delgado (University of Oviedo)

Zuheros (Córdoba, Spain) is a small village located at the northern edge of the Sierras Subbéticas, in contact with the countryside, that has undergone the economic transformations typical of contemporary western rural areas. Traditionally, its self-subsistence economy was based on diversified agriculture, forest management, and goat and sheep farming. These activities developed within a model that integrated the dynamics of both the mountains and the lowlands, optimizing the use of the immediate environment. Some of these practices were closely linked to broader socioeconomic networks, connecting mountain economies with those of lower areas and urban centers. As a result, Zuheros was also recognized for its muleteering activity and its role in trade at various scales. With the advent of economic liberalism, a transition towards olive monoculture began, aligning with broader regional trends. More recently, natural and heritage tourism has emerged as a new development path. However, this approach has tended to “naturalize” the landscape, relegating key elements of its agrarian past to oblivion and, in some ways, distorting the traditional perception of the mountain as a productive source of subsistence. This paper, within the framework of a transdisciplinary research project that integrates Landscape Archaeology and Agrarian Archaeology, seeks to reassess the multifunctional role of microterritories. The aim is to analyze how historical land-use practices not only sustained the Zuheros community for centuries but also shaped local identities and attachments to its territory. Additionally, it seeks to provide data that can serve as a basis for defining sustainable development strategies, grounded in the scientific evidence that archaeology can offer to address current challenges of marginalization and the promotion of sustainable development in rural areas.

215. RETAILING ON THE SLOPES: AN INTERDISCIPLINARY EXPLORATION OF A VILLAGE SHOP IN ANO GATZEA, MOUNT PELION

**Contribution format:** Oral  
**Contribution authors:** Nota Pantzou (University of Patras) – Niels Andreasen (Copenhagen Museum) – Georgia-Cleo Gougoulis (Independent)

This paper explores the intersection between mountain economies and cultural landscapes through the lens of small-scale retailing in the mountainous region of Mount Pelion, Greece, specifically analyzing an abandoned village shop in Ano Gatzea that operated from the 1920s to the 1990s. The operation of this community shop is linked to the operation of the small railroad that connected the port city of Volos with the village of Milies, with Ano Gatzea flourishing as one of the six stations of the railroad. From 1920s onwards, its build environment grew, and a cash crop and commercial economy developed relying on migrant labour and exports to various commercial centers. These developments boosted local demography and contributed to the flourishing of local retailing and craftsmanship as attested by the gradual opening of a substantial number of retailing units and workshops in Mount Pelion. By situating this local enterprise within the broader economic practices and socio-cultural networks of South Pelion, we examine how such retail enterprises contributed to shaping both the physical and social landscapes of this mountainous area, following the changes brought to the landscape and the economy through the Pelion railway line operation. Adopting a “Follow the Thing” approach, our study traces the lifecycle of the exhibited commodities—from production to distribution and consumption—within the context of both local and global economies. This study contributes to our understanding of the dynamic relationship between local economic practices and their lasting impact on mountainous landscapes and communities during a transitional period characterized by the commercialization and modernization of local agricultural economies. By integrating interdisciplinary methods, this paper elucidates the often-overlooked contributions of rural retail networks to regional economies and their imprint on the cultural landscapes of mountain regions like Pelion, contributing to our understanding of economic continuity and change in mountainous regions.

826. CHARCOAL PRODUCTION AND LANDSCAPE TRANSFORMATION IN THE APUANO-VERSILIAN MOUNTAINS: AN ARCHAEOLOGICAL-ETHNOGRAPHIC PERSPECTIVE

**Contribution format:** Oral  
**Contribution authors:** Salvatore Basile – Francesca Anichini – Gabriele Gattiglia (Pisa University) – Radoslaw Grabowski (RAAP) – Claudia Sciuto (Pisa University)

Since ancient times, the Apuano-Versilian mountains have been characterised by a complex system of economies intrinsically linked to the region’s environmental specificities, progressively shaping its landscape. Traces of this deep relationship remain visible today and continue to influence local memory and certain preservation practices. Drawing on a broad territorial framework based on data collected through archaeological-ethnographic fieldwork and surface surveys, this study focuses on the material traces left by charcoal production processes,

which played a key role in shaping the landscape between the 19th and 20th centuries. These activities altered the physical environment and defined aspects of social relations within the region. Targeted sampling and archaeometric analyses have been conducted to examine the structure of charcoal-burning platforms, the types of wood used, and combustion sequences. Historical and cartographic data, combined with Historic Landscape Character Assessment (HLCA) techniques, have enabled researchers to explore the connections between landscape transformation and changes in production practices. Furthermore, oral history research has helped reconstruct the links between the mountains and the lowland areas. Initially, these lowland areas sustained the charcoal economy by creating demand through emerging factories in the plains and peri-urban zones. Later, they became centres of industrial employment, drawing workers away from traditional charcoal production and contributing to the gradual depopulation of mountain settlements. Ethnographic research has also highlighted key aspects of the social impact of this economy on local communities, including gender and generational relations, the recognition of social roles, the value attributed to the practice itself, and the processes of preserving and regenerating its memory.

**2223. KEEPING THE FIRE ALIVE: MAINTENANCE ACTIVITIES AND HUMAN-ENVIRONMENT RELATIONSHIPS IN THE PYRENEES**

**Contribution format:** Oral  
**Contribution authors:** Laura Obea Gómez – Raquel Piqué Huerta – Ermengol Gassiot Ballbè (Universitat Autònoma de Barcelona)

Archaeological research carried out over the last 20 years on the southern slopes of the Pyrenees has revealed a continuous and dynamic occupation of the high mountain areas over time. Livestock farming seems to have been the main economic activity although iron extraction and reduction sites, hunting camps, furnaces and charcoal kilns have also been documented. In addition to the main economic activities, maintenance activities, necessary for the sustenance and well-being of the people, were also carried out in the high mountain areas. These activities enable the reproduction of individuals and the transmission of social values. Among these is the collection of domestic fuel, which reflects the way in which societies relate to their environment. With the aim of defining the strategies of firewood gathering in the high Pyrenean mountains from the 9th millennium BCE and the 13th century CE, we have analysed the charcoal fragments recovered from 20 archaeological sites located in different valleys on the southern slopes of the Pyrenees. To have a complete image, we have included the results from seed, pollen and phytolit analysis and from palaeoenvironmental cores. The use of SIG tools have allowed us to integrate some geographical information regarding the location of the site into the analysis of charcoal fragments. The results allow us to suggest that the firewood used in the Pyrenean settlements would have been collected in areas located within a radius of less than one hour walk from the site, possibly in the spaces where other economic activities were carried out. Thus, although the altitudes within the area of influence of the settlements will be a conditioning factor for the firewood used, the way in which the different human groups interacted with their environment must also be taken into account.

**2172. HUMAN OCCUPATION AND PAST ECONOMY IN THE HIGH MOUNTAIN ENVIRONMENTS OF THE SOUTHERN CENTRAL PYRENEES: EVIDENCE FROM THE AIGÜESTORTES AREA**

**Contribution format:** Poster  
**Contribution authors:** Ermengol Gassiot Ballbè (Departament de Prehistòria, Universitat Autònoma de Barcelona) – David Garcia-Casas (Instituto de Ciencias del Patrimonio (INCIPIT-CSIC)) – Laura Obea-Gómez (Departament de Prehistòria, Universitat Autònoma de Barcelona) – Guillem Salvador-Baiges – Ferran Antolin-Tutusaus (Deutsches Archäologisches Institut) – Sara Díaz-Bonilla (Departament de Prehistòria, Universitat Autònoma de Barcelona) – Niccolò Mazzucco (Università di Pisa) – Ignacio Clemente-Conte (Institutió Milà i Fontanals (IMF-CSIC))

After 20 years of archaeological research (surface studies, site sampling and open-area excavations), 378 archaeological sites have been documented in the Aigüestortes i Estany de Sant Maurici National Park (PNAESM). This is a rugged area located at the eastern end of the Maladeta batholith, on the southern slopes of the central Pyrenees, with altitudes ranging from 1500 to 3000 meters above sea level. The documented sites have diverse characteristics, although the remains of dry stone constructions of fences and huts predominate, together with the occupation of small rockshelters. Nearly 115 AMS datings have made it possible to define a sequence of 10,000 years of occupation. The excavation of some of these sites (Abric de l’Estany de la Coveta I, Cova del Sardo, Despoblat de la Cova, Abric d’Obagues de Ratera and Portarró) has made it possible to characterize the dynamics of occupation and the activities carried out at these sites, all of which have a succession of prehistoric and historical phases of occupation. Archaeological research has often been carried out within the framework of interdisciplinary programs in which it has been combined with various paleoenvironmental and paleoecological approaches. This poster summarizes the results of this interdisciplinary research, which has made it possible to characterize, on

the one hand, the economic activities of the different human groups in the PNAESM throughout the Holocene. In this sense, in addition to the changes caused by the introduction of livestock farming and agricultural practices, modifications in the management of herds over time have been observed. On the other hand, it points to evidence of the impacts of these activities on high mountain paleolandscapes.

**168 MERC ROUNDTABLE. THE POST-MEDIEVAL BALKANS: FROM STEREOTYPE TOWARD ARCHAEOLOGICAL HERITAGE AND SCIENCE**

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Round table  
**Session keywords:** Postmedieval archaeology, Ottoman heritage, Balkans, scientific improvements  
**Session organisers:** Monika Milosavljevic (University of Belgrade) – Carlo Citter (University of Siena)  
**Session speakers:** Andrej Janeš (Croatian Conservation Institute Zagreb) – Veronika Nikolova (The National Archaeological Institute with Museum at the Bulgarian Academy of Sciences ) – Zrinka Mileusnić (University of Primorska) – Adnan Muftarević (Museum of Sarajevo)

**SESSION ABSTRACT**

A picturesque view of Ottoman-Balkan heritage lingers, one that incorporates both the expanse of its former glory and its internal issues - as represented by the iconic Mostar Bridge of the 16th c. in Bosnia and Herzegovina, the Parthenon of Greece which spanned its life as an ancient temple, church, mosque and emblematic tourist site, as well as the multilayered Belgrade Fortress, to name a few. As such, this forum aims to dissect Ottoman heritage and show advancement in postmedieval archaeology within the Balkans. In terms of education, postmedieval archaeology, even though it is highly present in research as well as as a source of identity signifiers, has yet to be fully recognised as a branch of archaeology in the Balkans. Although traditionally researched through the lens of architectural monuments and under the outdated paradigm and pressure of Oriental stereotypes. the late opening of the subdiscipline of postmedieval archaeology is not the result of insufficient material culture; rather, it is due to the persistent prejudices against the Ottoman past. In a more contemporary context, the perspectives of post-medieval archaeology, not merely Ottoman, permit an embrace of cultural heterogeneity and interconnectedness through its diverse material remains using up-to-date technologies and scientific approaches. In the archaeology of the Balkans, new potentials are emerging through the implementation of critical theoretical perspectives, archaeology and digital humanities, to mention just a few. This MERC roundtable is to serve as a platform to discuss the social, scientific, historical, aesthetic and economic values of postmedieval sites and heritage. The forum will be based on a presentation of several case studies.

**169 LATE NEOLITHIC/EARLY CHALCOLITHIC NETWORKS OF CHANGE: THE LOWER DANUBIAN TELLSCAPE TRANSFORMATIONS**

**Session theme:** 8. Along and across the Danube!  
**Session format:** Regular session  
**Session keywords:** Neolithisation, Chalcolithic, Tells, Networks, Socio-environmental transformations  
**Session organisers:** Robert Hofmann (Institute of Prehistoric and Protohistoric Archaeology, Kiel University) – Catalin Lazar (Research Institute of the University of Bucharest (ICUB))

**SESSION ABSTRACT**

In European prehistory, tell settlements represent a type of habitation of vital historical significance, introduced with the arrival of first farmers from Anatolia, dating back to the Early Neolithic. These settlements spread along the main route of Neolithization from Anatolia and Greece and the Balkans to the Pannonian Plain. Tells are more than just a new type of settlement; they are veritable socio-economic hubs incorporating new concepts, strategies and visions brought by the migrating newcomers from the south. During the Neolithization process, the Lower Danubian regions were influential areas in Southeastern Europe, many crucial innovations took place here (e.g., metallurgy). However, the area in question did not adopt the tell settlement model until the Late Neolithic and Chalcolithic, despite the presence of farmers with genetically Anatolian origin being attested as far back as the Early Neolithic (c. 6200-6000 BCE). The development of the Late Neolithic / Early Chalcolithic tellscapes represents a crucial peak in socio-economic and social cultural terms in the targeted area. In Southeastern Europe, recent fieldwork has displayed a new picture of these farmer’s societies at different sites. Several transformation events and phases could be detected in the area. Besides certain local, regional, and global changes visible within e.g. Gumelnița (KGK VI) and other societies, the end of the tells is still under discussion. New archaeological, environmental and genetic evidence sheds a new light on these transformation processes, and also in neighbouring

regions (e.g., North Pontic Steppe, Carpathian basin), important changes are indicated. The session aims to detect “networks of change” driven by the tell settlers. We welcome contributions by archaeologists, natural sciences and live sciences, in order to identify more precise the impact of tellscape phenomenon in Southeastern Europe and its effects in the neighbouring regions.

CONTRIBUTION ABSTRACTS

2181. TELL SETTLEMENTS FROM WALLACHIA AND DOBROGEA, SOUTH-EASTERN ROMANIA: GEOMORPHOLOGICAL BACKGROUND, STRATIGRAPHY, AND EVOLUTION

**Contribution format:** Oral  
**Contribution authors:** Constantin Haita (National Museum of Romania History)

In south-eastern Romania, tell sites phenomenon is specific to Gumelnița Eneolithic culture, although there are settlements continuing occupations attributed to the subsequent Boian culture. These multi-layered settlements now represent anthropic mounds with circular or oval areas, with a maximum diameter of about 200 m, marked by delimitation structures, stratigraphy formed by continuous accumulation of sediments from successive construction, occupation, and destruction phases, and an organization of the inhabited space. Archaeologically recovered structures are interpreted as fired or unfired dwelling structures, passage areas, waste zones, and various activity zones. Pits and trenches are also identified within the complex stratigraphy of these sites. In this paper, we discuss the spatial distribution of more than 200 tell sites, as resulting from the GIS mapping and analysis of their geomorphological background, in relation to Pleistocene and Holocene deposits. The identified areas of specific evolution, such as Dobrogea, the Danube floodplain, and the hydrological basins of main tributaries, were analyzed considering their relative and absolute chronology. Sedimentological case studies of tell sites with different geomorphological (low alluvial terrace or high loess terrace, terrace remnant, alluvial bar, island), and chronological framework (Gumelnița A1, A2, and B1 phases), are discussed in context with their landscape and the available environmental data. All relevant information resulting from the interdisciplinary research projects is addressed, to obtain a more complete image of the Gumelnița tell settlements formation and dynamic.

1794. UNRAVELING LOWER DANUBE REGIONAL NETWORKS: HOW VLĂDICEASCA’S TELL SETTLEMENTS SHAPED CULTURAL AND ENVIRONMENTAL CHANGES IN THE MOSTIȘTEA VALLEY (ROMANIA)

**Contribution format:** Oral  
**Contribution authors:** Catalin Alexandru Lazar – Cristina Covataru – Alfred Vespremeanu-Stroe – Theodor Ignat – Adrian Șerbănescu – Laurentiu Tutuianu – Cristian Roth – Catalin Rotar (University of Bucharest) – Valentin Parnic (Lower Danube Museum, Calarasi)

The pair tell settlements of Vlădiceasca (Ghergălăul Mic and Ghergălăul Mare), located in the Lower Danube region near the Mostiștea River, and dated in Eneolithic (c. 4900-4000 BCE), represent critical hubs for understanding socio-economic transformations driven by early farming communities. Submerged for decades and recently re-exposed due to water-level decline, these sites underwent multidisciplinary investigations combining intrusive (stratigraphic coring) and non-intrusive methods (aerial photogrammetry, magnetometry, bathymetry). Results reveal well-preserved stratigraphic sequences (up to 10 m depth) with alternating anthropogenic and natural deposits alongside archaeological materials from the Eneolithic and La Tène periods, indicating prolonged habitation and cultural continuity. The stratigraphic analysis identified distinct layers rich in charcoal, burnt clay, and ceramic fragments, suggesting intensive domestic activities and possible ritual practices. Magnetometric surveys and DEM mapping highlighted submerged sections of Ghergălăul Mare, while bathymetric profiles traced the proximity of the prehistoric river course, underscoring the settlers’ adaptation to dynamic hydrological environments. Loess-like deposits and flood-related silts point to episodic environmental challenges, mitigated through resilient settlement strategies. These findings contribute to the “tellscape” discourse by linking local Boian-Gumelnița groups practices (5th millennium BCE) to broader transregional networks. The sites’ role as socio-economic nodes is evident in their material culture and spatial organization, reflecting innovations in metallurgy and resource management. This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS - UEFISCDI, project number PN-IV-P2-2.1-TE-2023-0876, within PNCDI IV.

1717. LIFE IN THE FLOODPLAIN: MULTIDISCIPLINARY RESEARCH ON THE COPPER AGE TELL CHISELET IN THE LOWER DANUBE BASIN

**Contribution format:** Oral  
**Contribution authors:** Robert Hofmann (Institute of Prehistoric and Protohistoric Archaeology, Kiel University) – Stefan Dreibrodt (State Office for Monument Preservation Baden-Württemberg) – Manuel Zolchow (Institute for Geosciences, Kiel University) – Adrian Balaescu – Valenti. Radu (Institute of Archaeology “Vasile Pârvan” Bucharest, Romanian Academy)

– Theodor Ignat (Bucharest Municipality Museum) – Catalin Lazar (Research Institute of the University of Bucharest (ICUB), University of Bucharest) – Wiebke Kirleis (Institute of Prehistoric and Protohistoric Archaeology, Kiel University) – Wolfgang Rabbel (Institute for Geosciences, Kiel University) – Johannes Müller (Institute of Prehistoric and Protohistoric Archaeology, Kiel University)

In the 5th millennium BCE, Copper Age settlement landscapes developed in the valley of the lower Danube and its tributaries, within those impressive tells, adjacent flat settlements and extensive cemeteries became focal points of human communities. Differences in the location of tells in the landscape and the size of these settlements suggest a complex settlement system with different economical foci and communities sizes. Within a Romanian-Belgian-German cooperation, multidisciplinary investigations are being carried out at Tell Chiselet, which is characterised by its location deep in the floodplain of the Danube in the Călărași county at the shoreline of a former large riverine lake. In our paper we will present new data on geophysical, geoarchaeological, archaeozoological and archaeological investigations at this tell and its surroundings. As a contribution to the further multidisciplinary discussion on impact and land use in the surroundings of this settlement mound, we are able to reconstruct and contextualise duration, community size, settlement behaviour, and sedimentation history of this settlement.

1860. APPLYING GEOPHYSICAL METHODS FOR STRATIGRAPHICAL INVESTIGATIONS OF THE CHALCOLITHIC TELL CHISELET - GRĂDIȘTEA FUNDEANCA

**Contribution format:** Oral  
**Contribution authors:** Manuel Zolchow – Daniel Köhn (Institute of Geosciences, Kiel University) – Natalie Pickartz (State Office for Cultural Heritage Baden-Württemberg) – Martin Thorwart (Institute of Geosciences, Kiel University) – Adrian Serbanescu (Research Institute of the University of Bucharest (ICUB), University of Bucharest) – Stefan Dreibrodt (State Office for Cultural Heritage Baden-Württemberg) – Robert Hofmann – Johannes Müller (Institute of Pre- and Protohistoric Archaeology, Kiel University) – Catalin Lazar (Research Institute of the University of Bucharest (ICUB), University of Bucharest) – Wolfgang Rabbel (Institute of Geosciences, Kiel University)

For the understanding of socio-economic transformations occurring in the lower Danube area during the East European Chalcolithic period, the multiphase chronology and structural layout of tell type settlements inhabited by people of the Gumelnița society are of major interest. In this context non-invasive geophysical methods are valuable tools for the required stratigraphical investigations, but are challenged by the topographic conditions and small-scale internal habitation structures. We will show that essential stratigraphic information can be obtained by applying two-dimensional seismic shear wave sounding evaluated with full waveform inversion (FWI) beside standard magnetic prospection. Therefore we carried out measurements at the Chalcolithic tells Chiselet - Grădiștea Fundeanca located in Romania. Our investigation is aiming to identify archaeological features like buried houses or fortification installations as well as to reconstruct different settlement phases and the surrounding paleolandscape of the tell. We also include down-hole magnetic susceptibility measurements, dynamic testing and geoarchaeological corings for ground truthing. With our seismic investigations we were able to identify two zones of increased shear wave velocity, which are related to layers of densely accumulated daub and ceramics between the surrounding looser filling material and indicate horizons of settlement activity (4300 BC and 4500 BC). Moreover, we upgrade the reconstruction of the latest settlement derived from the magnetics, since house remains are clearly indicated by characteristic seismic anomalies and thus independent of their degree of combustion. Further investigations at the tell flank and in the surrounding plane reveal an palaeo-channel or lake shore adjacent to the southern tell flank.

1130. SUBSISTENCE STRATEGIES IN COPPER AGE SOUTHEASTERN EUROPE: INSIGHTS FROM Δ<sup>13</sup>C AND Δ<sup>15</sup>N ISOTOPE ANALYSIS AT TELL YUNATSITE (BULGARIA)

**Contribution format:** Oral  
**Contribution authors:** Ana García-Vázquez (ArchaeoScience Division, Research Institute of the University of Bucharest) – Kamen Boyadzhiev (National Archaeological Institute with Museum at the Bulgarian Academy of Sciences) – Petra Coman (ArchaeoScience Division, Research Institute of the University of Bucharest) – Adrian Bălășescu (ArchaeoScience Division, Research Institute of the University of Bucharest | “Vasile Pârvan” Institute of Archaeology, Romanian Academy) – Mihaela Golea (“Vasile Pârvan” Institute of Archaeology, Romanian Academy) – Mihail Secu – Iulia Bogdan (National Institute of Materials Physics (NIMP), Romania) – Viorel Atudorei (Department of Earth and

Tell Yunatsite, also known as Ploskata Mogila (the Flat Mound), is one of the most significant tell settlements in Southeastern Europe. Located in the Upper Thracian Plain, this site has been continuously investigated for over 50 years, yielding crucial insights into the Chalcolithic (5th millennium BC) and Bronze Age. Its strategic position along key communication routes, including the later Via Diagonalis, highlights its importance in prehistoric exchange networks. This study presents stable isotope ( $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ) analyses of collagen from eight human individuals dated to the second half of the 5th millennium BC, providing new data on dietary practices at Tell Yunatsite. To establish a robust isotopic baseline, we also analysed a range of domestic (cattle, dog, goat, sheep, pig) and wild (aurochs, roe deer, beaver, red deer, hare, wild boar, bear) fauna, alongside cultivated plant remains (wheat, barley, lentil). The results offer valuable insights into subsistence strategies, protein sources, and the role of plant and animal consumption in Chalcolithic diets. This research enhances our understanding of prehistoric lifeways in the Balkans and contributes to broader discussions on dietary variability in early farming communities.

### 2388. ON AND OFF THE TELL: WHAT IS THE DIFFERENCE?

**Contribution format:** Oral  
**Contribution authors:** Petar Zidarov (Universität Tübingen, Institut für Ur- und Frühgeschichte und Archäologie des Mittelalters)

Tell settlements were easily identifiable in the landscape and, along with caves, became obvious targets for aspiring prehistoric archaeologists throughout much of the 19th and 20th centuries. The last three decades have witnessed a surge in construction projects and intensified geophysical surveys across much of southeastern Europe, calling for a revision of the extended (flat) versus tell-settlement dichotomy. In this paper, I compare the overall picture provided by geophysical surveys with fine-grained and well-dated excavation results to earlier models of tell development in the Eastern Balkans in a diachronic perspective. Preliminary results provide evidence that many settlements began their development with the inherent elements of a tell settlement, such as a delimited territory and a regularly planned layout, but only some of them managed to develop cumulatively over time. Other settlements maintained a more loose settlement organization, but in their time they certainly participated in the exchange networks and deserve attention as a more resilient settlement form that succeeded the tell phenomenon after its demise towards the end of the fifth millennium BC.

## 170 FLAX AND LINEN IN ANTIQUITY: A MULTIDISCIPLINARY APPROACH

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Flax and linen, Fibre processing, Archaeology, Iconography, Social symbolism  
**Session organisers:** Chiara Serena Spinazzi-Lucchesi (University of Copenhagen) – Susanna Harris (University of Glasgow) – Cristina Ambrosioni (University of Padua)

### SESSION ABSTRACT

The study of flax and linen in ancient societies presents both a fascinating and complex challenge for scholars. Although linen textiles played a significant role in the daily lives and economies of ancient societies, physical remnants of these materials have largely disappeared from the archaeological record. Consequently, our understanding of ancient flax cultivation, linen production, and textile use must draw extensively on secondary sources across multiple fields. Archaeological artefacts, iconography, and written sources all provide valuable, albeit fragmentary, insights into the importance of flax and linen in this region. In societies where textual records are limited or absent, references to flax cultivation, linen production, and linen use become especially significant for reconstructing ancient practices. However, interpreting these data is no straightforward task. A primary challenge lies in assessing to what extent data from each subject align with results from other disciplines, mediated by artistic conventions, cultural values, and the symbolic meanings attributed to linen in particular contexts. Thus, reading these data involves more than identifying physical forms; it demands a contextual and interdisciplinary approach that considers the layered interpretations held by different viewers in different settings. This session invites papers that analyse flax and linen in antiquity, drawing on a range of disciplines including archaeology, linguistics, art history, epigraphy, archaeobotany, and textile studies. We encourage contributions that explore the cultivation, processing, and uses of flax and linen, as well as the social, economic, and symbolic roles that linen textile played in ancient societies. Key questions to consider include (but are not limited to):

- Cultivation and Processing
- Materiality and Representation • Garment Depictions and Written Sources

- Social Practices and Values
- Religious and Symbolic Aspects

### CONTRIBUTION ABSTRACTS

#### 606. DID LINEN MEAN LINEN IN THE LINEAR B TABLETS FROM CRETE AND MAINLAND GREECE DURING THE IIND MILLENIUM BC?

**Contribution format:** Oral  
**Contribution authors:** Gaétan L’Her (University of Strasbourg, ED 519, UMR 7044 Archimède)

Today, the English word “linen” refers not only to the plant matter (flax) but also to other fibre/fabric with similar qualities. Following this observation, the present paper aims to question whether the words currently translated by “linen” or “flax” (RI/ri-ta; SA/ri-no), in the Linear B texts from Crete and Mainland Greece (IInd Millenium BC), are employed to refer to real linen or to some items close to linen. The main corpus of the study will be constituted by texts in Linear B coming from Pylos, Thebes and Knossos. However, such an issue necessarily implies a multidisciplinary approach including the study of Aegean archaeological artefacts and ecofacts that shed a different light on the question. By reassessing the attestations of RI/ri-ta and SA/ri-no and their derivative in the Linear B tablets, the paper attempts to identify if and when it is possible to see in these words other reality than linen. The fibre thus identified will be compared to linen considering their physical characteristics (colour, fineness, thickness...), their origin (vegetal, animal, mineral, insects), and their treatments: how the raw material is treated to extract the fibres (ex. retting), how the fibres themselves are treated (ex. bleaching, washing), and which techniques are used to create threads from these fibres (ex. spindle spinning, hand spinning). In a comparative perspective, the paper will also refer to better known cases in which the name of a particular fibre is used for other fibres (ex. byssus from the Ist Millenium BC onwards) that has already drawn attention of scholars (Burke, 2012; Soriga and Carannante 2018). Finally, this inquiry will introduce a more global reflection on the fibres’ identification problematic in ancient texts and languages.

#### 1566. FLAX AS A TEXTILE PLANT IN FINNISH CONTEXT

**Contribution format:** Oral  
**Contribution authors:** Jenni Suomela (University of Helsinki)

Compared to the Southern Europe, flax is a relatively new fibre plant in Fennoscandian Finnish Peninsula. The earliest macrofossil finds are from the Late Roman Iron Age which was in Finland around 200-400 CE. These plant related finds do not reveal if the crop was utilised for oil or textile fibres, or both. Dual utilisation is possible - just recently researchers showed evidence of flax oil pressing from the 10th century at the island of Åland. Acid soil conditions do not support preservation of cellulose based textile remains and due to that occurrence of archaeological linen finds elude to the turn of the millennia. Other bast fibre possibilities in the context were hemp and nettle, cotton started to gain popularity in Finland only as late as in the 19th century. Even though the trustworthiness of older bast fibre identifications has been discussed in the field, it is quite safe to say that during the period starting from the Late Iron Age to the beginning of the Industrial Era, flax was clearly the most popular fibre plant in the Finnish area. During the historical times, it was for sure the most popular textile material produced in the area. The growing conditions were beneficial and flax both in fibre state as well as in ready woven cloth was exported tremendous amounts in the 18th and 19th centuries. Sadly, even though flax still thrives well in Finland, there has not been flax agriculture for textile purposes in Finland for the last 25 years. Without having the living heritage, flax has had a huge impact on Finnish cultural history, especially on vocabulary. This presentation summarises the main points and issues related to cultural heritage of flax utilisation in Finnish textile history.

#### 948. LOST BIODIVERSITY AND ERODED CULTURE OF FLAX. ARCHAEOBOTANICAL AND TEXTILE ANALYSES IN ANCIENT ITALY: PRELIMINARY RESULTS FROM THE ARAKNE PROJECT

**Contribution format:** Oral  
**Contribution authors:** Milena Primavera (Laboratorio di Archeobotanica e Paleoecologia - University of Salento (Le-IT)) – Gabriella Longhitano – Francesco Meo – Gianluca Tagliamonte (University of Salento (Le-IT)) – Anna Maria Grasso – Matilde Stella (Laboratorio di Archeobotanica e Paleoecologia - University of Salento (Le-IT)) – Giovanni Quarta – Maurizio Masieri (CNR-Istituto di Scienze del Patrimonio Culturale (Le-IT))

The ARAKNE project (PRIN2022 PNRR, funded by M.U.R. and NextGenerationEU) explores the “lost biodiversity” and “eroded culture” associated with flax production in ancient Italy, addressing the intricate relationship between biological and cultural heritage through a multidisciplinary framework. By integrating bioarchaeology (archaeobotany), textile archaeology, and historical and ethnographic perspectives, the project leverages a

deep-time archaeological approach to reconstruct the ancient exploitation of possible plant varieties that may have become marginal or even disappeared. Focusing on central-southern Italy—where flax remains and textile evidence are particularly well-preserved—the project adopts an innovative methodology that combines archaeobotanical analyses of *Linum* seeds, employing morphobiometric and image analysis techniques to identify different flax varieties and track their morphological evolution over time. In parallel, microscopic analyses of textile fragments, conducted through SEM and polarized light microscopy, provide insights into weaving techniques and fibre quality. In addition, by reviewing literary sources this project offers further data on the use of linen in pre-Roman times, with particular reference to its use in the military equipment and armour. The proposed contribution presents the preliminary results of the ARAKNE project, offering new perspectives on the history of flax in central-southern Italy. In particular, fibre analysis on textile fragments dated back from prehistory to Medieval times demonstrates a wide production and consumption of linen for clothing in southern Italy. Also, the comparison between modern seed collections and archaeobotanical specimens has revealed key patterns in the ancient diffusion of fibre flax and has identified morphotypes that were more likely cultivated for oil production. This paper sheds light on the diversity of cultivated flax varieties, possible technological changes in textile production, and contributes to a deeper appreciation of flax as a fundamental component of Italy’s biocultural heritage.

334. FLAX AND SPLICING TECHNOLOGY IN EUROPEAN PREHISTORY

**Contribution format:** Oral  
**Contribution authors:** Cristina Ambrosioni – Margarita Gleba (University of Padua)

Flax fibre products have a complex and time consuming chaîne opératoire which involves the interrelated tasks of gathering / cultivating and harvesting plants, processing to extract the fibres, then twisting them into threads before they can be worked into the more familiar stages of weaving, interlacing and looping. Recent research into fibre technology of Neolithic Switzerland and Bronze Age Britain points to a long tradition of working flax fibres into threads by splicing, rather than draft spinning. Spicing was the original plant fibre technology in Europe and the Mediterranean going back at least to the use of tree bast in the Mesolithic. Previously this technique was only recognised in ancient Egypt, Levant and the Far East. This paper presents new results that identify splicing of flax in pre- and protohistoric Italy. These results demonstrate that techniques of splicing flax fibres into yarn extend from the Neolithic to the Iron Age and continued alongside the adoption of draft spinning.

1114. WET SPINNING OF FLAX, A LONGUE DURÉE, TRANS-EUROPEAN AND TRANS-MEDITERRANEAN INDUSTRIAL PROCEDURE – FROM EARLY ANTIQUITY TO THE PRESENT

**Contribution format:** Oral  
**Contribution authors:** Nahum Ben Yehuda (—)

Since the dawn of history, staple fibers have been spun by hand. The implement used for spinning was a spindle. The spinning process serves to adhere the overlap of the natural fibers by friction of the twist, thus creating a virtually endless strand, which could then be used for weaving. The spinning wheel arrived in Europe in the 13th century CE. It emulated the functions of the spindle – and increased productivity by means of partial mechanization. Full mechanization – and subsequent superior productivity – was achieved by several inventions in the 18th century. A unique aspect of spinning flax fiber is mentioned by Pliny the Elder (1st century CE): “When (flax is) spun into thread, it is rendered additionally supple by being soaked in water...” This technique provides a smoother yarn with greater tenacity. It can also be applied to hemp. The wet spinning of flax is recorded in rabbinical literature of the 3rd century CE. In Europe, flax spun by spindle was wetted in the drawing stage (often with saliva – “through the mouth) before twisting. This was implemented from a very early, albeit unidentified, time. Wet spinning was easily adapted to the “new” 13th century spinning wheel, by means of wetting the fingers in a small bowl of water. We find evidence of this spinning method in the Iberian Peninsula, Scandinavia, as well as in Western, Central, and Eastern Europe. In the early 19th century, Philippe Henri de Girard and John Kay applied wetting to the existing flax spinning machinery. Today, various systems for the mechanized wet spinning of flax are still in use, producing high quality yarns. We will trace and analyze the evolution of this Longue Durée, Trans-European and Trans-Mediterranean process in its ethnological implications and industrial aspects – from early antiquity to the present.

717. TEXTILES AND TEXTS: UNDERSTANDING NEW KINGDOM LINEN PRODUCTION THROUGH ARCHAEOLOGICAL AND WRITTEN SOURCES

**Contribution format:** Oral  
**Contribution authors:** Chiara Serena Spinazzi-Lucchesi (Centre for Textile Research, Saxo Institute, University of Copenhagen)

Ancient Egypt is renowned for its production of exceptionally fine linen textiles and its well-organized, large-scale textile manufacturing. Linen played a crucial role in daily life, the economy, and religious practices, serving as

clothing for all social classes, furnishings for homes and palaces, trade goods, and essential elements in funerary rituals. Excavations have revealed a tremendous number of textiles, including mummy shrouds several meters long and hundreds of meters of linen bandages used in embalming. The production of such vast quantities of fabric required the cultivation, processing, and spinning of flax, the warping of looms, and the weaving of textiles, some of which were further treated through bleaching or dyeing. This industry involved multiple levels of society, from domestic production within households to large-scale workshops managed by temples, palaces, and state institutions. Beyond the textiles themselves, what other sources are available for reconstructing linen production in the New Kingdom? What insights do they provide, how reliable are they, and how can they help us understand this key sector of ancient Egypt’s economy? This paper explores various textual, iconographic, and archaeological sources to examine the organization of textile production, the terminology used to describe different manufacturing stages, and the people and places involved. By integrating these different types of evidence, the study aims to clarify terminological issues and provide a comprehensive understanding of the linen industry in New Kingdom Egypt.

2274. INTERWOVEN SCENTS: THE INTERSECTION OF FRAGRANCE AND TEXTILES IN ANCIENT FLAX PRODUCTION

**Contribution format:** Oral  
**Contribution authors:** Robyn Price (Brown University) – Jordan Galczynski (University of California, Los Angeles)

Flax cultivation in ancient Egypt was a highly specialized process, yielding multiple valuable products—including linen textiles, linseed oil, and possibly fragrant materials. This paper examines the intersections between flax cultivation, textile production, and the use of scented oils, asking whether a single flax harvest could serve multiple economic and sensory functions. Did flax flowers contribute to fragrance production before stalks were processed into linen? Were fragrant oils incorporated into the spinning or finishing of linen textiles. Through a close analysis of artistic evidence, textual references, and archaeological remains, this study explores the seasonal rhythms of flax production and the potential overlap of labor, material use, and ritualized gifting and offering practices. Experimental archaeology provides further insights into linen’s capacity to absorb and retain scent, offering a new perspective on the relationship between textiles and fragrance in elite contexts. Additionally, the study considers why linen and scented oils were so frequently paired in textual and material records, moving beyond symbolic readings to explore the practical and labor-based links between these industries. By tracing the journey of flax from field to finished products, this paper highlights how fragrance and textiles were not just linked in ideology but in practice, shaping networks of production and exchange.

2472. A MULTIDISCIPLINARY STUDY OF A LATE IRON AGE BAST FIBRE CLOTH FROM ALCAÇOBA DE SANTARÉM (PORTUGAL)

**Contribution format:** Poster  
**Contribution authors:** Maria Martin Seijo – Joeri Kaal (Institute of Heritage Sciences (INCIPIT-CSIC), Santiago de Compostela) – João Tereso (CIBIO-BIOPOLIS – Research Center in Biodiversity and Genetic Resources, University of Porto | UNIARQ – Archaeology Center, University of Lisbon | CEIS20 – Centro de Estudos Interdisciplinares da Universidade de Coimbra) – Ana Margarida Arruda (UNIARQ – Archaeology Center, University of Lisbon)

Alcáçova de Santarém is situated on a plateau at 106 metres above sea level, overlooking the Tagus River on the south-eastern limits of Santarém, Portugal. The site was the focus of archaeological investigations between 1983 and 2001, when approximately 2000 m² were excavated as part of rescue and research projects led by A. M. Arruda and C. Viegas. The excavated area revealed evidence of a Late Bronze Age occupation dating from the early 1st millennium BCE, representing one of the few instances in the Lisbon Peninsula where a clear continuity between the Late Bronze Age and the Iron Age has been documented. The Iron Age phase is characterised by material culture, architectural features, construction techniques, and social practices influenced by eastern Mediterranean traditions, indicative of western Phoenician settlement in the region. The ceramic assemblage comprised vessels for food preparation and cooking, including pots, pans, and basins, alongside large containers used for storage. Inside one of these ceramic containers and associated with carpological remains, several fragments of a charred textile were found. Fibres were identified using optical and scanning electron microscopy (SEM), and they were chemically characterised using Energy Dispersive X-Ray Spectroscopy (EDX). In addition, analytical pyrolysis-GC-MS (Py-GC-MS) and thermally assisted hydrolysis and methylation (THM-GC-MS) of the fabrics were performed to assess the presence of chemical markers associated with the use of these textile remains. This multidisciplinary approach led to the classification of this cloth as a tabby textile made of bast fibre, most probably linen, radiocarbon dated between the 4th and 1st centuries cal. BCE. The presence of flax seeds has also been identified in this archaeological site.

171 UNDERSTANDING NEANDERTAL MOBILITY: RECENT ADVANCES IN RESEARCH AND DISSEMINATION

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Regular session  
Session keywords: Neandertals, Mousterian, Palaeolithic, Cultural heritage, Public archaeology,  
Session organisers: Ivor Jankovic (Institute For Anthropological Research) – Francesca Romagnoli (Universidad Autónoma de Madrid) – Lia Vidas (Institute for Anthropological Research)

SESSION ABSTRACT

Neandertals have captivated scientists and the public for nearly 170 years, often depicted as either primitive “cavemen” or idealized “noble savages.” Recent advances in paleoanthropology, archaeology, and related fields have significantly reshaped our understanding of Neandertals. Researchers now have extensive datasets offering fresh insights into their biology and behavior. This session provides a platform to explore new interdisciplin-ary approaches to Neandertal mobility, a key aspect of their behavior that sheds light on how they adapted to changing environments and navigated complex landscapes. Isotopic analysis of Neandertal remains, alongside archaeological evidence of resource procurement and site occupation patterns, reveals strategies for exploiting diverse ecological niches, often involving long-distance travel to access essential resources. Moreover, individual mobility is linked to social networking, the spread of innovations, and the persistence and diversity of material culture. By integrating various perspectives and methodologies, we aim to offer a more holistic understanding of Neandertal behavior, ecology, and their role in human evolution. This session also challenges outdated stereo-types that have long influenced popular perceptions of Neandertals. We seek to promote a more scientifically grounded, evidence-based view of these hominins, acknowledging their complexity and highlighting their signif-icance in human evolution. Through this approach, we aim to clarify Neandertals’ cognitive, social, and cultural capabilities, reinforcing their importance as a pivotal chapter in human ancestry.

CONTRIBUTION ABSTRACTS

688. SYSTEMATIC PRODUCTION OF NATURALLY BACKED “KNIVES” FROM 290 TO 110 THOUSAND YEARS AGO: EVIDENCE FROM SOUTHEAST SERBIA

Contribution format: Oral  
Contribution authors: Danilo Pajovic – Anđa Petrović – Dušan Mihailović (Faculty of Philosophy, University of Belgrade)

Naturally backed “knives” represent one of the long-lasting types of stone tools produced by the different homi-nin species. Emergence of this phenomenon starts in the Lower Palaeolithic and continues, in different forms, even today. Term “backed” refers to the either cortical or non-cortical surface, opposite the cutting/working edge, that is used to form a better grip, both when tools have been hand-held or hafted. These technological advances have enabled a more efficient use of the tools. The systematic production of these artefacts shows the developed cognitive abilities of the Chibanian (Middle Pleistocene) hominins. While the appearance of this phenomenon is now well documented across Western and Central Europe, there are no such studies in the Southeast of the conti-nent. This paper presents results of techno-morphological analysis of Velika Balanica (Layer 3), Mala Balanica (Layer 2) and Pešturina cave (Layer 4) assemblages. Dated respectively to 290 ka, 240 ka and 110 ka, these three assemblages represent the oldest record of systematic production of naturally backed artefacts in the Central Balkans. Results of the analysis are discussed regarding the raw materials used in backed artefact production, with the aim to shed more light of the methods employed, but also on the position of these artefacts within the techno-economic Neanderthal behaviour. Funding: This research has been supported by the NEEMO project of the Science Fund of the Republic of Serbia (7746827), and the MIRA project funded by the Social Sciences and Humanities Research Council of Canada SSHRC (895-2024-1005).

1204. NEW EVIDENCE FOR NEANDERTHAL OCCUPATION OF THE TEJO BASIN AT VILA VELHA DE RÓDÃO DURING THE LATE MIS 6

Contribution format: Oral  
Contribution authors: Carla Castro (Faculdade Ciências Sociais e Humanas, Universidade NOVA de Lisboa) – Telm. Pereira (Universidade Autónoma de Lisboa | Instituto Politécnico de Tomar | Centro de Geociências da Universidade de Coimbra | UNIARQ – Centro de Arqueologia da Universidade de Lisboa) – Mário Monteiro (EMERITA–Empresa Portuguesa de Arqueologia) – Francisc. Henrique. (EMERITA–Empresa Portuguesa de Arqueologia | AEAT – Associação de Estudos do Alto Tejo) – Emanuel Carvalho (EMERITA–Empresa

Portuguesa de Arqueologia) – David Nora (ICArEHB – Interdisciplinary Center of Archaeology and Human Behaviour, FCSH, Universidade do Algarve) – Marina Évora (ICArEHB – Interdisciplinary Center of Archaeology and Human Behaviour, FCSH, Universidade do Algarve | Departamento de Ciências Sociais e de Gestão, Universidade Aberta. Centro de Estudos Globais) – Catarina Gil (EMERITA–Empresa Portuguesa de Arqueologia) – Pedro Baptista (CEAACP - Universidade de Coimbra | AEAT – Associação de Estudos do Alto Tejo)

The Tejo River provides evidence of the long sequence of Middle Paleolithic occupation in the center of the Iberian Peninsula. At Vila Velha de Ródão, the Middle Paleolithic occupations occur from the top of T4 terrace to the lower division of T6, chronologically ranging from ca. 165 to 45 ka (MIS 6 to MIS 3). Monte da Revelada is an open-air site associated with correlative erosin ramp of T4, with an estimated age of between 155 and 135ka (late MIS 6). This work uses a techno-typological analysis to explore the different strategies from raw material acquisition to tool production. 623 artefacts have been studied from the basal layer (stratigraphic unit 27). The artefacts are predominantly made from local quartzite (493), along with quartz (113) chert (16) and schist (1). The assemblage is dominated by chips and other debris, that ensure the reliability of the context. Along with them, flakes are the most common technological category (412) and is noteworthy the small number of cores (2), although some artefacts having core-size dimensions and weight. The dorsal patterns of the blanks and cores indicate simple and discoidal methods, with Levallois being rare and Quina absent. Among the formal tools, there are typical and atypical Levallois flake, a Levallois point and pseudo-Levallois points, along with denticulates, notches and a diversity of sidescrapers. Blanks often have one of their edges marked by greater abrasion or micro-denticula-tion, suggesting their use. The artefacts are homogeneous, slightly eolised, with sporadic cases of heavier patina or double patina, suggesting their possible occasional transport from older sites exposed nearby. The overall differences between Monte da Revelada and other nearby sites, such as Cobrinhos or Foz do Enxarrique, are substantial, which may reflect the necessary adaptation to the rapid warming period of the MIS6-MIS5 transition.

2028. STONES IN TRANSIT: ANALYSING THE MOBILE TOOLKITS FROM LEVELS M AND P OF ABRIC ROMANÍ (CAPELLADES, SPAIN)

Contribution format: Oral  
Contribution authors: Irene González-Molina (Universidad Nacional de Educación a Distancia (UNED) | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) – Amèlia Bargalló (Universitat Rovira i Virgili (URV) | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA)) – Gema Chacón (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV) | Seminari d’Estudis i Recerques Prehistòriques (SERP),Universitat de Barcelona | Institut d’Arqueologia de la Universitat de Barcelona (IAUB) | UMR7194-HNHP, Musée de l’Homme) – Bruno Gómez De Soler (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV)) – Francesca Romagnoli (Universidad Autónoma de Madrid (UAM)) – Palmira Saladié – Josep Vallverdú (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV) | Museo Nacional de Ciencias Naturales (MNCN-CSIC)) – Manuel Vaquero (Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV))

The relationship between mobility and lithic technology is a topic that has been extensively debated in the scien-tific literature, particularly in relation to the technological variability observed among Neanderthal groups and the complexity of knapping methods. A central aspect of this debate is the selection of mobile tools and personal gear according to transportation needs. This study aims to contribute to this debate by analysing the mobile tool-kits from levels M and P of the Abric Romaní (Capellades, Barcelona), with dates between 51.8 ±1.4 ka BP to 55.8 ±2.3 ka BP for level M, and between 54.24 ± 0.42 Ka BP to 55.0 ± 2.6 Ka BP for level P. Abric Romaní is an exceptional site for studying Neanderthal mobility due to its high stratigraphic resolution, which allows the identification of specific technological events. The mobile toolkits, identified using the Raw Material Units approach, along with refits and petrographic characterisation, indicate that these elements were already knapped when introduced to the site. The two levels present different technological contexts: level M, with a discoid and expedient technol-ogy, and level P, with a more complex Levallois and laminar technology. The objective of this study is to examine whether the composition of the mobile toolkits is predominantly influenced by the necessity for mobility or by the technological strategies employed within the respective contexts. This analysis will provide new insights into the interactions between lithic technology and mobility patterns in Neanderthal groups, enhancing our under-standing of how they adapted their behaviour to the needs of movement and subsistence.

501. CAN SIMPLE PHYSICAL MODELS AID IN THE SEARCH FOR LITHIC RAW MATERIALS? THE CASE OF VINALOPÓ AND JÚCAR BASINS

**Contribution format:** Oral  
**Contribution authors:** Nahum Chazarra (Universitat de València) – Jaime Cuevas-González (Universidad de Alicante) – Aleix Eixea (Universitat de València)

The search for lithic raw materials, a critical step for a better understanding of tool production, trade networks and mobility patterns, has long relied on intensive field surveys, data gathering from archaeological and geological data and regional geological insights. While effective, these methods are often costly, time-consuming and constrained by logistical challenges, particularly in understudied regions with complicated reliefs. We explore the potential of simple physical models to accelerate the identification of lithic raw material in the Vinalopó and Júcar Basins, where there are several Middle and Upper Paleolithic sites in which flint has been found as raw material but whose origin is still open to further research, due to the multiple possibilities offered by the primary outcrops. The strength of these models lies in their accessibility and adaptability. Unlike advanced computational methods requiring specialized software and powerful computers, simple physical models rely on basic equations, topographic maps and geological inputs to generate probabilistic maps according to a series of initial conditions. However, these models are not without limitations. Simplifications inherent to the physical model used may lead to false positives or overlooked deposits. Their accuracy depends on the quality of input data, but also lithic raw material procurement strategies employed by humans may complicate purely geological predictions, for example cultural factors like selective quarrying or long-distance trade that may defy physical deposition models. To mitigate these possible issues, hybrid approaches are recommended, combining physical models with archaeological data. In conclusion, while simple physical models cannot replace detailed fieldwork or geochemical analysis they can serve as a powerful tool to guide the search for lithic raw materials. By translating geological processes into predictive frameworks, they offer a balance between accuracy and efficiency that can help us uncover new insights into human prehistory while saving time and resources.

1903. TOOLS, MATERIALS, AND ADAPTATION: NEANDERTHAL HUNTING IN THE MIDDLE PLEISTOCENE

**Contribution format:** Oral  
**Contribution authors:** Annemieke Milks (University of Reading) – Michell. Bebbber (Kent State University) – Metin Eren (Kent State University) – Rob Hosfield (University of Reading) – Francy Kiabiya Ntamboudila (Marien Ngouabi University) – Sheina Lew-Levy (Durham University)

The emergence of Neanderthals in Eurasia during the Middle Pleistocene led to a shift in techno-behavioral strategies, notably in their use of materials for tool-making. Archaeological evidence indicates that wooden weapons were utilised by at least 400,000 BP, and likely much earlier. By the later Middle Pleistocene, Neanderthals had adopted innovations such as tool handles, glues, and stone-tipped spears. This diverse technological repertoire may have bolstered their ability to adapt to various environments through enhancing access to and increasing success with different hunting strategies, landscapes and prey. However, simpler technologies and materials did not disappear; they persisted into the Late Pleistocene and beyond. The reasons for the adoption of new materials, alongside the retention of older strategies, remain opaque. This paper presents findings from the interdisciplinary project, Reverse Engineering Pleistocene Spears, exploring varying weapon material and design strategies used by early Neanderthals during the Middle and early Late Pleistocene. We combine archaeological data with experimental research testing the performance of wooden versus stone-tipped weapons. Additionally, new ethno-archaeological research, based on semi-structured interviews with children, adolescents, and adult spear hunters in the Republic of the Congo, offers insight into the socio-cultural aspects of choices in weapon materials and design. While these analogical tools do not directly mirror Neanderthal decision-making, they can provide valuable context for understanding often overlooked factors in the emergence and transmission of new behaviours and technologies. Our results inform current views of flexibility in Neanderthal behaviour, materials, hunting strategies, and landscape use that challenge the traditional narratives of Neanderthals as rigid, inflexible big-game hunters.

1707. NEANDERTAL SPELEOTHEM BREAKAGE IN THE BRUNIQUÉL CAVE 176.5KA AGO

**Contribution format:** Oral  
**Contribution authors:** Sophie Verheyden (Royal Belgian Institute of Natural Sciences - RBINS) – Serge Delaby (UNESCO Global Geopark Famenne-Ardenne) – Kim Genuite (University of Bordeaux, PACEA) – Denise & Michel Soulier (La Mangrove) – Jacques Jaubert (University of Bordeaux, PACEA)

The Bruniquel cave contains circular structures of broken stalagmites dated 176,5 ka as published by J. Jaubert, S. Verheyden and co-authors in 2016 in Nature. Recently obtained ages for regrowths, i.e. more recent stalagmites sealing broken bases located behind the structures, in a sector now called “Magasin” (shop). These results

are entirely consistent with those of the structures (≈175 ka) and confirm that this area was indeed a supply site related to the mentioned structures. A large stalagmite (BR-Stm-9), which previously blocked the passage shortly before the “Salle de la Structure” grew during MIS 9 and the beginning of MIS 8, with regrowth seemingly starting around 172 ka. This regrowth seems to mark the onset of a climatic improvement. This, along with other stalagmites and regrowths dated around 175 ka, suggests a temperate climate when Neanderthals occupied the Bruniquel cave. The knowledge of the climatic condition is indeed important when tackling the functions of such structures.

2050. PREY CHOICE AND MOBILITY IN THE LATE MIDDLE PALEOLITHIC OF LAPA DO PICAREIRO

**Contribution format:** Oral  
**Contribution authors:** Milena Carvalho (ICArEHB) – Jonathan Haws (Dept. of Anthropology, University of Louisville | ICArEHB) – Emily Jones (Dept. of Anthropology, University of New Mexico)

This study examines Neanderthal subsistence strategies, mobility patterns, and territory use through zooarchaeological and taphonomic analyses of faunal remains from Levels JJ and KK at Lapa do Picareiro, Portugal. Archaeological evidence from Levels JJ and KK represents the latest Middle Paleolithic of the region. Situated in the ecologically varied Estremadura region, the site provides valuable insights into how Neanderthals adapted to shifting environmental conditions and resource distributions during Marine Isotope Stage 3. Taphonomic evidence indicates that human activity was the primary driver of assemblage formation, with additional contributions from carnivores and raptorial birds. The faunal assemblage is dominated by red deer (*Cervus elaphus*), supplemented by ibex (*Capra pyrenaica*), aurochs (*Bos primigenius*), and other ungulates, suggesting a diversified hunting strategy. Patterns of short-term site use point to localized mobility within a dynamic ecotonal landscape. Despite environmental fluctuations, particularly Heinrich Event 5, the findings underscore Neanderthal resilience in their subsistence behaviors, contributing to broader discussions on mobility and ecological flexibility in Middle Paleolithic Iberia.

1801. UNGULATE MOBILITY AND NEANDERTAL PREDATION AGENDA IN AXLOR LEVEL D (BASQUE COUNTRY, NORTH ATLANTIC IBERIA)

**Contribution format:** Oral  
**Contribution authors:** Antigone Uzunidis (ASM, UMR 5140, Univ Paul-Valéry, CNRS, MCC, F-34000, Montpellier. | Université de Paris 1 Panthéon-Sorbonne & UMR 7041 ArScAn-Archéologies Environnementales) – Audrey Roussel (ASM, UMR 5140, Univ Paul-Valéry, CNRS, MCC, F-34000, Montpellier) – Jesus González-Urquijo (IIIPC, Universidad de Cantabria) – Talía Lazuen (IIIPC, Universidad de Cantabria | Univ. Bordeaux, CNRS, MCC, PACEA, UMR 5199, F-33600)

As hunter-gatherers, Neanderthal groups were mobile, moving within their territory based on the availability of targeted resources. Their mobility was an integral part of their subsistence strategies. Level D of the Axlør site (MIS4, North-western Spain) is an ideal assemblage for reconstructing human habitats and seasonal mobility since, unlike most contemporary accumulations, that of Axlør is predominantly of anthropogenic origin. In this study we combined several proxies in order to reconstruct precisely Neanderthal predation agenda: zooarchaeology, tooth eruption patterns and dental meso- and microwear. The study of dental remains from Layer D reveals that 99.26% of the remains are attributable to herbivores. Among these, the most represented taxa are *Capra pyrenaica*, *Cervus elaphus*, and cf. *Bison priscus*. *Equus caballus*, *Capreolus capreolus*, *Rupicapra pyrenaica*, and *Stephanorhinus* cf. *hemitoechus* are also present. The analysis of herbivore diets indicates that regional and local habitats were largely dominated by dicots, corresponding to heathlands or forests with some grassy areas. Estimates of mortality periods and durations suggest that the site was occupied by Neanderthals only during the warm season during long or short repeated stays, with a slightly different hunting calendar depending on the species. The site was likely geographically situated at the intersection of the seasonal movements of several ungulate species, particularly in autumn. Thus, the ecological characteristics of Axlør Level D were especially favorable for animal-derived resources procurement by predators, in this case, Neanderthals.

1442. NEW HOMININ DENTAL REMAINS FROM THE MIDDLE PLEISTOCENE DEPOSITS OF VELIKA BALANICA, SERBIA

**Contribution format:** Oral  
**Contribution authors:** Predrag Radovic (Department of Archaeology, Faculty of Philosophy, University of Belgrade) – Joshua Lindal (Department of Anthropology, University of Winnipeg) – Petar Milovanovic (Center of Bone Biology, Faculty of Medicine, University of Belgrade) – Dušan Mihailović (Department of Archaeology, Faculty of Philosophy, University of Belgrade) – Mirjana Roksandic (Department of Anthropology, University of Winnipeg)

Dated to 285 ± 34 ka and 295 ± 74 ka via thermoluminescence, Layer 3a of Velika Balanica cave (Sićevo Gorge, southern Serbia) previously yielded dental remains of at least two individuals (BH-2, BH-3, BH-4, and BH-5) attributed to early Neanderthals. Here, we present three new permanent teeth—a lower lateral incisor (BH-7), an upper central incisor (BH-8), and a lower third molar (BH-15)—identified in Layers 3a and 3b during recent laboratory and field research. The massive and robust structure of the BH-7 and BH-8 crowns and roots aligns with a dental morphological pattern characteristic of Eurasian Pleistocene hominins. Moreover, BH-8 displays linear enamel hypoplasia, an important marker of systemic physiological stress during childhood. Despite some damage to the crown, the enamel-dentine junction of the BH-15 molar shows a continuous middle trigonid crest—a trait regarded as typical of the Neanderthal lineage. The morphological and metric features of the new dental specimens align with previous findings, indicating the presence of an early Neanderthal population around 300 ka at Velika Balanica.

2158. DIFFERENCES OF RAW MATERIAL PROCUREMENT IN THE MIDDLE PALAEOLITHIC ASSEMBLAGES FROM THE CSERHÁT REGION (NORTHERN HUNGARY)

Contribution format: Poster  
Contribution authors: András Markó (University of Szeged)

During the past 25 years a number of Middle Palaeolithic assemblages with leaf shaped tools were recognised in the Cserhát mountains (Northern Hungary). During the excavations at Vanyarc, Galgagyörk and Szécsénke the artefacts were documented in undisturbed artefact-bearing layers. In the presentation we discuss the typological aspects and raw material composition of these closed assemblages. The Vanyarc site seems to be unique as one third of the nearly 2000 lithics were made of extralocal metarhyolite raw material having a single source at a distance of 95 km from the archaeological site. In typological point of view, the assemblage is dominated by the leaf shaped tools, including point fragments. Based on the analysis of the lithic artefacts, the site is interpreted as a short-term hunting station. In the side-scraper dominated assemblage from Galgagyörk, beside the metarhyolite, various obsidian types and the very low quality local hydrothermal rocks and andesite are well represented. In our view the site represent the occupation of a special ‘pioneer’ groups who had no information concerning the potential siliceous rock in this part of the Carpathian basin. Finally, the excavated assemblage from Szécsénke is largely dominated by the local or mesolocal hydrothermal rocks, while metarhyolie is represented by a few single pieces. The most numerous groups of the retouched tools are the end-scrapers with a few leaf shaped implements. As a total, in our view these three documented localities lying on a small micro region seems to represent the ‘leaf point group’ (Blattspitzengruppe) with a Central European distribution, which is suggested instead of the ‘Szeletian’ having problematic documentation and typological composition of several industries and complex taphonomic history with unclear processes connected to the site formation.

172 EXPLORING THE MARGINS: ARCHAEOLOGY OF REMOTE AND RESOURCE-RICH LANDSCAPES

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: Remoteness, Outlands, Mountain Archaeology, Polar Archaeology, Wetlands Archaeology, Forest Archaeology  
Session organisers: David González-Álvarez (Institute of Heritage Sciences (INCIPIT-CSIC)) – Andreas Hennius (Upplandsmuseet) – Maria Ximena Senatore (Institute of Heritage Sciences (INCIPIT-CSIC)) – Daniela De Simone (Ghent University) – Sergio Escribano-Ruiz (University of the Basque Country (UPV/EHU))

SESSION ABSTRACT

This session aims to gather case studies and theoretical proposals that address the concepts of remoteness and outlands. Remoteness is defined as a state of being distanced from, or lacking connection to, central cores. Geographically remote areas—such as the driest deserts, highest mountains, densest jungles, most isolated islands, freezing polar regions, and the edges of historical maps—have rarely been at the forefront of archaeological research. The concept of outlands refers to regions beyond the primary centres of settlement and agriculture, often encompassing forested areas, mountains, coastal zones, and open seas. These diverse landscapes, generally unsuitable for cultivation, have historically served various economic and cultural functions. Outlands also denote the resources and raw materials sourced from these areas, such as wood, iron, gemstones, meat, furs, and blubber—commodities crucial to broader networks and economies. In archaeology, studies of remote lands and outlands have often been sidelined, with global historical processes largely interpreted from central or urban perspectives. As a result, these allegedly distant and marginal regions have been overlooked in discussions of major historical narratives. This session seeks to challenge this oversight, demonstrating that we can engage

meaningfully with global themes and contribute to key narratives worldwide by focusing on remote lands and outlands. We therefore invite contributions that examine remote lands or outlands in relation to significant historical processes, including but not limited to the following:

- Revisiting centre-periphery models in archaeology
- Critically examining Big History
- Analysing global migrations and human expansions into these areas
- Considering remoteness and outlands through the lenses of connectivity and globalization
- Questioning the complementarity of non-agrarian production systems
- Examining the relationship between market-oriented production in these regions and capitalism
- Exploring the otherness and livelihood strategies of people from these lands

CONTRIBUTION ABSTRACTS

533. SCANDINAVIAN OUTLANDS - NEITHER REMOTE OR MARGINAL

Contribution format: Oral  
Contribution authors: Andreas Hennius (Stiftelsen Upplandsmuseet)

The Scandinavian term Utmark—translated as Outlands—refers to areas beyond the cultivated fields and meadows of the home farm, encompassing the non-agrarian landscape such as forests, mountains and coastal zones. These landscapes could be near or far from agrarian regions, and their resources were exploited either as part of the farming community’s annual work cycle or by people residing permanently in these forested areas. Crucially, the Outlands were unsuitable for extensive agriculture and were instead utilised for other valuable resources. For a long time, research focused primarily on central agrarian regions—settlements and burial sites—while the Outlands remained largely overlooked. However, recent studies within Outland discourse have underscored their significance as resource-rich landscapes that played a crucial role in societal development. As early as the 4th to 6th centuries AD, large-scale production of iron and tar was initiated. This, alongside intensified hunting of terrestrial and marine mammals and the exploitation of animal products such as antlers and furs, facilitated the expansion of long-distance trade, which flourished during the Viking Age. In return, exotic goods from distant regions—including garnets, elephant ivory, cowrie shells, amethyst, and silk—began to flow into Scandinavia. This paper provides an overview of ongoing research on the exploitation and extraction of the Outlands from a Scandinavian perspective. It highlights the importance of non-agrarian production and challenges the traditional notions of marginality, remoteness and the very concept of “Outness” embedded in the term Outlands.

2368. REFRAMING REMOTENESS: THE NILGIRI MOUNTAINS AND THE ARCHAEOLOGY OF UPLAND FORESTS

Contribution format: Oral  
Contribution authors: c(Ghent University)

The Nilgiri Mountains, a region of montane subtropical forests in South India and home to indigenous communities, have long been marginalised in archaeological discourse, regarded as spatially and culturally remote and thus peripheral to the historical processes shaping the agrarian and urban societies of the plains. Colonial narratives have reinforced the notion that forest-dwelling communities existed outside history, reducing them to ethnographic subjects rather than active agents of cultural transformations. Drawing on recent fieldwork and archival research, this paper examines the megalithic landscapes of the Nilgiris through indigenous spatial and temporal frameworks, presenting a decolonial perspective that challenges Eurocentric historical models. Despite providing crucial evidence of long-term habitation and ritual continuity, these sites remain understudied within broader South Asian archaeology. By addressing the historiographical marginalisation of Indian forested regions, this paper contributes to wider discussions on remoteness, otherness, and alternative histories in archaeology. It highlights the significance of forest archaeology in redefining marginality and demonstrates that upland landscapes were integral to regional and transregional interactions rather than isolated peripheries.

1235. RUNNING TO THE HILLS: FORTIFIED HILLTOP SITES IN THE DIOECESIS DACIAE (4TH–7TH C.)

Contribution format: Oral  
Contribution authors: Samira Fischer (FAU Erlangen-Nürnberg | JGU Mainz)

In the 6th century, a change in the settlement pattern can be observed in the central Balkans. Numerous hilltop fortifications appeared in the hinterland of the Danube Limes. Some of these fortifications were situated on hills along the main traffic routes, while others were deep in the mountains, far from the main roads. Archaeological research interprets this move to higher areas primarily as a protective response to the increasing invasions of various barbarian groups, such as the Avars and Slavs, who threatened the Eastern Roman provinces. This interpretation is often based on Procopius’ accounts of construction activities under Emperor Justinian I (527–565),

who established a network of fortifications to defend Eastern Roman territory. However, the exact nature of these sites remains a topic of debate. Were they fortified villages of the local population, refuges, military forts, installations protecting mining activities in ore-rich regions, regional centres of power, or something else entirely? What is certain is that people had to adapt to the challenges of these locations: difficult access, poor soil quality for agriculture, problematic water supply, and the risk of erosion all played significant roles. The fortified hilltop sites of the Dioecesis Daciae can be understood as an expression of the transformation of the Late Roman Empire, in which strategies, structures, and social relations were reconfigured in response to internal and external challenges. This paper aims to highlight the diversity and adaptability of human settlement patterns in times of crisis.

179. ORGANISING THE INSULAR LANDSCAPE: INFIELDS AND OUTFIELDS ON THE ÅLAND ISLANDS

**Contribution format:** Oral  
**Contribution authors:** Kristin Ilves – Petter Larsson (University of Helsinki)

This presentation examines the interplay between remoteness, marginal landscapes, and agrarian systems on the Åland Island during the Nordic Late Iron Age and Medieval period. Drawing on pollen analyses from five lakes – ranging from densely settled areas to topographically and geographically marginal sites – we uncover nuanced patterns of land use and resource management that are discussed through the lens of infields and outfields. The Åland Islands provide an interesting opportunity to expand theoretical discussions on the infields-outfields concept to the insular landscapes. Outfield utilisation on islands is largely underexplored as these regions are in itself considered “outlandish”. Research on subsistence practices in Åland and on islands more generally is often approached from a maritime perspective, highlighting activities such as sealing, fishing and fowling. By applying the infields and outfields framework, we aim to advance the understanding of insular land use organisation, also moving beyond site-specific analyses to reveal broader trends across Åland. Furthermore, we examine fluctuations and transformations in land use on Åland in relation to external events, interpreting signals of landscape utilisation within the context of known crises, such as the mid-6th century climate crisis and the Black Death of the mid-14th century, and our findings are further contextualised within the broader framework of societal changes documented in the Baltic Sea region during the same period.

2320. MATTER AND MEANING IN ANTARCTICA: RETHINKING A REMOTE CONTINENT

**Contribution format:** Oral  
**Contribution authors:** Maria Senatore (Institute of Heritage Sciences (INCIPIT-CSIC))

Antarctica is considered one of the most remote places on Earth. It is often viewed as an exceptional place, with its isolation perceived as an inherent quality of its geography and harsh environment. Distance and challenging accessibility have reinforced Antarctica’s prevailing image as the last frontier of human exploration. However, this perception of remoteness has been shaped through cultural narratives that construct and reinforce its meaning. In this presentation, I argue that material objects have played a crucial role in shaping and sustaining these narratives of Antarctica. By examining three case studies from contemporary Antarctica, I explore how often-overlooked material objects influence political dynamics, historical memory, and environmental discourse, as well as the cultural and social processes of inhabiting the continent. Because Antarctica is commonly imagined as a place devoid of human presence and material culture, this presentation highlights their significance, challenging the narratives that disconnect Antarctica from broader historical, social, and cultural processes.

356. URBANITY IN THE OUTLANDS. BRINGING THE OUTLAND TO THE TOWN AND THE TOWN TO THE OUTLAND

**Contribution format:** Oral  
**Contribution authors:** Eva Svensson (Karlstad University)

Outland use, that is use of various resources in outlying areas, was pursued for several, often intersecting, reasons; eg. adding to the agrarian subsistence of the farm, producing commodities for trade, and as a means for spreading risks. The people engaged in outland use could belong to different groups, but here the focus will be on outland using forest peasants. The commercial signature was always present among the forest peasants, and they moved between production sites in the distant outlands and central trading places – in medieval Scandinavia mostly towns. So far, in Scandinavian research, we have been fairly successful in detecting and analysing the production of commodities based on outland resources – at least production leaving traces in the landscape. We are struggling more with reconstructing trade routes and networks, although various natural science methods enabling analyses of extraction origin for goods recovered in eg. urban environments and graves are making good progress. So far, also less attention has been paid to what the forest peasants retrieved from the markets and brought back to their farmsteads. A number of excavated medieval farmsteads in Scandinavia will be examined in this paper in order to discuss what the medieval, Scandinavian forest peasants brought back from the towns to their farmsteads; goods as well as ideas. The paper will also examine how the forest peasants’ interaction with the

towns as well as the outlands shaped their daily lives and strategies at the farmsteads.

794. CONCEPTUALISING MOUNTAINS AS MARGINAL OR REMOTE LANDSCAPES MISREPRESENTS THEIR ARCHAEOLOGICAL UNDERSTANDING: RECENT RESEARCH ON THE REGION OF BABIA (LEÓN, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** David González-Álvarez (Institute of Heritage Sciences (INCIPIT-CSIC))

When considering mountainous landscapes, it is important to avoid oversimplifying their nature as ‘marginal’ or ‘remote’ areas. The diachronic anthropogenic impact on suburban and coastal areas in Europe is well-documented, yet naturalistic views regarding mountains remain prevalent. Alpine and subalpine areas are often considered ‘nature refugees’, where wildlife finds shelter beyond the scope of human action. Moreover, contemporary discourses on the rewilding and the rural decline in Europe serve to perpetuate these naturalistic imaginaries. However, palaeoenvironmental studies and recent archaeological research highlight the profound impact of human activities on the formation of upland landscapes since the Late Prehistory. Consequently, mountains represent some of the most evident scenarios for challenging dichotomist perceptions of landscapes, transcending the ‘nature/culture divide’. Archaeological research in the Cantabrian Mountains (NW Iberia) has demonstrated the complexity of these upland environments. It emphasises their nodal role as places for encounters and highlights their potential to host abundant resources, which are sometimes only accessible to their inhabitants seasonally. The long-term landscape formation processes in the region of Babia (León, Spain) are under study by our research team, aiming to understand changes and continuities in landscape biographies. The investigations undertaken involve an examination of the socio-environmental relations established by local societies with their surroundings. This involves an analysis of both material and intangible traits that mediate their experiences and perceptions. The preliminary outcomes of this research line offer a foundation for broader reflections on the ongoing touristification and heritagization processes of rural landscapes in these mountains. Some of these processes may serve to perpetuate misconceptions, such as the so-called ‘nature/culture divide’. However, through the rigorous lens of archaeological research and the interdisciplinary understanding of cultural landscapes, these misconceptions can be systematically deconstructed, facilitating a more nuanced and informed understanding of the dynamics between humans and their environments.

1091. MARINE RESOURCE EXPLOITATION FROM THE MIGRATION PERIOD UNTIL THE MIDDLE AGES: RISE AND ABANDONMENT OF SEASONAL SETTLEMENTS IN SOUTHWESTERN NORWAY

**Contribution format:** Oral  
**Contribution authors:** William Van Hemelryck (Universitetet i Bergen)

This research reassesses seasonal settlements found along the coast of Southwestern Norway. By revisiting the finds from previous excavations and by analyzing the sites in their regional and social context, this research explores marine resource exploitation and its relation to societal change during the Viking Age and the Middle Ages. The sites under investigation are located on rocky islands along Southwestern Norway’s outer coast. The house remains tend to be clustered along narrow inlets or small, sandy beaches, sheltering them from the wind and providing safe landing places for boats. Although most of these structures have not been investigated, archaeological excavations of some of the tufts indicate that the sites were first occupied during the Roman Iron Age. Activities increased dramatically from the second half of the Migration Period onwards, until the sites were eventually abandoned by the end of the Early Middle Ages. Although these sites have received little scholarly attention, the modern consensus is that they were organized by local chieftains, and that the reason for their abandonment needs to be sought in the changed socio-political reality in the region. Yet, the moment of their decline is quite remarkable, since it coincides with the rise of Bergen as a city and as a nodal point for the international stockfish trade. Although competition with the Lofoten fisheries has been named as a contributing factor, it remains unexpected that stations for marine resources were abandoned at a time when the international demand for these resources was rising. By focusing on seasonal settlements in liminal landscapes, the research breaks with the more traditional farm-centered view which has been prominent in Norwegian archaeology. The findings will contribute to our understanding of the relation between marine resource exploitation and societal change during the Viking Age and Middle Ages.

891. IN THE MARGINS OF THE WESTERN PYRENEES: DEVELOPING CONNECTIONS ON THE PYRENEAN PERIPHERY (ZALDUA, AURITZ/BURGUETE, NAVARRE)

**Contribution format:** Oral  
**Contribution authors:** Oihane Mendizabal Sandonís (Université de Pau et des Pays de l’Adour (UPPA) | University of the Basque Country (EHU/UPV) | Aranzadi Science Society) – Elena Torregaray Pagola (University of the Basque Country (EHU/UPV))

The western Pyrenees has been a peripheral territory during most of the historical periods and Antiquity is no

exception. Far from the Mediterranean Sea, the most important cities and the main fluvial corridors (both the Ebro and the Garonne), this territory has traditionally been little studied, to the extent that the Roman impact of these valleys was questioned for decades in the 20th century. However, since 2011 new research projects have focused on this a priori ‘marginal’ territory. One of the areas studied comprised a secondary trans-Pyrenean road together with the urban and non-urban elements that surrounded and characterised it. Thanks to it, new sites could be identified, including urban centres close to the mountain, as is the case of Zaldúa. They were related to the economic resources of the area, far from the traditional agricultural model of the mediterranean triad. Its development is giving us an insight into a specific type of economic exploitation, but of strategic importance for the territorial networking of the Roman Empire. In this context, the aim of this communication is to present some examples of the socio-economic particularities identified in the small town of Zaldúa. It clearly shows the development of a particular model of territorial exploitation that combines the basic features of the Roman urban model with the needs of a territory with specific conditions. Therefore, our intention is to present this Pyrenean site as a contribution to the creation of alternative models to the Roman ideal. So the trans-Pyrenean dynamics, which have often been interpreted as evidence of the limited impact of Roman culture, are, on the contrary, the sign of a particular type of exploitation. It constitutes an essential complement and challenges the model that has been dominant in historiography for years on the general characterisation of spaces in the Empire.

1257. SURFING THE MARGINS. MARINE AND FOREST LANDSCAPE EXPLOITATION IN NORTHERN BASQUE COUNTRY

**Contribution format:** Oral  
**Contribution authors:** Sergio Escribano-Ruiz (University of the Basque Country (UPV/EHU))

When the Romans arrived in what would later be called the Basque Country, they divided the territory into two distinct regions based on the landscape. The southern part, suitable for agriculture, was known as Ager, while the northern, less arable region was designated as Saltus. Each area underwent different forms of land management and material interventions. This division also established a hierarchical relationship, with the Ager serving as the primary economic driver and maintaining stronger ties to Rome. This dichotomy persisted into the medieval period, evolving over time until industrialization reversed the dynamic. Through this study, we aim to explore a broad historical period (10th–19th centuries) to examine how non-agrarian activities played a central role in both local and global economies. We will focus on case studies involving people from the northern Basque Country, particularly those engaged in activities with archaeologically attested traces, such as medieval ironworking and millstone quarrying. Situated between land and sea, these communities also played a crucial role in Iberian trade. From the late medieval period, they participated in Irish fisheries, and by the early modern era, they were investing in Canadian fisheries, accumulating wealth in the process. In the 19th and 20th centuries, many young Basque people migrated to the Americas to work as shepherds, contributing significantly to the success of the U.S. textile industry. Viewed as a whole, these case studies offer a compelling case of marine and forest landscape exploitation, highlighting the significance of non-agrarian, remote areas in global economic networks—key developments that ultimately contributed to the rise of capitalism.

173 SHAPING TOMORROW’S HERITAGE KEEPERS: THE ROLE OF YOUTH ENGAGEMENT IN PRESERVING ARCHAEOLOGICAL HERITAGE

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Regular session  
**Session keywords:** Youth engagement, Archaeological heritage, Cross-curricular education, Museums, Cultural Routes of the Council of Europe, Prehistory  
**Session organisers:** Marta Rakvin – Jacqueline Balen (Archaeological Museum in Zagreb | Iron Age Danube Route Association) – Szilvia Fábián (Hungarian National Museum | Iron Age Danube Route Association) – Petra Stipančić (Dolenjska Museum Novo mesto | Iron Age Danube Route Association)

SESSION ABSTRACT

The preservation of cultural and archaeological heritage is intrinsically linked to public understanding. Educating young people about cultural and archaeological heritage is vital for fostering appreciation and respect for their shared past. However, school curricula often underrepresent or omit these subjects, particularly prehistoric periods and context-based heritage learning. Efforts to teach young people about archaeological topics and their heritage, often solely depend on the enthusiasm of their teachers, who frequently lack sufficient resources to perform extracurricular learning activities. This can have significant consequences for the long-term preservation of heritage, as this imbalance can limit future public engagement with archaeological sites and museums,

ultimately hindering efforts to protect and conserve these invaluable resources. With prehistoric and archaeological topics largely missing from the school curricula, museums have already taken on the leading role in providing knowledge about these periods to children and young adults. Therefore, the youth involvement and educational work done by the heritage institutions, as well as other heritage preservation, presentation and promotion programmes and initiatives (such as Cultural Routes of the CoE, Europa Nostra, European Heritage Days, European Archaeological Days...etc.) is essential for fostering archaeological heritage in days to come. Outreach programmes can enrich children’s engagement with archaeology, and provide the context-based approach often missing from formal classroom teaching. By involving young people in archaeological projects, volunteer programs, and digital heritage initiatives, we can cultivate a new generation of heritage stewards. In this session we are looking for papers which present challenges, approaches, initiatives and best practices in youth involvement and education, development of new programmes, (particularly programmes enhanced through the use of digital technologies), as well as papers focusing on collaborative approaches involving schools, museums, and other heritage institutions, as well as organizations and experts which work on strategical approach and policies to integrating archaeological heritage into curricula.

CONTRIBUTION ABSTRACTS

2202. CONNECTING PAST AND PRESENT: INSPIRING YOUNG MINDS THROUGH PREHISTORIC OUTREACH

**Contribution format:** Oral  
**Contribution authors:** Ana Abrunhosa (IPHES-CERCA - Institut Català de Paleoecologia Humana i Evolució Social | Universitat Rovira i Virgili (URV), Departament d’Història i Història de l’Art | ICaREHB Interdisciplinary Center for Archaeology and Evolution of Human Behaviour, UAlg) – Joana Rebelo (Escola Montessori do Porto) – Andrea Alías Sotos (IPHES-CERCA - Institut Català de Paleoecologia Humana i Evolució Social)

Outreach science activities and heritage education play a key role in developing curiosity and a sense of responsibility in young learners. By engaging students in hands-on activities such as recreating ancient tools, making prehistoric art, and exploring archaeological sites, prehistory becomes both exciting and accessible. These activities foster critical thinking and a deeper understanding of early human life while teaching children the importance of protecting cultural heritage. Understanding the ways early humans lived and adapted encourages respect for diverse cultures and environments, highlighting the value of conservation and sustainability. While Spain has established successful outreach programs that actively involve diverse communities in prehistoric research, Portugal’s efforts in this area remain limited. Although Portugal possesses significant archaeological heritage, outreach initiatives tend to focus on large events like European Research Night, with fewer continuous programs that integrate with local communities. This creates a gap in public engagement, particularly in schools where teachers face challenges in accessing age-appropriate educational materials about prehistory. Educators, especially those working with young children (ages 6-9), often struggle to find resources that balance scientific accuracy with pedagogical needs. To address this, there is a pressing need to expand outreach initiatives in Portugal, making prehistoric research more accessible and ensuring that educational resources are tailored to younger audiences. A collaboration between researchers and teachers can help bridge this gap, offering engaging, age-appropriate content. Here we present our experience applying outreach practices at a Montessori school in Portugal, demonstrating the potential for such cross-border collaboration. It showed that well-planned outreach activities, with active teacher participation, can inspire curiosity and foster meaningful learning experiences. Prioritizing the dissemination of accessible resources would ensure that prehistory is effectively brought to life for future generations in Portugal

787. VOLUNTEERING FOR HERITAGE: THE FIRST ARCHAEOLOGICAL EXCAVATIONS OF THE IVANIĆ FORTRESS (IVANIĆ-GRAD, CROATIA)

**Contribution format:** Oral  
**Contribution authors:** Laura Šejic (Friends of Heritage Association | University of Zagreb, Faculty of Humanities and Social Sciences)

In 2023 and 2024, the Friends of Heritage Association, in collaboration with the Ivanić-Grad City Museum and the European Heritage Volunteers organization, organized international volunteer workshops on archaeological excavations in Ivanić-Grad, Croatia. These workshops brought together emerging young heritage professionals from around the world, providing them with a unique opportunity for hands-on archaeological research. As the only EHV workshop focused on archaeological excavation during this period, the initiative played a pivotal role in both advancing participants’ professional expertise and promoting the historical significance of the site. Significantly, this initiative marked the first-ever archaeological excavations in Ivanić-Grad. The archaeological finds confirmed continuous habitation of the wooden fortress between the 16th and 18th centuries, a historical

assertion previously supported only by written records. Moreover, the extensive collection of artifacts will enrich the newly established Archaeological Collection of the City Museum. These discoveries underscore the importance of continued archaeological research to further explore, preserve, and interpret the site’s historical legacy. The training course provided a comprehensive introduction to archaeological excavations, with the primary objective of defining the stratigraphic layers within the fortress. Practical activities began with cartographic and archival research, followed by systematic excavations, and processing of archaeological finds. The workshops concluded with report writing and research presentations, ensuring a well-rounded academic and practical experience for participants. Throughout the course, volunteers gained in-depth knowledge of archaeological methodologies, including field documentation and artifact handling, while also exploring the cultural heritage of Ivanić-Grad and Zagreb County. A key component of the training was community engagement, fostering international cooperation, and reinforcing local heritage research efforts. The presence of participants helped raise awareness of the local heritage, promote youth involvement in heritage preservation and promotion, and inspire local young people to participate in international training programs such as the European Heritage Volunteers programme.

1820. ENGAGING WITH THE FUTURE CUSTODIANS OF OUR ARCHAEOLOGICAL HERITAGE IN NORTHERN IRELAND

Contribution format: Oral  
Contribution authors: Colm Donnelly – Eileen Murphy (Queen’s University Belfast)

Youth engagement and educational work is an established tradition within Archaeology at Queen’s University Belfast, notably through the work of the Belfast branch of the Council for British Archaeology’s Young Archaeologists Club, established in 2006 but also through the direct participation of school groups in the community excavations undertaken by the university’s Centre for Community Archaeology (CCA), with an average of 650 young people working with the unit each year between 201. and 2023. In addition, in 2019 and 2024 the CCA contributed their “Discovering the Past” schools programme as part of the successful application by the Hill of the O’Neill Visitor Centre in Dungannon to the Heritage Education Trust’s Sandford Awards. Building on these successes the CCA has now obtained major funding from the UK National Lottery Heritage Fund to undertake a public-facing three-year project (2024-2026), The Community Archaeology Programme Northern Ireland (CAPNI), with school engagement a central component of the work, delivered through school hubs, school visits and the opportunity for schools to take part in archaeological excavations. The lecture will review the work completed in 2024 when 1,543 school children across Northern Ireland participated in CAPNI activities.

471. MUSEUM MAKERS: CURATING THE CORINTH COLLECTIONS FROM THE CLASSROOM

Contribution format: Oral  
Contribution authors: Taylor Cwikla (ASCSA Corinth Excavations)

Thanks to the support of the Steinmetz Family Foundation, ASCSA Corinth Excavations has launched an educational outreach initiative to invite classrooms around the world to curate displays of ancient artifacts to be featured in public-facing educational programming delivered by the Steinmetz Fellow in Ancient Corinth, Greece. The “Museum Maker” program promotes student-led inquiry as it introduces the process of curating an archaeological exhibit. Students become curators as they navigate the ascsa.net online research database to explore the Corinth collections and collaborate with their peers to determine the direction of their display. For each object selected for exhibition, students prepare a label incorporating contextual data from the excavation database as well as additional content that further explains the reason for that object’s inclusion in the overall display. Once a teacher submits a final list of artifacts, labels, and a curators’ note for their class, the display is assembled and the group is invited to discuss their handiwork during a personalized educational program organized by the Steinmetz Fellow. By involving students in the curatorial process and inviting them to create an exhibit of their own, we hope to enrich their learning experiences and demonstrate the impact their efforts can have in the public sphere. By involving students as museum makers in the classroom we encourage them to grow into engaging and conscientious heritage keepers in the future.

886. GOING BACK TO SCHOOL!

Contribution format: Oral  
Contribution authors: Jacqueline Balen (Archaeological museum in Zagreb) – Kristina Rupert (Zlatni Papuk Tourist board) – Ana Solter (Archaeological museum in Zagreb)

Main goal of this lecture is to present two programs which have been developed in the Požega Valley, Croatia which are intended for elementary and high school pupils. Programs has several objectives. 1. make a step forward in the availability of activities outside the big centres 2. bring archaeology (of the homeland!) closer to the student population 3. enable the adoption of new content through interaction and the experience of own participation 4. develop a model for the introduction of archaeology as an extracurricular activity 5. raise the level of awareness

of heritage as a whole 6) develop alternative teaching models with the aim of better understanding the interdisciplinarity of archaeology The significance of the program conceived in this way lies in the fact that only in this way can it be expected that the question of introducing archaeology as a supplementary activity in schools will be approached in an empirical way and avoid the pitfalls of excessive reliance on theoretical elaborations devoid of practical checks, so often present in (failed) attempts organizing activities like these.

604. MUSEUM EDUCATIONAL PROGRAM “LET’S DIG INTO THE PAST”

Contribution format: Oral  
Contribution authors: Kristina Yanakieva (Rousse Regional Museum of History | Iron Age Danube Route Association)

The purpose of this brief summary is to present a cultural and educational program “Let’s dig into the past”, successfully implemented in the museum pedagogical practice of the Regional Historical Museum - Ruse. It represents an innovative form of extracurricular education consistent with the school programme and for the benefit of children from 1 to 5 grades, their teachers and families. It offers free and informal communication with specialists in various fields of cultural heritage, both from local museums and galleries, and in partnership with scientific institutions in the country. The focus is on the local prehistoric archaeological heritage, as part of the national and world cultural wealth. The educational program is structured in modules presenting different points of view, that of the prehistoric man and that of the archaeologist-researcher. The emphasis is on the experience of the children who participate in the construction of a shelter from mammoth bones, making tools and clay vessels. The second part is discovery, and the children are put in the “shoes” of the archaeologist and participate in excavations, where they discover objects specially made according to samples from the museum showcases and explore them. “Let’s dig into the past” is a flexible and mobile program that travels and easily reaches new audiences. The presentations and worksheets are freely accessible on social networks, which also allows for independent use of the resources. It combines classic elements of museum educational practices – work in the exhibition spaces, as well as practical activities in newly built partner educational spaces. The program engages the audience with participation in competitions and exhibitions. This provokes creative and abstract thinking, key to revealing full-fledged individual intellectual abilities. Children create a lasting interest in the past and acquire significant knowledge, a prerequisite for developing long-term civic sensitivity to cultural heritage.

849. IRON AGE ARCHAEOLOGY INVOLVING SCHOOL CHILDREN

Contribution format: Oral  
Contribution authors: Petra Stipancic (Dolenjski muzej Novo mesto)

Dolenjski Muzej Novo Mesto is preparing a special programme for the Situlae Festival for school children of the 5th class from the Dolenjska region. For the first time we prepared it in 2023 and 430 children visited Situlae Festival, which celebrates the Iron Age life and cuisine. In 2024 we had 484 pupils. The whole programme is dedicated to presenting Early Iron Age life, costumes, culinary, spiritual life, sports and music. The entire event is at the prehistoric settlement of Marof and lasts from 9 a.m. to 1 p.m. This is a cultural-sports-natural history day. They actively participated in all activities. All our activities first have a short presentation, why we do it and how we know it. In the foreground, there are scenes from richly decorated Iron Age bronze vessels, known as situlae. Children have 30 minutes at each station. We have external and also associates from our museum for each station. The program consists of 6 stations where they are introduced to different activities. 1. PRINCELY COURT 2. MUSIC AND DANCE 3. CULINAR. 4. POTTERY 5. CRAFTS 6. SPORT. Our main work and role is to develop common consciousness of meaning of heritage, on which national identity is standing and to help growing museum public from the earliest time. As a method of experiential interpretation (living history) it allows us to relive the past with the help of games and costumes.

2140. LIVING PASTS, EXPLORING FUTURES: “BEYOND THE WALLS” – A PAN-EUROPEAN COURSE IN BUDAPEST

Contribution format: Poster  
Contribution authors: Alexandra Anders (Institute of Archaeological Sciences, Eötvös Loránd University) – Orsolya Réthelyi (Department of Netherlandic Studies, Eötvös Loránd University) – Dániel Veress (Atelier Department for Interdisciplinary History, Eötvös Loránd University)

‘Living pasts, Exploring futures’ is a course that has been offered since 2019 at Utrecht University (Netherlands). A team of teachers wanted to educate differently than before, thus this new course is characterised by multi- and transdisciplinary approaches. The content of the course is driven by co-creation, with a community-engaged outcome. In the seminars, students explore the history of Utrecht through their own research and that of their peers. They are asked to select, research and work on local history topics using new media. Rather than producing

a traditional seminar paper, the course’s output takes the form of a “prototype,” which could be an object, a game, a podcast, or an app. In 2023, a team of teachers at ELTE in Budapest (Hungary) was introduced to the concept of the Living pasts course through CHARM-EU, which is an alliance of nine European universities with the symbolic aim of creating a new European university, both on- and offline. In the autumn semester 2024-25, we decided to implement this new course type with the theme ‘Beyond the walls’. We chose the medieval city wall of Pest, which, despite being largely invisible today, still defines the internal structure of the city. Students from Utrecht University worked together with students of ELTE during this semester. We organised walkings and visits to the city archive. Experts and stakeholders form museums and NGOs supported the work of the ELTE teachers. The poster will show the milestones of the course, the challenges faced, the results and the most remarkable moments. We believe that this new initiative will inspire other universities to adopt this form of sensitization to heritage and archaeology.

174 CURRENT RESEARCH IN THE AMERICAS. BEYOND ARTIFACTS: INDIGENOUS NARRATIVES AND ARCHEOLOGICAL CO-CREATION IN THE AMERICAS

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: American archaeology, Indigenous knowledge , Heritage ,  
Session organisers: Natalia Moragas (University of Barcelona) – Carla Jaimes Betancourt (University of Bonn)

SESSION ABSTRACT

Organized by EAA4Am Community, this session aims to create a welcoming space for archaeologists participating in the 2025 annual meeting and interested in introducing and sharing results of ongoing research on the archaeology and heritage of the Americas. Despite the long trajectory of research in the Americas by scholars based in European institutions, few spaces dedicated to Americanist archaeology exist in European archaeological meetings. Sessions at the last EAA conferences have successfully showcased the vitality and diversity of European-based ongoing projects in the Americas. Researching the Americas within the framework of European institutions has its own challenges, conditioned by the history of both continents from the end of the 15th century to the present day. Likewise, the archaeology developed in America has its own setting with the existence of an indigenous cultural context in which our research is inserted. It is also a space to generate new networks of academic exchange between colleagues.The 2025 Belgrade conference will allow us to discover new projects, as well as networking and discussing the current theoretical debates and methodological approaches related to archaeological and heritage research in the Americas. The session is open to all geographies and chronologies. To guarantee the greatest number of participants, projects are encouraged to present their results jointly. More on EAA4Am: [https://www.eaa.org/EAA/Communities/Community\\_for\\_the\\_Archaeology\\_of\\_the\\_Americas/EAA/Navigation\\_CommunitiesEAA4Am](https://www.eaa.org/EAA/Communities/Community_for_the_Archaeology_of_the_Americas/EAA/Navigation_CommunitiesEAA4Am)

CONTRIBUTION ABSTRACTS

1416. EL SHINCAL PROJECT: ANDEAN RITUALS FROM INCA TIMES TO THE PRESENT DAY

Contribution format: Oral  
Contribution authors: Tomás Fernández Iriarte (ArqueoUIB Research Group. Universitat de les Illes Balears | Institut Català de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i Virgili (URV), Departament d’Història i Història de l’Art) – Mariana Valderrama – Iván Fasciglione – Alejo Rubert – Candela Recalt – Renata Verna – Abril Martí (División Arqueología (FCNyM-UNLP)) – Marco Giovannetti (División Arqueología (FCNyM-UNLP) | conicet)

In this work we want to present a non-European archaeology project in the South Andean region of America. The El Shincal site is well known today for representing the largest settlement built by the Incas in the Argentine Northwest. It is located in the province of Catamarca (Argentina), in a region previously occupied by local communities in the precedent centuries. It is estimated that this occurred in the mid-15th century with the intention of establishing a ceremonial center where state festivals were held, attended by hundreds of people who arrived from various regions on both sides of the Andean Mountain range. Our research showed that a truly sacred landscape was built. Different places of worship were built, and the nearest hills were reconfigured as high places where ceremonies were offered to the Andean deities. A solar marker was even installed at the top of one of the hills to measure the most important dates of the Inca ceremonial calendar. We identified evidence of massive festivals from the objects used to consume food and alcoholic beverages, as well as of hallucinogens. Furthermore, the

project has entered a phase where we are trying to transcend the purely Inca period to try to understand what happened at the site with the arrival of the Spanish. We were able to recognize that it was reoccupied during times of indigenous rebellions against the Spanish occupation. These events would have occurred in the 17th century and left evidence of Inca ritual spaces in the same places, even after the fall of Tawantinsuyu. In recent decades, partly due to the advance of archaeological studies, the site has gained great notoriety and is visited by hundreds of people. But at the same time, local indigenous communities claim their right to reoccupy ceremonial sites to perform their own rituals.

1591. COMMUNITY ARCHAEOLOGY IN A GARIFUNA VILLAGE OF NORTHEAST HONDURAS

Contribution format: Oral  
Contribution authors: Markus Reindel (German Archaeological Institute)

How can community archaeology be introduced in a region with a complex, multilayered history, where the present dominant indigenous population is not directly connected to the pre-Hispanic remains uncovered in recent excavations? The area surrounding the modern town of Trujillo, in northeast Honduras, is widely recognized as the site of Columbus’s first landing on the American mainland, a hub of pirate activity during the colonial period, and a center for large banana companies in the early 20th century. However, the indigenous pre-Hispanic history of the region remains significantly underrepresented. Today, the villages west of Trujillo are predominantly inhabited by the Garifuna people, descendants of African slaves who arrived on the Honduran coast in the late 18th century. In contrast, the region’s original pre-Hispanic indigenous communities—most notably the Pech—have been reduced to small settlements, struggling to preserve their language and cultural heritage. Since 2016, we have conducted archaeological research in northeast Honduras with the aim of reconstructing its pre-Hispanic settlement history. Our surveys, excavations, and archaeometric analyses have documented more than 60 archaeological sites, providing insights into the Betulia (300 BC–300 AD), Selin (300–1000 AD), and Cocal (1000–1500 AD) periods. In collaboration with Honduran institutions and local Garifuna and Pech communities, we strive to integrate these newly acquired historical insights into local educational curricula. Community members actively participate in archaeological surveys and excavations, as well as in the design and construction of a site museum and the dissemination of discoveries. In doing so, archaeology serves as a catalyst for raising awareness of the region’s rich autochthonous cultural heritage and fostering dialogue between the diverse indigenous communities of northeast Honduras.

1603. TRANSITION AND TRADITIONS: STUDY OF INDIGENOUS AND COLONIAL INTERACTIONS IN 16TH-18TH CENTURY AD CARTAGENA DE INDIAS (COLOMBIA) THROUGH CERAMICS

Contribution format: Oral  
Contribution authors: Sonia Pujals Blanch – Roberta Montesana (University of Barcelona) – Monika Therrien (Fundación Erigaie. Grupo de investigación Herencia Cultural, Bogotá, Colombia) – Jaume Buxeda I Garrigós (University of Barcelona)

Cartagena de Indias, founded in 1533 on the Caribbean coast of present-day Colombia, became a hub of cultural exchange during the 16th and 17th centuries. As a major port linking the Americas and the Iberian Peninsula, it brought together Indigenous peoples, African slaves, and European colonisers, fostering the emergence of creole identities shaped by cultural negotiation and technological transfer. Ceramic production reflects this cultural synthesis, where Indigenous people, while preserving local techniques, incorporated European ones. This adaptation was not merely a passive assimilation of foreign styles, but an active reworking of their traditions in response to the new trends brought by the colonisation process. This paper explores the technological impact of European colonialism in the Colombian Caribbean through an study of 147 post-contact ceramics from Cartagena de Indias, primarily used for cooking, transport, and tableware. It focuses on ceramics identified by archaeologists as Indigenous contact ceramics, specifically Crespo typologies, and Creole ceramics, including Mayólica Cartagena and Rojo Compacto typologies. These ceramics, recovered from various archaeological contexts within the city, including the Convento de San Francisco, Batería de San Ignacio, and the Museo del Oro Zenú, provide insights into the distribution, consumption, and circulation of Cartagena de Indias’ pottery production. The research employs analytical techniques such as X-ray fluorescence (XRF), X-ray diffraction (XRD), and optical microscopy (OM) to reveal the possible provenance and production techniques involved in its manufacture. As the first in-depth study of Indigenous Crespo and Creole ceramic typologies, this work contributes to understanding Cartagena de Indias’ ceramic production. It bridges the gap between pre-contact and post-contact ceramic technologies, shedding light on how Indigenous communities modified their practices under the pressures of colonisation. By tracing these changes, the study highlights the resilience of Indigenous people as they navigated cultural transformations while preserving elements of their cultural heritage.

2234. ARCHAIC LIFEWAYS AND HUMAN-ENVIRONMENT INTERACTIONS AT EL POZITO, SAMANÁ PENINSULA, DOMINICAN REPUBLIC

**Contribution format:** Oral  
**Contribution authors:** Francesco Genchi – Emanuela Cristiani (Sapienza University of Rome) – Giampiero Tursi (Freie Universität Berlin) – Sergio Botta (Sapienza University of Rome) – Carola Flores (Universidad Adolfo Ibáñez, Chile | Universidad Adolfo Ibáñez, Chile) – Cornelio Nolasco (Universidad Autónoma de Santo Domingo UASD) – Renato Rimoli – Glenis Tavarez (Museo del Hombre Dominicano, Universidad Autónoma de Santo Domingo) – Alfredo Coppa (Sapienza University of Rome)

The Samaná Peninsula, located in the northeastern Dominican Republic on the island of Hispaniola, long overlooked archaeologically, has recently become the focus of systematic excavations. Among these, The Archaeological-Anthropological Mission of Sapienza University of Rome in the Caribbean Archipelago has investigated the El Pozito site, an Archaic settlement near a natural spring-formed well close to Las Galeras and 4 km from the burials recently discovered in the caves of Cabo Samaná. A burial that came to light in the last excavation campaign was analysed for ancient DNA and will allow a comparison with these burials. El Pozito provides direct evidence of pre-ceramic and pre-agricultural lifeways, offering new insights into early migrations and human-environment interactions in the region. Excavations revealed a well-preserved anthropogenic layer containing shell middens, faunal remains, combustion features, and a dense assemblage of lithic and shell tools. Functional and technological studies using microscopic wear-trace and residue analysis identified food processing, woodworking, and craft production. Grinding stones and pestles show wear patterns linked to cassava (*Manihot esculenta*) and other starchy plants, while mariposoid axes and perforated coral tools indicate woodworking and material transformation. The integration of archaeozoological and malacological data highlights complex human-environment interactions, with evidence of terrestrial and marine mollusk exploitation (*Caracolus*, *Cittarium pica*, *Aliger gigas*) for food, tool-making, and possibly ritual practices. These findings contribute to our understanding of early settlement patterns, technological adaptations, and inter-island connections in the Greater Antilles, bridging archaeological evidence and indigenous ecological knowledge.

1325. TEACHING PRE-HISPANIC STUDIES IN EUROPEAN CONTEXTS: CHALLENGES AND OPPORTUNITIES

**Contribution format:** Oral  
**Contribution authors:** Natalia Moragas – Alessandra Pecci (University of Barcelona)

Teaching about the pre-Hispanic world at universities in Europe presents a very particular context due to the prior lack of knowledge about these cultures. On top of that, there are various paradigms that students bring with them, shaped by preconceived ideas about the pre-Hispanic world, mostly influenced by Eurocentric perspectives. In universities, teaching and research feed into each other, but when the field of research is thousands of kilometers away, it becomes much more complex to bring this past into the classrooms. This lack of knowledge is accompanied by a series of prejudices, such as human sacrifice, the idea of being inferior to European classical cultures, or, on the contrary, narratives full of epic and exotic elements that offer a biased and misleading image of the complexity of the American past. It is often reduced to the classic: Mayans, Aztecs, and Incas. If we want to consolidate pre-Hispanic research in Europe, we must also focus on teaching from the undergrads. In recent years, and within the framework of teaching in the History degree at the University of Barcelona, various strategies have been implemented to rethink how and why to teach pre-Hispanic cultures in European contexts.

175 THE WAR STARTS OVER THAT HILL: EXPLORING WARFARE AT THE LOCAL SCALE IN PRE-INDUSTRIAL SOCIETIES

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Conflict Archaeology , Battlefield , Aftermath, Preindustrial , Local scale  
**Session organisers:** Pablo Harding (Universidad Autónoma de Madrid) – Mario Pereiro (Universidade do Minho) – Javier Moralejo – Fernando Quesada (Universidad Autónoma de Madrid)

SESSION ABSTRACT

War has been a central theme in history since the works of the earliest historians, who recognised it as a force of change in human communities, altering the social, political, economic and ideological makeup of all involved. Nonetheless, traditional discourse has routinely framed war within the “Grand Narratives” of history, emphasizing large battles between great states. The more routine small-scale warfare that prevailed throughout history

and the effects of warfare on the local population have traditionally been deemed secondary, although this has changed in recent years. In this sense, Conflict Archaeology and its methodological toolkit have proven especially fruitful in shedding light on conflicts and engagements otherwise ignored or minimized by written sources. In cases, archaeological battlefield studies have altered widely-held perceptions of well-known battles. This session aims to focus on the local and regional scale of warfare in past societies, analysing the engagements themselves (battlefields, sieges, mass graves, and other evidence of collective violence) and their aftermath. This focus shies away from interpreting conflicts from a global, external perspective, and highlights the utility of conflict archaeology for microhistory analysis. Emphasis is placed on the interactions between external and local agents through warfare, on conflicts between local communities, and the influence of the immediate environment, both human and geographical, on armed engagements. This entails re-framing and re-contextualising a wide array of artefacts and contexts. These include direct evidence of violence: weaponry, fortifications, human remains, destruction events, etc; and also evidence of sudden, violent change among the communities themselves: the appearance of foreign militaria, erected monuments, modified settlement and territorial patterns, etc. Lastly, this session limits itself to pre-industrial societies, as we consider that warfare at an industrial scale merits its own separate study. On a European scale, this sets a chronological limit in the first third of the 19th century.

CONTRIBUTION ABSTRACTS

422. LOCALS OR FOREIGNERS? THE TRANSFORMATION OF THE MIDDLE TAGUS VALLEY DURING THE LATE IRON AGE IN A FRAMEWORK OF CONFLICT

**Contribution format:** Oral  
**Contribution authors:** Pablo Sánchez De Oro (Universidad Autónoma de Madrid)

The fourth century BC marked the start of the Late Iron Age in the Middle Tagus Valley (Central Spain). A series of changes occurred at this point at several levels: new technologies, new dynamics, and, especially, new types of settlements. The latter are hillfort like sites —presenting defences such as ramparts and moats— occupying singular points of the landscape as peninsulas and earth spits. This evidence has traditionally raised a discussion about the motive that led to the appearance of these new settlements. Local and foreign causes have been proposed. Additionally, the lack of archaeological fieldwork has generated a poor knowledge of the inner spaces of these sites, not conducting to a clear interpretation of these ‘hillforts’ as habitat spaces nor shelters, or even both. Through this contribution, we present a revision of both opinions, including new data to generate a discussion which will try to answer the traditional question presented above. All of these in a wide framework that unites theoretical approaches and the archaeological record.

425. SHEETS, RINGS AND PINS. A SOCIO-TYPELOGICAL ANALYSIS OF THE SOCKET-SHAFT FITTING METHODS APPLIED TO IBERIAN SPEARHEADS

**Contribution format:** Oral  
**Contribution authors:** José Manuel López Manzanera (Universidad de Murcia)

Originally, spearheads featured a tang that was inserted into the end of a wooden shaft. The connection between the two parts was reinforced with cords and other adjustment elements arranged around it. Later, during the Late Bronze Age, a paradigm shift occurred that led to the tang attachment system being replaced by a tubular socket over a conical tenon. The efficiency of this new structural scheme would ensure its continuation throughout the Iron Age, when spearheads began to show a regularity in the use of complementary fastening methods. Within the Iberian world, this socket-shaft connection was secured through three types of additional adjustments: an internal bronze cap, a diametrical metal pin, and an external pressure ring. This study aims to reinterpret the socio-typological aspects of one of the military artifacts most commonly found in Iberian necropolises: spearheads. Based on a sample of both unpublished and published specimens, this proposal focuses on the variability of the different adjustment methods present in the socket (functional combinations and typological variants). The objective is to establish a relationship between the use of one or more categories of adjustment and the shape and size of both the blade and the socket. All of this is an attempt to identify production patterns and possible chrono-geographical trends. There are specimens whose adjustments exhibit a differential level of detail. In these cases, aside from their functionality, we might be talking about elements with a certain aesthetic value. In other words, the manifestation of such elements could be related to the social status of the deceased, serving as a possible indicator of social differentiation and distinction.

2449. A GLIMPSE OF IRON AGE VIOLENCE FROM NORTH-CENTRAL IBERIA

**Contribution format:** Oral  
**Contribution authors:** Teresa Fernandez-Crespo (Universidad de Valladolid)

Direct evidence from prehistoric and ancient Europe for violence inflicted on human bodies and material property

is rare, especially that involving large-scale, organised hostilities. One example is the massacre that took place in La Hoya Iron Age village located in Álava region, Basque Country, north-central Iberia. The site was brutally attacked and set alight in a market day sometime between the mid 4th and late 3rd centuries BC, in what is interpreted as an instance of conflict between rival local communities. Here, we discuss the available osteological and material evidence to assess the degree of violence observed. We compare the results with Iberian Roman massacres. We suggest that, although Iberian pre-Roman Iron Age polities were not fully formed states, they were sufficiently cohesive entities to engage in large-scale, organised martial endeavours in proportion to their territorial and demographic resources, and that politically motivated warfare was not introduced by the Romans in Iberia.

921. ON THE REALITIES OF WAR: MASS MURDER IN IBERIAN IRON AGE ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Fernando Quesada – Pablo Harding (Universidad Autónoma de Madrid)

The intrinsically cruel nature of war is clearly reflected in Graeco-Latin literary sources and in iconography. However, texts and images serve as an intellectual filter that tends to soften the ferocity of reality. Archaeology in the Iberian Peninsula has increasingly provide. direct and harrowing evidence of human remains in contexts of assaults, destructions and massacres in settlements and cities, largely through extensive excavations over the last two decades. These findings span a period between the 4th and 1st centuries BCE, with a particular concentration during the Sertorian Wars (c. 80–74 BCE). The archaeological remains predominantly belong to non-combatants or prisoners, including men, women, and children, whose skeletons—often mutilated—are found lying on streets or crushed beneath the rubble of burned houses. This paper will briefly present several recent case studies and discuss how this brutal reality is beginning to appear displayed and explained i. exhibitions and Interpretation Centers in archaeological sites.

742. RETHINKING THE SECOND PUNIC WAR: NEW CONTRIBUTIONS TO THE KNOWLEDGE OF THE ROMAN-PUNIC CONFLICT IN THE UPPER GUADALQUIVIR (JAÉN, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Juan López Martínez (University of Granada) – Juan Padilla Fernández (University of Salamanca) – Francisco Matas Adamuz (Independent) – José Ortega Diez – Luis Arboledas Martínez (University of Granada)

The study of the Second Punic War in the Iberian Peninsula (III-II B.C.E) has experienced notable advances in recent decades, driven by new archaeological methodologies and the discovery of key sites. In this context, the Upper Guadalquivir (Jaén, Spain) stands out as an area of vital importance in the confrontation between Rome and Carthage. The area played a crucial role in the fight for territorial dominance and the military strategies of both armies. The remains of settlements, camps and war confrontations found in the region reinforce the idea of their central role in the events that marked the outcome of the conflict. This communication offers a synthesis of the most recent research on the study of this conflict in the westernmost part of the Upper Guadalquivir through archaeomagnetic surveys and archaeological excavations. These have made it possible to identify defensive structures and various materialities of military origin. Through an interdisciplinary approach that combines archaeological data and historical sources, this proposal aims to contribute to the debate on this topic and provide a new approach to the impact of the Second Punic War in that region. An alternative configuration of the war landscape of Iberia at the end of the 1st millennium BC is proposed, expanding knowledge about the military tactics of the time, the dynamics of the movement of armies and the different interactions between the forces involved in this conflict.

1043. USQUE A SUCRONE AD CARTHAGINEM NOVAM. THE PATH THAT DECIDED THE CONQUEST OF HISPANIA

**Contribution format:** Oral  
**Contribution authors:** Feliciana Sala-Sellés (Universidad de Alicante | Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico) – Estela García-Botella (Universidad de Alicante | Instituto Interuniversitario de Geografía) – Fernando Llorens-Cobos (Universidad Miguel Hernández) – José Luís Martínez-Boix – Pascual Perdiguero-Asensi (Universidad de Alicante | Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico) – Alfredo Ramón-Morte (Universidad de Alicante | Instituto Interuniversitario de Geografía)

In 209 BC Scipio began the forced march that would take him to the Barquid capital in seven days, culminating in the capture of the city, arsenal and naval base of the Carthaginian army. The start of the march, traditionally

placed at the Ebro or Sagunto, gives a higher number, between 15 and 10 days respectively, attributing the difference to a transcription error. Recent opinions propose placing the start of the march at the camp on the river Sucro, which would make the seven days in the account complete. In this paper we present the methodology and first results of the research whose aim is to reconstruct the route by trying to locate the six marching camps of Scipio’s army from the river Júcar to Cartagena, as well as to assess the effects of the army’s passage on the population that lived near the route. To this end, a Geographic Information System (GIS) has been created that integrates the geolocation of the known archaeological items (settlements, necropolis, treasure troves, stretches of road, Roman villas, etc.) together with other information of a spatial nature, such as orography, historical road routes, livestock trails, land use, and terrain features, with the aim of combining a multi-criteria evaluation (MCDA) and least-cost route calculation (LCP) to determine the route of Scipio’s army and the location of its marching camps based on objective criteria.

694. EVERYDAY SIEGE WARFARE IN MEDITERRANEAN GAUL FROM THE LATE 3RD TO THE 2ND CENTURY BC

**Contribution format:** Oral  
**Contribution authors:** Dominic Vallieres (Université de Perpignan)

The archaeometric analysis of catapult balls found at Greek and Gallic sites in southern France revealed unknown military operations involving the artillery of the Greeks of Massalia against the Gallic oppida of Provence and Languedoc during the final centuries BC, supplementing historical sources. It also sheds light on the unexpected realities of the daily experiences of both attackers and defenders. At the forefront were the catapult operators (the katapultaphétai) and stonemasons. Their labour was crucial to maintain pressure on the besiegers by continuously supplying projectiles and targeting vulnerable spots in the enemy defences, thereby facilitating the infantry’s advance and capture of the position. Meanwhile, the besieged endured relentless artillery fire from within their fortifications, with all the distress that these types of weapons could cause to defences and civilian populations. If a city was captured but not destroyed and abandoned, its fall led to profound political and social changes. A striking example is Craton, who aligned with Rome and Massalia and, along with 900 fellow citizens, was freed from enslavement after the city’s capture from the Salyans in 123 BC—an event plausibly linked to the Entremont oppidum. This study also explores the introduction of the catapult to Massalia in the last decades of the 3rd century BC and how Gallic communities adapted to this new siege technology, as evidenced by sites like Pech Maho and Entremont. Finally, it questions the training of artillerymen, the role of gymnasium competitions, and artillery production and storage organization in the Greek city of Massalia.

607. WAR WAS SUPPOSED NEVER TO CHANGE. OR DID WE? LOW-INTENSITY CONFLICT(S) IN NORTHERN IBERIA DURING THE ROMAN EXPANSION

**Contribution format:** Oral  
**Contribution authors:** José Costa-García (Universidad de Salamanca)

In the last decade, the development of targeted archaeological methodologies led to the detection of a considerable number of sites related to the presence of the Roman army in Northern Iberia. Most of these sites are large-scale field fortifications whose insertion into the main historical narratives on the Roman conquest (2nd-1st centuries BC) has been taking place relatively quickly. A careful analysis of the evidence also allows us to appreciate a picture that transcends the account focused on large troop deployments and could respond to different strategies for the effective control of a vast territory which shows very diverse physical and human geographies. The gradual overcoming of specific morphological and locational apriorisms has brought with it the discovery of new sites that, despite appearing isolated, were undoubtedly embedded in complex, rapidly changing landscapes. Unfortunately, the precise characterisation and dating of these fortifications are still limited by factors such as the scarcity of archaeological parallels, elusive materiality, or the methodologies’ constraints. Furthermore, research has not yet addressed the systematic review of the Late Iron Age native contexts in connection with these recent discoveries. The archaeological evidence of physical violence is scarce and uneven regarding territorial distribution, but we cannot determine to what extent this factor reflects differential native responses. Likewise, the dismantling and bypassing of pre-existing, organisational structures scarred the landscapes for decades and undoubtedly impacted the indigenous settlements. However, calibrating the Roman army’s direct involvement in these processes —transpired by other sources— remains a major challenge in archaeological terms. This paper addresses these problems to establish a casuistry that allows us to deepen our knowledge of specific (military) actions presumably oriented to integrating the recently conquered territories into the Roman imperial structures.

190. HATRA, A DIFFICULT NUT TO CRACK. HOW TO SUCCESSFULLY DEFEND A CITY, AND LOSE IT

**Contribution format:** Oral  
**Contribution authors:** Krzysztof Jakubiak (University of Warsaw, Faculty of Archaeology)

Lying in northern Mesopotamia, Hatra is undoubtedly one of the most important cities existing in the region in the first centuries AD. Its origins are still being studied, but it is not only these threads that focu. attention, but also the development of the city’s importance, which began to attract potential conquerors. The city’s importance as one of the most important religious centres in the region, and therefore a potentially wealthy urban centre, may have attracted the interest of enemies. The city’s strategic location was also not insignificant. Hatra successfully defended its independence against Roman armies when Trajan and later Septimius Severus stood beneath its walls. The steadfast attitude of the city’s inhabitants shows how successfully it was possible to defend itself against the seemingly invincible Roman army and even develop its city. The end of its existence is brought only by the confrontation with the Sassanids. It is therefore worth considering what - and if indeed - the Romans made mistakes in the art of war, and whether the Sassanids learned from their failures.

**883. AN INSIGHT INTO BYZANTINE ALCHEMICAL TREATISES INVESTIGATING THE METALLURGICAL AND WEAPONS TECHNOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Errikos Maniotis (Masaryk University) – Georgios Sanidas (Université de Lille)

Alchemical knowledge reached the Byzantine Empire through Alexandrian scholars and texts, preserving and expanding upon the works of Hellenistic figures like Zosimos of Panopolis and Maria the Jewess. Byzantine alchemists also engaged with Persian and Indian alchemical traditions, resulting in a cosmopolitan body of knowledge. Byzantine alchemical treatises on metals and iron offer a fascinating blend of practical metallurgy and symbolic interpretation. These works reflect a continuation of ancient traditions, enriched by Byzantine spiritual and cultural elements. Metals, especially iron, are discussed in both practical terms, concerning their properties and transformation, and in philosophical or allegorical contexts, linked to ideas of perfection, decay, and renewal. A corpus of alchemical texts (four of which are attributed to Zosimos of Panopolis, c. 300 A.D.), surviving in three medieval manuscripts, compiled during the 9th or 10th century, possibly by Constantine VII, makes brief mention of some ferrous metallurgical techniques, with particular emphasis on the production of bladed weapons. Alchemists explored the unique characteristics of metals, such as their malleability, ductility, and resistance to corrosion, particularly focusing on their role in crafting tools, weapons, and artistic objects. Alchemists explored the unique characteristics of metals, such as their malleability, ductility, and resistance to corrosion, particularly focusing on their role in crafting tools, weapons, and artistic objects. This scientific proposal aims to investigate the contribution of the Byzantine Alchemical Books to our knowledge of metallurgy and iron processing, while some notable examples of metallographic analysis of weapons, especially swords, will be presented, since the field of metallographic examination of Byzantine weapons has not been developed yet.

**1366. FORGOTTEN BATTLES FOR RUS’, KYIV, AND THE CROSSING OF THE DNIEPER: SEARCHING FOR ARCHAEOLOGICAL EVIDENCE**

**Contribution format:** Oral  
**Contribution authors:** Mariia Videiko (Boris Grinchenko Kyiv metropolitan university)

Over 900 years ago, armed conflicts took place for the supreme power and the capital of Rus — Kyiv on the Dnieper. To win the war, it was critically important to transport troops across the great river. The chronicle mentions such operations more than ten times near the city of Tropol. The width of the Dnieper valley in this place is ten kilometers. This was the closest crossing to Kyiv from the south, which determined its strategic importance. Archaeological searches for this crossing and traces of events around it yielded interesting results. The key to the crossing on the right bank was the large city of Tropol, founded in the 11th century. The city was located on a high mountain surrounded by a swampy lowland. The path to Kyiv began from here. Further south, at an interval of four kilometers, there were two more fortress cities at this time, known as Halep and Vytachiv. On the left bank, traces of at least three unnamed fortresses have been discovered, which in the 12th-14th centuries blocked the road from the crossing. The fortresses were complemented by a long rampart located south of them. All these fortifications were built at the time of the most intense conflicts and were in use after their completion. Thus, archaeological research has significantly supplemented the picture of events described in the chronicles. The fortresses and rampart on the left bank are not mentioned in any documents. Their existence allows us to explain the course of some events in the ancient battles for Kyiv. Archaeological prospections have shown that two fortifications on the routes through the crossing were later restored and functioned in the 16th and 17th centuries. Further archaeological research on the left bank will help complete the picture of events.

**2534. LANDSCAPE ANALYSIS OF MEDIEVAL CASTLE SIEGES IN MORAVIA (CZECH REPUBLIC): FIELD SURVEY DATA AND LIDAR DATA**

**Contribution format:** Oral  
**Contribution authors:** Jana Mazackova (Masaryk University, Department of Archaeology and Museology)

The 15th century was a turbulent period in Czech history, encompassing the lands of Bohemia, Moravia, and Silesia. The Hussite Wars, a civil war, caused significant disruption to the state and social hierarchy. However, these conflicts also advanced military technology, particularly the improvement of firearms and military siege tactics in the Czech lands, which expanded into foreign territories with Hussite armies. The political resolution after the Hussite Wars led to the rise of the first king from a noble family of the Hussite faction. Despite this, the Catholic faction remained in opposition, continuing the struggle and marking the beginning of the era of castle sieges, which are well-visible and documented in the landscape. This military period is well-recognized in the surroundings of the three Moravian castles: Rokštejn, Cornštejn, and Vranov, where field surveys were conducted (detection of anthropogenic features, metal detector surveys and analysis in GIS and using LiDAR data). The terrain data shows the tactics of the besiegers and the differences and similarities in the military actions and capabilities of the castle men-at-arms and the castles themselves (architecture). From the castles Rokštejn and Cornštejn, we know the archaeological situation because systematic or rescue excavations were conducted there. The spectrum of weapons and the final impact of the besiegers on the fortified castle areas, such as fire and the destruction of castle buildings, are well-documented.

**1251. SOLDIERS ON THE MOVE: ISOTOPIC AND HISTORICAL INSIGHTS INTO MILITARY LIFE IN 17TH-18TH CENTURY LISBON**

**Contribution format:** Oral  
**Contribution authors:** Ana Curto (HERCULES Laboratory, University of Évora) – Susana Henriques (CIDEHUS, University of Évora) – Carina Leirião – Liliana Carvalho – Sofia Wasterlain – Ana Amarante (CIAS, University of Coimbra) – Anne-France Maurer (HERCULES Laboratory, University of Évora)

The InOsteo project pioneers an interdisciplinary approach, integrating osteology, archaeology, history, chemistry, paleoparasitology, and genomics, to explore the health, mobility, and care of military populations in 17th-18th century Portugal. Focusing on an osteological collection from the Military Hospital of São Jorge Castle in Lisbon, this study employs strontium stable isotope analysis of dental enamel (2nd and 3rd molars) to assess geographic origins and mobility patterns. Preliminary findings indicate that a significant proportion of the individuals were non-local, aligning with historical records of soldiers from diverse Portuguese regions and foreign contingents, including French troops during the Restoration War. The study also investigates whether some soldiers may have embarked on the vessels of “Carreira da Índia” to Asia, contributing to early globalization, and returned to Lisbon, potentially introducing non-European diseases. By combining isotopic data with historical and archaeological evidence, this research aims to reconstruct the life trajectories of these soldiers, shedding light on their mobility, health challenges, and medical care. The results will provide historians and scientists with novel data, methodologies, and insights into military life and movement during this transformative period in European history.

**176 MATERIALITIES OF MEMORIALISATION: SPATIAL TRANSFORMATIONS AND THE ROLE OF ARCHAEOLOGY AT SITES OF RECENT CONFLICT, OPPRESSION AND VIOLENCE**

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Regular session  
**Session keywords:** Heritage, Remembrance, Memorial Sites, Space, Landscape  
**Session organisers:** Peter Hinterndorfer (Institut für jüdische Geschichte Österreichs) – Layla Renshaw (Department of Applied and Human Sciences, Kingston University) – Esther Breithoff (School of Historical Studies, Birkbeck, University of London) – Barbara Hausmair (Institut für Archäologien, Universität Innsbruck) – V. Camille Westmont (University of Cambridge)

**SESSION ABSTRACT**

This session explores two intersecting questions within the archaeology of recent conflict, oppression and violence: How do acts of memorialisation change the materiality and spatiality of sites and landscapes where conflict has occurred? How does archaeological knowledge and evidence influence memorialisation at such sites. When conflict sites and landscapes are designated as heritage, a broad range of interventions and transformations can occur. These include the restoration or demolition of structures, landscaping and replanting, and the creation of monuments, choreographed routes and visitor facilities. At the same time, these processes are charged with symbolic meaning and (sometimes diverting) aspirations of different groups involved. How does the physicality of a site itself, and material traces, shape the forms of remembrance that emerge? Conventionally conceptualised

as forms of preservation, what may be lost during these transformations? How do existing memorial and heritage interventions influence or constrain our approaches to these sites as archaeologists. The impact of archaeology on sites of recent conflict includes: the discovery and excavation of new features, the assessment of standing buildings, conservation of existing monuments, and the recovery of artefacts. Archaeological work can directly shape memorialisation, for example when artefacts are incorporated into monuments or put on display. New archaeological evidence may destabilise settled narratives. The immediacy and emotive power of archaeological discoveries can elicit new public engagement with past conflicts, but also risks being divisive or exploitative since archaeological practice itself is inherently destructive in nature and also operates within current socio-political discourses. This session invites both theoretical discussions and critical field-based examples to explore the intertwined nature of sites or landscapes of violence, archaeological processes, and memorialisation. The focus of this session is on all forms of conflict including warfare, protest, economic or environmental violence, political repression, encompassing all geographical areas in the 20th and 21st Century.

CONTRIBUTION ABSTRACTS

188. BY ORDER OF ASSAD: STRATEGIES FOR RE-IMAGINING CULTURAL HERITAGE DURING THE SYRIAN ARMED CONFLICT

**Contribution format:** Oral  
**Contribution authors:** Nour A. Munawar – James Symonds (University of Amsterdam (UvA))

There is a well-known truism that history is written by the victors. When wars end the victors invariably use cultural heritage to commemorate the events and individuals that have supported their struggles and rise to power. The armed conflict in Syria (2011 – 2024) resulted in the destruction and looting of numerous historic sites and cultural institutions and prompted international dialogues on how best to preserve, protect and rebuild the country’s cultural heritage in the post-conflict era. This paper provides an overview of how the long civil war impacted Syria’s rich cultural heritage and the ways in which the past was appropriated and used to support the al-Assad regime and the Syrian governing elite. The paper stresses the significant role that heritage reconstruction and memorialisation practices have on war-damaged sites and monuments and explores how practices orchestrated by the al-Assad regime aimed to (re-)shape cultural identity and public spaces in Syria and to selectively re-imagine the nation’s symbols and heroes during an unfinished conflict.

860. THE LEGACY OF BELLIGERENT LANDSCAPES IN UKRAINE: BETWEEN REUSE, DESTRUCTION, AND ETHICAL DEBATES

**Contribution format:** Oral  
**Contribution authors:** Oleksandra Ivanova (National University of Kyiv-Mohyla Academy)

Military landscapes do not disappear after conflicts end. They transform and persist as part of the long-term continuity of strategic spaces. They are not merely witnesses to former defensive frontiers but active elements in shaping military strategies across different historical periods. In Ukraine, we can trace the reuse of belligerent landscapes over centuries: from Scythian and Rus’ fortifications to Cossack strongholds, Polish and Moscovium border defenses, pillboxes from the time of the Second World War, and contemporary fortifications built during the ongoing full-scale russian invasion. The same locations have been deliberately chosen for military purposes time and again, adapting to evolving warfare technologies. However, modern reuse of fortifications raises complex ethical questions. Ongoing military actions in Ukraine have led to the construction of new defensive structures on ancient sites—hillforts, fortified settlements, and fortress ruins. This process is simultaneously “destruction” in the legal sense and “continuation of tradition” from the perspective of historical continuity. According to the 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict, “any act of hostility directed against historic monuments, works of art or places of worship which constitute the cultural or spiritual heritage of peoples” is prohibited. Yet, when defensive structures are built as a necessity for survival, how should we approach these landscapes in research? Can we separate destruction from strategic reuse? This presentation considers belligerent landscapes as active agents in historical interactions and analyzes them as institutions regulating military engagement over centuries. Using case studies from the Kyiv region, I examine how the current war influences the perception, preservation, and academic interpretation of military landscapes. Can we define these processes as destruction when they have been occurring for centuries? How should archaeologists navigate the ethical challenges of studying conflict-related landscapes?

2213. MEMORY AND MATERIALITY IN CONFLICT LANDSCAPES: SPONTANEOUS MEMORIALS IN THE RUSSIAN-UKRAINIAN WAR

**Contribution format:** Oral  
**Contribution authors:** Diana Nahirna (Ukrainian Institute of Cognitive Behavioural Therapy) – Alisa Demina (National University of Kyiv-Mohyla Academy)

The war in Ukraine is transforming public and private spaces through destruction and acts of violence. Some of these places are becoming memorials or spontaneous shrines, while others are avoided. Some, particularly living spaces, are attempting to return to pre-war life. Along with the transformation of physical spaces, people’s memories of the tragic events are also evolving. The materiality of war and human perception of it continue to shape one another as the conflict continues. This research bridges the material analysis of trauma-related objects, spaces, and memorials with psychological studies on their impact on mental health. Given the ongoing nature of the war, the primary form of civilian memorialization observed is spontaneous, grassroots initiatives - memorials created by individuals, local communities, or eyewitnesses and relatives of the victims. Recognizing that memory is dynamic, especially in the context of an active war, a key component of this study is tracking changes in both the physical condition of these memorials and public perceptions of them over time. By examining how these spaces emerge, change, or disappear, the research aims to contribute to a deeper understanding of the relationship between conflict, material culture, and memory.

1767. TREES AS LIVING MEMORIALS AT VIMY RIDGE? COMMEMORATION, CONSERVATION AND REGENERATION IN TIMES OF CHANGE

**Contribution format:** Oral  
**Contribution authors:** Esther Breithoff (Birkbeck, University of London) – Layla Renshaw (Kingston University UK)

The Battle of Vimy Ridge in April 1917 was fought in the Pas-de-Calais department of France, during the First World War. The main combatants were the four divisions of the Canadian Corps in the First Army, against the German 6th Army. The huge losses sustained by Canada meant that Vimy became a central focus of their WWI heritage. The former battleground is now a memorial park and site of the Canadian National Vimy Memorial, which commemorates Canadians killed in France who have no known grave. The landscape at Vimy is inseparable from the aesthetic effect of the monument. The monument is located at the crest of this ridge with panoramic views across the plain below. The planting of this area with imported pine and maple trees has been integral to emphasising the natural drama of the topography, shaping the choreography of how visitors traverse and relate to the site. At Vimy, the species, positioning, geographical provenance, and aesthetic appearance of the plants have densely layered association, stories, and mythologies. This paper investigates how this carefully curated aesthetic has become unsettled with two recent developments. Firstly, the die-off of the original planting due to a fluctuating climate and, secondly, a centenary project nearby to install Vimy oaks, believed to be the offspring of acorns collected as mementoes by a Canadian soldier in 1917. Using a natural-cultural heritage perspective to think through the instability of the seeming permanence of the trees at Vimy, this paper will consider the memorial affordances of plants in shaping ideas of identity and nationalism, as well as discuss the impact of climate change on “natural” commemorative landscapes within a (post)conflict setting.

1075. PRACTICES OF MEMORY: CRIME SITES, CEMETERIES, MONUMENTS. INTERDISCIPLINARY RESEARCH ON THE KATYN MASSACRE

**Contribution format:** Oral  
**Contribution authors:** Olgierd Lawrynowicz – Magdalena Majorek-Lipowicz – Anna Zalewska (Institute of Archaeology, University of Lodz) – Aleksandr. Krupa-Ławrynowicz – Sebastian Latocha (Institute of Ethnology and Cultural Anthropology, University of Lodz)

The research project “Lexicon of Katyn Archaeology (1990–2015)” aims to collect, systematise and make available information on archaeological research related to the war crime committed by the Soviets against 22,000 Polish prisoners of war. This crime, known as the ‘Katyn Massacre’, took place almost simultaneously in many places in 1940. The intention of the perpetrators was to erase and cover up the material traces of this crime. For many decades, the perpetrators maintained and strengthened the so-called ‘Katyn Lie’. Our contribution will present issues related to methods of archaeological research used in the course of the search and exhumation works and their results, as well as their public perception and significance. Emphasis will be placed on justifying the thesis that it is legitimate to consider an interdisciplinary approach as inalienable in the study of memory practices. We will show that, in addition to archaeological, historical data, ethnographic interviews with the descendants of the victims and researchers are a very important element. By analysing the areas where Polish war cemeteries were established after archaeological research at the turn of the 20th and 21st centuries, the relationship between the practices of remembrance and the problem of the transformation of the landscape of crime sites will be revealed. We will present official and private practices of remembrance and commemoration: cemeteries, monuments, relics, events. We will propose answers to the questions: what is remembered and how? Who protects the memory of the victims of the Katyn massacre? While the core case will be the memory practices in and transformations of the Katyn Forest - where the first war cemetery was established as early as in 1943 after exhumations carried out by Germans - some references will be made to Mednoye, also in Russia, as well as to Kharkiv and Bykivnia, now in Ukraine,

1203. THE NECROPOLITICS OF MEMORIALISATION IN VUKOVAR (CROATIA)

Contribution format: Oral  
Contribution authors: Britt Baillie (Aarhus University)

In 1991, Vukovar was besieged by the Yugoslavian National Army (JNA) and Serb paramilitary forces resulting in a pyrrhic ‘victory’. The three-month ‘urbicide’ of Vukovar was followed by the expulsion of the ethnic Croat community. Five kilometers south of Vukovar, at least 194 identified individuals were beaten and summarily executed by Serb paramilitary forces at Ovčara. The search continues for the missing of Vukovar with ‘new’ internments turning up frequently over the last three decades. Vukovar was ‘peacefully (re)integrated’ into the Republic of Croatia under the auspices of the UN (1996-1998). It was part of the only region of the former Republike Srpske Krajina not to be (re)taken by Croatian military force. Since the return of the ethnic Croat population, an annual commemoration procession from Vukovar hospital to the ‘Homeland War’ cemetery coupled with segregated schooling have become central practices in the choreography of ongoing ethnic division. In 2019, the 18th of November, the day of the fall of Vukovar was declared a national holiday. Vukovar is not a space merely remembering crimes of the past, but rather a place of explosive emotions and intense attachments in the present. Vukovar is mired in ‘conflict-time’. Here, necropolitics determine who is deemed ‘worthy’ of commemoration and who may take part in commemorative activities and therefore ultimately who is ‘welcome’. Memory wars are fought over what scripts, dates, and labels may be used on memorials. The ethnicization of space is achieved through the strategic proliferation of memorials throughout Vukovar to enable the reification of national borders and the sacralization of public space deemed necessary for this self-proclaime. ‘place of special piety’. While the traces of war are increasingly ‘destroyed’ by the ‘benevolent’ processes of reconstruction, excavation, and development, memorials are increasingly used as political stages and props.

2109. THEY CAN’T HEAR US UP HERE. NEW APPROACHES TO THE ARCHAEOLOGY OF THE SPANISH CIVIL WAR IN MOUNTAINOUS CONTEXTS

Contribution format: Oral  
Contribution authors: Alejandro Trejo (Institute of Heritage Sciences (INCIPIT-CSIC))

Over the last two decades, an increasing scientific and social interest in the archaeological remains of the Civil War (1936-1939) has been developed in Spain. During the nearly three years of the conflict, thousands of military enclaves were built across the country to protect the mountain passes that connected the main hotspots of the war. Nevertheless though many studies have been carried out, only a few of them are focused on investigating mountain warfare contexts and their importance in the Spanish history. This lack of knowledge is due to the classification of mountain fronts as ‘secondary’, attributing less interest to them for scientific study. This paper outlines the first results of my thesis dissertation, which addresses the archaeological analysis of mountain military positions from the study of the material culture left behind by the violence that took place there. The results have provided new data about the development of the war, the organization of these repressive spaces, and the specific challenges of warfare in high mountains, such as logistical difficulties, the construction of defensive fighting positions and the adversities faced by the soldiers in their daily life. Our research has also allowed us to highlight the relevance of this unknown heritage to the local communities and the scientific academy and also has allowed us to get closer to the traces of the past that remain in the present of Spanish society. Although visiting the site itself by the community is already widespread within our discipline, new technologies allow us to carry out this social exchange in reverse, bringing the material remains to society. GIS, 3D modelling and photogrammetry have become really useful tools in the dissemination of this unknown heritage by the rest of society, especially when some of these military enclaves are in locations that are difficult to access.

2427. UNCOVERING THE TRENCHES: UNVEILING NEW PERSPECTIVES OF FORGOTTEN BATTLES ON THE EASTERN FRONTS

Contribution format: Oral  
Contribution authors: Jirí Zubalík (Institute for Archaeological Heritage Brno) – Jakub Těšnohlídek (Archaia Brno) – Jan Petřík – Martin Vojtas (Masaryk University) – Radim Kapavík (Signum Belli 1914) – Vojtěch Koudelka (Masaryk University) – Peter Tajkov (Technical University of Košice) – Martin Greša – Tomáš Hofírek (—) – Martin Drobnák (KVH Beskydy)

The mountainous region of eastern Slovakia was deeply affected by the events of both world wars, most famously known for the offensive of the Dukla pass of 1944, where the Russian army reinforced by Czechoslovak units entered the newly liberated Czechoslovakia. However, while the Dukla offensive was heavily glorified and commemorated as part of the Communist propaganda, the largely celebrated Russian success completely overshadowed some other marginal but no less bloody fights of WWII and even more so the fierce fights of WWI. From autumn of 1914, the Russian army was attempting to break through the Austro-Hungarian positions in the

eastern ridges of Slovak Carpathians. By spring of 1915 the Carpathian front became one of the focal points of WWI. In the end, the Russian army was repulsed and withdrew from the area in May. Despite their importance, these battles have been forgotten, the battlefield is not commemorated and the graves of the fallen have been slowly perishing in the Slovak hills and village graveyards. This has changed in the past 10 years. Research on the Carpathian front is gradually emerging and first war graves are being restored thanks to the activities of the association KVH Beskydy. Archaeological research combined with historical research sheds some light on forgotten battles; mapping the trenchline, metal detecting, and excavation on a number of chosen sites helps reconstruct the course of particular military operations, whose memorialisation was ignored for years due to socio-political reasons. Moreover, our field research challenges some long-standing prejudices, such as the lack of skill and frequent desertion of Czech soldiers, which have persisted since the 1920s. In addition, archeological evidence concerning WWII also emerged during our fieldwork, bringing hitherto unknown knowledge about the war, which was generally ignored by the Communist and post-socialist historiography.

53. MATERIALITIES OF EXCLUSION: ARCHAEOLOGY AND HERITAGE OF AUSTRO-HUNGARIAN PSYCHIATRIC INSTITUTIONS

Contribution format: Oral  
Contribution authors: Pamela Fragnoli (Austrian Archaeological Institute) – Maria Bianca D’Anna (Vienna Technical University)

Throughout their life-cycle, psychiatric institutions embody a complex and layered history of care, control, and societal exclusion. Drawing from archaeological and heritage studies, this paper examines how these sites function as spaces of contested memory and materialized ideologies, reflecting broader social and cultural dynamics. This study focuses on three Austrian institutions—the Narrenturm, Steinhof, and Gugging—as well as comparative examples from the former Austro-Hungarian territories, including the Bohnice Psychiatric Hospital in the Czech Republic and the Lipótméző National Lunatic Asylum in Hungary. These sites collectively trace the historical evolution of psychiatric care, from Enlightenment-era innovations in institutional design to 19th-century pavilion systems and the traumatic impact of Nazi policies, such as the so-called Aktion T4. Through an archaeological lens, the analysis emphasizes the materiality of these spaces—their architectural design, placement within the landscape, and surviving artifacts—as expressions of medical, social, and political ideologies. This paper also critically examines the heritagization and musealization of these sites, addressing how some have been abandoned or remain active, while others have been selectively incorporated into heritage narratives, often with fragmented or uncritical interpretations. By reflecting on these differences, this paper proposes a more cohesive and inclusive approach to the memorialization of psychiatric institutions. It highlights how archaeological and heritage practices can reveal silenced people but also narratives that continue to resonate in contemporary society particularly by addressing enduring misconceptions about mental illness.

1683. LANDSCAPES OF TERROR, LANDSCAPES OF REMEMBRANCE: INTERRELATIONS BETWEEN SITES OF VIOLENCE BY THE NAZI REGIME AND MEMORIALS TO ITS VICTIMS

Contribution format: Oral  
Contribution authors: Peter Hinterndorfer (Institut für jüdische Geschichte Österreichs)

During the seven years Austria was part of the National Socialist German Reich, functionaries and accomplices of the Nazi regime did not only install a large number of forced camps, but also exercised their power to terrorise, imprison, enslave and kill people at many other sites. Numerous memorials and monuments in public spaces commemorate the victims of National Socialism. Having been designed and built by different individuals, groups, administrative bodies or private initiatives since 1945, they appear in a variety of material forms, from memorial stones and plaques, to graves, sculptures and art installations, forming a diverse landscape of remembrance. While many memorials were erected in direct spatial reference to sites and infrastructures of terror and persecution, others have been set up in different spots, that are for example easier accessible, more public or were considered more appropriate or suitable. Some memorials also have been removed or relocated over the course of the years, sometimes including the exhumation of corresponding (mass) graves. This paper aims to discuss the material and spatial interrelations between places of nazi terror and sites of remembrance, highlighting examples from Austria.

2355. A COLD WAR HERITAGE ICON IN FLUX – THE SPATIAL TRANSFORMATION AND MEMORIALISATION OF CHECKPOINT CHARLIE

Contribution format: Oral  
Contribution authors: Diana Unterhitzzenberger (University of York)

In October 1961, it appeared as if the Cold War could turn hot when American and Soviet tanks faced off at Checkpoint Charlie, a crossing point of the Berlin Wall reserved for foreigners, diplomats and Allied military

personnel. The site garnered worldwide fame and has been considered a Cold War heritage icon ever since. In the years between 1961 and 1989, Checkpoint Charlie witnessed numerous successful and unsuccessful flight attempts, demonstrations and riots, but also millions of tourists and the Fall of the Berlin Wall in November 1989. As Berlin became a single city again and Germany reunified, Checkpoint Charlie was rendered obsolete as a border crossing point, and most of its physical structure was removed. By 2000, the few prominent elements that had remained were taken from the site to later be incorporated into an exhibition or to make space for a business centre, none of which has been realised to this day. This paper investigates a site of conflict eventually designated as an official heritage site despite its lack of substantial original structure. It focuses on different commemorative elements which have been added to the Checkpoint Charlie heritage site since the Fall of the Berlin Wall and have greatly influenced its appearance and perception. Furthermore, it investigates the role of archaeological surveys in the decision making on the long-term memorialisation of a site which has seen continuous change and ongoing debate regarding its appropriate management.

2450. NO BODY, NO CRIME: THE CHALLENGES OF COMMEMORATING SOUTHERN CONVICT LEASING WITHOUT HUMAN REMAINS

**Contribution format:** Oral  
**Contribution authors:** V. Camille Westmont (University of Alabama at Birmingham)

The transitory nature of the Southern convict lease system, a system of racialized forced prison labor in use until the mid-20th century, established a new form of enslavement in the post-emancipation United States South. This system was more brutal, dangerous, and deadly than that witnessed under US chattel slavery, a fact that has best been captured in a now-infamous 1885 interview quote: “These convicts, we don’t own ‘em... One dies, get another.” The high fatality rates have become one of the system’s most well-known features. Today, archaeology is playing a leading role in bringing this form of American oppression back into public memory. Major new sites in Tennessee, Texas, Georgia, and North Carolina have been identified in the last five years, in part through the efforts of historical archaeologists. However, as sites related to convict leasing continue to be identified, protected, and researched, a new and ethically complex issue is arising: the fate of prisoners’ remains who perished while incarcerated. Descendant communities and interested members of the public continue to highlight human remains as their top priority when discussing research questions and future memorialization. However, the realities of industrial landscapes, racial politics, and cemetery excavations have repeatedly pitted archaeologists’ recommendations against the desires of passionate and well-intended members of the public. This paper will explore the consequences of the “CSI effect” on the commemoration of the Southern convict lease system in the southern United States through a discussion of case study sites where the presence (or absence) of human remains has led to community tensions. The problems associated with fights over human remains and the problematic underlying implications of a focus on recovering bodies will be discussed. The paper will make recommendations on ways archaeologists can manage the expectation of stakeholder groups and reframe conversations about respect, dignity, and memory.

1259. MATERIAL AND IMMATERIAL: SPIRITS, STONES, AND THE MEMORIALIZATION OF JAPANESE AMERICAN INCARCERATION

**Contribution format:** Oral  
**Contribution authors:** Koji Lau-Ozawa (UCLA)

During World War II, over 125,000 people of Japanese ancestry were confined throughout the United States in purpose-built incarceration camps. Confronted with immense loss from their forced removal and confinement, Japanese Americans contended with poor living conditions, exploitative labor practices, and the continuous threat of violence. The intergenerational trauma from the years of incarceration lingers to the present day. Remarkably, Japanese Americans began commemorating their incarceration while still imprisoned, creating a landscape of ephemeral and monumental memorials. This material landscape continues to shape the ways in which survivor and descendant communities organize and relate to the memory of the incarceration. In this paper, I discuss the continuous dialogue between past and present memorial practices as Japanese Americans continue to process the history of incarceration through pilgrimages and visitations of past monuments, and an array of new memorial practices. Focusing in particular on two monuments at the Manzanar and Topaz Incarceration Camps, I discuss how the practices established by incarcerated themselves during their confinement still resonate materially and immaterially, and the attempts of contemporary heritage communities to redefine what a monument can look like.

2251. TESTIMONIES OF LIFE ON THE OBJECTS FROM THE DEATH PITS AND THEIR RE-PRESENTATION. LEXICON OF KATYN ARCHAEOLOGY

**Contribution format:** Poster  
**Contribution authors:** Magdalena Majorek-Lipowicz – Anna Zalewska – Olgierd Ławrynowicz (Institute of Archaeology, University of Lodz) – Aleksandra Krupa-Ławrynowicz – Sebastian Latocha

(Institute of Ethnology and Cultural Anthropology, University of Lodz) – Kacper Ciesielski (Katyn Museum in Warsaw, Branch of the Polish Army Museum)

The poster presents images of hand-made inscriptions on selected everyday objects found during exhumations and archaeological work on traces of the Katyn massacre. Material evidence of this war crime, committed by the Soviets against 22,000 Polish prisoners of war, includes objects on which inscriptions made by prisoners of war using the hand-engraving technique have survived. On objects made of metal, plastic or wood (e.g. cigarette boxes), iterations and designs can be read, which are a personal signature and testimony to the dramatic life of a prisoner of war. They are linked to the specificity of a particular community – prisoners of war who were murdered and buried in Katyn, Miednoye, Kharkiv and Bykivnia. On the basis of the research material collected during the implementation of the project “Lexicon of Katyn Archaeology 1990-2015” we have considered the expressiveness of this type of media on the following levels: lexical, semantic and graphic/artistic. We will show the relationships that result from the links between these levels, using specific examples of proper names, dates of events and symbols. In this perspective, we will show the results of attempts to read traces that lead from the traces of the prison reality, through the biographies of the victims, to the currently active symbols of the communities of memory. We will re-present the objects from death pits focusing on their agency as well as the carriers of camp inscriptions as the specific, multifaceted, dynamic phenomena with great potential for us and future generations to experience and remember.

177 DIGGING DEEPER: ARCHAEOLOGY AS A TOOL FOR SOCIAL CHANGE

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Regular session  
**Session keywords:** nationalism, archaeological knowledge, societal challenges,  
**Session organisers:** Cristina Gameiro (UNiarQ - Centre for Archaeology, University of Lisbon) – Sérgio Gomes (CEAACP- University of Coimbra) – Rui Gomes Coelho (Department of Archaeology, Durham University | UNiarQ - Centre for Archaeology, University of Lisbon)

SESSION ABSTRACT

The 2024 European elections reveal a rising influence of far-right parties across Europe. Often characterized as part of a ‘new nationalism’ wave, these parties claim to represent the ‘pure people’, call for the restoration of national sovereignty (from supranational institutions) and promote ‘national preference’ by advocating stricter immigration and citizenship policies (Halikiopoulou & Vlandas, 2019). In such a political context, and regarding the deep connection between the politics of the past, present uncertainties and expectations for the future, how can archaeologists nurture a critical public sphere or create safe spaces to discuss? Archaeology has traditionally mediated narratives that normalise inequalities and legitimise dominant power structures. Archaeological knowledge has been mobilized to support populist narratives that promote the idea of a ‘golden age’ when a culture or nation was purportedly ‘pure’ and superior. It is also worth noting that such narratives entail the dehumanization of certain social groups, reinforcing prejudices and undermining social cohesion. Archaeologists have also critically evaluated historical contexts and documents, offering non-hegemonic perspectives about the past. For example, what more powerful tool could combat racial or ethnic discrimination than the understanding that, despite our diversity, all humans share the same origin and that, for the past 300,000 years, we have all belonged to the same species? Yet, we struggle to go beyond critiques when it comes to confront reactionary narratives. In this session, we aim to discuss how archaeological knowledge can be mobilized to challenge populist narratives and support a more informed and inclusive society. We seek contributions focusing on educational projects or community participation and encourage participants to showcase how their research is committed to a society grounded on values of social justice, equality and peace.

CONTRIBUTION ABSTRACTS

1475. DIGGING DEEPER: AN INTRODUCTION

**Contribution format:** Oral  
**Contribution authors:** Sérgio Gomes (CEAACP - University of Coimbra) – Cristina Gameiro (UNiarQ - University of Lisbon) – Rui Gomes Coelho (Department of Archaeology, Durham University)

The relationship between politics of the past, present uncertainties, and future expectations raises important questions about how archaeologists can challenge and transform biased, oversimplified portrayals of historical groups, events, and processes. This issue is widely discussed due to its significance in critically assessing archaeology’s role in legitimizing different ideas and narratives. However, it remains especially relevant as the cultural,

political, and social contexts that shape these discussions continue to evolve. From this perspective, values such as objectivity, political engagement, social justice, equality, freedom, and peace are not only fundamental social principles but also essential epistemic opportunities for archaeology as it redefines itself as a discipline. These values are applicable across diverse work contexts and can be meaningfully integrated into archaeological practices to foster more just, inclusive, and peaceful societies. This introduction provides a brief review of the literature on the topic, highlighting the importance of these concepts, their relevance across different archaeological settings, and their role in shaping a more socially engaged discipline.

2010. DIGGING DEEPER INTO MOTHERHOOD. AN APPROACH TO STRATEGIES OF CARE AND COOPERATION IN THE PORTUGUESE CHALCOLITHIC

Contribution format: Oral  
Contribution authors: Ana Vale (CITCEM/FLUP - University of Porto)

This paper aims to dig deeper into the social fabric of past human communities through the study of strategies of care, focusing on motherhood. Within the patriarchal structure, motherhood has been a factor of social difference between men and women in the past, based on established gender prejudices and stereotypes of motherhood that are highly penalising for women (in the past and present) and with deep historical roots (Federici, 2014). Feminist theories and the history of women have focused for long on the analysis of sexuality, (pro)creation and motherhood. However, it is still necessary today to dismantle the prejudices rooted in the archaeological tradition and contribute to a broader understanding of the networks of sociability based on care strategies, specifically during the Iberian Chalcolithic period (between 3200 and 2200 BC). Studies on motherhood in prehistoric archaeology are scarce and have little impact due to two main factors: (i) on the one hand, the (false) naturalisation of motherhood, which is considered a biological capacity inherent to the female body and therefore without interference from women and the need for historical contextualisation (ii) and on the other hand, the common acceptance of the rarity of archaeological objects and contexts that allow the study of mothering in archaeology. However, this study aims to draw attention to multiple possible motherhood strategies, like othermothering, in prehistory by analysing particular archaeological contexts in Portugal. It will also consider more inclusive and fairer images that could open up to other grammars for reading the past.

2113. FROM RESEARCH TO SOCIAL ACTION: A DISSEMINATION PROGRAM BASED ON THE PRE/PROTO-HISTORIC OCCUPATION AND ROMAN COLONIZATION EVIDENCE IN MURÇA (PORTUGAL)

Contribution format: Oral  
Contribution authors: Maria Sanches (Faculty of Arts and Humanities-Oporto University | CITCEM reseach Centre) – Miguel Almeida (Dryas | UNIARQ research centre) – Mónica Corga (Uniarq | Dryas/FCT)

Although, in the past, Archaeology was often mobilized to support political narratives of supposed golden ages of pristine nations, thus serving to legitimise the persistence of inequalities and iniquitous dominant political agendas (as was the case of Manuel Heleno’s programme for the National Archaeological Museum during the Portuguese dictatorship period), nowadays new nationalist wave sweeping across Europe calls on historians to actively participate in pivotal debates as sources of knowledge and reason about the evolution of past human societies. Because of its inherent materiality, narrative potential, and proximity to the terrain and populations, Archaeology should take on a significant part of this societal mission. Murça is a small, mostly agricultural, Portuguese municipality of c. 5k inhabitants where such biased perspectives have coupled the local verraco (= Porca de Murça), established as Murça’s ex-libris since the 19th century, with the romanised hillfort of Castelo dos Mouros do Cadaval, traditionally presented as the ancestral origin of Murça, despite no scientific arguments. Since then, three decades of Archaeological research have shed new light into the development of pre/proto-historic occupation and early roman colonization of the region. The challenge is now to convert this scientific knowledge into social action. A new research programme, “TSF” (= Territories with no borders), fostered by the municipality and engaging local schools, includes a bottom-up approach to educational programmes targeting the young student population, aiming to reinforce the community’s cultural identity, develop civic engagement and social tolerance, and promote the fixation of population and sustainable economic development through micro-entrepreneurship in the areas of CCI’s and endogenous productions. This communication will focus on:

- The state of our knowledge about the human occupation of the region since prehistoric times,
- Strategic goals of the dissemination programme, and
- Methods of engaging the students in expositive and immersive actions.

995. NECROPOLISES, IDENTITIES, ETHNICITY, AND POLITICS. INTERTWINED CONNECTIONS OF THE “VISIGOTHIC ARCHAEOLOGY” IN THE IBERIAN PENINSULA

Contribution format: Oral  
Contribution authors: Andreia Arezes (Faculty of Arts and Humanities - University of Porto | Transdisciplinary Culture, Space and Memory Research Centre)

The first half of the 20th century was pivotal in developing what is known as “Visigothic archaeology” in the Iberian Peninsula, particularly in Spain. The identification of vast necropolises classified as “Visigothic”, mainly in the area of the Castilian Meseta, the artefactual assemblages therein exhumed, the connotations with an alluring “barbarian” landscape, and the interest shown by foreign researchers, seem to have played a key role in in the constitution and consolidation of such a research field. The historical context experienced in Europe, in the shadow of the two brutal conflicts, indissociable of a nationalist ideological framework, and of the dissemination of lines of thought where ethnicity or particular identities were part of institutionalized narratives, marked how specific sectors of archaeology positioned themselves. The personal and institutional relationships established between Spain and Germany, especially from the 1930s onwards, have been under scrutiny in the last decades by various scholars. However, the depth and scope of the impact exerted by the complex conjuncture on the compromised focus of research, or the potential bias that may have arisen from these interactions, still require critical reflection. In this presentation, I will address the ambivalences of Portuguese archaeology during the Estado Novo dictatorship, discussing what kind of balance was established between the historiographical discourse and the materialities and to what extent archaeologists were caught within this research dynamics or developed a proper voice, on the fringes of the “air of time”.

1995. 50 LAYERS OF A REVOLUTION: PREHISTORIC ARCHAEOLOGY AFTER APRIL 25TH, 1974

Contribution format: Oral  
Contribution authors: Cristina Gameiro (Uniarq - Centro de Arqueologia da Universidade de Lisboa) – Sérgio Gomes (CEAACP- University of Coimbra) – Daniel Carvalho (Uniarq - Centro de Arqueologia da Universidade de Lisboa)

Portugal is celebrating the 50th anniversary of the Carnation Revolution (April 25, 1974). These celebrations aim to highlight the end of the dictatorship and commemorate key milestones, including the approval of the Constitution and the first legislative, presidential, regional, and local elections in 1976. The Resolution of the Council of Ministers emphasizes that “Portuguese democracy is inseparable from freedom and pluralism, decolonization and European integration, as well as cultural, social, and economic progress,” calling for inclusive celebrations that unite the Portuguese people around the conquest of freedom. This paper presents the project 50 Layers of a Revolution: Prehistoric Archaeology after April 25, 1974, developed as part of these commemorations. The project explores how prehistoric archaeology evolved after the Revolution, focusing on its political dimensions and how prehistorians contribute to consolidating democracy. It investigates how theoretical approaches, methodologies, and narratives reflect broader political and social transformations. Archaeology is closely tied to contemporary political and social issues. The topics prehistorians choose, the questions they pose, and their interpretations of archaeological evidence are shaped by historical circumstances, revealing the influence of political regimes and socio-cultural dynamics. Three key questions frame our research: How did narratives about prehistory change after 1974? To what extent do prehistorians situate their work within political contexts, consciously or unconsciously? And how can archaeology contribute to addressing democratic challenges today? By combining data science for narrative analysis and engaging the scientific community through four workshops and an exhibition, the project encourages reflection on archaeology’s civic role. Ultimately, it seeks to promote archaeology as a space for inclusive historical knowledge and inspire prehistorians to embrace their civic responsibilities.

1287. PREHISTORY, COMMUNICATION, AND SOCIAL CHANGE IN THE XXI CENTURY

Contribution format: Poster  
Contribution authors: Sara Cura (ICArEHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour) – Pedro Cura (Pre&Historic Skills)

Archaeology cannot commit to social change without effective communication. In the 21st century, this imperative becomes even more critical as pseudoarchaeology and misinformation proliferate, sometimes fueling xenophobic and nationalist movements. Popular media, such as the Netflix series Ancient Apocalypse, and the unregulated spread of content on platforms like YouTube, TikTok or Facebook, exploit the public’s fascination with prehistory to promote narratives that distort scientific understanding. Many of these narratives are rooted in ideas of cultural or racial superiority, echoing and reinforcing exclusionary ideologies that undermine social cohesion. This poster explores the role of archaeologists in challenging these reactionary narratives through proactive and accessible communication, using the project Pre&historic Skills and Comunicar Arqueologia as a case study. Pre&historic Skills, grounded on experimental archaeology, organizes and develops face to face

events in Schools, Museums, Festivals or Archaeologic Parks mobilizing and successfully engaging thousands of participants of all ages each year. Comunicar Arqueologia, on the other hand, leverages communication through public speaking, podcast, and newsletters. Booth projects demonstrate how archaeologists can engage diverse audiences and reclaim the narrative space and can counter misinformation and foster inclusive perspectives. To challenge pseudoarchaeology and misinformation effectively, archaeologists must move beyond critique and actively participate in shaping public discourse. Without this engagement, archaeology risks ceding its potential to address broader societal challenges such as climate change, environmental crises, migration debates, and the need for cultural diversity acceptance. By asserting its relevance through communication, archaeology becomes a tool for resisting populist ideologies and building a more informed, equitable society, truly achieving its social impact and therefore engage in social change.

2236. STRATEGIES FOR DISSEMINATION OF THE PREHISTORIC MONUMENT OF PRAIA DAS MAÇÃS (SINTRA, PORTUGAL)

**Contribution format:** Poster  
**Contribution authors:** Eduardo Porfirio (Câmara Municipal de Sintra | Centro de Estudos em Arqueologia Artes e Ciências do Património) – Catarina Costeira (Câmara Municipal de Sintra)

The Prehistoric Monument of Praia das Maças is situated on a small hill on the right bank of the Colares River, in the municipality of Sintra, and has been classified as a National Monument since 1974. This monument is a funerary complex, consisting of an artificial cave and a tholos with different phases of construction and use, from the end of the 4th to the 2nd millennium BC. It was identified in the 1920s, with archaeological excavations having been carried out in the 1960s/1970s. Since 2020, Sintra municipality has been promoting a conservation and restoration project for this monument, which includes extensive archaeological work, led by the municipal archaeology team. In parallel with this field work, a program to disseminate the results obtained was developed, organized around three major axes: a) scientific dissemination; b. participation of young students in archaeological work; c) guided and spontaneous visits to the site during and after the excavation work. In this poster we intend to present the results of the actions to disseminate this megalithic monument, reflecting on the potential and communicative challenges of a program developed in a local government context, financed by public funds, in a coastal settlement with a tourist vocation, but which aims to target the different communities that make up the society of the Sintra.

178 THE POWER OF PUBLIC ARCHAEOLOGY TO TACKLE THE SUSTAINABLE DEVELOPMENT GOALS

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Regular session  
**Session keywords:** applied archaeology, public engagement, participatory approach, sustainable development goals, nature and heritage, co-design  
**Session organisers:** Lenore Thompson (University of Derby) – Veronica Testolini (Independent)  
**Session discussant:** Håkon Glørstad (University of Oslo, Museum of Cultural History, Historical Museum | Museum of the Viking Age)

SESSION ABSTRACT

This session aims to showcase the ability of archaeology as a discipline to address the challenges humanity is facing. Archaeologists can play a relevant role in informing decision-making and providing practical examples for building a sustainable future. Public archaeology, like its anthropological counterpart (Borofsky and De Lauri 2019), can support the achievement of the Sustainable Development Goals set by the United Nations in 2015. Case studies presented in previous EAA meetings have demonstrated the effectiveness of archaeological research in culture-based climate action (Davies et al. 2022), identity and heritage building (Atalay 2012, Downum and Price 1999), and finding sustainable economic alternatives (Cejuela et al. 2018). Moreover, archaeology holds a privileged position, being a discipline methodologically equipped to analyse past successes and failures. This provides the opportunity to build future-proof projects by applying lessons learned. Based on this rich portfolio of experiences (see Harrison et al. 2020), this session seeks to communicate the work public archaeology has done in recent years and what has been achieved by policymakers, the private sector, and wider publics based on this research. The aim is to encourage multiple sectors to include archaeologists in the process of building our future. This session welcomes papers presenting projects that have employed archaeology to tackle the Sustainable Development Goals, particularly: Goal 4 – Quality Education, Goal 9 – industry, Innovation and Infrastructure, Goal 10 – Reduced Inequality, Goal 11 – Sustainable Cities and Communities, Goal 12 – Responsible Consumption and Production, and Goal 13 – Climate Action.

CONTRIBUTION ABSTRACTS

974. A CRITICAL LOOK AT ARCHAEOLOGICAL SCIENCE FOR SUSTAINABILITY

**Contribution format:** Oral  
**Contribution authors:** Lenore Thompson (University of Derby) – Veronica Testolini (Independent)

The use of Archaeological Science in academic archaeology is increasingly common today and has the power to positively impact the public by enabling researchers to pursue new avenues of investigation and to reach a wider audience. However, researchers need to be aware of potential unintended consequences of applying archaeological science without clearly defined goals and ethical parameters. For example, undertaking unnecessarily expensive analysis can divert funds away from public projects, and the destructive nature of many analytical techniques can mean that heritage and history, valuable to creating meaningful social connections for the future, are lost. This paper will present examples of projects, co-created with publics beyond academia, in which thoughtful Archaeological Science has been used to contribute to the Sustainable Development Goals (SDGs). These projects range from exploring the establishment of heritage craft networks to build social cohesion within communities and support local economies (SDG 11.4), to investigations of pollutants generated during the Industrial Revolution in the UK with outcomes aimed at informing future heritage resource management policy (SDG 3.9 & 13.3). Within archaeological science, it is our duty to highlight and learn from both the successes and potential pitfalls of employing certain methodologies, or of the importance of designing projects with sustainability in mind. Archaeology as a discipline should be integral to the process of building a more sustainable future.

371. ARCHAEOLOGY AND THE CHALLENGE OF LONG-TERM COMMUNICATION: LESSONS FOR NUCLEAR WASTE MANAGEMENT

**Contribution format:** Oral  
**Contribution authors:** Cornelius Holtorf (Linnaeus University)

Archaeology is often valued for uncovering knowledge about the past but overlooked for its role in addressing present and future challenges. I see it instead as a powerful practice that helps us make sense of the world, ourselves, and each other—an essential tool for sustainable development and shaping the future. In this presentation, I explore how we can communicate messages across generations about deep geological repositories for nuclear waste (SDG 12.4: Responsible Management of Chemicals and Waste). From an archaeological perspective, I am skeptical about accurately transmitting knowledge across millennia, especially when the goal is to influence behavior rather than ensure precise understanding. Human perspectives and actions are always diverse, and the past is marked by continuous transformation. The key lesson from archaeology is therefore that long-term communication must work with change, not against it: facilitating adaptation rather than resisting it. A broader implication for archaeology in society is the need to ask more often not just what archaeological sites, objects, and associated ideas once were, but what they could (and should?) become.

1104. “MURI PER TUTTI”: WHEN ALL YOU NEED IS ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Valeria Di Cola (IES Abroad Rome)

In Rome, archaeology serves as powerful evidence of the Past, rather than facilitating effective interaction between the community and its rich historical landscape. Is it possible to foster a community around ancient walls and historical landscapes through social media? Can it evolve into a genuine community when typical engaging activities, such as excavations and university research projects, are unavailable? What objectives should be pursued? These are the questions I have sought to answer as an independent researcher since 2021, when I first launched a quiz on Instagram inviting the audience to identify a wall from ancient Ostia. The initial challenge was to build an audience from scratch as an individual with expertise in this field. Today, after three years of daily engagement, launching a personal blog, and creating a YouTube channel to enhance the communication strategy, the community surrounding the public archaeology project “Muri per tutti” has grown to nearly 2,000 members. The project has facilitated numerous interactions and opportunities to meet and explore the archaeology of Rome and its surroundings, fostering a collective process of learning ancient history alongside experts. To explore the tangible value of being in the field—not just in the digital realm—I have also initiated a program called “Muri e Marmi” (Walls and Marbles), in collaboration with Dr. Alessandro Mortera, an expert in marble decoration. We have conducted several explorations of archaeological sites varying in size and significance (including Villa Adriana, Villa dei Quintili and the Pantheon), where architecture and decorative elements were subject to interdisciplinary analysis. So far, the results have been encouraging, evidenced by the consistent increase in followers and supporters, as well as the identification of weaknesses in national and local heritage administration. Further, this endeavor reveals important insights regarding the role—and necessity—of archaeology in contemporary society and the key-role of the community.

2448. PUBLIC AND COMMUNITY ARCHEOLOGY FOR THE SUSTAINABLE DEVELOPMENT OF CULTURAL HERITAGE. CHALLENGES AND PERSPECTIVES IN CENTRAL SICILY

Contribution format: Oral  
Contribution authors: Daniela Patti (University Kore of Enna)

The peculiarity of our cultural heritage consists in the close relationship between the cultural assets and the landscape that now constitutes an essential element of our culture, our way of being, our “identity”. Several scholars insisted for a long time that the specificity of Italian cultural goods is constituted by the widespread presence, by the continuum of presences or goods, large and small, in cities, in the countryside, along the coasts. In accordance with this open and dynamic vision of cultural heritage, as expressed in the Faro Convention, it is necessary to promote the development of a shared awareness and public commitment. This can assist publics to recognise cultural and natural heritage as one’s own, without hierarchy. The development of the archaeological and architectural heritage, the landscape, its history, its nature is even more in the inland areas. The central Sicily is characterized by several archaeological records, with little-known topics, but related to a rich history, characterized by a flourishing economy based on agriculture mainly, but not exclusively cereal-growing, and on the exploitation of Sulphur mines. In recent years, this area already partly characterized by the youth migration, by the abandonment of the countryside, but also of the few urban centers, many of which of ancient origin, sign of a life in the ancient world until, at least, the repopulation of the XVIII century. In this context the public archaeology is a unapplied resource that could be used for to ensure a development of communities anchored on participatory approaches and stakeholder involvement.

2153. THE EXTREMO TERRITORY SCHOOL (ARCOS DE VALDEVEZ, PORTUGAL). AN ARCHAEOLOGICAL-ARCHITECTURAL APPROACH TO COMMUNITY RESEARCH ON THE LANDSCAPE

Contribution format: Oral  
Contribution authors: Rebeca Blanco-Rotea (Landscape, Heritage and Territory Laboratory, University of Minho) – Cidália Silva (Landscape, Heritage and Territory Laboratory, University of Minho | School of Architecture, Art and Design; University of Minho) – Marta Labastida (School of Architecture, Art and Design; University of Minho) – Emília Araújo (Institute of Social Sciences, University of Minho) – Sara Traba (University of Santiago de Compostela) – Célia Alves – João Alves – Rodrigo Pereira (School of Architecture, Art and Design; University of Minho)

This proposal seeks to describe and present the main reflections issued from ongoing participative research developed in the northern part of Portugal, involving archaeological findings. We have developed a series of archaeological research projects in the parish of Extremo (Arcos de Valdevez, Portugal) since 2018 addressing highly relevant patrimonial elements. Concepts of public and community archaeology, citizen science and living laboratories become pivotal in the research programme, which is focused on the different cultural landscapes of Extremo and their interrelationships; the contemporary problems affecting these rural and mountain landscapes; a heritage education programme; the processes of heritage and identity building through audiovisual tools; and the use of heritage as a sustainable resource. We believe that its continuity is due to three aspects: the combined work between materiality, immateriality and historical documentation; the interdisciplinary, multi-scale and multi-agent approach (researchers, teachers, students, local and municipal agents, community...); and above all, the incorporation of the community in the processes of knowledge production, through the implementation of methods for co-creation and co-participation. We are currently immersed in a project to build a territorial school based on these principles, which recovers heritage elements in a sustainable way, combining formal and non-formal training, sustainability, innovation and heritage education: a project based on the past to build the future collectively. In this communication we will give an account of the approaches, the process and the results of this transversal and participative project.

2047. SAFEGUARDING ARCHAEOLOGICAL HERITAGE IN AFFORESTATION AND REFORESTATION PROJECTS

Contribution format: Oral  
Contribution authors: João Marques (Património Cultural, Instituto Público | CEAACP - Centro de Estudos em Arqueologia, Artes e Ciências do Património) – Filipa Bragança (Património Cultural, Instituto Público) – Samuel Melro (CCDR Alentejo | UNIARQ)

This proposal will seek to establish a relationship between Portuguese legislation for safeguarding archaeological heritage in afforestation and reforestation projects and the guidelines for technical procedures for safeguarding archaeological heritage in the context of afforestation and reforestation projects. Forestry projects represent

a high value in the Portuguese economy, but its undeniable that they pose a significant threat to these heritage elements. According to the current environmental impact assessment (EIA) legislation, given the minimum size of projects covered by it until December 2023, out of a total of 3,690 projects subject to EIA, with an Environmental Impact Statement issued, only 33 projects are forestry or agroforestry projects. Of these, only ten dated from after the 1990s. The Guidelines for Archaeological Heritage in the Environmental Factor Cultural Heritage in Environmental Impact Assessment - of 29 March 2023, which, under the terms of the EIA’s Legal Framework, covers agricultural development projects and afforestation and reforestation, if they involve replacing pre-existing species, in isolated or continuous areas, with fast-growing species and deforestation intended for conversion to another type of land use. Although, Portugal has consolidated legislation on Cultural Heritage since 2001 and a forestry legislation that imposes some specific preventive measures for archaeological heritage, namely in the Regional Forestry Management Programmes (PROF), the protection of this finite and non-renewable heritage resource falls far short of what is needed because many of these projects fall outside this scope and no prior characterisation work are required. To fill this gap and standardise procedures in all regions of continental Portugal, the cultural heritage administration has produced a set of guidelines for safeguarding archaeological heritage, to be implemented in afforestation and reforestation projects using impactful soil mobilisation techniques, namely: stone removal works, heavy mechanical scarification, subsoiling, ground levelling, mega ridges-furrows, and terracing, among others.

956. THE ECONOMIC CONTRIBUTION OF ARCHEOLOGY BEYOND TOURISM: THE EXAMPLE OF A MICRO-BUSINESS BASED ON EXPERIMENTAL ARCHAEOLOGY

Contribution format: Oral  
Contribution authors: Giovanni Sartori (Ca’ Foscari University (Venice))

Among the scientific disciplines, archaeology is often considered an economically unsustainable branch, and funding for this science is increasingly rare. Except for the exploitation at the tourism level that can be done with a site or artifact, governments and public institutions seem to overlook further economic benefits provided by archaeology. My intervention aims to clarify, through my personal experience as a micro-entrepreneur, the economic value that archaeology can represent in various fields not strictly connected to it: social, educational, scientific, artisanal, and industrial (SDG 8.3). As a professional, I provide consulting and research in the field of archaeometallurgy for businesses and public institutions (universities and museums), and archaeology is indeed a fundamental component of my business. My approach, which follows the principles of experimental archaeology, bases its economic value on know-how developed through the collection and processing of data at a multidisciplinary level. Archaeological research constitutes one of the main references of my theoretical background. The projects I manage in the educational field, through collaborations with museums and universities, promote the recovery and safeguarding of traditional metallurgical know-how. The awareness of a craft and manufacturing tradition to be preserved, achieved through object-based learning, can be an effective tool for addressing crises of identity and demographic challenges that developed countries are already facing (SDG 4.7). Finally, archaeometallurgy and experimental archaeology are unexpectedly proving to be useful tools in supporting challenges related to renewability and sustainability in the steel industry (SDG 7.3, 7.a, 12.2).

179 DISSEMINATION IN ARCHAEOLOGY: FROM SCIENCE TO THE MASSES

Session theme: 6. Intertwining archaeology, heritage, and museums  
Session format: Regular session  
Session keywords: Dissemination, Archaeology, Multi-level communication, Historical narratives, Social media  
Session organisers: Cynthia González-Olivares (Fundación Palarq | Seminari d’Estudis i Recerques Prehistòriques (SERP), University of Barcelona | Institute of Archaeology (IAUB), University of Barcelona) – Nicola Scheyhing (Independent | Kulturbetriebe Burgenlandkreis GmbH)

SESSION ABSTRACT

One of the primary objectives of archaeology as a discipline is to construct historical narratives based on the analysis of material remains. However, beyond the critical realm of research, the role of archaeologists extends significantly to the communication of their findings to various sectors of society. In contemporary academia, much emphasis is placed on ethics and scientific rigor when publishing scholarly articles. However, the communication of archaeological knowledge to a wider public is often a neglected aspect of our professional responsibilities. Rapidly advancing technology and artificial intelligence equips us with powerful tools that can enhance our ability to engage the public. These allow us to present the advances and discoveries of our discipline in more

accessible and engaging formats. In this context, the reach of social media within archaeology represents a vital opportunity to invigorate research efforts and foster greater public interest in our field. This session aims to bring together current projects on archaeological outreach through multilevel multimedia formats -traditional and social media- and to critically evaluate the strengths and weaknesses that these formats currently have. In addition, it aims to recognize the main concerns surrounding this area of engagement, analyze the current situation of archaeological outreach, and explore new strategies adapted to the message and audience to be reached. By facilitating dialogue among practitioners in the field, we hope to explore effective tactics for bridging the gap between academic research and public understanding by bringing together synergies of archaeology and communication experts. Ultimately, one goal of the session shall be to promote a more inclusive appreciation of archaeology, as well as to create a deeper connection between researchers, the best practices employed in professional communication, and the diverse communities they serve, and in doing so, to bring greater recognition to the work of outreach in the scientific endeavor.

CONTRIBUTION ABSTRACTS

31. ENGAGING PORTUGUESE SPEAKING AUDIENCES IN PREHISTORY TROUGH PODCASTING AND SOCIAL MEDIA

**Contribution format:** Oral  
**Contribution authors:** Sara Cura (ICaREHB - Interdisciplinary Center for Archaeology and the Evolution of Human Behaviour)

The podcast Let’s Rock – Um Podcast da Idade da Pedra serves as an innovative platform for disseminating archaeological knowledge, specifically focused on Prehistory, to Portuguese-speaking audiences. Combining interviews with researchers from diverse subfields—such as geoarchaeology, bioarchaeology, lithic studies, DNA analysis, zooarchaeology, Rock Art or Experimental Archaeology—with immersive storytelling, the podcast promotes both scientific culture and scientific literacy and public engagement. By exploring how research is conducted and presenting the individuals behind the science, it humanizes archaeological work while making complex ideas accessible to a non-specialist audience. With over 5,000 reproductions of its 24 episodes, hundreds of followers on Spotify and significant engagement on social media, the podcast demonstrates the potential of audio media to attract audiences traditionally underrepresented in archaeological outreach and science communication. Listener feedback highlights the importance of making high-quality content available in Portuguese, meeting a growing demand for archaeology dissemination contents. Podcasts, as a flexible and intimate format, are particularly well-suited for addressing this gap, allowing for deeper connection with diverse audiences. This presentation will examine the strengths and challenges of podcasting as an engagement and science communication tool, particularly in fostering public understanding of archaeology as a interdisciplinary science. It will also explore the challenges of marketing the podcast on social media while being an independent project. By focusing on digital engagement and tailored messaging, Let’s Rock aligns with the session’s aim of evaluating multimedia strategies in archaeological outreach. The project demonstrates how creative, localized initiatives can bridge the gap between academic research and public knowledge, offering a model for inclusive and impactful communication.

197. DISSEMINATION ON TII PROJECTS - OPPORTUNITIES AND CHALLENGES

**Contribution format:** Oral  
**Contribution authors:** Ronan Swan (TII)

TII (Transport Infrastructure Ireland) is a stage agency in Ireland, responsible for delivery of national road, greenway and public transport projects. One of TII’s strategic objectives is to communicate with the communities affected by our schemes. For the communication of archaeology, TII adopts a range of approaches suiting different audiences. From traditional site visits and public talks, to on-line videos and storymap. to exhibitions and books. On-line story maps bring together the results of particular schemes using maps, videos, text highlighting not only the initial discovery and excavation but also the post-excavation specialist analyses and conclusions. While audiobooks can provide a synthesis of the archaeological result. in innovative and engaging ways whether through fictional narratives e.g. The Unsilent Stones, Athlone Abbey Graveyard , or by inviting local communities to respond to the archaeology emerging results e.g. Buttevant Heritage Trail. TII also has a strong record of publication with 46 books to-date (including 9 accessible as PDF and ePubs). These and other resources are all available from TII’s website <https://www.tii.ie/en/technical-services/archaeology>, grounded in the primary ‘grey-literature’ which is freely accessible on TII’s Digital Heritage Collections (<https://repository.dri.ie/catalog/v6936m966>). In this paper I will discuss some of the drivers that underpin our overarching communication strategy especially our quality contracts, which mandate dissemination throughout the life of a project. I will also highlight some of the synergies that occur from working with different stakeholders (archaeological consultancies, local authorities, local societies, national agencies and universities) and how we can successfully facilitate dialogue between these different groups. Ultimately, this presentation will provide examples of how multilevel

multimedia formats allied to traditional means of communication can be successfully achieved, and how adopting a holistic approach can lead to a range of successful outcomes both in the short and long term.

2119. PICTURE THAT! GENAI AND THE VISUAL PICTURE OF THE PAST IN DISSEMINATION OF ARCHAEOLOGICAL RESEARCH

**Contribution format:** Oral  
**Contribution authors:** Nicola Scheyhing (Independent Researcher | Kulturbetriebe Burgenlandkreis GmbH, Arche Nebra)

One of the most impactful tools for disseminating research of the past is the creation of images. Reconstructions based on interpretations of scientific knowledge have a long history in museum presentations, publications, and other media addressing the public. They function as an additional form of expression, as well as an implement to generate an emotional response from the observer. Images have also long been used to influence and direct emotions towards certain causes. Curators, publishing academics, and science communicators are long aware of the possible pitfalls of the creation of visual reconstructions as well as their fortitudes. The last couple of years have seen a plethora of discussions and projects on the creation of realistic images of the past, on the role of diverse reconstructions, the imbalance of representation of women, children, elderly people, individuals with disabilities, skin color, etc. With the latest developments, though, it seems like a significant shift has happened again with the newly found possibilities Generative Artificial Intelligence is offering for the creation of images. Easy to train and use, GenAI seems to offer an opportunity not only for self-pronounced history buffs online to cater to the steadily growing number of media channels courting attention online but also to professionals. With the ever-present challenge of a lack of funding for outreach, publication projects, exhibitions, or the creation of marketing materials, the possibility of creating reconstructions without the additional costs and time necessary to collaborate with human creators is a major drawing point. But at what cost. In my presentation I want to give perspective on the current state of reconstructions of the past created by GenAI, cases of usage, and what might be worth considering regarding their application from the perspective of a science communicator.

143. THE PALARQ FOUNDATION AND ITS ROLE IN THE DISSEMINATION OF SPANISH ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Lourdes Palomo (Fundación Palarq) – Cynthia González (Fundación Palarq | SERP-IAUB, Universitat de Barcelona)

Palarq Foundation is a private, non-profit organization created with the aim of supporting missions in Spanish Archaeology and Human Palaeontology –more than 600 projects–, within a perspective that ranges from the palaeontological stage to prehistoric and historical periods of monumental interest. In addition, Palarq Foundation gives financial support for archaeometric analysis applied in Spanish sites. With the aim of generating interest in archaeology and human paleontology in society and among young people, in 2021 the project of creating content for social networks, in particular Youtube and Tik Tok, was initiated. The goal is to reach young people in a rigorous and, at the same time, motivating way. Our channels are nourished with scientific information that with the visible faces of the cultural influencers Pakozoico and JJprieo convey this information in a more entertaining language. In January 2024 we started the videopodcast format in collaboration with National Geographic History, where prestigious researchers and public figures talk about a topic connecting the past with the present, while maintaining scientific rigor. The intention is to penetrate other sectors of the population and bring these disciplines closer to the present. After an analysis of the results obtained in these networks, an audience of more than 2.5 million monthly views (more than 30 million per year) has been reached, with an average age of 25 years. This shows a high interest in archaeological and paleontological heritage and contributes to strengthening the presence of these disciplines in new forms of communication. This session, therefore, aims to present a case of success in the dissemination of archaeology and human paleontology.

1261. BRIDGING THE WORLDS OF THE LIVING AND THE DEAD: A PROPOSAL FOR THE DISSEMINATION OF MENORCA’S PREHISTORIC ROCK- CUT TOMBS

**Contribution format:** Oral  
**Contribution authors:** Sonia Carbonell Pastor (Grup de Recerca en Arqueologia Protohistòrica (GRAP) | University of Barcelona (UB))

Necropolises reflect the values, beliefs and symbolism of the living communities that created and used them. However, the musealisation of these spaces poses major challenges, especially when it comes to making them accessible to the general public. Unlike prehistoric settlements, which have a variety of functional areas, including domestic spaces, production areas and defensive structures such as towers or walls, burial sites are often perceived as empty spaces, mere cavities or holes carved into the rock where the deceased were laid to rest. Menorca’s rock-cut tombs, dating back to the first millennium BCE, are chamber tombs carved into the rock

and represent a particular challenge for heritage management. Although some guided tours and internal visitor routes have been developed, the general public still has a limited and fragmented understanding of the burial practices and rituals that took place in these spaces. Museums also struggle to convey the spatial and architectural complexity of these burial caves. The burial chambers are often subdivided by embedded pilasters and/or freestanding pillars, which influenced internal circulation and movement. This presentation will offer a proposal for the dissemination and interpretation of these spaces. Firstly, we will outline an approach to on-site heritage management using Augmented Reality technologies. In addition, we will propose a strategy for enhancing the understanding of these burial spaces in museums and interpretation centres through 3D printed models.

2256. EYES AND EARS: USING PODCASTS AND VIDEO CONTENT FOR PUBLIC ARCHAEOLOGICAL DISSEMINATION

**Contribution format:** Oral  
**Contribution authors:** Matilda Siebrecht (APN | EXARC) – Raven Todd Dasilva (Independent)

One of the central criticisms of academia is the lack of approachability and accessibility. Research conferences are often restricted by registration fees that are unaffordable to those without an institutional affiliation. Research positions demand logistical flexibility, adding complications to those with families or other personal ties. Academic papers are too often hidden behind a paywall or else made incomprehensible by scientific jargon to those outside the field. However, research grants and fellowships increasingly acknowledge the importance of approachable and accessible research dissemination, which allows academics to allocate resources to such outreach. Nevertheless, the successful implementation of this outreach requires an understanding of the advantages and disadvantages of each platform, and the ability to decide which one is right for a particular project. In this paper, we present several examples of long form content in both audio (podcasting) and visual (YouTube) form, and compare this with the possibilities offered by short form content in the form of social media.

1503. ENHANCING PUBLIC ENGAGEMENT WITH PREHISTORY: DIGITAL STRATEGIES FOR CONNECTING ARCHAEOLOGY WITH MUSEUM AUDIENCES

**Contribution format:** Oral  
**Contribution authors:** Carine Souza (UNIARQ - Centre for Archaeology of the University of Lisbon | FCT - Foundation for Science and Technology, Portugal | MNA - National Museum of Archaeology, Portugal) – Ana Albuquerque Pinto (CREA School, Omnes Éducation, Suisse)

One of the primary responsibilities of Archaeology is to disseminate its knowledge to diverse audiences. When it comes to Prehistory effectively communicating this knowledge remains a challenge. The public often perceives Prehistory through stereotypes or non-scientific interpretations, which hinders a deeper understanding of its significance. Reshaping these perceptions requires innovative strategies that bridge the gap between academic rigour and effective public engagement. Through an interdisciplinary collaboration between an archaeologist/museologist and a digital communication expert, this research applies digital strategies to examine how audiences engage with Archaeology, particularly Prehistory, and how communication can be enhanced to foster deeper connections. A key component of this approach is the development of audience personas – representative profiles that reflect different ways people interact with Archaeology – allowing for content to be tailored to their interests and behaviours. By analysing social media trends, Google Insights, and audience behaviour, this study identifies what truly captures public attention in Archaeology and Prehistory. These insights enable the development of targeted, engaging strategies that employ SEO techniques, customised content, and audience segmentation. Digital platforms, particularly social media, could serve as significant channels for making Archaeology more accessible and interactive. This presentation examines the potential of digital tools in enhancing communication strategies for museums and cultural institutions, moving beyond traditional methods to create narratives that not only inform but also captivated. Museums, as dynamic communication platforms, have the capacity to reach diverse audiences and facilitate meaningful interaction. Meanwhile, digital strategies are not solely concerned with outreach; they seek to integrate audiences into an ongoing dialogue. In this regard, the data obtained from this study are relevant for developing targeted communication strategies, demonstrating that by fostering curiosity and emotional connections with Prehistory, museums can transform scientific research into compelling stories that resonate with contemporary audiences.

1189. ARCHAEOLOGISTS SIFTING THROUGH TRASH: FROM PALEOLITHIC WASTE TO CONTEMPORARY CHALLENGES

**Contribution format:** Oral  
**Contribution authors:** Maria Joana Gabucio – Patricia Martín (Institut Catala de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i virgili (URV)) – Ana Abrunhosa

(Institut Catala de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i virgili (URV) | Interdisciplinary Center for Archaeology and Evolution of Human Behaviour (ICArEHB)) – Andrea Alías (Institut Catala de Paleoecologia Humana i Evolució Social (IPHES-CERCA) | Universitat Rovira i virgili (URV))

Archaeological remains are essentially the refuse of the past. For this reason, understanding how past societies managed their waste is essential for correctly interpreting the archaeological record. However, this topic has received little attention from archaeologists and is rarely communicated to the public, particularly in the case of Prehistory. Over the past five years, we have developed the outreach programme Arqueòlogues remenant brossa (Archaeologists Sifting Through Trash), which explores the parallels between waste management in the past and the present. Its main objectives are: (1) to disseminate current knowledge on cleaning practices, the space maintenance, and waste management during Prehistory; and (2) to foster a deeper reflection on the waste management practices we implement today. In doing so, we also aim to help raise awareness of one of the most pressing contemporary challenges, as recognised in the Sustainable Development Goals (SDGs) of the United Nations 2030 Agenda. To achieve these objectives, we have designed an interactive and immersive workshop, aimed at both families and school groups, as well as talks targeted at the general public. Both the workshop and the talks have been implemented in several outreach programmes, both national and international, such as the European Researchers’ Night (2020, 2022), the Festa de la Ciència (Barcelona, 2024), #científiques (2025), Espaiciència (2025), Pint of Science (2025) and IPHES at the Schools (Ongoing). The workshop has been well received, both for the general public as well as in a school setting, which has been adapted for both primary and secondary education centres. Currently, we are seeking funding to expand and diversify this outreach project.

2179. CONCIENCIA HISTÓRICA, A CULTURAL SPACE TO DISSEMINATE ARCHAEOLOGY AND HERITAGE IN RURAL AREAS

**Contribution format:** Oral  
**Contribution authors:** Patricia Aparicio Martínez (University of Toronto, Canada | Pontificia Universidad Católica del Perú) – María Fernández Mier – Jose Delgado Arcos – Paloma Sánchez-Broch (University of Oviedo) – Pablo López Gómez (University of Leon)

One of the big challenges of archaeology today is to disseminate research to awaken the interest in History and Heritage to a broad public. Captivating attention to different audiences is not easy and it is required to develop different communication strategies. After several years of study and thanks to the link created in the rural territories we work. The research group LLABOR-Social Landscapes from the University of Oviedo started to think about how we could transfer the knowledge of our research and how to get involved in local communities. Therefore, since 2018 we have created a cultural space through it, we design different activities to involve local cultural heritage to the inhabitants where we carry out our research, fostering attachment to the territory and trying to promote scientific vocations. This cultural space is called ConCiencia Histórica, where we use different strategies to spread our findings. The main objective of our research projects is to study ancient rural societies from their landscape in a diachronic manner and we use archaeology as a tool for knowledge transfer and scientific dissemination in these areas, mainly in the North of Iberian Peninsula and in the South-Central Andes of Peru. In this talk we will review several activities and programs that we have developed through this cultural platform, disseminating research results and returning the research to the communities we mainly work with. We will analyze the appropriateness of these activities and their impact to spread archeological research on rural communities and beyond.

1973. EXPLORING COLOMBIAN INÍRIDA RIVER ENGRAVINGS, BETWEEN THE PAST AND PRESENT

**Contribution format:** Oral  
**Contribution authors:** Carmen Perez Maestro (Research center and ecomuseum La Ponte) – Primitiva Bueno Ramirez (University of Alcalá) – Natalia Lozada Mendieta (Universidad de los Andes) – Monica Bran Pérez – Diana Mendoza León – Ainara Cano Echeberria (Independent)

The research project on the rock art of the Inírida River in Colombia is a crucial effort in a challenging area that goes beyond mere documentation. One of its primary objectives is to disseminate knowledge among communities, especially those in remote areas where access to archaeological and historical information is often limited. Research projects have a responsibility not only to study archaeological materiality but also to ensure that their findings are communicated effectively and accessibly to the people living in these regions. This strategy is essential for fostering social appropriation, a process through which local populations recognize and value their own cultural heritage. Similarly, oral traditions enrich researchers’ understanding of material culture and its role in the present. Without this connection between archaeological remains and local communities, conservation and protection efforts risk becoming unsustainable in the long term. To achieve this, the project helps bridge the gap between scientific research and public engagement. By integrating these approaches, the engravings

of the Inírida River can become more than just remnants of the past; they will be living cultural elements that strengthen identity, promote heritage conservation, and ensure that future generations continue to appreciate and protect them. The assemblies with indigenous communities, workshops and talks in educational centers, the recording of audiovisual capsules, and the creation of educational booklets are some of the activities related to the on-site dissemination of the archaeological project.

1766. OPENING HERITAGE: EXPERIENCES OF DISSEMINATION AND VALORISATION OF CULTURAL HERITAGE (INCIPIT-CSIC)

**Contribution format:** Oral  
**Contribution authors:** Yolanda Seoane-Veiga – David Barreiro (Institute of Heritage Sciences (INCIPIT-CSIC))

From the beginning, the Institute of Heritage Sciences (INCIPIT-CSIC) has developed different dissemination strategies to bring science and cultural heritage closer to society. It seeks not only to expand access to general knowledge but also to encourage citizen participation and the inclusion of groups with greater difficulties in accessing heritage and scientific values. Our own programmes with associations such as Down Compostela or FAGAL (Alzheimer Galician Federation) are proof of this purpose. This viewpoint is currently reflected in the activity of the institute’s Valorisation Unit, which develops and coordinates the dissemination actions carried out at the centre, trying to find a balance between bottom-up initiatives (from society to institutions) and the traditionally predominant top-down ones (from institutions to society), convinced that the active participation of society is key to creating a long-lasting bond with the community. The Unit is now involved in Cultur-Monts, an Interreg Project to enhance the heritage associated with mountain cultural landscapes to offer new development opportunities to mountain communities, improving their quality of life, territorial cohesion, boosting the self-esteem of the local population and increasing the capacity of public bodies to attract visitors, integrate new populations and attract young people to their territories. To conclude, INCIPIT remains committed to exploring innovative, inclusive, and effective ways of disseminating and outreaching cultural heritage, which is why we would like to present our approach and experiences in the valorisation of cultural heritage, to contribute to the debate and rethink aspects linked to the how we should improve dissemination methodologies: from the way we accompany the various collectives how we should effectively evaluate projects. The most recent example is “Root Women”, a project of citizen science with rural women of advanced age or with cognitive impairment, for the recovery of the musical heritage associated with trades.

88. FROM EXCAVATION TO A VIRTUAL JOURNEY: EXPLORING THE MEDIEVAL MONASTERY OF SANT GENÍS DE ROCAFORT USING VIRTUAL REALITY

**Contribution format:** Poster  
**Contribution authors:** Sonia Medina Gordo (Universitat de Barcelona | Centre d’Estudis Martorellencs) – Isidre Ot Padilla (Virtual Past) – Pablo Del Fresno Bernal (Sistemes de Gestió de Patrimoni SCCL) – Josep Socorregut Domènech (Universitat de Barcelona | Sistemes de Gestió de Patrimoni SCCL)

The Sant Genís de Rocafort monastery, located in Martorell (Baix Llobregat), has been the subject of archaeological excavation since 2014. The effects of systematic looting and centuries of abandonment have concealed the monument’s structures, which cover nearly the entire area enclosed by a wall surrounding the hill where the Romanesque church stands. Recent excavations have unearthed monastic buildings from the Romanesque period and earlier elements, contributing new knowledge to the current academic understanding of the site. Despite its significance, the monastery’s remains form a heritage ensemble that is difficult to access due to the site’s location atop a hill. To address this, our research team has developed a digital twin of the monastery. This digital resource offers great potential not only for basic research but also for public outreach and knowledge dissemination. Sant Genís’s digital twin is at the centre of a broader initiative: a virtual exhibition using augmented reality, where visitors can explore the archaeological site and learn about its history through interactive panels and resources, all within a virtual environment. This project has enabled us to engage audiences who otherwise might never have been able to visit the site, making the monastery’s heritage accessible to a wider public. However, the development of such an ambitious project has also raised challenges and questions, particularly regarding the choices made in selecting certain dissemination strategies and adapting the historical narrative for different audiences. This poster will present the results of this work, reflect on the difficulties encountered, and discuss how technology, particularly augmented reality, can serve as a powerful tool in the dissemination and democratization of archaeological heritage.

1175. LET’S DIFFUSE SCIENCE ALONG A SOUTH BRAZILIAN RIVER! BUT HOW AND FOR WHO?

**Contribution format:** Poster  
**Contribution authors:** Alejandra Ordóñez (Universidad de Las Palmas de Gran Canaria) – Lucas Bueno – Gabriela Oppitz – Fabiana Merencio Terhaag – Thiago Umberto Pereira – Matheus Fedechen – Lorena Ferreira Nogueira (Universidade Federal de Santa Catarina) – Simon-Pierre Gilson (Universidad de Las Palmas de Gran Canaria)

When sharing archaeological results, we must consider our diverse audiences and design effective outreach strategies. This task becomes more complex when engaging with different stakeholders in the same areas where we operate. Thus, we carry the obligation to shape our narratives thoughtfully. This is crucial from both an ethical and scientific standpoint, as our discussions can have political ramifications. Science now plays a significant political role, especially in archaeological studies in former colonial regions. In this poster, we outline our research strategy for the Pedra de Amolar site, which is part of a larger project in the Valley of Itajaí (Brazil). This site is a funerary shell midden, dated back to 6,000 to 7,000 years CalBP, and belongs to the Sambaqui tradition. The connections between this archaeological context and contemporary Indigenous groups are still under investigation. Nevertheless, these sites are acknowledged as meaningful places to these groups’ profound historical narrative and their traditional lands. The European colonization of this region is relatively recent, dating back to 19th century, with a last wave of migration following World War II. This was a violent process, leading to intense conflicts regarding the use and occupation of indigenous traditional lands. This context means that recognizing Indigenous Lands and Rights remains contentious and has occasionally led to violent confrontations. Thus, while discussing outreach, we must recognize two distinct audiences: the Indigenous population and the descendants of colonizers, each requiring tailored approaches. For the Indigenous population, we advocate for a collaborative archaeology framework that involves community participation not only in communicating findings but also in the design and implementation of research. For the non-indigenous population, our role is to create outreach initiatives that encourage them to understand the various historical narratives and recognize Deep History as an essential part of Brazil’s heritage.

1301. EXPERIENCING THE PAST: EXPERIMENTAL ARCHAEOLOGY FOR INCLUSIVE DISSEMINATION

**Contribution format:** Poster  
**Contribution authors:** Annamaria Daniele – Francesco Lucchini (Sapienza University of Rome, Department of Antiquity)

This work presents an archaeological dissemination project that integrates experimental archaeology in two distinct contexts—a retirement home and a high school—highlighting its potential as a dynamic and inclusive communication tool. The initiative was carried out using hands-on experimental protocols for the production of prehistoric pottery, adapted to meet the unique needs of each environment and audience. The experimental sessions demonstrated notable therapeutic and cognitive benefits in the retirement home. The elderly participants experienced improved social interaction, rekindled memories, and a renewed sense of purpose. By directly engaging with prehistoric crafts, they established creative links to the distant past, promoting mental well-being and fostering a sense of fulfilment. In high schools, the project aimed to address a gap in the curriculum, where prehistory is often overlooked in favour of later periods. Through these interactive, hands-on activities, students were able to touch and experience the past directly. The experiential learning sessions provided students with a tangible connection to prehistoric human development, encouraging them to broaden their historical perspectives and develop critical thinking skills. The project highlights the successes and challenges encountered along the way and explores how similar initiatives could be expanded to reach more communities. By tailoring archaeological outreach to different audiences, the project demonstrates how experimental archaeology can serve as a bridge between academic research and public understanding. Ultimately, this initiative offers a pathway towards a more inclusive appreciation of often-overlooked periods of human history, enriching both education and community engagement.

1478. DISSEMINATING NEOLITHIC DOLMENS THROUGH IMMERSIVE 3D VIDEO GAMES

**Contribution format:** Poster  
**Contribution authors:** Mikkel Nørtoft (Section for Archaeology, Saxo Institute, University of Copenhagen/Copenhagen School of Archaeology) – Daniela Hofmann (Department of Archaeology, History, Cultural studies and Religion, University of Bergen) – Rune Iversen (Section for Archaeology, Saxo Institute, University of Copenhagen/Copenhagen School of Archaeology)

Video games are becoming powerful media for heritage dissemination, shifting from industry-led projects to archaeologist-created interactive experiences. Using free tools, we, with no experience in game development,

created a 3D game featuring photogrammetry-modeled Neolithic dolmens and AI-driven NPCs engaging players in dynamic oral conversations about the past. Our case study focuses on the Neolithic long dolmens at Lindeskov Hestehave, Funen, Denmark (in connection with the Deep Histories of Migration project). We created photogrammetry models of these long dolmens (using Reality Capture), integrated them into Unreal Engine 5.4, and created AI-powered NPCs (using Metahuman) conversing freely from their dedicated backstories, personalities, and knowledge (using Convai and ChatGPT 4o-mini). Players engage with our NPCs embodying different perspectives—scientific archaeology vs. spiritual experience—while exploring the dolmens in an immersive, fog-shrouded forest-clearing or passing through a dolmen to experience an “afterlife” world. Preliminary testing (10 players, 8 sessions) showed rapid engagement, with players adopting diverse interaction styles—from role-playing to critical questioning. The NPCs “Dolmen Guy” and “Dolmen Debbie” successfully conveyed archaeological knowledge, and were continuously updated to ensure accuracy and immersion. Our proof-of-concept highlights the feasibility of archaeologist- developed video games using free tools, with great potential for museums and other digital heritage outreach. AI-driven NPCs offer a flexible format for engagement but require careful narrative management. To limit the energy consumption of the interactions, we use a particularly “cheap” language model. Future directions include event-driven narratives, expanded player and event functionalities, and potential simulation experiments in emerging social structures among NPCs within archaeogames. Overall, this empowers archaeologists to create their own video games.

**2224. MUSEOLOGICAL PRESENTATION OF MINIATURE ARCHAEOLOGICAL MATERIAL FROM THE SITE VUČEDOL – CORNFIELD STREIM, VUKOVAR (CROATIA)**

**Contribution format:** Poster  
**Contribution authors:** Petra Nikolic – Mirela Hutinec – Mirna Šuljug (Vucedol Culture Museum)

At the beginning of 2025, an exhibition called “Little secrets of the big depot - Male tajne velikog“; was opened in the Vučedol Culture Museum. The exhibition takes visitors through the story of miniature objects from the period of the Vučedol Culture (3000-2500 BC) found during the systematic archaeological research of the eponymous site within closed units, pits and houses, at the position of Streim Cornfield. These excavations lasted for a whole decade, from 2012 to 2021, and resultet only in a smaller number of miniature finds. Miniature models of consecrative horns, censers, and footwear are only a part of the displayed objects that served in everyday or ritual activities. Especially interesting are the ones with multiple purposes, and those whose real purpose is still not fully defined. In addition to the diverse miniature archaeological material presented to the general public for the first time in this context, the interactive exhibition captures attention with its visual concept, which allows visitors to see the museum’s storage rooms and the workspaces of the curators - archaeologists. Depots, due to their primary function and inaccessibility to visitors, often represent a true mystery. This presentation will refer to the creation and realization of the exhibition concept, which in a visually attractive way presents the material that, due to its simplicity, may not be so attractive among the audience. Additionaly, it will explain in which way interaction was encouraged among everyday visitors with minimal use of additional technological solutions.

**180 IDENTITY OF PLACE AND SPACE IN HISTORICAL AND ARCHAEOLOGICAL CONTEXT**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** material culture, identity, sites of memory, spatial relationships, interconnecting cultures, historical events  
**Session organisers:** Anna Miaczewska – Anna Obara (Maria Curie-Skłodowska University) – Clara Maria Ramos Taboada (Foundation of Research and Technology - HELLAS) – Rachael Lane (University of Sydney)

**SESSION ABSTRACT**

Pierre Nora’s (1984-1992) term lieux de mémoire – places/sites of memory – defined the artefacts recognised by specific groups/communities as pertaining to the these groups’ understanding and establishing their local history. Taking into consideration this definition created by Nora, the aim of this EAA session is to examine the concept of places and spatial relationships between archaeological objects, domestic features, large and ritual structures, etc., in order to prove their specific effect on shaping and reshaping the identities of various communities. Conversely, this theoretical perspective can also be used in this session to assess how the practical application of the concept of ‘identity’ of various societies transformed places and spaces they came in contact with. The papers presented in the sessions will address methods and tools which were used during the processes of cultural and historical changes, and how these processes marginalised and/or pushed aside the material culture typical of

other specific groups/communities, at the same time transforming the cultural, political, and social space, as well as the natural landscape of the affected areas. This session will focus on historical events (wars, conquests, invasions, attacks against indigenous inhabitants of various regions and countries vs. interactions and interdependencies between local material cultures in times of peace) and archaeological case studies which can determine that. 1) specific individual or group identities emerged as a result of the interconnectivity/clashing of different ethnic/religious/political groups and societies. 2) new places (and sites of memory) were established due to the occurrence of violent events in the past or because of various peaceful communication processes (e.g. exchange of goods). 3) different space, landscape, urban or rural areas were (re)created as a consequence of assuming new identities (notion of forced vs. voluntary acculturation and assimilation).

**CONTRIBUTION ABSTRACTS**

**285. KOUROI AT THE PTOION SANCTUARY: THE ARTISTIC IDENTITY OF BOEOTIAN COMMUNITIES IN THE ARCHAIC PERIOD**

**Contribution format:** Oral  
**Contribution authors:** Lucrezia Mastropietro (Scuola Superiore Meridionale)

“Les sculpteurs béotiens de l’époque archaïque ont bien moins de talent que de sentiment ; peu de savoir-faire, mais beaucoup de franchise ; si leurs œuvres demeurent très-éloignées de la perfection plastique, elles restent assez voisines de la nature ; ils ne savent guères ce qui peut s’apprendre, mais ils possèdent d’instinct quelques-unes des qualités qui ne s’acquièrent pas”. With these brief remarks, Holleaux, the discoverer of the Temple of Apollo Ptoios in Boeotia, summarized his assessment of the region’s archaic sculpture. In his view, the kouroi found at the site bore, more than those discovered elsewhere, the imprint of an “indigenous” art. The selection of the Ptoion sanctuary—among all possible sites—as the place of dedication for these kouroi is likely a reflection of the fact that, as early as the 7th century BCE, the community regarded it as a locus of identity. By analysing the different materials used, stylistic evolution, patterns of patronage, and the historical context and events within which this production took place, it becomes evident that the kouroi serve as direct testimony to the identity-building function of artistic languages in the sanctuary. As such, they can be interpreted as material manifestations of the individuality of Boeotian communities, for whom this sanctuary functioned as a point of reference and convergence, an expression of their collective memory. The creation of kouroi thus for the Ptoion constitutes a fundamental cultural premise of identity.

**1197. IDENTITIES AND ONOMASTICS OF ENSLAVED PERSONS IN THE CLASSICAL PERIOD: EPICHO- RIC SLAVE SYSTEMS AND ALTERNATIVE MODELS**

**Contribution format:** Oral  
**Contribution authors:** Ioannis Diamantopoulos (Foundation of Research and Technology - HELLAS)

Until recently, it was widely accepted that slaves during the classical period were bearers of stereotypical ethnic names, reflecting an ideology that differentiated citizens from slaves. Recent studies have shown that, while ethnic names were a common way to identify slaves as foreigners, they were not the only form of names used. That study revealed a more complex picture where many slaves, freedpersons, and even possible slaves shared the same names with citizens, disproving the assumption that slave names always served as a way of distinguishing them from the free population. Does the model of classical Athens apply to the rest of the Greek world? My presentation examines the existence of two distinct onomastic models in the classical period, by comparing Athens and Chios, on the one hand, with four regions of the Peloponnese on the other. The evidence suggests that while Athens and Chios share a common pattern, in which ethnic and foreign names constitute a substantial proportion of slave names, such slave names are completely absent from the Peloponnesian slave systems. The Athenian and Chian names suggest closer interactions with Asia Minor, whereas the Peloponnesian model appears more inward-looking, attesting different trends, dynamics and influences. By analyzing these differences, this paper contributes to our understanding of regional identity expression through personal names in the classical Greek world.

**908. THE IDENTITIES OF ROMAN ENSLAVED PERSONS IN RELIGIOUS INSCRIPTIONS FROM THE REGIONS OF UMBRIA AND ETRURIA (REGIONES VI AND VII)**

**Contribution format:** Oral  
**Contribution authors:** EB Rummel (University of Crete | Institute for Mediterranean Studies (IMS-FORTH))

This presentation offers an exploration of the identities of enslaved persons as expressed in religious inscriptions from Roman Umbria (Regio VI) and Etruria (Regio VII), dating from the first century BCE and first two centuries CE.A central component of community in ancient Roman society was participation in shared religious practices. The dynamic overlapping of the religious practices of the individual, family, familia, occupation and

chosen communities, city, and more general geographic region formed an intertwined and multilayered religious landscape. Partially constitutional of this landscape were religious inscriptions, dedications and vota. Through their creation, individuals and groups asserted their place in the community and contributed to its ever-evolving dimensions. The texts of such religious inscriptions produced by enslaved persons serve as vital evidence of the complex and potentially heterogeneous identities they espoused and embodied. While marginalized and rendered lesser by many metrics, they nevertheless created objects, whose texts speak to their participation in their community’s religion and their being intertwining in the varied relationships which constituted it and its members. Moreover, the creation of at least presumed permanent objects demonstrates the agency of slaves to shape their community and their place within, an agency greatly impacted by their various identities.

1241. SPACES OF SELF-REPRESENTATION AND GROUP IDENTITIES IN ROMAN THUBURSICUM NUMIDARUM

**Contribution format:** Oral  
**Contribution authors:** Clara Ramos-Taboada (Institute for Mediterranean Studies (IMS) – Foundation for Research and Technology (FORTH))

The present study focuses on the epigraphy of the ancient city Thubursicum Numidarum (modern-day Khamisa, Algeria), covering the period from 1st to 3rd century AD. The material employed is the epigraphic corpus of the city, comprising more than 800 inscriptions. This study assumes that the habit of epigraphic commemoration reflects a certain degree of Roman acculturation. However, the population comprises various groups which adopt distinct representation patterns, demonstrating deliberate behaviours. On the one hand, the pre-Roman and Numidian population take part in epigraphic commemoration more frequently than in other nearby cities and exhibit a differentiated identity due to a distinct name-giving system. Consequently, there seems to be an absence of the display of a sense of integration into the pyramid of legal statuses of Roman society. On the other hand, the servile population is present in a lesser number of inscriptions than in other nearby epigraphic corpora. This is a striking phenomenon given that this community is usually overrepresented in epigraphy. The analysis will address the question of whether their presence in the city is linked to the Roman or Numidian communities. In addition, the investigation will examine how well the subjects adopted Roman modes of representation or whether they maintained their own identity. Finally, the study will address also the hybridisation of freedmen, slaves and Numidians. It is important to consider that, a priori, these communities would be regarded as under Roman power. Therefore, the present study will use epigraphy to examine how these identities coexist in the funerary space and how they hybridise or remain separate, starting from the premise that epigraphic commemoration in this context is in itself a Roman acculturation.

1557. LANDSCAPES OF INFLUENCE: THE RELATIONSHIP BETWEEN GREEK IDEAS AND ROMAN GARDEN DESIGN

**Contribution format:** Oral  
**Contribution authors:** Rachael Lane (University of Sydney)

This paper explores the influence of the Greek world on Roman gardens and landscapes, examining how the Romans adapted Greek ideas and material features in their own garden designs. I will investigate shifts in style, fashion, and philosophical outlook that contributed to a more favourable Roman view of Greek culture, leading to its assimilation into Roman garden aesthetics. Through the lens of philosophy, architecture, art, and aesthetics, I will identify both the elements that were embraced and those that were discarded, considering the reasons behind these choices and their role in redefining Roman material culture. Additionally, I will explore historical, practical, and technological factors—such as advances in water and waste management—that facilitated this integration. The Romans took many of these ideas, built on them and incorporate. them into their gardens, villas, and public spaces. Finally, I will examine the botanical influences from Greece, highlighting the plants and horticultural practices introduced into Roman gardens and how they reflect broader cultural exchanges.

1010. MEMORY, IDENTITY, AND THE TRANSFORMATION OF SACRED SPACES: THE ARCHAEOLOGICAL SITE OF LAS CALAVERAS (RENEDO DE ESGUEVA, VALLADOLID, SPAIN)

**Contribution format:** Oral  
**Contribution authors:** Santiago Sánchez De La Parra-Pérez (Universidad de Santiago de Compostela | Institut Ausonius - Université Bordeaux-Montaigne) – Sonia Díaz-Navarro (Universidad de Burgos)

The archaeological site of Las Calaveras (Renedo de Esgueva, Valladolid) spans nearly 15 hectares and has been continuously occupied over several centuries. Nearby, Iron Age ritual deposits and a Roman peristyle villa, likely dating to the Early Imperial period, indicate long-standing ritual and domestic activities in the area. Since 2024, excavations have focused on a monumental complex consisting of two significant structures: a double-apsed

basilica and a tetraconch mausoleum. The mausoleum, originally constructed in the 4th–5th centuries AD, was likely part of an individual or family funerary complex. In later phases, the site underwent a transformation, with the mausoleum repurposed as a necropolis during the Visigothic period. The clear space sacralisation in relation to the nearby basilica underscores the significance of this site in shaping collective memory and identity. The reuse of construction materials from the now-decommissioned mausoleum for Visigothic burials further highlights the complex interplay between continuity and change in the perception of sacred spaces. By the 6th century AD, the mausoleum had been completely dismantled, yet its influence persisted in the evolving cultural and religious landscape. This paper explores the transformation of the Las Calaveras site as a lieux de mémoire, examining how shifting religious and social identities influenced the use and reinterpretation of space over time. The study contributes to broader discussions on the role of material culture in the construction of memory and identity, particularly in transitional periods from Antiquity to the Early Middle Ages.

1788. NOMADIC PLACE IDENTITY AS REVEALED BY THE THOUSAND YEARS OF THE KEGEN VALLEY BURIAL MONUMENTS

**Contribution format:** Oral  
**Contribution authors:** Vera Uhrin-Majerik (National Institute of Archaeology, Hungarian National Museum Public Collection Centre) – Gabor Viragos (Independent) – Nabira Torezhanova – Olga Myakisheva (Central State Museum of the Republic of Kazakhstan)

In 2024, the Central State Museum of the Republic of Kazakhstan (Almaty) launched a collaborative three-year research project with the Hungarian National Museum investigating the archaeological and ethnographic monuments of the Kegen Valley. This interdisciplinary study examines how geographical space influenced community identities through millennia, focusing on the spatial relationships between settlements and burial complexes. The project, entitled “Archaeological and ethnographic monuments of the Kegen Valley: topography, cultural and chronological aspect and museification,” extends beyond traditional site excavation to analyze the complex spatial organization of burial monuments. Of particular interest is the systematic arrangement of burial mounds (kurgans) that demonstrate continuous spatial patterning from the Bronze Age through the Medieval period, despite significant demographic changes among the nomadic populations. Our preliminary findings reveal that successive nomadic groups maintained established spatial organizations in their burial practices, suggesting a strong relationship between place identity and cultural continuity. The linear arrangement of kurgans, indicates deliberate adherence to existing spatial patterns despite cultural transitions. This phenomenon raises important questions about the transmission of spatial knowledge and the role of landscape in shaping group identities among nomadic societies. This presentation will discuss initial results from the 2024 field season, examining how various nomadic groups interpreted and maintained spatial traditions while adapting them to their own cultural practices, demonstrating the complex relationship between place, identity, and cultural continuity in a Central Asian archaeological context.

2154. MIGRATION, IDENTITY, AND LANDSCAPE TRANSFORMATION OF THE CROATIAN MILITARY FRONTIER

**Contribution format:** Oral  
**Contribution authors:** Nikolina Antonic (Charles University, Faculty of Arts, Prague)

Beginning in the second half of the 14th century, the Ottoman Empire’s expansion into Europe triggered large-scale migrations from the Balkans and southeastern Europe to the north and west, permanently reshaping the region’s ethnic composition. These migrating groups carried with them distinct cultural, religious, and burial traditions, yet their ability to preserve these practices varied depending on the political, economic, and environmental conditions of their new homelands. This paper focuses on the Croatian Military Frontier, particularly the Banal Frontier. Initially established as a defensive buffer against the Ottomans, the Military Frontier gradually transformed into a distinctive socio-political and cultural entity within the Habsburg Monarchy and Europe. It was inhabited by soldier-peasants, known as Grenzers (“krajšnici”), whose military service became one of the defining elements of their collective identity. However, the Grenzers originated from diverse regions of Croatia, Serbia, and Bosnia and beyond, bringing with them various cultural and religious traditions. This convergence of influences led to a complex identity formation, shaped by both integration and conflict, while simultaneously reshaping the landscapes of their new homeland. This paper examines the multifaceted factors that influenced the evolution of these frontier societies, with a particular focus on the establishment of religious structures and cemeteries. It explores how these dynamics redefined both the people and the spaces they inhabited, ultimately shaping new identities within the changing frontier landscape.

513. EXAMING THE SLAVIC IDENTITY IN THE ANNALS BY JAN DŁUGOSZ

**Contribution format:** Oral  
**Contribution authors:** Anna Obara (Maria Curie-Skłodowska University, Lublin)

Jan Długosz (1415-1480) is one of the most important European chroniclers of the 15th century. His monumental work, the twelve-volume Annals or Chronicles of the Famous Kingdom of Poland (Annales seu cronicae incliti Regni Poloniae), remains a phenomenal source for the knowledge of the medieval history of Poland and its neighbours. At the same time, Długosz - a well-educated person, an astute observer of reality and a representative of the Polish intellectual, religious and political elites - possessed the right competence to formulate opinions on issues going beyond a simple reconstruction of historical events. One such issue was that of the Slavic identity. In my presentation, I will try to provide an answer to the question of how the Polish chronicler understood the Slavic identity. I will focus on issues such as the origin of the Slavs, their language, and the territorial extent of their presence. In order to understand the meaning of the Slavic identity in Długosz’s work, it will also be necessary to analyse the circumstances in which a given reference was cited.

479. POLITICAL PETROGLYPHS — THE HISTORICAL MARITIME ROCK ART OF SKAGERRAK AND THE BALTIC SEA

**Contribution format:** Oral  
**Contribution authors:** Anton Larsson (Uppdrag arkeologi)

Between the mid-15th century and the early 19th century CE, seafarers navigating the Northern European maritime contact zones of the Skagerrak Strait and the Baltic Sea left behind a remarkable corpus of historical rock art. Along the insular anchorages and natural harbors that served as vital nodes in regional communication and shipping networks, they carved names, dates, coats of arms, and a variety of pictorial imagery. These petroglyphs held significant meaning, ranging from late medieval Danish aristocrats asserting their status and lineage through heraldry, to common soldiers and sailors of the Finnish War (1808–1809 CE) using the stone surfaces to express wartime patriotism and camaraderie. Social structures, identities and ideas were recreated and reaffirmed through the process of carving messages and symbols into the rock. Many key sites were reused over centuries, and the presence of these petroglyphs would influence how the locations were perceived by local communities. This paper provides an overview of the historical maritime rock art found in the Bohuslän Archipelago, the Stockholm Archipelago, and the Gulf of Finland, highlighting the untapped research potential of this underexplored field of cultural heritage. Additionally, it introduces a case study of two newly surveyed sites on the island of Tyvö, Sweden, offering fresh insights into this long-lasting practice of place-making.

1859. OLĘDER SETTLEMENT IN THE AREA OF MODERN ŁÓDŹ

**Contribution format:** Poster  
**Contribution authors:** Anna Olczyk (University of Lodz, Doctoral School of Humanities)

The presentation will focus on the material traces of Olęder settlers in Łódź, their current condition and the circumstances that led to it. In particular, I will focus on the specific expressions of the Olęder identity that have emerged as a result of the interactions and confrontations of various ethnic and religious groups over a period of at least three centuries. The beginnings of Olęder settlement within the present city limits date back to the end of the 18th century. Unlike the first wave of this settlement in Poland (16th century), a community of mixed origin settled in the suburbs of Łódź. Most of the settlers came from the German cultural area. Among them were also descendants of settlers from earlier waves of settlement. The settlements they founded were intended for the economic development of areas that had not been cultivated before, usually due to difficulties in accessing them, such as forests or wetlands. The settlements, which had existed since the end of the 18th century, became urbanised and the cultural landscape of most of them underwent significant changes. The expulsions and population exchanges had a significant impact on the condition of the remains of the Olęder settlement, which were gradually destroyed by both natural and anthropogenic causes. The material traces of the settlement, which are - or rather could be - the “last witnesses” of the functioning of the Olęder communities around Łódź have almost completely disappeared from the social memory. At present, the urban areas that are the subject of my research have been almost completely transformed as a result of the adoption of new identities, in which there are scarcely any traces of the former presence of such an important and unique component of the past: the Olęders.

181 HUMAN REMAINS IN MUSEUMS: BRIDGING NARRATIVES AMONG ETHICS, SCIENCE, HERITAGE, AND COMMUNITY ENGAGEMENT

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Regular session  
**Session keywords:** university collections, museology, anthropology, bioarchaeology, ethics, human remains  
**Session organisers:** Giovanni Magno (Morgagni Museum of Human Anatomy - University Museums Centre CAM, University of Padua) – Alice Cusan (School of Social Science- University of Aberdeen) – Dario Piombino-Mascali (Department of Anatomy, Histology and Anthropology, Faculty of Medicine, Vilnius University)

SESSION ABSTRACT

Today, museums preserve collections of human remains interpreted variously among anthropology, archaeology, and medicine. These categorisations contribute to distinct and sometimes conflicting interpretations and narratives, embedded in gray legislations and guidelines. Along with being invaluable for research in archaeology, anthropology, and the history of medicine, human remains are multilayered, simultaneously belonging to different, opposing, or contested narratives. Therefore, nowadays museums have an important role in bridging archaeology, heritage and science, engaging the public in both scientific and cultural knowledge. Recent debates have underlined that ethical considerations are crucial, especially regarding the consent of those whose remains are studied. However, existing laws leave many collections without adequate regulation. This lack of comprehensive guidelines risk compromising ethical integrity, highlighting the need for an expanded ethical framework to ensure respectful and responsible treatment of all human remains in museum collections, considering the evolution of conceptualizing consent of those whose remains are studied, sometimes rarely applicable for remains from archaeological sites. Such measures will support ongoing studies and honour the cultural and historical significance of these remains, contributing to our understanding of humanity. This panel aims to explore the educational and cultural roles of museums, focusing on the ethical display and interpretation of human remains and how these practices can connect past and present knowledge. Insights will help shape a comprehensive ethical framework and promote respectful treatment to all human remains in museum collections. This dialogue seeks to widen the collective understanding and appreciation of our shared heritage.

CONTRIBUTION ABSTRACTS

195. VALUING, RESEARCH AND PUBLIC ENGAGEMENT: THE MORGAGNI MUSEUM EXPERIENCE

**Contribution format:** Oral  
**Contribution authors:** Alice Cusan (School of Social Science, University of Aberdeen, Edward Wright Building, Dunbar Street) – Giovanni Magno (Morgagni Museum of Human Anatomy, University Museums Centre CAM, University of Padua)

Antonio Vallisneri (1661–1730) initiated scientific museology in Padua by collecting rare biological specimens for student education. Giovanni Battista Morgagni (1682–1771) attempted to establish the first medical museum in 1756, but it was only in the 19th century that Lodovico Brunetti (1813–1899) unified the medical-pathological collection and founded the Pathology Museum. The absence of laws on body acquisition and the lack of medical documentation historically made it difficult to determine whether specimens were donated voluntarily or collected post-mortem. Different attitudes towards death may have also encouraged spontaneous body donations. In 1933, new laws significantly limited the preservation of specimens in Italian anatomical museums, leading to a decline in medical museology. However, new legislation in 2020 now allows for the consensual donation of bodies for study, medical training, and scientific research, with updated regulations for the return of bodies. However, the museum aspect is still not considered. Given this complex history and evolving legal landscape, how can museums balance the ethical considerations of displaying human remains with the educational and cultural benefits they provide? To answer this question, we give the example of the Morgagni Museum of Human Anatomy. It is recently renovated and serves as an educational and scientific hub even for non-specialist visitors. The exhibition focuses on the scientific nature of the preparations, respecting the human body and increasing knowledge about human pathologies and ancient living conditions. Innovative educational tools such as QR codes and Augmented Reality enrich the experience, enhancing the visit scientifically and ethically. Numerous positive feedback confirms the growing public interest in these museums.

895. THE ANTHROPOLOGICAL ANTIQUE AND MEDIEVAL COLLECTION AT THE MUSEUM OF SRE. – PROBLEMS, SOLUTIONS AND EXPERIENCES

**Contribution format:** Oral  
**Contribution authors:** Nataša Miladinovic-Radmilovic – Dragana Vulović (Institute of Archaeology, Belgrade)

In 2016, at the Open-call for co-funding projects in the area of research, preservation and usage of the museum heritage of the Ministry of culture and information of the Republic of Serbia, we were given considerable funding to start the project Preparation of final documentation and provision of permanent and safe storage of osteological material from earlier anthropological research in Sirmium. Out of all the museums in Serbia, we chose, as the starting point, the Museum of Srem and the material from Sremska Mitrovica (Sirmium) and its’ immediate surroundings, not only because it is one of the most significant antique and medieval sites in our country, but also because anthropological examinations and analyses, accompanied by photos, were performed, and also published, for over 1.000 individuals. In the period between 2016 and 2025 we managed to form an anthropological collection with more than 2.000 individuals in the Museum of Srem in Sremska Mitrovica, which is important not only for the research on the population of Srem in the Antiquity and in the Middle Ages, but also for the entire territory of Serbia. We rearranged and deposited the human osteological material in adequate and permanent storage equipment, properly marked, we place the containers on high-quality steel shelves and in this manner protected the human osteological material from decay. Every single skeleton, i.e. every single deceased, had its’ own record, where it was listed: site on which the material was found, grave number and designation, the number of shelf and box, finding conditions in the field where it was found, its’ sex and individual age, body height, as well as additional notes, if there was need for them. The forming of the collection also enabled, along with safe storage, greater availability of the anthropological material for the needs of future research and presentations.

1239. PEOPLE, RELICS, SPECIMEN OR SAMPLES? MUSEALIZATION OF HUMAN REMAINS IN POLAND

**Contribution format:** Oral  
**Contribution authors:** Emilia Jastrzebska (The Royal Łazienki Museum in Warsaw) – Joanna Ślaga (Jagiellonian University Museum)

Human remains have been part of museum collections since the dawn of museums and Polish collections are no exception to this rule. They are present in various forms and shapes in museums including regional, historical, medical, ethnographic, art, and archaeological museums, with the latter being the most common ones to house such relics. Despite the considerable size of the collection and the debate ongoing in the widely understood West, the question of their legal status and ethics of their display have somehow been neglected in Poland for decades. The reason for that is partially the usual anchoring of that western debate in the post-colonial discourse, which Polish curators hesitate to become a part of. It was not until a couple years ago when the topic was first officially addressed in a report published by the National Institute of Museums and Public Collections (today National Institute for Museums) presenting the questionable legal situation and considerable moral dilemmas expressed by curators working with collections of human remains in various museum contexts. The publication of the report triggered further actions. The National Heritage Institute called to life a working group whose task was to provide official interpretation of legal regulations regarding archaeological human remains. The National Institute for Museums also continues to work on proposing solutions and guidelines for museums regarding various aspects of caring for human remains in their collections. The presentation will cover where Polish museums currently stand on the field of the complex question of musealisation of human remains - it will discuss what has been done so far and what the plans for the future are.

11. DECOLONISING DEATH: INDIGENISATION OF COMMUNITY COLLABORATION AT MUSEUMS

**Contribution format:** Oral  
**Contribution authors:** Katie Clary – Carolyn Dillian (Coastal Carolina University)

Museums and public institutions tout buzzwords like “decolonisation” and “collaborative” work regularly in their marketing and public-facing information; often there is very little action to back up this talk. This has become particularly apparent as changes to federal laws in the United States caused modifications to exhibits that are tangible and visible to visitors, and the story was picked up by journalists covering impacts at major museums. Federal law changes demanded that museums work with Native American tribes to repatriate human remains and belongings, as well as to build exhibition and public programming. This paper details the ways museums, public institutions, and archaeologists use (or do not use) decolonisation efforts in their displays, programs, and public events, especially in regards to human remains. The paper begins with a survey of human remains of subjugated people in museums, then focuses on how that past impacts museums still today. It also explains how the Native American Graves Protection and Repatriation Act and other federal legislation discriminates against non-federally recognized indigenous communities in the United States. The chapter includes a case study on the Waccamaw Indian People (WIP) of South Carolina to demonstrate these issues. . The authors argue that though many institutions and practitioners like to use these popular words in grant applications and on public-facing texts, it is of paramount importance that professionals actually do that work ethically and thoughtfully, especially when the work considers death practices and human remains. Though this paper is not specifically European in scope, the European coloniser settlements of the United States still impact practices today, and indigenous and other subjugated communities exist globally. This paper focuses on these issues through the lens of Native

American groups in museums both in the United States, and in Europe.

509. RETHINKING ETHICAL RESPONSIBILITIES: CHANGING ATTITUDES TO THE STEWARDSHIP OF HUMAN REMAINS IN MUSEUM COLLECTIONS

**Contribution format:** Oral  
**Contribution authors:** Hana Lukesova – Camilla Nordby (University Museum of Bergen)

In 1828, Bergens Museum acquired an Egyptian wooden coffin containing a mummified woman, Teshemmin, reflecting the intense European fascination with Egyptian heritage during the early 19th century. Nearly two centuries later, a CT scan of her body has reignited critical discussions about the ethical management of human remains in museum collections. This presentation examines the challenges of handling, conserving, and exhibiting an ensemble consisting of Teshemmin’s mummified body, her painted coffin and associated textiles. Teshemmin, a priest’s daughter from the late Ptolemaic or early Roman period, was originally laid to rest with textiles, including a painted shroud bearing her portrait. However, only fragments remain, and damage to her face suggests a face mask was forcefully removed. When her remains were lifted for transport to a hospital for examination, a remarkable painted depiction of Osiris was discovered on the coffin’s bottom. To preserve this artwork, a pivotal decision was made: Teshemmin’s mummified body would not be returned to the coffin. This outcome raises profound ethical dilemmas. Does prioritising preservation of material culture justify separating human remains from their original resting place? Should Teshemmin receive a new coffin, and if so, what criteria should guide its design—historical accuracy, conservation priorities, or broader ethical considerations? This presentation explores how evolving museum practices must navigate the intersections of scientific investigation, conservation, and respect for the dead. By interrogating these ethical dimensions of Teshemmin’s case, we highlight broader implications for the stewardship of human remains in museum collections worldwide.

1619. SHIFTING THE NARRATIVE: WARNING AGAINST OR PREPARING TO ENCOUNTER THE HUMAN REMAINS IN MUSEUMS?

**Contribution format:** Oral  
**Contribution authors:** Nicole Crescenzi (IMT School for Advanced Studies Lucca)

The presence of human remains in museum collections and exhibitions is certainly not a novelty, and in the professional community, the debate related to this topic is a long-standing one. In their role as educators, museums found themselves faced with ethical questions that present no easy answer, trying to balance the need to spread knowledge while also respecting past lives. According to most professionals, visitors have no problem with the display of human remains; they want to see them when they visit museums, and it seems to be one of the reasons to go – even though most museums do not seem to engage directly with the public, they also very rarely receive complains about human remains on display. Still, as a reaction to the existing debate, some museums feel the need to ease the experience for the visitors without forcing them to see the human remains, using, among other devices, warning signs, which are becoming increasingly common and leave the choice of seeing the human remains to the visitors themselves. Starting from the data collected in an online survey, underlining that the public does not feel the need to be protected, in this paper, we would like to offer a different option: preparing the visitors for what they are about to see does not necessarily mean to warn them – especially if we think of the definition of warning, i.e., something that makes you understand there is a possible danger or problem. Human remains are not a problem and surely not a danger. Through two Italian case studies, we will underline the importance of shifting this narrative, which could result in respecting the deceased and making them the center of the debate while at the same time starting an engaged conversation between different stakeholders.

1406. (NOT SO) ETERNAL REST: ETHICAL CONSIDERATIONS IN THE CURATION OF HUMAN REMAINS FROM ARCHAEOLOGICAL CONTEXTS

**Contribution format:** Poster  
**Contribution authors:** Anne Malcherek (Laboratory of Biological Anthropology and Human Osteology–LABOH, CRIA, FCSH, NOVA University Lisbon | In2PAST–Associate Laboratory for Research & Innovation in Heritage, Arts, Sustainability & Territory | Direção Municipal de Cultura e Património da Câmara Municipal do Porto) – Zélia Rodrigues (Laboratory of Biological Anthropology and Human Osteology–LABOH, CRIA, FCSH, NOVA University Lisbon | In2PAST–Associate Laboratory for Research & Innovation in Heritage, Arts, Sustainability & Territory | Arqueologia e Património Lda.) – Manuela Ribeiro (Direção Municipal de Cultura e Património da Câmara Municipal do Porto) – Paula Mota Santos (Universidade Fernando Pessoa: Porto | CAPP ISCSP, Universidade de Lisboa) – Francisca Alves Cardoso (Laboratory of Biological Anthropology and Human Osteology–LABOH,

Debates about appropriate treatment of human remains held by museums and universities have proliferated in recent decades. Legacy anatomical collections, and collections connected to colonial contexts have rightfully been scrutinized. Human remains also frequently emerge during archaeological excavations, conducted for scientific research or required by construction regulations, continually generating new collection. to be curated by museums and other research and public institutions. However, ethics surrounding the care of archeological remains are less often explored. These ethical obligations include: heritage stewardship, scientific rigour, educational goals, wishes of descendant communities, and the rights and dignity of the individuals whose remains we study. While the availability and quality of legislative frameworks and official guidance concerning archaeological human remains varies, abundant literature exists to guide heritage professionals in their care. In practice, however. these professionals often experience tensions and navigate difficult decisions surrounding best curatorial and scientific practices, limited resources, professional and community expectations, and ethical considerations. This research investigates current discourses and practices in heritage management and curation of archaeological human remains and associated data in Portugal, where relevant legislation is lacking and practices vary. This is supplemented by comparisons to other European countries, in order to review and evaluate best practice approaches. The mixed methods approach utilises ethnographic methods (semistructured interviews, participant observation) and surveys of heritage professionals and local communities. This use of quantitative and qualitative data generates a complex view of the status quo and future directions in heritage management of human remains: showing that ethical discourses and best practice differ across countries (e.g. Germany, Italy, Portugal. and institutional settings, such as museums, commercial archaeology, public and academic settings. Likewise in a pluralistic society public attitudes towards appropriate care, research and display of human remains are multifaceted and contradictory, further complicating the role and responsibility of heritage professionals.

182 INVISIBLE ECONOMIES: FOOD, FIBRES, TEXTILES, TIMBER, LEATHER, PEOPLE, AND MORE

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** food, textiles, wood, leather, archaeobotany, zooarchaeology  
**Session organisers:** Bela Dimova (University of Padua) – Mila Andonova-Katsarski (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences)

SESSION ABSTRACT

Food, shelter, and clothing have always been essential human needs. Meeting these needs, whether by producing or acquiring them, was a primary focus for ancient societies. Agriculture and the textile industry remain significant drivers of today’s economy and the environmental disruption, which it causes. Trade with spices, perfumes, fine foods and fabrics, alcohol and psychotropic plants, timber, livestock and even enslaved people has also been highly lucrative throughout history. Yet, the study of these central aspects of the economy is a challenge, because organic materials often do not survive. It is especially difficult to estimate the scale of economic activity and its social and environmental impact. Archaeologists now have a large toolkit for retrieving information about these invisible economies, ranging from proteomics and isotope analysis to new conceptual approaches to material culture and written sources. We invite papers that examine the production, exchange, and consumption of ‘invisible’ organic goods and materials. We are especially interested in contributions, which consider how the production, consumption, and exchange of organic materials was part of social shifts and affected the relations between society and the environment. How did various craft, agricultural, or other extraction practices transform the landscape? How did people adapt their economic activities to environmental changes? How were these adaptations related to social changes?

CONTRIBUTION ABSTRACTS

1629. DENDROLANDSCAPES PROJECT: MAKING NEOLITHIC WOOD FUEL ECONOMIES VISIBLE THROUGH DENDRO-ANTHRACOLOGICAL ANALYSES

**Contribution format:** Oral  
**Contribution authors:** Llorenç Picornell-Gelabert – Sabrina Bianco (Universitat de les Illes Balears) – Alexa Dufraisse (UMR 7209 - AASPE-CNRS/Muséum National d’Histoire Naturelle) – Oliver Nelle (Landesamt für Denkmalpflege Baden-Württemberg) – Ethel Allué (Institut Català de Paleoeologia Humana i Evolució Social - Universitat Rovira i Virgili)

In this presentation we will introduce the DENDROLANDSCAPES project, with which we intend to contribute to the development of an archaeological approach to forests resources management. Our analysis focuses on the interrogation of non-food forest resources management by Neolithic communities in north and northeastern Iberia, with which we develop a fuel-centered analysis of people-forests interaction. The use of woody biomass as fuel has been one of the most enduring arenas of socio-environmental interaction since the control of fire in the deep prehistory. However, the interrogation of fuel-related practices is often brushed aside from archaeological narratives or approached as a routine practice disconnected from economic complexities, social practices, and cultural developments. This can be shocking considering that, unlike other plant uses, the recurrent burning of wood as fuel generates archaeobotanical macroremains, archaeological charcoal fragments, that have good prospective of preservation, sampling, and analysis (anthracological assemblages). Therefore, we are studying archaeological charcoal assemblages from Neolithic sites with the aim to analyze how forests resources were managed to obtain a critical natural resource (fuel); and how this fuel management was integrated in the complex agro-sylvo-pastoral Neolithic economies. We apply dendrological measurements and techniques (e.g., diameter estimation, ring width) to archaeological charcoal fragments and use current dendrochronological reference datasets to identify how fuel was obtained through complex management practices (e.g., branches gathering, trees felling and use of trunks, coppicing/pollarding). We perform this dendro-anthracological approach in archaeological sites that register both human habitation contexts and herds stabling (e.g., fumier sequences) with the aim to understand the integration of fuel management with other economic practices (herds feeding, agricultural land openings, pastures, etc.). With such an approach we intend to understand the role of “plant invisible economies” in the context of the complexity of Neolithic socio-environmental systems.

1972. FOREST MANAGEMENT AT EARLY NEOLITHIC SETTLEMENTS IN MARGINAL AREAS (DOBŘEŇ SITE – A CASE STUDY)

**Contribution format:** Oral  
**Contribution authors:** Markéta Šmolková – Daniel Pilař (Institute of Archaeology of the Czech Academy of Sciences, Prague)

The problematics of forest management in the context of Neolithic populations based on anthracological material has not been addressed to a significant extent so far. We dispose of numerically richer charcoal collections within the Czech Republic so far only from a few sites, which does not allow for a broader comparative analysis in terms of species selection and the landscape context. The fuel strategies of Neolithic settlements located in peripheral areas have also not been much addressed. One such settlement is the Dobřeň site in Central Bohemia (Czech Republic), which belonged to Linear Pottery culture (5500 - 4300 BC). The site’s location represents a relative exception in the context of most Neolithic settlements, both in terms of its higher altitude profile and colder climatic conditions. The site revealed, in addition to several longhouses, a large number of settlement pits with rich palaeobotanical material. The analysis of anthracological material from this settlement contributes to the issue of landscape management of marginal areas in early Neolithic communities and it raises questions regarding: 1) fuel strategies, species selection and specialization in the management of wood resources, 2) possible differences in forest use at neolithic settlements inside and outside commonly preferred areas and, 3) the problematics of potential forest grazing. The paper aims to present a rich anthracological assemblage from an Early Neolithic settlement in Central Bohemia, located in an unusually marginalized area, and also to contribute to the debate on the variability of forest management in Neolithic communities in general.

1320. INVISIBLE WOOD AND LABOR: THE HIDDEN SIDE OF THE MONUMENTALITY OF MEGA- SITES OF THE COPPER AGE

**Contribution format:** Oral  
**Contribution authors:** Mykhailo Videiko (Kyiv Metropolitan Borys Grinchenko University)

Wood and clay were the main materials in the construction of mega- sites of the Trypillia Culture between 4200-3600 BC. The remains of the different houses represented by burnt clay provide information about the methods and volumes of its use. Imprints of wooden constructions have been perfectly preserved on this clay. Their study makes it possible to assess the quality of wood, methods of its processing, and also to approximately calculate the scale of use. Ordinary houses were 10-15 m long and 4-5 m wide and required dozens of trees. Structures of various profiles were used. Hundreds of trees were spent on more monumental structures. They were used to make pillars, beams, floors, roof structures. Fortifications around mega-sites required many thousands of trees. Even rough estimates of labor costs for procurement, transportation, and construction indicate a significant scale of labor activity. Such large-scale projects required long-term labor of hundreds of people. The labor resources of mega-sites numbered thousands of people and they could afford such projects. Evidence of this is the mega-structure in the settlement of Nebelivka, as well as the fortifications around this settlement and Maidanetsky. One of the consequences of the implementation of the projects was the destruction of forests around dozens and even hundreds of hectares. A large amount of wood was needed to maintain everyday life, cooking, and heating. The

costs of firing ceramic dishes were significant. Thus, mega-sites could not but become a problem for the environment. One of its solutions was their periodic relocation to a new location. The era of mega--sites of Trypillya Culture continued more than 600 years. This indicates the successful creation of social mechanisms and organization necessary for the implementation of large-scale projects and supporting the livelihoods of the population in such conditions.

2285. DOMESTIC ACTIVITIES AT THE ARGARIC SETTLEMENT OF CABECICO REDONDO DE LA MUELA (SOUTHEASTERN IBERIA) THROUGH PHYTOLITH AND CALCITIC MICROFOSSIL EVIDENCE

**Contribution format:** Oral  
**Contribution authors:** Maria Victoria Garcia Martinez (University of Granada) – Alberto Lopez Lopez (University of Murcia) – Marta Portillo Ramirez (Institución Mila y Fontanals-CSIC) – Francisco Contreras Cortes (University of Granada) – Benjamin Cutillas Victoria (Complutense University of Madrid)

The site of Cabecico Redondo de la Muela (Alhama de Murcia, Murcia), located in the southeast of the Iberian Peninsula, belongs to the Argaric culture (2200–1550 BC). It is a small settlement (<0.1 ha) on an elevated hill on the northern bank of the Guadalentín River corridor with contexts primarily associated with domestic and productive activities. Sediment samples for microfossil analyses at the settlement have been collected from five excavation sectors and two profiles, together with a selection of recovered grinding stone tools. The main aim of the current study is to present the first results obtained from integrated microfossil analyses, including phytoliths and calcitic plant and faecal microremains from the site. The phytolith assemblages were dominated by short cells produced by grasses from the Pooideae subfamily, including cereals such as wheat (*Triticum* sp.) and barley (*Hordeum* sp.), but also forms associated with the Panicoideae subfamily, therefore related to wild grasses and weed. Elongated dendritic phytoliths and epidermal appendages, which are often considered fragile morphologies, were also identified. Additionally, multicellular phytoliths, which are susceptible to mechanical degradation through dehusking and grinding, pointed to cereal processing at the site. Notably, the presence of spheroid echinate phytoliths, characteristic of the Arecaceae family (palms), was detected, likely belonging to the specie *Chamaerops humilis*, native to the Mediterranean region. Although invisible in the macroscopic archaeobotanical record, these vegetable resources were commonly used as a fiber resource for basketry or matting, among other uses. Furthermore, calcitic wood pseudomorphs similar to those produced by the oak (*Quercus* sp.) were also identified, suggesting its use as fuel. In conclusion, the present study provides new microbotanical records for reconstructing plant use as well as opens a new line of research concerning domestic patterns and environmental interaction of the Bronze Age communities settled in the region.

1539. CROSS CULTURAL COMPARISON OF PLANT FIBER UTILIZATION IN EURASIA FROM THE NEOLITHIC TO THE IRON AGE (7000 BCE–221 BCE)

**Contribution format:** Oral  
**Contribution authors:** Yaqi Yan (University of Padua)

Plant fibers, as a core economic resource in early societies, exhibited convergent technological logic and divergent cultural expressions across Eurasia. During the Neolithic to the Iron Age (Warring States period in China), both China and Europe relied on indigenous plant species—flax (*Linum usitatissimum*) in Europe, and hemp (*Cannabis sativa*), ramie (*Boehmeria nivea*), and kudzu (*Pueraria lobata*) in China. Shared techniques such as retting, scutching, and splicing were developed, with archaeological evidence preserved in specialized environmental contexts (European peat bogs and waterlogged tombs in China). Plant fiber production was deeply embedded in socioeconomic systems: flax complemented pastoral economies in Europe, while hemp and ramie formed a dual economic system with sericulture in China, serving as cornerstones of taxation and trade. This paper will analyze the differences in the relationship between plant fibers and society in Europe and China from four aspects: economic foundation and social division of labor, technological innovation and social power, cultural symbolism and identity construction, and environmental adaptation. Plant fiber economies were not merely technological vehicles but also reflections of ecological resilience and social power dynamics. Cross-continental comparison reveals that under similar environmental constraints, human societies shaped diverse exploitation models of “intangible resources” through differentiated technological choices and cultural frameworks. This provides critical perspectives for understanding the complexity of early economies.

1353. EXPLORING THE TEXTILE REMAINS FROM THE ROMAN SHIPS OF THE LAKE OF NEMI (ITALY)

**Contribution format:** Oral  
**Contribution authors:** Francesca Coletti (Department of Science of Antiquity, Sapienza University of Rome | Research Centre of Archaeology and Archaeometry of Ancient Textile, Sapienza University of Rome) – Margarita Gleba (Department of Cultural Heritage, Padua

University) – Ilaria Serafini – Alessandro Ciccola (Department of Environmental Biology, Sapienza University of Rome | Research Centre of Archaeology and Archaeometry of Ancient Textile, Sapienza University of Rome) – Adele Bosi (Institute for Complex Systems, National Research Council (ISC-CNR), Rome) – Danela De Angelis (Direzione Regionale Musei Lazio, Ministero della Cultura. Museum of The Roman Ships of Nemi (Rome))

The survival of archaeological textiles in the Italic peninsula is generally very limited. Everyday life and utilitarian textiles from settlements or urban contexts are rare compared to burials, where textiles are primarily preserved in mineralised form in contact with metal objects. The textile fragments recovered from the Roman ships of the Lake of Nemi in central Italy are thus crucial for a better understanding of the Roman textile technology, consumption, and economy at the centre of the Empire. This contribution presents preliminary results of a comprehensive approach based on microscopic, spectroscopic and spectrometric techniques applied to the textiles found in the Roman ships of Nemi. The textile remains were analysed with digital and scanning electron microscopy to characterise the technical aspects and the fibres used in textile manufacture. FTIR and proteomic techniques were also applied to deepen our knowledge of the type of wool and dyes identified. In particular, the data on wool quality and re-use or recycling of these textiles have been collected, establishing valuable comparisons with other Roman textile evidence that allows the identification of economic activity related to the recycling of textiles for new purposes, with specific functions. The research also explores the use of plant-based material to manufacture ropes and cords and caulking for the nautical sector.

871. FROM HARVEST TO MARKET: THE INVISIBLE ECONOMY OF INCENSE IN THE ROMAN WORLD

**Contribution format:** Oral  
**Contribution authors:** Alice Capobianco (Università di Genova | Universität zu Köln)

Incense was a valuable commodity in the Roman world, essential for religious, medical, and cosmetic practices. Despite its widespread use, the production and trade of incense remain archaeologically elusive: while resin can be preserved under favorable conditions, it is predominantly found in consumption contexts, making it difficult to trace its production and commercial infrastructure. This study aims to reconstruct the economic network of incense, focusing on its production, trade routes, and market integration within the Roman Mediterranean. The production of incense began with the harvesting of resins from trees such as *Boswellia* and *Commiphora*, primarily in the Arabian Peninsula and East Africa. Ancient sources describe increasing pressure on these resources due to growing Roman demand, leading to intensified exploitation and possible environmental consequences. After the harvest, incense was transported via well-established trade routes, including the Incense Route through Arabia and Red Sea networks, connecting the East with key Mediterranean markets. While production sites and trade routes are partially documented, the commercial distribution of incense within the Roman Empire remains largely invisible. *Tabernae thurariae*, shops specializing in incense, are attested in literary and epigraphic sources but are difficult to identify archaeologically. The absence of clear physical markers makes it challenging to recognize spaces dedicated to incense storage, processing, or sale. To bridge this gap, this study integrates literary, epigraphic, archaeological, and ethnoarchaeological evidence. Comparative studies of contemporary incense-producing regions provide valuable insights into traditional harvesting, processing, and trade practices, allowing for a better understanding of the possible organization of these activities in antiquity. By analyzing patterns of distribution and infrastructure supporting incense trade, this study seeks to define indicators for identifying these invisible economic spaces and to explore how Roman demand shaped both the economies and landscapes of incense-producing regions.

991. FOOD AND FUEL RELATED ECONOMY OF THE BIBRACTE OPPIDUM (FRANCE) – FIRST RESULTS AND AN INTRODUCTION TO THE PHD PROJECT

**Contribution format:** Poster  
**Contribution authors:** Natalia Prochackova (Constantine the Philosopher University in Nitra)

The study of economic aspects associated with procurement and management of food and fuel, the two essential commodities for human survival, is fundamental for understanding the functioning of any society. The site on Mont Beuvray in Burgundy identified as oppidum Bibracte since the 19th century and excavated almost continuously became the case study for this thesis. One of a key questions of the scientific discourse pertains to the organization of food supply for the oppidum. J. Wiethold (2011), along with many others, sees the immediate environs of Mont Beuvray unsuitable for arable farming, suggests that staple cereals and pulses were imported from surrounding lowland areas and further distant calcareous regions. The studies of fuelwood are rare and limited and did not yet address its origin. Thus, the aim of the dissertation is to use both old and new archaeobotanical data originating from various areas of Bibracte for verification of existing hypotheses regarding food and formulating new ones concerning fuel sources. The examination of archaeological finds of crops used as food and the

accompanying wild species will serve the following: 1.) define the origin of the samples in terms of crop processing (products/wastes) and geography (local/imported); 2.) reconstruct the arable practices (intensive/extensive, traditional/innovative, subsistence/surplus oriented); 3.) to reveal evidence of additional activities connected to management, consumption and discard of plant foods. The new samples for this project come from excavations of different settlement parts of the site each with different functions and excavated by different teams. Majority of new materials were collected between 2000 and 2016. To obtain statistically robust data, all available samples will be analyzed, although due to time constrains, larger volume samples are being subsampled. The poster presents the first results obtained from the study of new seed assemblage from PC2 and partly also PC14 and PC15.

**1663. INVISIBLE WEALTH: FOOD STORAGE, SOCIAL HIERARCHIES, AND CRISIS RESPONSE AT THE 10TH-CENTURY CHERVONE HILLFORT OF THE ULICHI TRIBE**

**Contribution format:** Poster  
**Contribution authors:** Stepan Stepanenko (Leibniz-Zentrum für Archäologie - Zentrum für Baltische und Skandinavische Archäologie)

In the 20th century, excavations at the Chervone hillfort of the Slavic Ulich tribe (Vinnytsia region, Ukraine) uncovered a remarkable destruction layer dating to the 10th century, marked by ash, charcoal, and an absence of human remains. Although evidently cleared of traded goods and precious metals, the site held an unexpectedly large volume of charred grain and storage pits, offering unique insights into how early Slavic communities managed agriculture and potential wealth. This poster explores the significance of these food remains, often rendered invisible through decay or continuous use, as indicators of social structures, agricultural production, and crisis management. The extensive grain pits suggest a complex network of production and storage, reflective of both community needs and social hierarchies. The decision to abandon food, while evacuating objects of higher perceived value, reveals how 10th-century Slavs ranked commodities during emergencies. Although the granaries themselves no longer survive, the excavation reports allow us to reconstruct which crops were cultivated and how they were stored, shedding light on broader patterns of wealth distribution and resilience in early medieval societies. This study contends that the site’s destruction highlights not only the vulnerabilities of agricultural wealth but also the critical role of food in shaping socio-economic dynamics. By examining the interplay between perishable subsistence resources and more traditionally esteemed items, the Chervone hillfort enhances our understanding of what was deemed ‘worthy’ of safeguarding, contributing to our understanding of resource management, social value, and the shifting perceptions of wealth during periods of crisis. Ultimately, these findings provide a crucial comparative framework for investigating how communities in early medieval Eastern Europe balanced subsistence, status, and security, shedding new light on the archaeology of intangible wealth and social memory, especially in the context of historic excavations and limited remaining archaeological resources for analysis.

**183 SILVER IN THE COPPER, BRONZE, AND EARLY IRON AGES (C. 4000–600 BCE) ACROSS EUROPE, THE MEDITERRANEAN, AND WESTERN ASIA**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Session with keynote presentation  
**Session keywords:** Silver, hoard, currency  
**Session organisers:** Tzilla Eshel (—) – Lorenz Rahmstorf (Seminar für Ur- und Frühgeschichte, University of Göttingen)

**SESSION ABSTRACT**

Silver is a captivating material, valued since the Chalcolithic period for its rare, moon-like shine. Early on, it was used to produce jewellery and other decorative objects, sometimes alloyed with copper or gold. Repeatedly cast into rings and fragmented pieces (hack-silver) in the 3rd and 2nd millennia, silver likely functioned as a store of value and currency in Mesopotamia, gradually spreading to Anatolia and the Southern Levant. However, despite its appeal, silver’s appearance and applications varied significantly across Europe, the Mediterranean, and Western Asia. In some regions, silver is appreciated as jewellery in elite burials, as seen for example in the Yamnaya culture in Southeast Europe and the Pontic-Caspian steppe and the El Argar culture in Iberia. In other regions, it frequently appears not only in graves but also in hoards, such as in Mesopotamia, Anatolia, and the Southern Levant. However, there are also areas—like Central Europe from the Middle Bronze Age until the Latène period—where silver is notably scarce. This raises important questions: What accounts for these regional differences in the occurrence and use of silver? How did silver evolve as a store of value and currency in certain areas? What were its sources, and did the regional distribution of natural deposits shape its role? This session will explore these questions from multiple perspectives, including chronology, distribution, composition, function,

and origin. By examining silver across different regions and contexts, we aim to uncover the factors behind its varied roles and evolving significance throughout early Western Eurasian history.

**CONTRIBUTION ABSTRACTS**

**554. THE CONNECTED WORLD OF THE 4TH MILLENNIUM BC: QUESTIONS CONCERNING SILVER**

**Contribution format:** Oral  
**Contribution authors:** Susan Sherratt (University of Sheffield)

Some of the attractions of silver are obvious, but what is particularly intriguing is the way in which it became and has remained deeply embedded in the economies and cultures of the Old World (and subsequently a wider, global world) during the last six millennia. Although we can see extremely sporadic use of probably native silver in the western Old World as early as the 6th millennium BC, silver does not make a determined appearance until the 4th millennium. In the earlier part of this millennium there is evidence of the use of silve. in Iran, Mesopotamia, south-east Anatolia and the north Caucasus, and by the end of the millennium this can also be seen in the Levant, Egypt, the Pontic region, the Balkans and the Aegean. During the course of the millennium there is evidence of its cupellation from silver-rich lead ores in Iran, Central Asia, Mesopotamia, south-east Anatolia and the Aegean, and it is assumed (though cannot be proven) that most, if not all, of the silver deployed in these and surrounding areas was obtained by the process of cupellation. Opinions differ as to whether or not this process was discovered independently in a number of different regions, and I shall try to navigate through some of the arguments and uncertainties surrounding such disparate views.

**723. SILVER IN THE 4TH AND 3RD MILLENNIUM BCE: MAJOR TRENDS IN ITS USE IN EUROPE, THE MEDITERRANEAN AND WESTERN ASIA**

**Contribution format:** Oral  
**Contribution authors:** Lorenz Rahmstorf (Seminar für Ur- und Frühgeschichte, Georg-August-Universität Göttingen)

The early history of silver – in contrast to that of gold – never received much scholarly and popular interest. Yet, silver is a culturally fascinating material: it is strongly related to early economic history, trade and to the development of concepts of material value. The fundamental significance of silver during the Early Metal Ages (Late Copper and Early Bronze Age) has not been fully understood so far, especially in a wide geographical perspective. During the fourth millennium BCE silver appears in various regions of Western Eurasia mostly as rings/spirals, in a few cases also as vessels and weapons. Apparently, it was its shininess which was appreciated, while its softness made it rather impractical for tools. Weights and scales were invented shortly before 3000 BCE, making it possible to accurately measure amorphous metal. From the 3rd millennium BCE fragmented silver objects – hacksilver – were weighed out in Mesopotamia and neighbouring regions and took on the function of money as a medium of exchange, a unit of account and a store of value. First results of a quantitative analyses of nearly 500 sites from the 4th and 3rd millennium BCE with silver objects from Europe, the Mediterranean and Western Asia will be presented. In which numbers and in which kind of sites (settlements, graves, hoards etc.) were silver objects found during this period? What functions did they fulfil? What value did they have in the respective societies? Such questions will be shortly discussed in the presentation.

**173. “KESEPH”: THE USE OF SILVER-MONEY IN THE SOUTHERN LEVANT ~2000–600 BC**

**Contribution format:** Oral  
**Contribution authors:** Tzilla Eshel (—)

Silver gradually emerged as a preferred medium of exchange, beginning with its introduction in Mesopotamia and Syria in the Early Bronze Age, mid-3rd millennium BC. The Southern Levant saw the first silver-currency hoards during the final stages of the Middle Bronze Age (~1650/1600–1600/1550 BC), predating other regions. Although silver was temporarily replaced by gold in the Late Bronze Age, it re-emerged as the dominant form of money by the Late Bronze Age IIB, ~1300 BC, a status it retained until the end of the Iron Age (~600 BCE), despite occasional shortages. The distribution and context of silver hoards suggest evolving socio-economic patterns, where silver was initially restricted to elite transactions but later became more widely used in both domestic and public spheres. While silver became the leading form of money in the Southern Levant, other regions used different metals, such as gold, copper and bronze, at various times. The adoption of silver in the Levant likely reflects broader political and economic ties with Mesopotamia, Syria and Anatolia.

2533. LAVRION METALS DATABASE: A KEY TO DECIPHER ANCIENT SILVER PRODUCTION IN SOUTHEAST ATTICA

**Contribution format:** Oral  
**Contribution authors:** Markos Vaxevanopoulos (University of Thessaly) – Andreas Kapetanios (Ionian University)

Lavrion in Southeast Attica constitutes the most extended ancient silver mining district in Greece. Silver production in the area can be traced back to the late 4th millennium BC, as substantiated by archaeological evidence. The Lavrion Metals Database (LaMDa Project) is an ongoing project that aims to contribute to the study of ancient metallurgy by providing an essential tool for understanding the chaîne opératoire of metal production in Attica. It entails the development of a database for the detailed recording of Lavrion mines, metallurgical areas and metallic objects bearing the Lavrion lead isotopic signature. The database is being populated with available published and archival data on the ancient mines and metallurgical workshops of Lavrion. In parallel, it is being enriched by primary survey data which has located entrances of horizontal mines and vertical mining shafts. The interior surface of the mining galleries and the shafts have been mapped using Laser Disto-X2 and LIDAR and recorded in the database. Additionally, the available data on metallic objects provenanced to Lavrion through chemical and trace element analysis have been catalogued and recorded. Each record is linked to geospatial information in a GIS platform. The database outcome shows a diachronic exploitation with several fluctuations in production through time. The mining area is more limited geographically than was thought by previous scholars. The geographical extent of the objects produced from Lavrion silver and lead implies a great mining and metallurgical centre in antiquity.

1898. THE SILVER BRACELET FROM BUZA(TRANSYLVANIA) IN EUROPEAN LATE BRONZE AGE CONTEXT

**Contribution format:** Oral  
**Contribution authors:** Mihai Wittenberger (National History Museum of Transylvania)

In this presentation we present a silver bracelet from the late Bronze Age or early Hallstatt. Silver pieces from the Bronze Age in Central and Eastern Europe are extremely rare. In Transylvania there are two small pieces from the Middle Bronze, Wietenberg Culture, which we will discuss later, and the bracelet from Buza, Cluj County. The reduced presence of silver pieces in continental Europe cannot be attributed to a lack of resources but rather to ideological constraints. The few pieces discovered up to the Late Bronze Age were discovered in graves or in sacrificial sites (Oarța de Sus, Transylvania). Discovered in Buza, Cluj County at the “Dosul Țăpieșului” point, it may have been part of a bronze deposit discovered in 1971, dated to early Hallstatt. The silver concentration is 90.784% and it weighs 55.09g. The chemical elements, besides silver, seem to indicate other origin than Transylvania. As a bracelet typology, it falls into the very numerous series of bronze bracelets. Only in the Uioara deposit (over 6000 pieces in total) are a few dozen pieces of this type of bracelet, but made from bronze. It has been assumed that these pieces are pre-monetary payment systems. The commercial links between the Aegean area and northern Europe, through Transylvania, are proven by the Mycenaean glass and amber discovered here, as well as the presence on the Uluburun ship of an axe-scepter of Carpathian origin. Is very probable that bracelet was a form of pre-monetary payment that could circulate widely in time and space and, like other discoveries, proves the interconnectedness of communities over large areas. Chemical analyses were performed with an Elva X ProSpector3 MAX portable EDXRF Spectrometer with large area SDD detector.

320. SILVER SURFACE TREATMENTS IN EARLY BRONZE AGE CENTRAL EUROPE: EVIDENCE AND EXPERIMENTAL INSIGHTS

**Contribution format:** Oral  
**Contribution authors:** Eva Schimerová (University of Hradec Králové | Universitat Autònoma de Barcelona) – Christian-Heinrich Wunderlich (Landesamt für Denkmalpflege und Archäologie Sachsen-Anhalt) – Oliver Michael – Sebastian Dieck (DeltaSigma Analytics GmbH) – Ken Massy (Ludwig-Maximilians-Universität München) – Michal Ernée (Institute of archaeology of the CAS Prague) – Jan-Heinrich Bunnefeld – Harald Meller (Landesamt für Denkmalpflege und Archäologie Sachsen-Anhalt)

Silver in the Central European Early Bronze Age is, with notable exceptions and in contrast to the preceding Bell Beaker period, an unfamiliar and overlooked metal. Although silver sources were available throughout Europe—in some cases even co-located with copper deposits—it seems to have escaped attention. Over the past 20 years, evidence has emerged suggesting that silver may have been used as a surface treatment in regions such as Bohemia and Moravia. Two noteworthy finds are the axes from the hoard of Sýčína and decorative objects from Mikulovice cemetery. Remarkably, the latter also provides evidence of silver traces present on tools made from stone and bone. Until the discovery of the hoard of axes from Kukleny, this phenomenon appeared isolated. The Kukleny hoard, revealed that the majority of these objects had silver remains on their surfaces. This prompted

further examinations, which confirmed added layers of silver. Subsequent analyses identified silver coatings on copper(alloyed) artefacts from Saxony-Anhalt and from Bavaria. Such treatment dramatically altered the colour of objects—a transformation comparable only to effects achieved by adding high amounts of tin or arsenic. Additionally, the treatment used to coat objects with silver produced high-purity silver layers, which could only have been achieved through chemical electroless plating. Our research focuses on identifying the character and elemental composition of these layers. The objective is to determine the specific methods used to achieve these coatings. Ongoing experiments explore not only the application methods but also the effects of corrosion—investigating how to differentiate between natural corrosion processes and intentional layers. This phenomenon demonstrates that silver was a highly desired material, primarily for its distinctive colour, so different from gold, bronze and copper. It highlights the Early Bronze Age as a period of experimentation with metallurgy, offering insights into technological advancements of the time.

184 GIVE ME SHELTER! PERSPECTIVES ON ARCHAEOLOGICAL SHELTERS: BALANCING CONSERVATION, VISITOR ENGAGEMENT, AND SUSTAINABILITY

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Discussion session  
**Session keywords:** Shelters, Visitor engagement, Public access, Conservation, Site management  
**Session organisers:** Ashley Lingle (University of York) – Jerrod Seifert (University of Oslo)

SESSION ABSTRACT

This session will explore the multifaceted roles of permanent archaeological shelters - protective structures designed to safeguard sites - highlighting their capacity to influence conservation, visitor experience, and sustainable site management. As recognition of their appeal grows, heritage professionals are grappling with key debates around shelter design, management, and interpretation. The effectiveness of these shelters relies heavily on their ability to enhance visitor experiences while also addressing environmental challenges and the economic viability of heritage sites. However, the implementation of archaeological shelters is not without its controversies. Critics have pointed out challenges related to the perceived authenticity of the sites, potential disengagement of local communities, and the balance between preservation and public accessibility. The discourse surrounding these issues underscores the need for heritage professionals to navigate complex socio-cultural dynamics while ensuring that conservation efforts are inclusive and responsive to the needs of diverse stakeholders. As public access to archaeological sites continues to evolve, the future of archaeological shelters is increasingly focused on enhancing visitor engagement through technological integration and sustainable practices. Ongoing dialogue and research in this area aim to redefine the roles of these structures in heritage management, emphasising the importance of adaptability and collaboration in preserving the significance of archaeological sites for future generations. This session will address the current discussions around these protective structures and their precarious nature, underscoring the importance of interdisciplinary approaches that integrate innovative technologies and community involvement. The organisers welcome talks illustrating a range of case studies demonstrating shelter successes and cautionary tales, including but not limited to.

- Community and stakeholder engagement
- Sustainable design and modifications
- Digital and environmental innovation
- Economic viability.
- Authenticity and Visitor Experience
- Broader landscape impacts

CONTRIBUTION ABSTRACTS

762. MONUMENT OVER MONUMENT? EVALUATING THE DESIGN STRATEGIES OF PROTECTIVE SHELTERS AT ARCHAEOLOGICAL SITES IN ASIA MINOR

**Contribution format:** Oral  
**Contribution authors:** Basak Kalfa – Ayca Ozmen (Cankaya University)

The design strategies of the permanent archeological shelters, ensuring the preservation, interpretation, and presentation of the archaeological findings in situ and the comfort of the excavations, necessitate the impacts of Vitruvius’ durability, functionality, and aesthetics (firmitas, utilitas, venustas) as well as ethics and ecology. Ethics, associated with conservation principles, enables the archaeological site to be protected respectfully. Aesthetics defines the formal relationship of contemporary design with the archaeological site and its environment. On the other hand, the ecological impact is related to the minimum hazard of its materials to nature and

the utilization of climatic conditions. In addition, it is expected to be durable in all kinds of disasters and fulfill its function as a protective shelter. Asia Minor is exceptional regarding archaeological sites, and protective shelters have been constructed in numerous archaeological sites in this context. Critically, it can be argued that these shelters pose challenges to the authenticity and integrity of monumental-scale findings in archaeological sites. Besides, the discussion of protective shelters in archaeological contexts generally remains outside of the architectural design and conservation discourse. Therefore, this study aims to investigate and compare the durable, functional, aesthetic, ethical, and ecological impacts of the design strategies of archaeological shelters in Asia Minor through the lenses of architecture and conservation disciplines. These shelters may occasionally compete with the ruin they protect concerning their monumentality. In light of these outputs, through cross-case comparison and literature review used as methodology, the paper will discuss which criteria are mostly realized and what should be normative.

**1868. CHANGING CONTEXTS, MOTIVATIONS, AND APPROACHES IN SHELTER DESIGN OVER THE LAST CENTURY: A RETROSPECTIVE FROM PERGAMON**

**Contribution format:** Oral  
**Contribution authors:** Seçil Tezer Altay (DAI Istanbul)

The ancient city of Pergamon (Izmir, Türkiye) has been subject to archaeological excavations for more than 140 years and comprises a rich history of the ever-changing practices of archaeology and conservation. No doubt, protective shelters also played a significant role in the preservation and presentation of the remains. But how far have they achieved what they were originally intended to do, and what other unforeseen problems have arisen? This paper aims to bring together examples from different time periods: 1900s, 1970s and 2000s. The case studies will be briefly described within their archaeological context and the debates of the period. It will also examine the design approaches adopted in response to the main driving factors for a shelter. The tense balance between the aspects of conservation, presentation, authenticity and economic viability are worth a detailed observation on these examples. In conclusion, the paper aims to discuss the multiple roles of shelters in the context of the changing needs of the times.

**1628. MORE DATA, MORE PROBLEMS - DIFFICULTIES IN RECTIFYING DISCRETE DATASETS FOR THE MANAGEMENT OF SHELTERED ARCHAEOLOGICAL SITES**

**Contribution format:** Oral  
**Contribution authors:** Jerrod Seifert (University of Oslo) – Ashley Lingle (University of York)

The ability of archaeological shelters to successfully protect their archaeological assets hinges on mitigating environments that are deleterious to their survival. If these environments are not adequately characterised, they cannot be properly combatted. Mitigation strategies derived from improperly defined environments can be ineffective or can exacerbate site deterioration. Conservation site managers are keenly aware of this, and so to avoid such scenarios they incorporate rigorous environmental monitoring plans to capture as much data as possible. These datasets may include relative humidity and temperature fluctuations, solar radiation, wind speed, precipitation, soil moisture content, and CO2 monitoring. These can then theoretically be combined with 3D and photogrammetry site scans, geographical location, site composition, and soil pedology and composition to build or augment a shelter that will successfully abate any detrimental action that might impact site statics. And therein lies the dilemma facing conservation site managers: how can all of this data possibly be managed? How can these disparate datasets be aligned to produce meaningful understandings of the impact each has upon the other? How much data is necessary without succumbing to entropy? This paper discusses the difficulties inherent in rectifying such datasets and incorporating their findings into effective conservation management plans of sheltered sites.

**1946. GLASS FOR THE PAST THE PROJECT FOR THE PROTECTION OF THE TOMB OF NAKHT BY MILAN KOVAČ, SWEDEN/SLOVENIA (1986)**

**Contribution format:** Poster  
**Contribution authors:** Mateja Ravnik (Institute for the Protection of Cultural Heritage of Slovenia) – Jan Ciglencečki (University of Ljubljana, Faculty of Arts, Center for Middle Eastern Studies) – Milan Kovač (independent architect)

The Slovene Egyptology Databaseis (Baza slovenske egiptologije/BSE) is a collaborative project between the Faculty of Arts, University of Ljubljana, and the Institute for the Protection of Cultural Heritage of Slovenia, focuses on systematically collecting, archiving, cataloging, and digitizing a wide range of materials related to Slovenian contributions to the study of Ancient Egypt from the 19th century to the present. The systematic investigation, archiving, and digitization of the private archive and collections of Milan Kovač are carried out as part of this project. Among the materials of the architect Milan Kovač were also the plans for the protection of the Nakht tomb (TT52) with the patented protection system Eureka! EU 1586 (arch-in-situ), which is based on the principle

that archaeological remains, including decorations, need similar climatic conditions in which they have been preserved over thousands of years. It is therefore necessary to separate the climate in which the visitors are and the climate in which the decorations are preserved. The Theban Tomb TT52 is located in Sheikh Abd el-Qurna, part of the Theban Necropolis, on the west bank of the Nile, opposite to Luxor. It is the burial place of Nakht, an ancient Egyptian official who held the position of a scribe and astronomer of Amun. On the poster, we will present the project of the architect Kovač, carried out in 1986, with the basic principles of protection and the measurements of humidity and temperature in the tomb, which are an important document about the preservation of cultural heritage and the management of the impacts of tourism and climate already almost 40 years ago, and show the relevance of activities that are still ongoing today to establish a balance of all these impacts for of cultural heritage preservation.

**187 INVESTIGATING CERAMIC BUILDING MATERIAL (CBM) IN DIFFERENT CONTEXTS - LIFE CYCLES OF TERRACOTTA OBJECTS**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Ceramic building material, tile, brick, terracotta, life cycle, object biographies  
**Session organisers:** Pirjo Hamari (University of Helsinki) – Annalize Rheeder (Independent) – Julian Bauch (German Archaeological Institute, Berlin)

**SESSION ABSTRACT**

The life cycle of ceramic building material (CBM) can be described as a series of phases during which the objects are assigned diverse functions and meanings. At different stages objects are the product of a design and production process, goods to be traded, cargo to be transported or building materials. Reuse is also a common occurrence with the change in an object’s function leading to physical and/or symbolic transformations. To investigate the wider social and economic impact of these objects it is necessary to contextualise objects within their individual life cycles. The life cycle of ceramic building materials (including bricks, tiles and decorated architectural terracottas) can leave identifying traces on the objects themselves. The reconstruction of a specific phase of even an entire biography is aided through the study of these traces, which is further aided by developments in scientific analyses and technology. The analysis of individual life cycles of this group of finds can give specific insights into different economic strategies within ancient building (industries). This session invites researchers interested in this material to join the discussion and share their latest findings and discuss new research avenues and growing collaboration. We are inviting contributions from the entire Mediterranean and European region (and beyond), spanning from the Classical to Medieval period. The session is interested in contributions that focus on different life cycle phases and the methods which can be applied to their study, e.g.:  
- Production processes and the investigation of Chaîne opératoire  
- Object biographies and style genealogie.  
- The trade and distribution of materials  
- The construction process and building techniques involving CRM  
- The investigation of wear and object function  
- Changes in form, function and design when objects are re-used or recycled  
- Destruction and deposition and the traces these leave, whether intentional or accidental

**CONTRIBUTION ABSTRACTS**

**973. FROM REPAIR TO DEPOSITION: THE LIFE CYCLE OF ARCHITECTURAL CERAMICS IN GREEK SANCTUARIES**

**Contribution format:** Oral  
**Contribution authors:** Jane Kreiser (Technical University Darmstadt)

Ceramic building materials (CBM) in ancient sanctuaries underwent complex life cycles, from their production and use to processes of maintenance, repair, reuse, and eventual deposition. While the study of CBM often focuses on production techniques and stylistic developments, their later transformations—such as repair, removal, or recycling—remain an underexplored aspect of their material biography. This paper investigates these processes with a focus on Greek sanctuaries, examining how architectural ceramics were managed over time and what this reveals about economic and ritual practices in these sacred spaces. The study is centered on the extra-urban sanctuary of Spáthari in Akarnania, a relatively small rural cult site that, despite its scale, featured an unexpectedly elaborate roofing system in the Archaic period. This makes it a particularly valuable case study for analyzing the role of architectural ceramics in sanctuary maintenance, transformation, and disposal. Through the material

and contextual study of roof terracottas, the paper explores.

- The significance of high-quality roof decoration in a non-urban sanctuary setting.
- Repair and replacement strategies, including material choices and workshop connections.
- The reuse and deposition of architectural ceramics, tracing their transformation from functional elements to discarded material.
- Comparative insights from other sanctuaries, including Athens and Olympia, to contextualize these practices.

Using archaeometric methods (macroscopic analysis, XRD, pEDXRF), this study reconstructs the life cycle of architectural ceramics within the sanctuary and its broader economic and cultural implications. By examining how these materials were managed—whether through maintenance, reuse, or deposition—this paper contributes to a deeper understanding of the economic and ritual strategies underlying sanctuary architecture.

**126. LONG-TERM USAGE AND REUSE OF ROOF TILES IN MEDIEVAL CRIMEA: ARCHAEOLOGICAL AND STATISTIC EVIDENCES**

**Contribution format:** Oral

**Contribution authors:** Moisieiev Dmytro (NGO “Crimean institute of strategic studies”)

There is an opinion concerning roman- and byzantine-time roof tiles, that they were a long-term and mass secondary use building material with minimal differences in design. However, there is not enough objective archeological data about this problem. We analyzed four well-dated medieval roofs from Crimean sites to obtain objective statistical data about that. As a rule, the major part of each complex consists of products synchronous with roof construction time (“first” set). These roof tiles are characterized by the following features: presence in the whole roof; similar design and fabric – production in one workshop; the vast majority in the complex (up to 70%). The term of the usage of tiles of the “first” set is ranged from half to three centuries. A tiled roof is a complex engineering construction. It demands permanent technical support with the replacement of tiles, repair of rafters and underlying material of roof tiles. As a result, tiles that differ from the “first” set appear on the roof during repairs. “Repair” tiles can be single or make significant (16-20%) groups of identical in design and fabric products. Sometimes “repair” groups of roof tiles overtop the “first” set (it recorded once on Crimean material with 22% to 20%). This indicates significant damage of the building in the past. Serious damages and repairs of walls should be detected in such cases. “Repair” roof tiles date back to the time after construction of building or before it (from half a century to four centuries). If roof tiles are older than the “first” set, it is mean that they are secondary used. Usually the latest “repair” roof tiles are single products with chronology close to the time of the destruction of building. Therefore, the stratification of roof tiles on ancient roofs corresponds to the construction history of the complexes.

**791. CERAMIC BUILDING MATERIALS IN PUBLIC STRUCTURES: QUANTITATIVE REQUIREMENTS, PRODUCTION AND USE. CASE STUDIES FROM BYZANTINE AND OTTOMAN THESSALONICA**

**Contribution format:** Oral

**Contribution authors:** Konstantinos Raptis (Ephorate of Antiquities of Thessaloniki)

The paper presents diachronically the construction process and the building techniques involving the use of ceramic building materials in various masonry types, used in public, both secular and ecclesiastical, monumental structures from the late antiquity until the medieval and early modern period in Thessalonica, a diachronic urban center without historical gaps throughout a period that covers more than two millennia. It also examines the quantitative requirements in bricks and tiles in monuments with significant use of ceramic building materials in different periods and discusses whether the contemporaneous brickyards and tilleries that have already been excavated and documented in the periphery and the outskirts of the fortified city could cover the quantitative needs for ceramic building materials used in public, either secular or ecclesiastical, architectural projects during the periods of construction boom in the city. In this framework, several study cases from Late Antique, Byzantine and Ottoman Thessalonica will be briefly presented and discussed.

**1694. BETWEEN UTILITY AND SYMBOLISM: THE LIFE CYCLES OF ARCHITECTURAL TERRACOTTAS FROM THE VILLA METRO ANAGNINA**

**Contribution format:** Oral

**Contribution authors:** Julian Bauch (German Archaeological Institute) – Jane Kreiser (Technical University Darmstadt)

The study of ceramic building materials (CBM) in Roman architecture has traditionally focused on their functional aspects, such as production, distribution, and technical properties. However, architectural terracottas, especially decorated antefixes, often carried additional symbolic, social, and possibly sacral meanings. The contribution examines the life cycle of roof terracottas from the Villa Metro Anagnina, a Roman production and

agricultural complex in the suburban periphery of Rome, which exhibited unexpectedly high-quality decorative elements. The villa, occupied from the Republican to Imperial period, provides an excellent case study to assess how mythological antefixes functioned within non-sacral contexts. Previous studies have often assumed that richly decorated roof terracottas indicate sacred structures, yet this research questions such assumptions by considering a broader range of economic and architectural factors. Were these antefixes aesthetic and status markers within an elite productive estate, or do they suggest a cultic space within the complex. To address this, the study integrates: - New documentation techniques, including 3D scanning and color analysis, applied to selected antefixes preserved in the Antiquario Lucrezia Romana. - Macroscopic and material analyses to assess production techniques and potential workshop affiliations. - Comparative studies of CBM from contemporary suburban and rural sites to contextualize the economic and ideological role of decorated roofs. - A lifecycle perspective tracing the use, maintenance, potential reuse, and deposition of these architectural elements. By bridging technical, economic, and symbolic interpretations, this paper contributes to a broader discussion on the role of CBM beyond their primary function, integrating insights into architectural identity, economic investment, and possible religious implications within elite Roman estates.

**1983. TRASH OR TREASURE? RECYCLED ROOF TILES AND BRICKS IN ROMAN PETRA**

**Contribution format:** Oral

**Contribution authors:** Pirjo Hamari (Finnish Heritage Agency / Independent)

Among the number of other remarkable finds from the Nabataean-Roman House IV on the Ez Zantur hill in Petra, Jordan, a large quantity of brick and roof tile fragments were recovered. These came mostly from secondary deposits, having been used as recycled building material in the infrastructure of the house. Regardless of its used nature, the material provides an exceptionally valuable overview of the types of CBM in use in Petra during the late Nabataean and early Roman periods, from 1st c. BCE to 2nd C. CE. The study of these types and their possible original contexts opens up several interesting new avenues for research, such as the origin of the habit of CBM use in Petra, the genealogy of the types used, and the overall impact of CBM use in the cityscape of Petra. In my contribution I will focus on analysing the processes and signs of reuse of CBM in the area. In addition I will discuss the possibilities for further work on tile and brick typologies based on this reused material.

**2464. FIRING THE FOUNDATIONS: AN OVERVIEW OF CERAMIC BUILDING MATERIAL PRODUCTION IN CLASSICAL AND HELLENISTIC ATHENS**

**Contribution format:** Oral

**Contribution authors:** Franziska Lehmann (dArV)

The production of ceramic building materials (CBM) in Athens during the Classical to Hellenistic periods remains underexplored, despite the central role these materials played in the city’s architecture. This paper seeks to provide a preliminary overview of the broader trends in CBM production in Athens, examining how this activity may have evolved over time and its integration into the urban fabric. Drawing from both written and archaeological sources, the paper will explore key aspects of the production process, including the types of materials used, potential workshop locations, and the socio-economic context in which these materials were produced. By focusing on Athens as a case study, this paper aims to illuminate the relatively undocumented production processes of bricks, tiles, and architectural terracottas, which were crucial to the construction of public and private buildings. Additionally, it will touch upon the role of such materials within the wider Mediterranean trade networks, providing a glimpse into their use beyond the immediate context of Athens. This contribution will offer new insights into an often-overlooked aspect of Athenian building industries, and lay the foundation for further investigation into the technological, social, and economic dimensions of CBM production in the ancient city.

**2164. A ROOF FOR THE DEAD: TERRACOTTA TILES IN BURIALS FROM THE CLASSICAL TO THE LATE ANTIQUE PERIODS**

**Contribution format:** Oral

**Contribution authors:** Annalize Rheeder (Independent researcher)

Roof terracottas appear in burials throughout the Mediterranean world in a variety of ways. An analysis of gabled roof tile graves from the Kerameikos in Athens and Pergamon, for example, reveal patterns of re-use and adaptation of building materials. Not only do wear patterns show that the tiles had formed part of functioning roofs for an extended period before burial. But the range of tile types suggest they came from different sources and time periods. Persons of humble economic means did have a variety of burial methods which did not involve roof terracottas to choose from. This raises the question of additional factors which might have led to the appeal of roof terracottas used in burials. Their frequent depiction in grave monuments and sarcophagi as well as their description in textual sources might suggest that this material was chosen for more than just its economic and functional properties. Conceptual links between roof tiles, architecture and the practice of creating a “house for

the dead” require further consideration.

2414. ALTERNATIVE USE OF BRICK AND TILE: GAME BOARDS AND „WRITING TABLETS” FROM ROMAN PANNONIA

**Contribution format:** Poster  
**Contribution authors:** Linda Dobosi (Eotvos Lorand University | HUN-REN-ELTE Research Group for Interdisciplinary Archaeology)

Roman ceramic building material is a frequent find at archaeological excavations and is an important source of information about Roman architecture. However, bricks and tiles were not only used in the construction industry, but had other, unconventional uses as well. Sometimes during the manufacturing process the soft clay was used for drawing or writing and when the bricks were fired, the markings became permanent. This way, the green tiles could be made into game boards, such as boards for nine men’s morris or ludus latrunculorum games. Also, the green tiles were suitable for recording writing, like detailed accounts of the production of a tilery or even jokes. In other cases, the bricks or tiles were turned into game boards or writing tablets after firing. The markings, lines or letters were scratched to the surface of the tiles often in a stage of re-use. The paper explores the use and re-use of tiles as game boards or writing surfaces in Roman Pannonia based on finds in the collection of Hungarian museums.

188 THE EPIGRAVETTIAN WORLD

**Session theme:** 7. Climate Change in the Past and Present  
**Session format:** Regular session  
**Session keywords:** Final Upper Palaeolithic, Climatic change , Land mammals, Human adaptation , Settlement patterns, Symbolic behavior  
**Session organisers:** Beniamino Mecozzi (Sapienza, University of Rome) – Nicolò Fasser (Universita` degli Studi di Ferrara) – Antonin Tomasso (Université Côte d’Azur CNRS CEPAM) – Dusan Boric (Sapienza, University of Rome) – Federica Fontana (Universita` degli Studi di Ferrara)

SESSION ABSTRACT

The Epigravettian corresponds to one of the final Upper Palaeolithic culture-historical taxonomic units in Europe. Many sites have been attributed to the Epigravettian over a wide area —from south-eastern France, Italy, and the Balkans to Russia and Armenia. The onset is almost synchronous across this territory with the start date of around 26 and 24 ka cal BP, whereas the end date is variable from region to region but could generally be said to correspond to the end of the Pleistocene. The term Epigravettian was introduced to emphasize continuities with the preceding Gravettian, pointing to a higher stability over the long-term in the regions where it has been detected compared to western Atlantic areas of Europe. However, the definition of this techno-complex is not identical in the Mediterranean and in central and eastern Europe and regional and diachronic divergences have been highlighted. The Epigravettian aligns with the end of the Last Glacial period, marked by a decline in biodiversity among mammalian palaeocommunities and changing in vegetation due to climatic instability. This session aims to bring together researchers from diverse disciplines to develop an interdisciplinary approach in characterizing the significant climatic, environmental, and landscape changes that occurred during the Epigravettian period and corresponding human adaptations in these territories. We invite speakers to present works characterized by multidisciplinary approaches, which could include aspects of human adaptations based on technological systems, paleoenvironmental reconstructions based on faunal and isotope analyses, subsistence and land-use strategies in different environments, settlement patterns, and symbolic behavior. We would like to provide a forum for a large-scale comparison and for updating the chronological framework of the Epigravettian by discussing connections, interactions, and human mobility and migration over this wide territory, and over the period that saw dramatic climatic and environmental changes.

CONTRIBUTION ABSTRACTS

2326. EPIGRAVETTIAN SUBSISTENCE HABITS AND SITE FUNCTIONS IN THE MIDDLE DNIPRO AND DNISTER VALLEYS DURING THE LATE PLENIGLACIAL

**Contribution format:** Oral  
**Contribution authors:** Stéphane Pean – Laëtitia Demay (Muséum national d’Histoire naturelle, UMR 7194 HNHP, Paris) – Pavlo Shydlovskiy (Taras Shevchenko National University of Kyiv. Department of Archaeology and Museology) – Dmytro Stupak (National Academy of Sciences of

Ukraine, Institute of Archaeology, Kyiv) – Larissa Koulakovska (National Academy of Sciences of Ukraine, Institute of Archaeology, Archaeology Museum, Kyiv)

During the Late Pleniglacial, Epigravettian cultural traditions spread throughout Central and Eastern Europe. In particular, large open-air settlements have been notably found out in the middle Dnipro and Dnister valleys. They have raised issues about woolly mammoth procurement and processing techniques among large mammal exploitation of food and not dietary resources, such as osseous artefacts and, in the Dnipro basin, dwelling structures. Zooarchaeological studies, including taphonomy, were carried out on faunal materials from deposits located in the Middle Dnipro basin (such as Mezhyrich and Buzhanka 2) and the Dnister valley (notably the Korman sites), in their palaeoecological and archaeological contexts. Mammoth appears as the main resource in the Mezhyrich residential campsite, which is known for 4 mammoth bone dwellings surrounded by pits. Conversely, reindeers and horses are the main game at Korman IX, which was occupied as a temporary camp. Regional comparative analyses provide a new understanding of the Epigravettian subsistence practices, settlement modalities and territorial mobility in two large river basins between the East Carpathian and East European Plain areas.

596. EXPLOITATION OF GEOLOGICAL SOURCES OF FOSSILIZED MOLLUSC SHELLS IN THE EPIGRAVETTIAN DANUBE BEND AREA

**Contribution format:** Oral  
**Contribution authors:** Csaba Bálint (Eötvös Lóránd University | Dobó István Vármúzeum)

Excavations done on the various Epigravettian sites of Central Northern Hungary’s Danube Bend area have yielded sizeable amounts of mostly unmodified, fossilized tertiary mollusc shells. At most of the sites these shells were scattered throughout the habitation surface, and, moreover at the site of Szob-Ipolypart they were arranged into piles, interpreted as storage deposits. The shell assemblages present at the sites show distinct preferences of mollusc shells mainly focusing on one to three different genera. These prefereces hint at conscious selection during the procurement process. The Danube Bend area possesses numerous exposed sediments bearing tertiary marine fauna that were available as possible sources during the Epigravettian. This presentation focuses on pinpointing the geological sources that could have been utilized for collecting these items per site, attempts to discern how many different sources would have been needed to procure these assemblages and if the obtaining of shells could have been embedded into lithic raw material procurement strategies.

1009. SYMBOLISM OR FUNCTION? AN INTEGRATIVE FUNCTIONAL ANALYSIS OF EPIGRAVETTIAN GLYCYMERIS SHELLS FROM VLAKNO CAVE

**Contribution format:** Oral  
**Contribution authors:** Barbara Cvitkusic (Sapienza University of Rome | Institute for Anthropological Research, Zagreb) – Emanuela Cristiani (Sapienza University of Rome) – Dario Vujevic (University of Zadar)

In the Adriatic region, climate changes from the Last Glacial Maximum (LGM) to the early Holocene significantly transformed landscapes, turning inland sites into coastal environments and affecting subsistence strategies, raw material procurement, and symbolic expressions such as body ornamentation. Vlakno cave, located on the island of Dugi Otok on the Eastern Adriatic coast of present-day Croatia, provides a unique opportunity to study these transitions, as evidenced by its rich archaeological assemblage. The preliminary geoarchaeological analyses indicate strong anthropogenic processes in almost all layers, with no visible hiatus apart from the tephra deposit. Notably, Vlakno Cave has yielded the most extensive Late Upper Palaeolithic assemblage of marine shells in the region, including various bivalve species used as food or ornaments. Recent archaeological and ethnographic research suggests that certain bivalve shells served multiple purposes, including as tools and containers. Here, we present our study of Glycymeris spp. shells, primarily considered as ornaments. After detecting use-wear traces along the inner edge, we explored their ambiguous function through microscopic surface analysis, supported by a reference collection of experimentally produced use-wear traces. By processing various animal, vegetal, and mineral materials on fresh Glycymeris specimens, we aim to discern wear patterns and clarify the possible functions of the archaeological specimens, which may represent the first Epigravettian and earliest known shell tools in the Adriatic region.

2216. THE RECOLONISATION DYNAMICS OF THE MIDDLE DNIPRO BASIN BY EPIGRAVETTIAN GROUPS

**Contribution format:** Oral  
**Contribution authors:** Diana Dudnyk (The Institute of Archaeology of the National Academy of Science of Ukraine) – Marharyta Chymyrys – Pavlo Shydlovskiy (Taras Shevchenko National University of Kyiv) – Ostap Tsvirkun (National Museum of the History of Ukraine) – Daria Alekseenko (Taras Shevchenko National University of Kyiv)

The most well-documented and extensively studied Epigravettian sites in Ukraine are associated with the Mizyn and Mezhyrich industries. The Barmaky site, linked to the Mizyn cultural tradition, represents the earliest known Epigravettian presence in the Middle Dnipro Basin, dating to approximately 19 kyr cal BP. Situated on the Volhynian Plateau during the initial stages of Scandinavian ice sheet degradation, the site marks the beginning of the region’s recolonisation after a 5–6-thousand-year period of depopulation. Geoarchaeological and climatic studies, combined with lithic analysis and resource exploitation models, identify Barmaky as a winter base camp for pioneering groups. The Mezhyrich site gives its name to the Mezhyrich industry, which also includes sites such as Dobranichivka, Gintsi, Semenivka 1, 2, 3, and Buzhanka 2. Among these, Mezhyrich remains a focal point of scientific inquiry, with a chronology of approximately 18–17 kyr cal BP. Excavations have uncovered four above-ground dwellings at Mezhyrich, alongside storage pits and a rich archaeological inventory, classifying it as a multi-layered settlement. Current research primarily focuses on Dwelling No. 4 and its associated features. Among all the Epigravettian sites in the Middle Dnipro Basin, Gintsi (upper layer k), Semenivka 1 and 2 are identified as specialized sites associated with the Mezhyrich industry. These sites are considered as temporary summer hunting camps. The recolonisation of the Middle Dnipro Basin by Epigravettian groups began with an opportunistic model of resource exploitation, as evidenced at Barmaky. However, during the peak of the Epigravettian techno-complex, more diversified forms of adaptation emerged, exemplified by sites associated with the Mezhyrich industry.

**2093. UTILISATION OF PEBBLE RAW MATERIALS DURING THE UPPER PALAEOLITHIC: THREE ASSEMBLAGES FROM HUNGARY**

**Contribution format:** Oral  
**Contribution authors:** András Markó (University of Szeged)

The exploitation of pebble outcrops as raw material sources had several advantages during the Prehistory. First, during the fluvial transport or abrasion near the marine or lake shores the inhomogenities of the raw rocks were removed by rolling and sediment transport. Secondly, the pieces of optimal dimensions and shapes could have been easily collected from the loose sediments, and, finally, in some cases various raw material type. including coarse grained quartzite and fine siliceous rocks could have been available from single outcrops or geological formations. In Hungary a special variant of the Upper Palaeolithic industries, the so-called Ságvárian or Pebble Gravettian, oriented towards the pebble manufacture, dated to the LGM were recognised during the 1990s. In the presentation we review some technological traits of the lithic collections excavated at Szob and Mogyorósbánya (Northern Hungary) and Madras lying in the southernmost part of the Great Plain (Alföld) in Hungary. As a result, two main methods were identified: blade and bladelet reduction based on single-platform cores and bladelet production from burin cores shaped basically on cortical flakes. The characteristic by-products (pebble slices and segments, naturally backed knives as well as ‘geometrically broken pebble types’) emphasized earlier, all belong to the special blank production based on raw material types collected from secondary raw material sources.

**1328. FUNCTIONAL VARIABILITY OF EPIGRAVETTIAN BURINS: A COMPARATIVE STUDY OF RIPARO TAGLIENTE (ITALY) AND BADANJ (BOSNIA AND HERZEGOVINA)**

**Contribution format:** Oral  
**Contribution authors:** Alice Vinet (Ferrara University) – Emanuela Cristiani (La Sapienza University) – Davide Visentin (Ferrara University) – Adisa Lepić – Ana Marić (National Museum of Bosnia and Herzegovina) – Federica Fontana (Ferrara University) – Dušan Borić (La Sapienza University)

The Late Pleistocene was marked by profound climatic and environmental transformations that influenced the adaptive strategies of hunter-gatherer communities. In the circum-Adriatic region, Epigravettian groups responded to these shifts through technological innovations and flexible settlement strategies, leading to the long-term occupation of key sites such as Riparo Tagliente (Italy) and Badanj (Bosnia and Herzegovina). Within the framework of the AFTER THE ICE project, this study examines the functional variability of Epigravettian burins from these two persistent places, aiming to understand the evolution of their use over time. By employing an interdisciplinary approach that integrates use-wear and residue analysis, we explore the functional diversity of burins, emphasizing their role as highly versatile tools rather than standardized implements. This comparative study explores diachronic patterns in tool function, shedding light on shifts in subsistence strategies, craft production, and site use in response to environmental and socio-economic changes. The results will contribute to broader discussions on the role of chipped stone tools in Epigravettian adaptations. By integrating functional analysis with other archaeological material culture studies, this research enhances our understanding of how prehistoric hunter-gatherers organized their technological systems in a dynamic landscape.

**1594. TRACING CONNECTIONS AND INTERACTIONS WITHIN THE ADRIATIC REGION THROUGH LITHIC PROJECTILE IMPLEMENTS**

**Contribution format:** Oral  
**Contribution authors:** Nicolò Fasser (University of Ferrara) – Adisa Lepić – Ana Marić (National Museum of Bosnia and Herzegovina) – Davide Visentin (University of Ferrara) – Dušan Borić (Sapienza University of Rome | New York University) – Federica Fontana (University of Ferrara)

The Late Epigravettian corresponds to the Late Glacial, a phase characterised by landscape and environmental changes in response to the climatic amelioration of the Bølling-Allerød interstadial. Such changes are particularly marked around the Great Adriatic Po region. The gradual loss of the land to sea, the glaciers’ retreat, and the reforestation processes deeply affected the territorial organisation of Late Palaeolithic hunter-gatherer communities of both the Balkans and Italy. Despite these dramatic transformations, human groups from the western and the eastern Adriatic coast seem to have followed a similar cultural evolution. Evidence of extensive social networks is highlighted by several cultural traits: from siliceous rock exchanges and affinities in lithic technology to similarities in ornamental traditions and decorative motifs. Even recent genomic data attest to population movements from the Balkan/Anatolian regions to Italy. In this context, to gain a more comprehensive understanding of the extent of interactions between Italy and the Balkans, we conducted a study focused on projectile implements from two Late Epigravettian sites with contemporaneous chronological sequences: Riparo Tagliente (VR, Italy) and Badanj (Bosnia and Herzegovina). This study goes beyond the typological approach by investigating whether the morphological affinities between the two areas correspond to the same production modalities—from blank selection to retouch methods and techniques. Projectile implements, being the most variable lithic tool type through time and space, are an effective marker in evaluating the extent of interactions and exchanges/mobility between Italy and the Balkans from a diachronic perspective. By studying this category of lithic tools, we are able to assess the role of the Adriatic Plain in the diffusion of technical know-how.

**2233. REVISING BATTAGLIA ROCK SHELTER LITHIC ASSEMBLAGE (NE ITALY): THE LATE EPIGRAVETTIAN EXPLOITATION OF THE HIGH PLATEAUS AND THEIR LITHIC RESOURCES**

**Contribution format:** Oral  
**Contribution authors:** Marzio Cecchetti – Nicolò Fasser (Dipartimento di Studi Umanistici, Università degli Studi di Ferrara) – Viviana Frisone (Musei Civici di Vicenza, Museo Naturalistico Archeologico) – Federica Fontana (Dipartimento di Studi Umanistici, Università degli Studi di Ferrara)

Among Late Epigravettian adaptations in northeastern Italy, the recolonisation of the southern Alpine fringe and the inner territories is a significant process with repercussions in territorial systems, resource exploitation, mobility, and cultural connections. Battaglia rock shelter (Vicenza, Veneto region, Italy), located at 1.050 m a.s.l. on the Asiago plateau and investigated in the early 1960s, represents one of the earliest discoveries of an Alpine Late Palaeolithic highland site. Following the advancement of methodological approaches, a revision of Battaglia rock shelter lithic assemblage aims to reconstruct the lithic reduction strategies conducted at the site and define a more precise chronology for its occupation. This allows a better understanding of the site in the context of Late Epigravettian territorial and resource exploitation strategies. Many tested blocks, pre-cores and cores at an early stage of exploitation, as well as corticated items, characterise Battaglia rock shelter lithic assemblage. These traits are shared with the well-known nearby site of Val Lastari, which is considered a specialised location for chert procurement. Therefore, this study highlights the importance of Battaglia rock shelter as another site strategically oriented toward the exploitation of the rich lithic resources of the Asiago plateau. Additionally, the site may represent one of the earliest highland occupations after the LGM in the Alpine region, providing insights into the timing of the re-occupation of the high plateaus by Late Epigravettian hunter-gatherer groups and the reasons behind their logistic displacements.

**1318. RECONSTRUCTING THE EVOLUTION MAMMALIAN PALAEOCOMMUNITIES IN THE FUCINO BASIN OF CENTRAL ITALY DURING THE LAST GLACIAL**

**Contribution format:** Oral  
**Contribution authors:** Beniamino Mecozzi – Dusan Boric (Sapienza University of Rome) – Francesca Alhaique (Museo delle Civiltà, Rome)

The Fucino Plain (649–667 m asl) is currently one of the main agricultural areas in central Italy today, but in the past it hosted the third-largest lake in Italy that was artificially drained in 1875. The shoreline of the Fucino Lake fluctuated through time, reaching 710 m asl between approximately 20 and 18 kya cal BP and 680 m asl between approximately 15 and 14 kya cal BP. The Fucino Basin is surrounded by the Apennine mountains, including Mount Velino (2487 m) and Mount Sirente (2349 m). The presence of this extensive lake (ca. 150 km²) created a favorable microclimate during the cold climatic conditions of the Late Glacial period, encouraging human occupation of the

area. Several caves were discovered and excavated between the 1950s and 1960s, mainly under the supervision of Antonio Maria Radmilli. These include Grotta della Continenza, Grotta Di Ciccio Felice, Grotta di Ortucchio, Grotta La Punta, Grotta Maritza, Grotta Tronci, and Riparo Maurizio. These caves yielded large paleontological and archaeological assemblages, referable to the Upper Paleolithic and dated between approximately 18 and 10 ka. Zooarchaeological analyses indicate that humans probably occupied this region year-round, taking advantage of the favorable microclimate created by the lake. Furthermore, the results suggest that carnivores also used and accumulated bones in these same caves when humans were not present, highlighting a complex pattern of cave frequentation. This study presents a comparison of the mammal assemblages collected from these caves, offering insights into the evolution of terrestrial ecosystems in the Fucino Basin and their responses to climatic changes. The analysis of mammal remains will enable us to investigate changes in palaeocommunities between 18 and 10 kya cal BP, including the potential mammal size changes driven by climate variations.

2137. WHAT ABOUT THE “EVOLVED EPIGRAVETTIAN”? NEW TECHNOLOGICAL DATA ON LITHIC ASSEMBLAGES FROM SOUTHERN ITALY

**Contribution format:** Oral  
**Contribution authors:** Matteo Rossini (Department of Physical Sciences, Earth and Environment, University of Siena) – Antonin Tomasso (Université Côte d’Azur CNRS CEPAM) – Clarissa Dominici (Department of Archaeology, Simon Fraser University | Department of Physical Sciences, Earth and Environment, University of Siena) – Adriana Moroni – Francesco Boschin (Department of Physical Sciences, Earth and Environment, University of Siena)

The definition of the so-called Evolved phase of the Epigravettian (ca. 16000 to 15000/14500 uncal. BP) remains debated. It was originally defined on a typological classification of undated archaeological layers. Several scholars disagree on the validity of this label, and, over the years, different proposals have been put forward regarding the integration of this period into either the Early or Late Epigravettian phases. In the light of this debate, the modern research focuses on a new study of lithic assemblages assigned to the Evolved Epigravettian. Here we present new unpublished data from two lithic assemblages: layer 9C of Grotta Paglicci (18,190– 18,984 Cal BP; Rignano Garganico, Apulia, Italy) and layer O of Grotta della Cala (Marina di Camerota, Salerno, Italy). We particularly conducted technological and petrographic analyses of lithic assemblages in combination with functional analyses of backed pieces. These two sites represent reference points for the Epigravettian in southern Italy, as they contain key stratigraphic sequences related to the Upper Palaeolithic. We compare the assemblages from layers 9C and O with recently published data on the Italian Epigravettian, combining technological and palaeoenvironmental perspectives, and discuss the data and their possible relevance to hunter-gatherer behaviour.

1840. (RE)CONSTRUCTING HOME: AN ETHNOARCHAEOLOGICAL APPROACH TO SHELTER CONSTRUCTION IN DYNAMIC ENVIRONMENTS

**Contribution format:** Oral  
**Contribution authors:** Tullio Abruzzese – Wei Chu (Department of World Archaeology, Faculty of Archaeology, Leiden University)

The Late Pleistocene in East-Central Europe is broadly characterized by a cooler climate and dynamic landscapes. Being able to build shelters as needed without relying on natural features such as caves, is one of the factors contributing to the spread of hominins in different biomes. However, the archaeological record does not offer definitive evidence to argue for the presence of shelters beyond doubt. This may result from an incomplete understanding of what shelters looked like, and where and how to identify them archaeologically. Posited evidence for shelters comes mainly from post hoc analyses of known sites, and reconstructions of their appearance are often based on little information. Examples of this are the infamous East-Central European Epigravettian mammoth bone structures interpreted as shelters, but poorly understood, especially when considering the reconstruction of their aspect. In this contribution, we propose an ethnoarchaeological approach to study and interpret archaeological evidence for Late Pleistocene shelters. We use diverse ethnographic accounts to create a database of shelters built by forager societies. We collect data on exterior appearance, building techniques, placement, as well as camp organization, settlement systems, and social dynamics in various biomes. We expect to detect patterns in the ways foragers situate, design, and make use of shelters. Based on these patterns, our objective is to create a frame of reference to find, recognise, and meaningfully interpret the archaeological traces left by Late Pleistocene hominins’ shelters. Identifying and describing prehistoric shelters has important consequences for understanding how past hominins lived and spread during the unpredictable environmental fluctuations of the Late Pleistocene. Clarifying shelter use will offer a better understanding of how hominins coped with vast landscapes without relying on the presence of caves and rock shelters. This will provide a frame of reference to understand shelters’ role within the social, cultural, and adaptive dynamic. of past people.

246. LAPLACE MAY HAVE BEEN WRONG, WHAT IF EPIGRAVETTIAN DOES NOT EXIST?

**Contribution format:** Oral  
**Contribution authors:** Antonin Tomasso (Université Côte d’Azur CNRS CEPAM)

Epigravettian was first defined in Italy by Laplace during the 1950s. At that time he emphasised the contrasting development of the lithic industries between two parts of Europe during the second half of the Palaeolithic: western Europe would have experienced several ruptures, while eastern and southern Europe were characterised by the continuation of Gravettian traditions up to the Mesolithic. Even if Italian authors qualified this perception of what Laplace wanted to call Tardigravettian and what became our Epigravettian, they did not radically rethink Laplace’s initial model. Moreover, the extension of the Epigravettian to a large part of south-eastern Europe was done with reference to Laplace’s notion of a perduration of the Gravettian traditions. The Epigravettian question is symptomatic of the weakness of the taxonomic models used to describe the Palaeolithic. These models have been developed empirically and are not based on a common definition of the criteria used, their hierarchy, the causal relationships that link them and their historical meanings. It is therefore particularly interesting to critically discuss the Epigravettian notion in order to feed a global reflection on our perception of changes and their historical meanings during the Palaeolithic. In this paper we will propose a critical review of the current definitions of Epigravettian. First, we will consider Laplace’s initial proposal and the extent to which his initial hypotheses can be accepted or refuted in the light of modern data. Secondly, we will propose an overview of the arguments used in different contexts to associate sites to the “Epigravettian” and thus discuss the real consistency of the “Epigravettian world”.

189 THE ADRIATIC SEA AS A CULTURAL CORRIDOR DURING LATE PLEISTOCENE AND EARLY HOLOCENE: MOBILITY AND INTERREGIONAL CONTACTS

**Session theme:** 1. On artefacts and beyond  
**Session format:** Discussion session  
**Session keywords:** Mobility, Interregional Contacts, Upper Paleolithic, Mesolithic, Neolithic, Adriatic sea  
**Session organisers:** Alejandro Sierra (Universitat Autònoma de Barcelona) – Aitor Ruiz-Redondo (Universidad de Zaragoza) – Marc Vander Linden (Bournemouth University)

SESSION ABSTRACT

The Adriatic Sea has played a fundamental role in human history as a corridor for communication and mobility. The distinctiveness of this region lies in its geographical position and the high sensitivity of its basin to climatic variations and sea-level changes. During the Last Glacial Maximum (LGM, c.y 19,000 cal BP), sea levels reached their lowest point, creating a vast land plain providing a habitable expanse where human groups could move, settle, and establish interaction networks. Towards the end of the Pleistocene, rising sea levels gradually submerged this plain, transforming the region’s geography and landscapes. Yet, the Adriatic Sea did not impede contact between human populations living on its shores. Societies continued to adapt, developing and using maritime technologies to cross the sea, settling on emerging islands, and maintaining networks, particularly as the Neolithic period expanded. This session seeks to explore these topics by examining how the last Palaeolithic and Mesolithic hunter-gatherer groups and the earliest farming communities viewed and used the Adriatic as a route for exchange and interaction. We invite contributions exploring themes such as coastal mobility and adaptation, archaeological evidence of early navigation, cultural and technological exchanges, and the role of the Adriatic as a crossroads for innovation and convergence between Eastern and Western Mediterranean traditions. We welcome the use of diverse techniques and methodologies to investigate these topics, encouraging interdisciplinary approaches that can offer new insights into this dynamic region’s historical interactions and adaptations.

CONTRIBUTION ABSTRACTS

484. NEW DATA AND PERSPECTIVES ON THE EPIGRAVETTIAN HUMAN OCCUPATIONS OF BADANJ ROCKSHELTER (BOSNIA AND HERZEGOVINA)

**Contribution format:** Oral  
**Contribution authors:** Aitor Ruiz-Redondo (IUCA, University of Zaragoza | CAHO, University of Southampton) – Marta Alcolea (IUCA, University of Zaragoza) – Virginia Barciela (INAPH, University of Alicante) – Catherine Ferrier (PACEA, Université de Bordeaux) – Cristina López-Tascón (Autonomous University of Madrid) – Siniša Radović (Institute for Quaternary Palaeontology and Geology, HAZU (Croatia)) – Alejandro Sierra (Università di Pisa)

– Marc Vander Linden (IMSET, University of Bournemouth) – Selena Vitezović (Institute of Archaeology, Belgrade) – Nikola Vukosavljević (FFZG, University of Zagreb)

Badanj rockshelter is a major Upper Palaeolithic site in south-eastern Europe. It was first identified in 1974 when local residents discovered lithic artefacts, which were subsequently reported to Đ. Basler of the National Museum in Sarajevo. Recognising the site’s potential, Basler promptly initiated excavations. The initial excavations revealed a remarkably rich assemblage, yielding over 20,000 lithic remains dating to the end of the Pleistocene (Late Epigravettian). Among the finds were hundreds of personal ornaments and dozens of engraved bone fragments, rare components in the Palaeolithic record of the Balkan Peninsula at the time and notable even today. This first campaign also led to an extraordinary discovery: a large engraved boulder buried beneath archaeological layers, marking the site as the first Palaeolithic rock art locality identified in the Balkan Peninsula. Following two excavation campaigns in the 1980s, led by Z. Kujundzić and R. Whallon, our team resumed fieldwork at the site in 2019. Over the past seven years, we have uncovered a sequence spanning ~20 ka to ~12.7 ka cal BP, supported by 22 new radiocarbon dates that have expanded and refined the previously established chronology. An international and multidisciplinary project has facilitated the chronological and technological analysis of the rock art, lithic and bone tools, and personal ornaments, contextualised through subsistence and environmental data obtained via geoarchaeological, zooarchaeological, and archaeobotanical studies. These results establish Badanj as a key site for understanding the Late Pleistocene in south-eastern Europe.

**2030. SHIFTING SHORES, SHIFTING NETWORKS: RAW MATERIAL PROCUREMENT AND CULTURAL CONNECTIVITY IN NORTHERN DALMATIA FROM LATE UPPER PALAEOLITHIC TO THE NEOLITHIC**

**Contribution format:** Oral  
**Contribution authors:** Maja Grguric Srzentic – Mario Bodruzic – Ana Jagić (University of Zadar, Department of Archaeology) – Zlatko Perhoč (Independant researcher) – Dario Vujević (University of Zadar, Department of Archaeology)

The Adriatic Plain has long served as a corridor for human movement, exchange, and adaptation. During the Upper Palaeolithic, climatic fluctuations and post-glacial sea-level rise reshaped mobility pathways and resource procurement strategies. Vlakno Cave, a well-stratified Epigravettian site on the eastern Adriatic coast, offers critical insights into these processes. Lithic assemblages from Vlakno reveal a strategic approach to raw material procurement, with both local cherts and non-local materials, including those from the western Adriatic coast. These distant raw materials are not only evidence of resource acquisition but also of cultural transmission across the Adriatic. However, their disappearance from Vlakno’s record coincides with rising sea levels, suggesting that marine transgression disrupted these long-established connections. Notably, these links were reestablished in the Early Neolithic, as evidenced at sites such as Ždrilo Cave near Rovanjaska, by the reappearance of western Adriatic raw materials, likely facilitated by seafaring. It remains unclear whether this maritime connectivity was established during the Late Mesolithic or emerged only with the spread of agriculture and early pastoralism in the eastern Adriatic. The absence of Late Mesolithic sites limits our understanding of this transition. This paper examines lithic procurement patterns at Vlakno Cave within the broader framework of Adriatic connectivity, comparing evidence across multiple sites. By integrating lithic analysis with paleoenvironmental data, we explore how Epigravettian, Mesolithic, and Neolithic groups responded to environmental change and how these adaptations shaped long-distance interaction in the region.

**315. SOCIAL IMPLICATIONS OF EARLY NEOLITHIC SEA TRANSPORT: ETHNOARCHAEOLOGICAL AND ETHNOGRAPHIC HINTS AT SOCIAL COMPLEXITY**

**Contribution format:** Oral  
**Contribution authors:** Thomas Rocek (University of Delaware) – Radomír Tichý (University of Hradec Králové)

The rapid spread of early Neolithic adaptations along the northern Mediterranean coast has long been recognized as involving water transport. Archaeological finds of preserved dugout canoes such as those from the Impresso-Cardial occupation at La Marmotta in Lake Bracciano near Rome, Italy, have provided increased insight into the technology involved. Complementarily, experimental archaeological work by the University of Hradec Králové has demonstrated the effectiveness of such canoes for long-distance sea transport. However, while the technological aspects of the Neolithic maritime expansion are becoming increasingly clear, relatively limited research has been devoted to the social context of the process. . We combine data from the experimental archaeological work, specifically the construction of a series of replica dugout canoes and four long-distance voyages (expeditions Monoxylyon I through Monoxylyon IV) with ethnographic data from the Northwest Coast of North America to consider the social implications of manufacturing and using such craft. While the ethnographic and early Neolithic cases have significant differences, we argue that the labor requirements for construction of the canoes, and particularly the organization of and commitment to such long-distance trips, combined with the evidence of long-distance transport of exotic materials, implies a level of social complexity that is not immediately evident in

the currently known archaeological record of Impresso-Cardial or other early circum-Mediterranean Neolithic sites. Such organization may have included the development of some degree of social-hierarchy; minimally, it involved cooperative social units well organized above the household level.

**136. EXPLORING LIVESTOCK MANAGEMENT AND SEASONAL RHYTHMS IN EARLY NEOLITHIC ADRIATIC COMMUNITIES**

**Contribution format:** Oral  
**Contribution authors:** Alejandro Sierra (Dipartimento di Civiltà’ e Forme del Sapere, Università di Pisa) – Marie Balasse (AASPE, CNRS MNHN, Paris) – Sinisa Radovic (Croatian Academy of Sciences and Arts) – Francesca Alhaique (Servizio di Bioarcheologia, Museo Delle Civiltà, Roma) – Denis Fiorillo (AASPE, CNRS MNHN, Paris) – Jean-Denis Vigne (AASPE, CNRS MNHN) – Mirella Cipolloni Sampò (Università degli Studi della Toscana, Viterbo) – Jean Guilaine (Collège de France)

The Adriatic region played a pivotal role in the Neolithization process of the central and western Mediterranean, notably marked by the spread of Impressa pottery complex. This “maritime stream” underscores a significant cultural cohesion between the Adriatic coasts, facilitated by sustained exchanges and shared elements of material culture. Economically, both regions share an emphasis on sheep herding and barley cultivation, although they differ in their use of wild resources, reflecting both local adaptations and cultural preferences. However, knowledge about livestock practices remains limited, particularly regarding animal management and exploitation. This study aims to characterize livestock practices in the Adriatic during the early Neolithic, focusing on sheep, the predominant species. By examining mortality profiles from sites on both Adriatic coasts, the study seeks to uncover herd demographic management and production orientations. Furthermore, the analysis includes pastoral calendars from sites such as Tinj and Crno Vrilo (Dalmatia) and Trasano and Rendina (southern Italy), with particular attention to the timing of lambing cycles. This may provide insights into potential early practices of autumn lambing deseasoning, a method still observed in contemporary Mediterranean contexts. The findings will shed light on the adaptive strategies of these early agropastoral communities and their socio-economic organization. This study highlights the Adriatic’s central role as a cultural and economic nexus in the Mediterranean during the Neolithic, contributing to a broader understanding of the region’s impact on the spread and development of early farming practices.

**2375. HUMAN-ENVIRONMENT INTERACTIONS IN THE UPPER PLEISTOCENE: NEW ARCHAEOZOOLOGICAL EVIDENCE FROM BADANJ ROCKSHELTER**

**Contribution format:** Poster  
**Contribution authors:** Sinisa Radovic (Institute for Quaternary Palaeontology and Geology, HAZU (Croatia)) – Alejandro Sierra (Università di Pisa) – Nikola Vukosavljević (FFZG, University of Zagreb) – Aitor Ruiz-Redondo (IUCA, University of Zaragoza | CAHO, University of Southampton)

Badanj rockshelter is a key Upper Palaeolithic site in south-eastern Europe. Excavations began in 1974 and uncovered numerous lithic and bone remains from the Late Epigravettian, along with personal ornaments and engraved bone fragments. The discovery of the first known Palaeolithic rock art in the region highlights its cultural significance. Recent fieldwork (since 2019) has refined the site’s chronology (~20 ka to ~12.7 ka cal BP) through radiocarbon dating. Multidisciplinary research has enhanced our understanding of human occupation, subsistence, and symbolic expression in the Late Pleistocene Balkans. Within this new research, the archaeozoological study of the sequence is essential for understanding the subsistence strategies of Late Pleistocene hunter-gatherer societies. This study aims to present the preliminary results of the faunal analysis and compare it with the archaeozoological analysis of old excavations (Miracle 1995; 1996). By examining the faunal remains found across different stratigraphic levels of the rich sequence, we will analyze shifts in subsistence strategies and their relationship with climatic and landscape changes. Expected outcomes include identifying variations in prey selection and hunting techniques over time, assessing the impact of environmental fluctuations on resource exploitation, and reconstructing seasonal mobility patterns. These findings will contribute to a broader understanding of the region’s human-environment interactions during the Late Pleistocene.

**190 ARCHAEOLOGY, ORAL TRADITION AND PLACE NAMES – NEW PERSPECTIVES**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Archaeology, Ethnology, Toponymy (place names), Landscape studies, Oral tradition,

Interdisciplinarity  
**Session organisers:** Alexandra Vieira (Polytechnic Institute of Bragança (IPB)) – Tönno Jonuks (Estonian Literary Museum) – Tomáš Klír (Charles University, Faculty of Arts, Department of Archaeology) – Loredana Lancini (Université catholique de Louvain) – Katja Hrobat Virloget (University of Primorska)

SESSION ABSTRACT

While archaeology provides material evidence through the excavation and analysis of artefacts, oral tradition and toponomastics complement these discoveries by offering historical, cultural and symbolic contexts that are often inaccessible through physical remains alone. Oral tradition is a way to encapsulate the memory of typical features of places, landscape, building, cultural activities, a behaviour observed in all societies. One way to codify the memory in oral tradition is the toponomastics, but there are other ways, like myth, legends, novels, dance, songs, all part of the collective memory of a community. Place names in particular can preserve past symbolic meanings and conceptualisations of places, identity and geography. By integrating archaeology and oral tradition researchers can reinterpret archaeological sites in the light of local narratives. Even if oral tradition constantly changes and adapts to current collective memories, identities, and values through time, researchers have shown that some continuity in its meaning and symbolism can be detected. Furthermore, this multidisciplinary approach allows us to explore how contemporary communities give meaning to landscape and how they associate with past people(s) and ancestral territories, revealing how place names and oral tradition provide the basis for collective identities, even in contexts of change and displacement. Oral tradition is still part of living culture and therefore becomes a tool to manipulate the perception of the past, it is an unexplored field that can be useful as long as it is systematic and based on a strict documentary basis. The abuse of oral history in the context of archaeological monuments is therefore an important subject of research. The ‘new perspectives’ reflect a more holistic approach to the study of the past: this interaction contributes to a more complex and complete view of ancient societies and their connections with present and past landscapes.

CONTRIBUTION ABSTRACTS

418. TOPONYMY: LIVING MEMORIES OF OUR PAST?

**Contribution format:** Oral  
**Contribution authors:** Leonor Maria Pereira Rocha (CHAIA, Universidade de Évora) – Gertrudes Branco (CHAIA, Universidade de Évora | CCDR Centro, Portugal) – António Diniz (CHAIA, Universidade de Évora | CIDEHUS, Universidade de Évora) – Inês Ribeiro (CHAIA, Universidade de Évora | FCT. Phd 2024.00869.BD) – Nelson Almeida (CHAIA, Universidade de Évora)

The information provided by thousands of archaeological excavations tells us about the existence (or not) of human occupation and the respective chronological period. However, in addition to this type of material evidence, there is also the analysis of oral tradition and onomastics that can contribute greatly to the identification or better cataloguing of sites and artefacts. In this context, toponymy translates, in most cases, reminiscences of a past that can be quite distant and that is part of the cultural memory of our populations, especially those in rural areas, who usually tend to preserve and pass on legends and collective memories orally for a long time. In this work, we aim to analyse how toponymy reflects ancient memories by matching names/toponyms to specific types of archaeological sites. It will be interesting to see what kind of toponyms are most represented, by chronological period and by name, which may allow us in the future to draw up lists of toponyms that are more probably to have archaeological sites associated with them.

1157. LANGUAGE CONTACT AREAS AND MOTIVES FOR SETTLEMENT NAMING IN THE MIDDLE AGES. EXAMPLES FROM CENTRAL EUROPE (BOHEMIA, GERMANY)

**Contribution format:** Oral  
**Contribution authors:** Tomas Klir (Charles University, Faculty of Arts, Department of Archaeology)

In the Central European landscape, it is often seen that neighbouring regions were settled at the same time and under the same social and economic conditions, but by different language groups. Scholars have often used place names in these areas to date the foundation of settlements, reveal chronological layering, or determine the origin of the first settlers. However, significant differences in the motives for settlement naming have not been addressed. This contribution focuses precisely on these neglected aspects. The starting point will be contemporary onomastic theories and models developed particularly by R. Šrámek, K. Hengst, E. Eichler and others. We will use the model of the proprial naming act, including the proprial naming motive model, the word-formation model and morphematic analysis. We will compare toponymic systems of the same age in German and Slavic languages in neighbouring areas on the basis of four main logico-semantic categories that can be expressed by

simple questions to which the place names answer: (1) “where”, “where did they come from?”, (2) “who, what?”, (3) “what, what kind”, “under what circumstances?”, (4) “whose?” Our research question is: How do toponymic systems differ and how can these differences be interpreted socially, culturally, linguistically and economically? We pursue this question with regard to study regions in northeastern Bavaria and western Bohemia, while addressing the period of the Early and High Middle Ages (800–1250).

1908. TARA BY NAME, TARA BY NATURE? EXPLORING THE ARCHAEOLOGICAL CONNECTIONS BETWEEN IRELAND’S TEMAIR PLACES

**Contribution format:** Oral  
**Contribution authors:** Susan Curran (The Discovery Programme) – Róisín Burke – Neil Jackman (Abarta Heritage Ltd.)

Few placenames in Ireland resonate with such depths of feelings as that of Tara. The most famous place to bear that name is the Hill of Tara in County Meath, the seat of kings and high kings, scene of myth, legend, and, amongst many scholars, much debate. The Hill of Tara is one of the best-known archaeological complexes in Ireland and has a particular meaning in the sense of identity for the nation in a way that very few other sites can claim. But is it the only one? Clues to the existence of multiple ‘Taras’ are found within historical literary and documentary sources, while ‘Tara’ or ‘Temair’ survives in many placenames across the island. Some of the sites can be located within the landscape, often with associated archaeological remains, whereas others have remained more elusive. At the core of various debates and discussions are the historical or proto-historical accounts of Tara and its landscape, along with the exploration and re-appraisal of the origins of its name, Temair, generally with reference solely to the place that is Tara, Co. Meath, or with the etymology of the name in a philological context. By undertaking a systematic appraisal of the archaeological significance, monumental arrangement, or artefactual associations of those other places that were once or still are called Tara, the ‘Tara by Name, Tara by Nature?’ project explores the connection, if any, between the well-studied Tara, Co. Meath and its namesakes which are found throughout the island. Comprising the acquisition of new archaeological data and the re-use of toponympic, documentary, folkloric, and archaeological material in conjunction with the integration of people and stories from contemporary communities within the various Tara locales, the project aims to shed new light on the origins, functions, intangible heritage, and potential inter-relationships of these places.

128. ANCIENT CEMETERIES AND ABANDONED VILLAGES IN PLACE NAMES AROUND DEBRECEN, HUNGARY

**Contribution format:** Oral  
**Contribution authors:** Flórián Harangi – Annamária Aranyos (Hungarian National Museum) – Szabolcs Balogh (Hortobágy National Park Directorate)

The medieval origin market town of Debrecen (Hungary) had extremely large outskirts until the middle of the 20th century, which merged the territory of several former villages. To the west of the town there were extensive ploughs and pastures, while to the east were woodlands, grazing was adapted to these natural conditions in post-Medieval times. Shepherd and field workers have preserved several place names in oral tradition, mainly associated with Early Bronze Age kurgans, Sarmatian burials and ruined medieval villages. In our paper, we will present case studies related to these place names. The large Early Bronze Age burial mounds were important for orientation in most periods, roads and settlement boundaries were aligned with them, so their names are known even from Late Medieval and post-Medieval litigations. Furthermore, there are countless legends and anecdotes connected to these kurgans. The so-called ‘tatárülések’ (eng.: ‘Tatar seats’) and testhalmok (eng.: ‘body mounds’) were most often associated with the devastation of the Ottoman period in the oral tradition, but they are in fact relics of a much earlier period, these are Sarmatian burial mounds. Sadly, the original names of those Medieval villages which were already deserted in the 13th century, are lost with them. But fortunately, sometimes, due to the brick and stone fragments the commoners are named them e.g. ‘Köves-halom. (eng.: Stony-mound). Also we know the names and locations of several deserted villages from the late Middle Ages. Thanks to the shepherding places and lodgings which kept these place names in the 18th and 19th centuries. Each type of archaeological site is associated with a specific type of toponym. Thus, only a single characteristic place name can predict archaeological sites, which is particularly important for heritage protection.

1610. BETWEEN ARCHAEOLOGY AND ANTHROPOLOGY. ON LIMINAL SPACES, BOUNDARIES, MYTHICAL LANDSCAPE, AND HISTORICAL FRAGMENTS

**Contribution format:** Oral  
**Contribution authors:** Katja Hrobat Virloget (University of Primorska Faculty of Humanities)

The presentation discusses the possibilities of interdisciplinary collaboration between archaeology and cultural anthropology / ethnology. What has seemed some decades ago unthinkable, due to the elusiveness or inaccuracy

of oral tradition perceived from the archaeological side, has recently provided new perspectives of understanding space, the key concept that links both humanistic disciplines. The paper shows some basic theoretical concepts, which enable the interdisciplinary collaboration between the two disciplines. The key elements which connect the two disciplines is the collective memory in the form of oral tradition, embedded in the local landscape. The traditional perception of space can offer a better understanding of some archaeological materials. The oral tradition embedded in the landscape can give us some understandings of the continuity of symbolic values of places, such as liminal spaces or elements of mythical landscape. In this case caves can be understood as the entrance to the other world and monumental stones as remains of an archaic all-European mythical being. Apart from understanding the traditional conceptualization of space the oral tradition linked to landscape can give us even some memory of the historical fragments, what is the case of the oral tradition of Ajdi, the mythical giants.

763. REFLECTION OF IRON AGE BURIAL SITES IN PLACE-LORE

**Contribution format:** Oral  
**Contribution authors:** Pikne Kama (University of Tartu)

This paper examines Iron Age (1-1250 AD) burial sites` reflection in place-lore in southeastern Estonia. These burial places are from the time before the official Christianization of the region and have witnessed many other cultural changes, as there is over a thousand-year gap between the establishment and primary use of sites and the time of folklore collection. Preliminary analysis indicates that approximately 75% of the known Iron Age burial sites are mentioned in place-lore. Place-lore may only acknowledge the existence of ancient burial sites or encompass more elaborate narratives. Longer narratives include descriptions of battles and burials of fallen soldiers, hidden treasures, the foundation of churches in the case of stone graves, the Devil transporting and dropping stones, and various supernatural occurrences in burial sites. In some instances, place-lore seems to result from continuous oral history and collective memory long after the sites` initial use. This seems evident in the case of Iron Age burial sites with historical burial sites at the same spot or in the vicinity (~50% of cases). In other instances, place-lore may have arisen from later discoveries of human remains or grave goods. The analysis reveals that archaeologists primarily have found Iron Age burial sites due to place-lore, suggesting a potential knowledge gap regarding sites not remembered by locals. Consequently, periods or regions lacking burial sites may reflect discontinuities in place-lore rather than the actual distribution of these sites.

1342. ARCHAEOLOGY AND LOCAL TRADITIONS OF MONTE FARINHA (MONDIM DE BASTO, PORTUGAL)

**Contribution format:** Oral  
**Contribution authors:** Alexandra Vieira (Instituto Politécnico de Bragança (IPB)) – José Augusto Gonçalves (Municipality of Mondim de Basto)

Monte Farinha is one of the most striking symbols of the municipality of Mondim de Basto. Its name is linked to a popular legend, which reinforces the richness of the region's oral tradition. At its peak is the Sanctuary of Our Lady of Grace, one of the most important Marian sanctuaries in the north of Portugal. This hill has an important archaeological heritage, with remains of fortified settlements and prehistoric rock art. On the summit, there are traces of three hill forts, evidence of the pre-Roman occupation of the area. Roads, bridges and mining structures testify the Roman presence. Also noteworthy is the existence of an old medieval road that leads to the top of the hill. Monte Farinha is a place of deep-rooted traditions. During the Night of the Pilgrims of Santiago, thousands of pilgrims climb Mount Farinha, singing songs and keeping alive ancestral traditions that are intertwined with the archaeological remains of the place. Along the way, they stop at the “Footprints of the Donkey of Our Lady”, rock carvings that tradition links to the sacred path of the Virgin, wash their faces at the Fonte da Costa, where, according to legend, there was an ancient chapel of São Veríssimo, and pray at the “Pedra Alta”, an ancient menhir still whitewashed and lit votive fires. At the “Capelas dos Passos”, pilgrims pay homage to religious figures and remember the ancient people who once worshipped this sacred mountain. Above, in front of the Sanctuary, they fulfil promises and perform rituals that date back to ancient times, reinforcing the fusion between Christian devotion and ancestral cults rooted in the archaeological landscape. With its combination of archaeological heritage, legends and toponyms, Monte Farinha is a paradigmatic case study, essential for a multidisciplinary approach on archaeology and oral tradition, in Portugal.

2015. ROCKY SEASCAPE, PERCEPTIBLE AND INTANGIBLE INVOLVEMENTS IN COLLECTIVE MEMORY

**Contribution format:** Oral  
**Contribution authors:** Christina Marangou (Independent scholar)

In the North Aegean Sea, on the western coast of Lemnos, the Kastro headland has been occupied diachronically, at least since Late Prehistory, during antiquity and in Medieval till modern times. In several sectors, beyond impressive natural rocky features, the carved volcanic anthropogenic constructions and still perceived petroglyphs, integrated within the natural surroundings of the peninsula, display intricate complexes in a prominent setting.

Current research, confirmed by surface and subsurface mobile finds, indicates that a large part of them would date from the Bronze Age and Iron Age and the main periods of antiquity, including Late Antiquity. Diachronic connections of the site complexes with the seascape and maritime facets seem obvious. However, practical, utilitarian issues, such as economic, trade and nautical matters, material functionalities and activities may not always be obvious, therefore suggesting plausible connections to intangible, including ritual and symbolic, practices or performances. In marginal, transition areas, such as hilly coasts and sea borders, influences from liminal processes are to be expected constantly, including till recent and present times, in the whole island, as attested by ancient texts, myths and local oral tradition. Both utilitarian concerns and symbolic behaviours constitute integral parts of life in successive human communities, past and present, in a permanency of meaningful places. While research continues and many questions remain open, the present paper examines features of the rocky seascape with possible parallels, integrating archaeology and oral tradition, considering various conceivable approaches and directions of interpretation in a continuity of collective memory.

191 CLIMATE CHANGE AND ARCHEOLOGICAL SITES: FROM KNOWLEDGE TO PLANNED CONSERVATION

**Session theme:** 7. Climate Change in the Past and Present  
**Session format:** Regular session  
**Session keywords:** Climate Change, Historical Built Heritage, Archeological Heritage, Risk management, Planned Conservation,  
**Session organisers:** Valentina Russo (University of Naples Federico II | Head of the Post graduate School of Specialization in Architectural Heritage and Landscape SSBAP) – Andrea Ugolini (University of Bologna Alma Mater Studiorum) – Cristina Gonzalez-Longo (University of Strathclyde Glasgow)

SESSION ABSTRACT

The effects of Climate Change (C.C.) on cultural heritage have become a major contemporary challenge. The consequences of these changes impact not only the environment but also affect historical built heritage. In this context, archaeological sites are an emblematic example, constituting a complex, layered palimpsest of historical, cultural values that must be preserved for future generations. It's a legacy, «of fundamental importance to humanity in identifying its cultural and social roots». So reads the Charter for the Protection and Management of the Archaeological Heritage, drafted by ICOMOS in 1990. A «fragile and non-renewable heritage» as it mostly consists of assets in the state of ruins. Constant exposure to natural risk factors, combined with the effects of C.C., increasingly threatens the integrity and authenticity of archaeological sites. In the international research landscape, the scientific community has increasingly emphasized the importance of integrating cultural heritage into C.C. mitigation and adaptation policies. This approach is promoted through a range of instruments, including the UNESCO report and numerous projects, which highlights the need to protect and enhance cultural heritage as a key component of collective identity. In this context, planned conservation emerges as an essential approach to effectively addressing the challenges posed by C.C. This strategy involves the planning of compatible and sustainable interventions grounded in thorough cognitive and diagnostic analysis of archaeological heritage. The goals of the session focus on promoting an active dialogue between parties involved in the protection and management of cultural heritage and international stakeholders. It aims at promoting stronger connections between archaeological research and conservation actions, thereby improving strategies to manage risks and vulnerabilities associated with C.C. The session will discuss applicable methodological guidelines that consider the specific vulnerabilities of archaeological sites to climate-related threats, to be integrated into operational frameworks for cultural heritage management.

CONTRIBUTION ABSTRACTS

980. CLIMATE PATTERNS AND EFFECTS IN EARTHEN ARCHAEOLOGICAL SITES OF EASTERN SPAIN: INSIGHTS FROM A DECADE OF DATA

**Contribution format:** Oral  
**Contribution authors:** Sergio Manzano-Fernández – Camilla Mileto – Fernando Vegas López-Manzanares – Valentina Cristini (PEGASO Research Centre, Universitat Politècnica de València)

Climate change has marked a turning point in the approach to conserving and protecting all types of architecture, although archaeological contexts introduce a set of particularly vulnerable factors, including disuse or the absence of original construction protections. The current unpredictable and evolving scenario caused by extreme climatic events has forced a redefinition of paradigms, leading to a potential acceleration in structural loss and

greater challenges in damage prevention. The scarce preserved earthen architecture of past societies, whose fragility is even more threatened in scenarios of partial collapse and severe climatic affection through desertification, torrential rain or flooding, stands out as one of the most urgent concerns for the elaboration of preventive conservation plans. This paper aims to compile climatic data on rainfall and temperature over the last ten years in three archaeological sites along the Spanish Mediterranean coast with earthen construction remains in varying degrees of intervention and degradation. To achieve this, nearby climatic stations and historical site records have been consulted, in order to track their temporal evolution, reflecting on the methodological limitations of analyzing short data series for a long-term processes. Based on this, an analysis is elaborated reflecting on the maximum and average annual rainfall patterns over time, sometimes preceded —or not— by prolonged drought periods, as well as the variable effects on earthen structures under different conditions.

279. CLIMATE CHANGE AND ARCHEOLOGICAL SITES: THE PORTUGUESE POINT OF VIEW

**Contribution format:** Oral  
**Contribution authors:** Gertrudes Branco – Leonor Rocha (CHAIA/Universidade de Évora)

Climate change is a global problem that requires a concerted response from the international community and appropriate action at the local level, as discussed at the United Nations Climate Change Conference - COP28 - held in the United Arab Emirates at the end of 2023, or integrated into the 2030 Agenda for Sustainable Development (SDG) adopted by all United Nations Member States in 2015. Due to its geographical location, Portugal is one of the European countries most vulnerable to climate change, the effects of which are being felt in the increasing frequency of extreme weather events such as droughts, heat waves, floods and storms. Official data from the Instituto Português do Mar e da Atmosfera (Portuguese Institute for the Sea and Atmosphere) show that there is growing concern about the increasing frequency of meteorological droughts in recent years, some of which have lasted for more than one wet period (autumn and winter) and one dry period (spring and summer) and have affected an increasing percentage of the territory. The 2016/2017 meteorological drought stands out for its severity, an event that worsened significantly at the beginning of autumn (on 31 October, 25% of the territory was in severe drought and 75% in extreme drought), in an unusual way and with damaging consequences for the territory. In this context, we propose to take stock of the impact of climate change on Portugal’s archaeological heritage, which, as a component of the human environment, is competing for space with, for example, agriculture, forestry and the facilities needed to produce renewable energy. These components are undergoing profound changes due to water scarcity, increased fires, increased afforestation and deforestation, and the urgent need to overcome the country’s dependence on fossil fuels.

910. PROBLEMS CAUSED BY CLIMATE CHANGE AND INCREASED RAINFALL ACIDITY AT GREEK ARCHAEOLOGICAL SITES WITHIN HISTORIC CENTRES

**Contribution format:** Oral  
**Contribution authors:** Stefano Gizzi (ICOMOS Italia)

Climate change and increased acidity in rainfall have given rise, in Greece, to a series of initiatives in archaeological areas within (but also close to) historic centres of varying content, some more sympathetic, others less so. Those currently underway at the Acropolis of Athens will be examined (work to consolidate the rock, which was disintegrating and landsliding, and to change the location of the internal road system, which had become muddy due to frequent rainfall, massive additions to the existing roofs to protect the Pinacoteca and Propylaea from acid rain), as well as at Epidaurus and Olympia, with very extensive reintegrations. Mention will also be made of the problems concerning the adaptations of roofs, again for protection against weathering, which have become more and more pronounced in recent years, on the island of Crete by the Italian Mission in Festòs (where Luigi Pernier, in the late 1940s, covered the room that was originally a small workshop with a concrete slab, now totally deteriorated) and by the Archaeological Mission of the Ecole française d’Athènes in Mallia.

346. WEATHERING THE PAST: ASSESSING CLIMATE-INDUCED DETERIORATION OF GREEK MARBLE IN ARCHAEOLOGICAL HERITAGE

**Contribution format:** Oral  
**Contribution authors:** Meilin Lyu (National University of Athens) – Radek Ševčík – Dušan Majtás – Lucie Zárbynická (Institute of Theoretical and Applied Mechanics, the Czech Academy of Sciences)

The accelerating impacts of climate change pose significant threats to archaeological sites, particularly through processes like thermal cycling and freeze-thaw (FT) action. These climatic stresses can induce severe physical deterioration in building stones, challenging the preservation of cultural heritage. This study explores the effects of accelerated thermal cycling and FT cycles on Greek marble—commonly used in historical monuments—to assess their vulnerability under simulated climate conditions. Thermal cycling experiments subjected marble

specimens to controlled dry and wet heating cycles, replicating summer temperature fluctuations observed in Mediterranean climates. Findings indicated that even mild temperature ranges (20–60-90°C) led to microstructural changes, with ultrasonic pulse velocity (UPV) measurements revealing an initial increase in stone density, followed by deterioration during wet cycles. In parallel, the FT experiment evaluated three types of local Greek marble under repeated freeze-thaw conditions, with temperature ranges from -20°C to +20°C. Results demonstrated that micropore expansion and subsequent microcracking were intensified by the presence of moisture and salt crystallization, leading to a notable decline in mechanical strength. These experiments employed a multi-method approach, including optical microscopy, water absorption tests, scanning electron microscopy (SEM), and micro-computed tomography (micro-CT), to assess deterioration from multiple perspectives. By understanding the anisotropic thermal and hygro-thermal behavior of marble, conservationists can make informed decisions to mitigate risks associated with climate-induced deterioration. The findings advocate for real-time monitoring, combined with laboratory simulations, to develop adaptive conservation frameworks that anticipate and address the evolving challenges posed by climate change. The research contributes to a broader discourse on sustainable heritage management, aligning with international efforts to integrate climate resilience into archaeological conservation practices.

731. CLIMATE CHANGE AND CULTURAL HERITAGE: A CASE STUDY FROM KALAPODI SANCTUARY IN CENTRAL GREECE

**Contribution format:** Oral  
**Contribution authors:** Artemios Oikonomou (German Archaeological Institute, Athens | Science and Technology in Archaeology and Culture Research Center | Department of Conservation of Antiquities and Works of Art) – Angelos Sotiropoulos – Penelope Gourgouleti – Themistoklis Bilis (German Archaeological Insitute, Athens)

The Kalapodi archaeological site, situated in present-day Fthiotis, central Greece, features a complex of various temples and surrounding structures. The archaeological site is one of the most significant sanctuaries of ancient Phokis and offers insights into Greek religious traditions and architectural developments. The ruins at Kalapodi site span from the Mycenaean to the Classical periods. Since 2017, the site has been the subject of extensive cultural heritage preservation efforts led by the German Archaeological Institute (DAI). The Kalapodi site is part of the TRIQUETRA program, supported by the EU Horizon Europe research and innovation initiative (GA No. 101094818). Main aim of this European project is the study of the challenges climate change presents to cultural heritage. The TRIQUETRA project focuses on developing a comprehensive methodological framework to protect archaeological sites from environmental threats. A core aspect of the project involves establishing a data-driven assessment platform for accurate risk classification, along with a detailed database of mitigation strategies. This paper aims to collect and assess environmental and material analysis data from Kalapodi site in order to evaluate the effects of climate change so as to develop targeted preservation strategies. Towards this goal the impact of frost on Kalapodi ancient structures will be evaluated and preventive measures to enhance their long-term stability will be implemented. A pilot structure of the monument has been designed and constructed, equipped with various monitoring instruments to analyze environmental impact on both the pilot structure and the historical monument. The insights gained and the methodology applied underscore the significance of integrating scientific research with heritage management to tackle climate-related challenges and safeguard cultural heritage for future generations.

1367. A COLLABORATIVE APPROACH TO SUSTAINABLE INTERVENTIONS AIMED AT SECURING THE FUTURE OF THE BELO BRDO ARCHAEOLOGICAL SITE IN VINČA

**Contribution format:** Oral  
**Contribution authors:** Dubravka Đukanovic (University of Novi Sad, Academy of Arts) – Nenad Tasić (University of Belgrade, Faculty of Philosophy) – Miroslav Kočić (University of Kragujevac, Center for Archaeology Dragoslav Srejskić) – Kristina Penezić (University of Novi Sad, BioSense Institute)

Although the River Danube has been a vital resource for numerous populations along its banks for thousands of years, permanent alterations to its geological and morphological patterns have resulted in significant environmental impacts. As it flows through Serbia, sediment gradually accumulates on the left bank, forming natural levees that promote floodplain inundation while simultaneously eroding the right bank and causing landslides. A notable recent landslide occurred near the loess plateau known as Belo Brdo in the village of Vinča, where a prehistoric, multi-layered archaeological site has been excavated since the early 20th century. Well-contextualised archaeological findings have provided rich evidence of developed agriculture, technological advancements, urban planning, and cultural practices, positioning this site as the type-site for the entire Late Neolithic culture of the Balkans. Despite its undeniable value, part of the site has been irrevocably lost to the River Danube due to erosion, landslides, and weathering. In 2021, the Serbian government established a long-term intervention framework to

safeguard the archaeological site, mitigate the effects of natural processes and human activities, and align with the SDGs. This initiative adopts an interdisciplinary approach, integrating scientific research from various fields. Heritage science establishes principles and serves as a pivotal point for the synthesis of knowledge and practices. The collaborative development of targets, lines of action, and procedures lasted three years and concluded in May 2024. Upon completing the first phase of the Exploration, Protection, and Presentation of the Belo Brdo Archaeological Site in Vinča Project, which aims to protect the site from further landslide erosion, new opportunities have arisen to revitalise this neglected heritage through cultural, educational, scientific, and environmental initiatives. This aligns with a 1980 initiative by the Municipality of Grocka to promote local development, generate public interest, and establish an archaeological park, ensuring that the invaluable cultural heritage is preserved.

551. REMOTE SENSING RESPONSES TO ARCHAEOLOGICAL AND CULTURAL HERITAGE SITES AT RISK BY CLIMATE-RELATED HAZARDS AND DAMAGES

**Contribution format:** Oral  
**Contribution authors:** Pouria Marzban – Benjamin Dücke – Elvira Iacono – Bernhard Fritsch (German Archaeological Institute (DAI))

Long-term climate change and its accompanying extreme weather events, as well as interlinked anthropogenic pressures, are causing significant damage to Archaeological and Cultural Heritage (ACH) sites worldwide. In response, the German Archaeological Institute (Deutsches Archäologisches Institute, DAI), in collaboration with partner organizations, has established the Cultural Heritage Response Unit (CHRU) to facilitate global heritage disaster recovery efforts. The CHRU’s remote sensing and monitoring unit is tasked with providing cost-effective and rapid support for damage assessment and on-site planning through the utilization of multi-source satellite datasets. This contribution categorizes our methodology into three primary components: preventive measures, time-series analysis (monitoring), and rapid response. We present recent case studies that illustrate these approaches, detailing the types of available data, the methods employed, and their application during emergencies. We use a toolbox that we develop in-house, called “KGR Finder”, which allows us to map all the ACH sites within a risk area. Furthermore, we use open data from the EU’s Copernicus Earth observation programme to provide insights about affected areas and continuously improve our methods on a case study basis. This methodical framework leverages advanced remote sensing and Geographic Information Systems (GIS) technologies, supporting the creation of data and tools to strengthen resilience to climate change on the ground and aid the effective preservation of ACH sites.

790. MAPPING THE IMPACT OF THE RECENT DANA ON BUILT AND ARCHAEOLOGICAL VALENCIAN CULTURAL HERITAGE: THE IPAP INITIATIVE

**Contribution format:** Oral  
**Contribution authors:** Carmen Cuenca-García (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València | Department of Archaeology and Cultural History, Norwegian University of Science & Technology (NTNU)) – Valeria Martín-Sidro – Centelles-Fullana Maria Lucrècia (Departament de Prehistòria, Arqueologia i Història Antiga, Universitat de València)

The acceleration of climate change, driven by anthropogenic pressures, is contributing to the increased intensity-and, for some experts, frequency- of extreme weather events. One such event was the DANA (Isolated Depression at High Altitude) that struck the Valencian Community and other eastern and southern regions in Spain last October. This catastrophic episode brought a year’s worth of rainfall within just a few hours, resulting in the loss of 232 lives, with three still missing, alongside substantial material damage, including to tangible cultural heritage. Given the unprecedented nature of the event and the uncertain level of damage to built. cultural heritage and archaeological sites, it became crucial to begin mapping and documenting affected assets in order to assess the extent of damage. In response, members of the SENSING IBERIANSCAPES project from the University of Valencia (CIDEXG/2022/55) developed the IPAP initiative. The primary objective of the IPAP is to create a public interactive map documenting damaged cultural assets, using data provided by both citizens and specialists. Through user-friendly GIS tools, the public will be able to visualise the location of protected buildings and archaeological sites in Valencia and register observed damages. Anyone with a smartphone will be able to collaborate by submitting data and photos of damage in their municipality, while also viewing the contributions on the interactive map. A pilot study, currently underway with undergraduate students collecting data in affected areas, has shown promising results. In collaboration with the General Directorate of Heritage of Valencia, we plan to expand the initiative to include broader citizen participation, such as local groups, schools and other stakeholders. The IPAP aims to provide a rapid solution for mapping and documenting the resilience or loss of Valencian cultural assets, fostering public empowerment, and raising awareness of the vulnerability of cultural heritage to climate change.

653. COASTAL ARCHAEOLOGICAL SITES AT RISK: THE CASE STUDY OF THE ROMAN SETTLEMENT OF CAPO COLONNA

**Contribution format:** Oral  
**Contribution authors:** Giuliana Vinciguerra (Scuola Superiore Meridionale)

Archaeological sites are particularly vulnerable to the effects of climate change, as they represent a fragile and non-renewable heritage constantly exposed to environmental risks. Coastal sites face increasing threats due to erosion, extreme weather conditions, and geomorphological instability. In this context, planned conservation emerges as a fundamental strategy to ensure their long-term preservation. The Roman settlement of Capo Colonna, located on the Ionian coast, is an emblematic case study. The site is at high risk due to progressive slope instability and exposure to marine erosion, which endanger both the integrity of the structures and the readability of the archaeological landscape. This contribution proposes a systematic monitoring approach to assess the site’s vulnerabilities and define effective conservation strategies. A combined methodology of photogrammetry, aerial imagery, and terrestrial laser scanning (TLS) will be employed to document ongoing geomorphological changes and structural instabilities. Additionally, periodic terrestrial surveys will provide a multi-temporal analysis to detect evolving patterns of degradation. The integration of GIS-based data analysis will allow for the correlation of environmental variables with structural changes, supporting a predictive approach to site management. The collected data will be integrated into a long-term monitoring framework, supporting preventive conservation actions and risk mitigation measures. By bridging the gap between scientific research and conservation practice, the study aims to establish guidelines for the sustainable management of coastal archaeological heritage. The approach adopted at Capo Colonna can serve as a model for other sites facing similar environmental threats, demonstrating how advanced documentation techniques and interdisciplinary research can contribute to the safeguarding of archaeological heritage in fragile coastal environments.

2432. INSTRUMENTAL INVESTIGATIONS AND THE TIME FACTOR: MONITORING STRATEGIES AND EFFECT PREDICTING IN THE DOMUS OF ARIANNA IN POMPEII

**Contribution format:** Oral  
**Contribution authors:** Sara Iaccarino – Ersilia Fiore – Luigi Cappelli (University of Naples Federico II)

This contribution explores the theme of monitoring in the restoration of archaeological sites, developing methodologies to manage risks and vulnerabilities associated with this heritage. Monitoring is essential for assessing and mitigating risk factors and climate change vulnerabilities, particularly in multi-risk environments like the archaeological parks of the Vesuvius area. Drawing on research experiences conducted in Archaeological Park of Pompeii, specifically on the Domus of Arianna (Regio VII, Insula IV), we propose a methodological approach that views monitoring as a continuous process integral to all phases of restoration, from knowledge acquisition to intervention planning and post-intervention evaluation. Initially, monitoring serves as a critical diagnostic tool for informing restoration decisions before interventions take place (Ex ante). During the restoration, it facilitates scheduled maintenance and functions as a dynamic alert system (In itinere), allowing for real-time adjustments in response to new information or unexpected challenges. Following the completion of restoration, monitoring is vital for evaluating the effectiveness of the decisions made throughout the process (Ex post). Focusing on “in itinere” monitoring, we implemented a photo monitoring process enhanced by AI, paired with a diagnostic survey of the Domus of Arianna’s archaeological evidence, particularly fragile elements like frescoes, mosaics, and columns. “Ex post” monitoring is particularly concerned with predicting potential effects from environmental risk factors, utilizing data gathered during all the knowledge phases. This phase is crucial for establishing regular maintenance practices after the restoration is concluded, also in the sense of planned conservation. In this sense, a specific focus on the ex-post analysis has been conducted on the floor mosaics, actually interested by maintenance process.

469. MEASURES TO PROTECT FRIESACK 4 (BRANDENBURG STATE, GERMANY) - SAVING ONE OF THE MOST IMPORTANT MESOLITHIC SITES IN EUROPE

**Contribution format:** Oral  
**Contribution authors:** Deborah Schulz – Andreas Kotula (Brandenburg State Authorities for Heritage Management, State Museum Archaeology)

Sites with wet soil preservation are particularly valuable archaeological archives. In constantly wet sediments even delicate organic materials can be excellently preserved for thousands of years. A particularly impressive example is the Stone Age site Friesack 4 (Havelland district). In the 1980s, almost 300 square meters of wet soil area were investigated and more than 130,000 flint artefacts, over 800 bone and antler artefacts and more than 130 wooden artefacts were recovered. In addition, there are over 3,000 fragments of cords, ropes and nets made of bast. These finds make Friesack 4 one of the most important Mesolithic sites in Europe. The find potential of Friesack 4 is still high today, especially since parts of the rich find layers have remained in the ground. Due to

ongoing melioration and climate change with increasingly frequent dry and warm environmental conditions, there is a need for action for this important site, as drying out gradually leads to the decomposition of the organic artefacts. In order to preserve these unique cultural treasures, we have carried out initial field work to evaluate the present condition. Comparing recent water levels with the known stratigraphy of the site showed that almost the entire find layer had already dried out temporarily and is therefore at long-term risk. In this talk we present investigations on the preservation of the site and discuss possible measures to save the organic Stone Age materials from the site. The aim is to work with various institutions from the areas of moorland protection, renaturation, water maintenance and agriculture. On a more regional scale, our goal is to preserve sites in the lowland areas of the Rhin and Havelland Luch in a permanently wet environment.

**1125. LEARNING TO MANAGE FRAGILITY: PREVENTIVE AND PROGRAMMED MAINTENANCE/ CONSERVATION PLANS FOR THE ARCHAEOLOGICAL SITES OF CUPRA MARITTIMA, FALERONE, AND MONTE RINALDO**

**Contribution format:** Oral  
**Contribution authors:** Andrea Ugolini (Alma Mater Studiorum - University of Bologna) – Giovanni Issini (Soprintendenza archeologia belle arti e paesaggio per le province di Ascoli Piceno, Fermo e Macerata) – Enrico Giorgi (Alma Mater Studiorum - University of Bologna) – Francesca Bindelli (Sapienza Università di Roma) – Mauro Saracco (Università di Macerata)

Every built artifact, as Giovanni Urbani pointed out as early as the late 1970s (especially if archaeological, we would add), is a complex object primarily relating to its surrounding environment. Awareness of this requires attention that is neither generic nor univocal, but based on a dynamic, ecological, and sustainable vision of reality. Consequently, a necessary paradigm shift at the strategic and operational level is required, moving away from episodic interventions in favor of periodic and systemic ones. The only viable way to maximize the longevity of archaeological artifacts is to manage their fragilities through repeated, conscious acts of care, which must be systematically planned. The essay provides an overview of the study and conservation activities carried out by the Superintendence of Archaeology, Fine Arts, and Landscape (SABAP) for the provinces of Ascoli Piceno, Fermo, and Macerata, in collaboration with the Universities of Bologna and Macerata, concerning the archaeological sites of Cupra Marittima, Falerone, and Monte Rinaldo. These Roman sites have differing histories and material consistencies: some have been excavated and restored in the last century, while others are still undergoing study and enhancement. The sites feature distinct landscape and environmental contexts, and varying conservation efforts have been carried out by their respective owners and managers. The preventive and programmed maintenance/conservation plans developed had to address the complex dynamics of these sites, their nature and contexts, the intrinsic and induced vulnerabilities of the ruins, and the challenges posed by climate change, which, as is well known, increase the risks to archaeological heritage. The contribution also reflects on the difficulties encountered in drafting and managing these plans, with the aim of improving their effectiveness, particularly regarding the programming of resources for the care of these sites. Acknowledgments: This project has received funding from the European Union’s Horizon Europe programme under grant agreement No. 101094978. RescueME Project: <https://resilientculturallandscapes.eu/about/project>.

**1120. CLIMATE CHANGE AND DISASTER RISK MANAGEMENT IN ARCHAEOLOGICAL CONTEXTS. A PROTOCOL FOR EMERGENCY RESPONSE AMID EXTREME WEATHER EVENTS.**

**Contribution format:** Oral  
**Contribution authors:** Eleonora Melandri (Alma Mater Studiorum - University of Bologna)

Climate change is one of the most urgent challenges of our time, reshaping the contexts in which heritage assets were established and have evolved through time. Rising temperatures, prolonged droughts, rising sea levels, and increasingly frequent and destructive extreme events pose significant threats to cultural heritage, of which archaeological one is among the most vulnerable (ICOMOS, 2019). Addressing these challenges requires an urgent paradigm shift in current heritage management practices to proactively address the uncertainties associated with intense meteorological events. This necessitates a stronger emphasis on systematic and continuous conservation efforts to reduce existing vulnerabilities while integrating new strategic awareness to face this new reality. Effectively addressing these challenges requires a comprehensive understanding of both current risks and projected future changes, ensuring that available knowledge is incorporated into existing risk management practices leveraging all available resources. By doing so, emergency situations can be managed more efficiently and systematically, minimizing unplanned responses before and after major weather events. This study examines three Italian archaeological sites previously impacted by intense rainfall events — the archaeological parks of Baratti-Populonia (Tuscany) and Suasa (Marche), along with the archaeological area of Claterna (Emilia-Romagna). Through these case studies, it underscores the critical role of disaster risk management strategies in safeguarding archaeological heritage from severe meteorological events. In this context, it aims to present a structured intervention

protocol for both pre- and post-emergency phases, emphasizing the importance of proactive planning to minimize the impact on ancient structures. Acknowledgments This project has received funding from the European Union’s Horizon Europe programme under grant agreement No. 101094978. RescueME Project: <https://resilientculturallandscapes.eu/about/project>

**1108. MITIGATING RISKS THROUGH HERITAGE: CONSERVATION AND SUSTAINABLE REUSE FOR THE ROMAN THEATRE OF NEAPOLIS, ITALY**

**Contribution format:** Oral  
**Contribution authors:** Andrea Pane (University of Naples Federico II) – Damiana Treccozzi (Scuola Superiore Meridionale) – Salvatore Pagano – Elisabetta Pedicini (University of Naples Federico II)

Climate change mitigation, a current issue in contemporary society, requires a radical change in the approach to archaeological heritage. Nowadays, there have been few concrete actions and some international organizations such as UNESCO and ICOMOS have recently taken a more specific interest in this matter. In response to ongoing climatic events Naples, a densely built city, offers limited open and permeable spaces. In this regard, the article aims at designing interventions capable of responding to the most widespread climatic events, thus strengthening their resilience. This paper focuses on the roman theatre of Neapolis, an archaeological site from the 1st-2nd century AD, that represents a unicum in the historic center. Over the centuries the insula’s stratifications have concentrated on the limits of the lot, preserving the internal courtyard that hosts the cavea, which benefits from shaded areas and natural cooling due to surrounding tall buildings. This research, developed as part of a master’s degree thesis in Architectural Conservation at the University of Naples Federico II, suggests design solutions based on a conscious conservation approach while addressing new needs brought by climate change. Starting from the ongoing UNESCO project, a few demolitions are proposed to increase preserved parts and reduce waste. Firstly, a reversible staircase compatible with the existing structure is added to reach the archaeological level. To concretely suit to climate change challenges, the project includes movable roof systems meant to mitigate heat islands and protect archaeological ruins from further degradation. Hidden rainwater harvesting systems in the courtyard are conceived to reuse it as greywater in the interior spaces of the buildings. These solutions envision the theater as part of climate shelters’ network within the historic center and show how the needs, dictated by climate change, can enhance the resilience of cultural heritage, guaranteeing its transmission to the future.

**1031. ROMAN THEATRE OF BENEVENTO: CONSERVATION AND REUSE OF AUXILIARY SPACES FOR CLIMATE ADAPTATION**

**Contribution format:** Oral  
**Contribution authors:** Francesca Spacagna – Lorenzo Capobianco – Francesca Castanò – Luigi Maffei (Università degli Studi della Campania “Luigi Vanvitelli”)

The interdisciplinary research aims to explore the potential of classical theater architecture, with reference to the Roman Theater of Benevento. Built between the 1st and 2nd centuries AD, it reflects the Augustan theater model and today serves as a layered cultural palimpsest and a study laboratory for the integration of innovative technologies for the conservation and reuse of auxiliary spaces. The theater features a semicircular cavea, divided into three stacked orders of arches, and a monumental scene, having withstood the Gothic War, World War II, and four earthquakes. Located near the cardo-maximus, it is now incorporated into the urban fabric, losing the perceptual and spatial isolation that once enhanced its symbolic and architectural value. Its preservation, extending to all the service spaces that define it, depends on external factors such as environmental variations and microclimatic conditions, as well as factors related to materials and construction techniques. The research will aim to identify models that combine heritage protection with the need for urban spaces that contribute to the well-being of the community by utilizing auxiliary spaces. Innovative solutions will be presented that allow, while respecting preservation regulations, the rethinking of these spaces as potential areas for protection and urban regeneration, capable of mitigating the effects of climate change and promoting a usable microenvironment. In this context, at the Theater of Benevento, which is monitored through measurements on climatic effects and thermal comfort, thermal variables will be recorded and compared with pre-existing data from the Istat database. The innovation lies in reconsidering the theater and auxiliary spaces as dynamic and adaptive assets, integrable into conservation and sustainable development policies, strengthening the dialogue between archaeology, architecture, and engineering, and contributing to urban regeneration in response to climate change.

**1230. PRESERVING MUTATIONS AS A SUSTAINABLE CONSERVATION STRATEGY: ARCHAEOLOGICAL LANDSCAPES AND AGRICULTURAL PRODUCTION IN SOME ANCIENT MEDITERRANEAN TURKISH CITIES**

**Contribution format:** Oral  
**Contribution authors:** Riccardo Rudiero – Emanuele Romeo (Politecnico di Torino, Dipartimento Architettura e Design (DAD))

For centuries, the climate changes that have affected the countries of the Mediterranean Basin have modified the habits of the native populations, stimulating or slowing down their economic and commercial activities. These transformations have changed the coastal landscapes, urban centres, and architecture that have often undergone periods of sudden abandonment. The reasons are mainly due to the advance or retreat of coastlines: in the first case, rising sea levels have submerged residential settlements and production centres, forcing the population to rebuild homes and cities inland; in the second case, the silting up of natural inlets and ports, with the advance of coastal strips caused by the lowering of the water level, led to the abandonment or decrease in commercial exchanges and economic activities. Phenomena of this type characterised various Turkish cities facing the Mediterranean Sea. The evidence of this can still be seen, for example, in the silting up of the bay of Priene, which became agricultural land, or in the remains of the port of Miletus. Similarly, Christian architecture and Islamic quarters were built in Ephesus, whose harbour basin was already abandoned in the 8th century. The same happened in Elaiussa Sebaste, where the retreat of the waters rendered the two ports of the Romano-Byzantine city unusable, having been used for a long time for cultivation activities. Starting from these dynamics and considering how the coexistence of agricultural and productive activities within the archaeological areas allows for the subsistence of the local populations and also avoids the phenomenon of desertification, the contribution proposes strategies for the conservation of these traces due to the centuries-old climate changes which, together with seismic phenomena, have modified an archaeological landscape that deserves to be adequately enhanced.

**741. UNDERSTANDING CHANGE: CONSERVING BIODIVERSITY IN THE EASTERN ADRIATIC’S THEATRES AND AMPHITHEATRES BETWEEN PROTECTION AND USE**

**Contribution format:** Oral  
**Contribution authors:** Fabio Ambrogio (Politecnico di Torino)

The Balkan territory along the eastern Adriatic coast preserves a significant historical testimony from the classical era relating to the heritage of theatres and amphitheatres of the ancient Roman Provinces. A set of buildings, often deriving from the Greek age, is currently preserved in present-day Croatia and Albania. The structures analysed here have a significant relationship with plant material, whose species have often been maintained over time, overcoming the difficulties imposed by climate change. Neglect, abandonment and protection of these areas contribute to conserving the different forms of biodiversity that persist among the ruins. This natural heritage, in the face of a climate crisis, can contribute to the improvement of visitor routes, the reduction of heat islands, the development of reforestation policies and the implementation of broader strategies for the enhancement of the territories, combining archaeological and botanical heritage. The analysis of the current archaeological contexts allows us to assess the state of conservation of the places, highlight the vulnerabilities of the sites, analyse the interventions carried out and monitor the enhancement policies in place, establishing operational methods for the promotion of good practices aimed at the protection of the archaeological and naturalistic landscape. Therefore, the contribution proposes the analysis of the state of the art relating to the landscape conditions of the places, with particular reference to the risks and opportunities posed by climate change. An operation aimed at evaluating monitoring and solutions for archaeological contexts, with specific reference to the development of biodiversity, by the needs of protection and archaeological use. Analysing the possible threats and opportunities of the archaeological heritage concerning climate issues can raise awareness in the local community, establishing fruitful scientific collaborations with research institutions and government bodies, with a view to growth and sustainable development.

**1593. ARCHAEOLOGICAL HERITAGE AND CLIMATE CHANGE: PREVENTIVE CONSERVATION STRATEGIES FOR THE QHAPAQ ÑAM IN PERU**

**Contribution format:** Oral  
**Contribution authors:** Roberto Villalobos (Patrimonio Architetonico. Politecnico di Torino)

The Qhapaq Ñam (Camino del Inca) originated as a road system of the Tahuantinsuyo Empire, serving as an infrastructure for communication across territorial areas. It also included a widespread architectural system of exchange and resting structures for the chasquis, the imperial messengers. This system, which over time has undergone numerous adaptations to climate conditions, is now found within six South American countries: Ecuador, Colombia, Peru, Bolivia, Chile, and Argentina. Specifically, the section within Peru represents and interesting case study to analyze the critical issues and propose solutions aimed at protecting this heritage in the face of climate change affecting the entire region. Currently, the conservation and enhancement project for this territory involves not only the road itself but also the entire archaeological heritage distributed along the route, including a landscape of scattered ruins that has evolved over time for the benefit of the population that have inhabited it. Although the main approach consists in preserve the existing structure, over time, other strategies have been adopted to reduce the consequences of climate change on this cultural heritage. For these reasons, the contribution proposes analyzing the various preventive actions implemented to mitigate the risks posed by natural disasters (flooding, landslides, heavy rainfall, and temperature fluctuations) that the Qhapaq Ñam faces daily.

These events not only deteriorate the ancient material but also interfere with the economic and social activities of the more than three hundred local communities that still use this infrastructure and the surrounding rural areas, primarily used for agricultural cultivation. At the same time, the analysis also examines strategies for managing theses territories by applying techniques and knowledge that have been employed since the pre-colonial era to address such climate changes, which could, even today, contribute to resolving the vulnerabilities of the land.

**192 WATER IN THE CITY. MULTIDISCIPLINARY APPROACHES TO URBAN WATER MANAGEMENT**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Water, Urbanism, Multidisciplinarity, Cities,  
**Session organisers:** Nikolai Paukkonen – Tia Niemelä (University of Helsinki) – Marcus Sink (Swedish Institute at Athens)

**SESSION ABSTRACT**

Water has been a primary condition for organic life since its very beginning. Starting from the earliest stages of urbanization, managing urban water—whether ensuring its availability or mitigating its excess—has necessitated a range of innovative solutions. These efforts have resulted in a variety of structural, architectural and technological developments, from extensive systems such as aqueducts, tunnels, and cisterns to more subtle patterns and design choices that often go unnoticed. Archaeology offers a unique lens through which these systems can be directly examined, revealing the physical remnants of historical water management strategies. Hydrological phenomena in urban contexts can also be explored using various interdisciplinary methods. These include digital modeling of drainage systems, paleoclimatological studies, and analyses of water accessibility in relation to settlement patterns, in addition to many other approaches. This session invites researchers from diverse disciplines to present studies on water management in urban settings across different regions and time periods—from the dawn of urbanization to the modern era. We welcome contributions such as descriptions of fieldwork projects, large-scale diachronic analyses, innovative methodological applications, and theoretical discussions. Our aim is to foster a comprehensive interdisciplinary dialogue that highlights the multifaceted ways water has been managed in cities throughout the history of urban life.

**CONTRIBUTION ABSTRACTS**

**1032. ABANDONMENT AS RESILIENCE: A CASE STUDY FROM OLYMPOS, LYCIA**

**Contribution format:** Oral  
**Contribution authors:** Catherine Keane (Universität Tübingen)

This paper focuses on late antique transformations of water management in Olympos, Lycia. Situated in a steep river valley on the coast, Olympos is a well-preserved site that experienced earthquakes in the 6th century with later phases of abandonment. Throughout these late antique phases, various renegotiations of water management are visible archaeologically, which correlate to a rising water table after the earthquake. At numerous churches in the city, water was also incorporated with pipes and basins for monumental purposes in later building phases. This paper analyses the transformations of the city after the earthquake, the changes to religious monuments, throughout the city’s abandonment. By applying paleoenvironmental data from nearby cave and lake records alongside a reconsideration of architectural phases, it is possible to discuss the site’s eventual abandonment. With aspects of complex adaptive systems from resilience theory approaches, the question of abandonment as a form of resilience will be presented.

**1094. WATER AND POWER: WATER FLOWING FEATURES IN THE ARCHITECTURE OF HERODES ATTICUS**

**Contribution format:** Oral  
**Contribution authors:** Marcus Sink (Swedish Institute at Athens)

Herodes Atticus, one of the wealthiest persons in Roman Greece, was responsible for the construction of a wide array of different buildings, both private and public, on the Balkan and the Italian peninsulas as well as in Asia Minor. This presentation will examine a series of architectural structures, from the second century AD, which are related to Herodes Atticus. This investigation will demonstrate a possible preference for running water as an incorporated element in Herodes’ building programs. While this is something that has been noticed for specific sites, e.g at his villa at Eva/Loukoús, it has never been studied as a recurring phenomenon in the architecture of Herodes. Why Herodes started adding water flowing features to his architecture is still unclear. It has previously

been suggested that he was inspired by Hadrian’s building projects, such as Hadrian’s villa at Tivoli. However, it might also be that he inherited the art from his father who, according to Philostratos, constructed a hydrological supply system for Alexandria Troas in Asia Minor. To demonstrate Herodes’ presumed preference of water related elements, material from several different sites will be offered as examples in order to provide for new interpretations of architectural structures with unclear functions.

2156. **”ΑΡΙΣΤΟΝ ΜΕΝ “ΥΔΩΡ: URBAN PLANNING AND WATER IN AKRAGAS AND METAPONTO**

**Contribution format:** Oral  
**Contribution authors:** Seraphina Vasilodimitrakis-Hart (Aristotle University of Thessaloniki)

This paper examines the water resource management in two Greek colonies in Magna Graecia, Akragas and Metaponto, and the relationship between resource management and political regimes. It asks how similar ancient urban theory was to the practical reality, and if different forms of government made different provisions for water management. By outlining urban and health theories found in the works of ancient theorists, it debunks the idea that Hippodamos was the inventor of grid planning, while introducing the concept of ‘total’ city planning. The focus of Classical scholarship on Athens necessitates discussions of several Athenian water systems and how resource management changed or continued through different governments in Athens as a point of comparison for Akragas and Metaponto. This is constructed through literary analysis and introduces the controversial Southeast Fountain House, with an in-depth consideration of the fountain’s naming and dating problems. Akragas and Metaponto are the two case studies examined in this paper. They are examined by an exploration of the hydrogeology at the two sites, with an introduction to the hydrological phenomenon of karst activity, and discussion of their unique water features—the kolymbethra at Akragas and the canals in the chora of Metaponto—connects the deliberate planning that occurred in both cities to Hippodamos and the urban theorists. Finally, the role of tyrants and democracies in water management is examined through the lens of these two cities with comparison to Athens. Regardless of authorship, water resource management and water systems are necessary for any city, and so most tyrannical water infrastructure continued to be used and improved upon under different governments. Even under tyranny water management is a provision of the state and is engaged with and managed by the citizens of the city.

926. **EPIGRAPHY AND WATER MANAGEMENT IN THE EASTERN MEDITERRANEAN FROM THE ROMAN IMPERIAL PERIOD TO THE OTTOMAN ONE: SOME CASE STUDIES**

**Contribution format:** Oral  
**Contribution authors:** Giovanni Salmeri (University of Pisa)

Inscriptions offer some important information on water management in the Mediterranean world. In this presentation I shall focus on the Eastern Mediterranean from the Roman Imperial period to the Ottoman one, adopting a comparative approach, and trying to define – through the analysis of half a dozen of inscriptions from Greece and Turkey – which were the limits and forms of private and public intervention in the water management of the cities. A special attention will be paid both to the evergetic behaviour quite often characterizing the construction of aqueducts and fountains and to the role played by the latter in the urban setting. Within the same perspective will also be taken into consideration the reliefs accompanying inscriptions on the walls of some fountains. Finally, the range of symbolic values attached to water in pre-industrial societies, touching also the religious sphere, and shared between ancient and early modern times, will be analyzed.

1511. **BENEATH OTTOMAN TIMIȘOARA: ARCHAEOLOGICAL PERSPECTIVES ON WATER SUPPLY AND MANAGEMENT**

**Contribution format:** Oral  
**Contribution authors:** Bogdan Craiovan (National Museum of Banat | Center of Interdisciplinary Research on Movable and Immoveable Archaeological Heritage “ArheoTim”) – Andrei Stavila – Dorel Micle (West University of Timisoara | Center of Interdisciplinary Research on Movable and Immoveable Archaeological Heritage “ArheoTim”)

Water is and will always remain a vital element in the economy and daily life of a village, settlement, or urban center, whether we are talking about prehistoric times or the modern era. This is especially true in the late medieval to the early modern period when cities and urban centers began to develop even faster than before. The population grew on a yearly basis, thus requiring a steady supply of water and a stable, functioning system to bring water into the city and remove the used water. This presentation explores the water management system of Ottoman Timișoara (late 16th–mid-17th century) through archaeological discoveries made in Piața Libertății during excavations in 2013–2014. The investigations uncovered several sections of an aqueduct, fragments of terracotta pipes, and a segment of a sewerage system, providing valuable insights into the city’s infrastructure. These structures likely played a crucial role in supplying water to key urban areas and public buildings, such as

the nearby hammam. The analysis of construction techniques, material use, and spatial distribution sheds light on the ways in which water was integrated into the daily life of the city. By examining these elements, this study contributes to a broader understanding of urban planning and resource management in the Ottoman period.

198. **THE MANAGEMENT OF EXCESS WATER IN THE STREETS OF MEDIEVAL LÜBECK**

**Contribution format:** Oral  
**Contribution authors:** Rebecca Pfaff (Otto-Friedrich-Universität Bamberg | ZKFL (Centre for Cultural Research Lübeck))

The supply of drinking and process water to the urban population was of great importance. As is also the case for Lübeck, one of the oldest hanseatic cities in Northern Germany. Moreover, the management of domestic wastewater and excess water resulting from precipitation within the densely populated cities of the Middle Ages also constituted an infrastructural problem for which a solution had to be found. Using an interdisciplinary approach that combines archaeological, historiographical and bioscientific analyses, my doctoral thesis focuses on the medieval infrastructure concealed within the streets of Lübeck. The focus is directed towards structures that still belong to critical sectors of infrastructure today. These include the water supply and waste disposal systems as well as the street surfaces. The paper focuses on the management of excess water in the streets of Lübeck. The dense development on properties prevented natural drainage and necessitated the strategic diversion of water to prevent its ingress into buildings. As urban development progressed, the disposal system shifted more and more to the streets. This resulted in the establishment of a complex, interconnected drainage system comprising of a variety of drainage methods that were well adapted to the environment. The complexity of the system suggests that the plots were meticulously planned, with the infrastructure being designed from the outset by a municipal or feudal authority. My paper explores the manner in which the city regulated its infrastructure in interaction with its citizens. The primary source of data for this study is derived from large-scale excavations in the area of the city’s so-called “founding quarter”. The aim is to compare the “founding quarter”, which was dominated by wealthy merchants, with other areas of the city, which were mainly populated by craftsmen.

2340. **THE MEDIEVAL WATER SUPPLY SYSTEM OF TALLINN**

**Contribution format:** Oral  
**Contribution authors:** Villu Kadakas (Tallinn University)

Almost nothing is known about medieval or Early Modern water supply systems of Estonian towns, except Tallinn. Smaller inland towns next to natural streams with abundant water probably did not need a complicated system. Tallinn as a coastal town was not able to supply itself with natural fresh water sources and eventually, by the 15th century built an artificial system. It included a 4 km long subterranean aqueduct, which brought water from a lake, situated 20 m higher than the Old Town, to the moat; a system of water mills on the moat, timber pipelines under the streets which brought water to public wells on the street. This system apparently functioned for a very long period: from its original construction in the 15th century until the 1860s. It is rather well reflected also in the surviving written records in the city archives. Throughout the last century, elements of this water system have been discovered both from under the streets of the Old Town and suburban areas. The aim of the paper is to give a short overview of what is known of this water system, as well as of the research problems and possibilities. The apparently very clear description of the water system is rather problematic when one takes a closer look on the data. The built elements of the system have been mostly discovered by history enthusiasts, before professional archaeology; the documentation is rather limited. The system has been described mostly based on the elements which functioned in the middle of the 19th century. How much of the documented water system elements really survived from the original system? Was the 19th century system simply a copy of the initial one or had there been changes extent and technology? Is there still enough preserved underground for further studies?

323. **WATER MANAGEMENT AND FIRE SAFETY IN EARLY MODERN TURKU, FINLAND**

**Contribution format:** Oral  
**Contribution authors:** Tia Niemelä (University of Helsinki) – Kari Uotila (University of Helsinki | University of Turku | Muuritutkimus Oy)

In the early modern town (in this case, from AD 1650 to the early 19th century), water was a necessity of life not only because of victuals but also in the case of fire accidents. The town of Turku was funded in the medieval period, and in early modern times, it was the most important town of current Finland, which was part of the Swedish Kingdom until 1809. During this period, the town was developing, and stone buildings became more common. However, Turku was still mostly a wooden town in the early modern period and was thus influenced by many fires. As in other European towns, fire insurances became more popular, and The General Fire Insurance Company in Sweden was founded in 1782. Muuritutkimus Oy conducted archaeological excavations at the Market Square of Turku between 2018 and 2022, and over 20 early modern town plots were investigated. Six plot owners

in this area had fire insurance for their property. These insurances date to between 1794 and 1821. Fire insurances provides valuable data on buildings in the plots, including building materials and structures, windows, interiors, and yards. Furthermore, there is information on wells and firefighting equipment, such as fire escapes and buckets. This paper aims to approach water management in early modern town with two different source materials: archaeology and historical written sources – fire insurances. Both materials provide information on wells and underline the importance of access to water. The main questions are where the wells are located in the town plots researched and what kind of equipment inhabitants owned in case of the fire?

2011. THE GEOMORPHOLOGICAL EVOLUTION OF A FORGOTTEN BRANCH OF THE RIVER SENNE IN BRUSSELS

**Contribution format:** Oral  
**Contribution authors:** Dries Vergouwen (Vrije Universiteit Brussel | urban.brussels) – Ralf Vandam (Vrije Universiteit Brussel) – Ann Degraeve – Marc Meganck – Sylvianne Modrie – Stephan Van Bellingen (urban.brussels) – Cristiano Nicosia (University of Padova) – Yannick Devos (Vrije Universiteit Brussel)

The 2015 rescue excavation at the Tours & Taxis site in Brussels, conducted by the Department of Archaeological Heritage of the Brussels-Capital Region, revealed surprising findings. Among them was the discovery of an undocumented branch of the Senne River, just north of the historical center of Brussels. This river arm has been studied extensively in terms of archaeology, archaeozoology, micromorphology and macro-botany. This paper reconstructs the geomorphological history of the meander, tracing its initial formation, periods of activity and dormancy, and eventual disappearance, offering new insights into the dynamic relationship between natural and human-induced changes in this urban landscape. The methodology of the fieldwork included making a general site description, profile description and documentation, describing the soil characteristics and features associated with archaeological structures and/or layers. A total of 21 soil profiles have been studied. The geomorphological evolution of this branch is characterized by 13 distinct phases, ranging from the Quaternary alluvium that filled the valley until the entire site got covered by alluvium and backfill before 1550.

1713. BEYOND THE TEXTS: ANALYZING ROME’S WATER NETWORK THROUGH DIGITAL ARCHAEOLOGY

**Contribution format:** Oral  
**Contribution authors:** Maria Elisa Amadasi (Scuola Normale Superiore di Pisa)

Water infrastructure has played a crucial role in the development of urban societies since ancient times, significantly improving the quality of life. In particular, the continuous advancements in water supply systems became a hallmark of Roman civilization and identity. The ERC-funded project IN-ROME examines urban structures and interactions in Rome and its surroundings, covering the period from the 1st century BCE to the 3rd century CE. Its innovative goal is to translate topographical data into socio-cultural insights, offering a deeper understanding of the city’s social dynamics beyond what is found in literary sources. A key focus of this project is the holistic study of water infrastructure. By analysing ancient and antiquarian texts, archival records, cartography, and the latest research on Rome and its hinterland, various water installations can be identified and mapped in a GIS system. This interdisciplinary method enables a more comprehensive examination of Rome’s water infrastructure, revealing its connections with urban society and the surrounding landscape. The detailed picture that emerges from this study provides valuable insights into the exploitation of rural areas, the management of water resources, and the use of both urban and suburban spaces.

307. WATER IN THE CITY: EPIGRAPHICAL EVIDENCE FROM GREEK POLEIS OF THE HELLENISTIC AND EARLY IMPERIAL PERIODS

**Contribution format:** Oral  
**Contribution authors:** Antiopi Argyriou (National and Kapodistrian University of Athens | Center for Hellenic Studies Harvard University Summer Fellow 2024-25)

Water was essential for the life of the ancient Greek poleis. The abundance of inscriptions which is preserved from the Hellenistic and the early Imperial periods attests to the importance of water management for urban life. Numerous inscriptions of various types (honorific decrees, dedications, laws, contracts etc.) shed light on the strategies employed by city officials (such as the epimeletes of the fountains, the ergepistates, and the hydrophoros) who facilitated the flow of abundant and clean water in the cities. The epigraphical evidence reveals that cities were particularly concerned with the availability of water for urban populations. Public inscriptions from various regions offer insights into how the cities managed water uses in urban contexts (gymnasia, sanctuaries etc.), regulated the use of public fountains, and contracted the restoration of fountains and baths. The inscribed laws from the poleis of Priene and Carthaea in Ceos, dating from the 3rd c. BC, are two illuminating examples that offer much detail about the use of water. Dedications of fountains and aqueducts by generous civic

benefactors, including Roman emperors, also convey the high priority of sufficient and clean water, which was not to be excessively or inappropriately used, in Hellenistic and early Imperial Greek poleis.

1733. WATER MANAGEMENT AND URBAN DEVELOPMENT IN FALERII VETERES: THE CASE OF VIGNALE

**Contribution format:** Oral  
**Contribution authors:** Omar Scarone (Università degli Studi di Pavia) – Filippo Materazzi (Sapienza Università di Roma)

Water infrastructure played a crucial role in the urban development of the pre-roman city of Falerii (Civita Castellana, VT, Italy), particularly during the Archaic period. The excavation at Vignale (Sapienza Università di Roma, teaching of Archaeology of pre-Roman Italy) has unveiled a complex system of cunicoli, wells, and cisterns, shedding new light on how the city managed water resources. This paper examines how the development of this hydraulic infrastructure reflects broader socio-political transformations during the 6th and 5th centuries BCE. Drawing on both archaeological and archival data, the research demonstrates a structured approach to water management, indicative of coordinated urban planning. The analyzed cisterns, including one with a capacity exceeding 1,000 cubic meters, attest a sophisticated understanding of water conservation; the presence of multiple cuniculi suggests a deliberate effort to regulate water flow, mitigating seasonal variations and ensuring a consistent supply. Furthermore, comparisons with contemporary hydraulic systems in Etruria and Magna Graecia underscore the interconnectedness of water management strategies across the Mediterranean world. By integrating digital modeling, archival research, and archaeological fieldwork, this study highlights the central role of water infrastructure in shaping urban landscapes. The findings contribute to wider discussions on ancient urbanism, proving how water management functioned not only as a practical necessity but also as an expression of political power in early cities.

106. URBAN AND NATURAL WATER: THE HYDROLOGICAL CYCLE OF A POMPEIIAN HOUSEHOLD

**Contribution format:** Oral  
**Contribution authors:** Nikolai Paukkonen (University of Helsinki | Institutum Romanum Finlandiae)

In urban environments, the supply of clean water and the management of wastewater have posed logistical challenges to human societies throughout the history of urbanization. Pompeii provides a unique lens through which to explore the sophisticated and multi-layered approaches of Roman water management, encompassing features such as baths, latrinae, aqueducts, fountains, and cisterns. The house of Trebius Valens, located in regio III, presents a rich but compact array of water-related installations, making it an ideal case study for understanding these systems. This presentation investigates the hydrological cycle within this household, analyzing its infrastructure and practices to illuminate broader Roman perspectives on water. By focusing on this micro-scale context, I aim to reveal the implicit and explicit roles and meanings that water held in Roman daily life, as well as its connection to nature and urban functionality. Ultimately, this study contributes to a deeper understanding of how water shaped Roman urbanism and the cultural significance ascribed to it.

2447. EXPLOITATION OF GROUNDWATER ON THE CISPIO AND VIMINAL HILLS IN ROME

**Contribution format:** Oral  
**Contribution authors:** Fabiola De Rossi (Università di Sassari | Pontificio Istituto di Archeologia Cristiana)

This study aims to shed light on the exploitation of soil for groundwater extraction in the urban area of Rome, with a particular focus on the Cispio and Viminale area. The area was traversed by the Spinon River, which channeled water from the springs and flowed between the Esquiline, Viminale, and Quirinal hills. From a geological perspective, the terrain was predominantly composed of lithoid tuffs and pozzolanic deposits. These characteristics appear to have facilitated the exploitation of both the soil—through tunnels for material extraction—and the groundwater, via tunnel-cistern systems, wells, and storage reservoirs. This contribution presents preliminary data from an ongoing doctoral research project, which outlines a general framework of infrastructural interventions primarily aimed at water collection in this urban sector. The available data are largely derived from excavations conducted in the late 19th and early 20th centuries. Despite their fragmentary nature, these findings warrant recontextualization and comparison with examples uncovered in recent stratigraphic excavations within the study area. The final framework aims to provide an overview of contextualized findings that may offer insights into construction techniques, periods of use, and the decommissioning of the facilities.

286. SURVEYS ON HISTORICAL WATER SUPPLY OF İSTANBUL AND ARCHAEOMETRIC APPROACHES

**Contribution format:** Oral  
**Contribution authors:** Çigdem Özkan Aygün (İstanbul Technical University)

Archaeological surveys regarding the historical water supply of İstanbul have been conducted by the author since

2005. For a recent interdisciplinary research related with those surveys, GPR(Ground Penetrating Radar) is applied as a archaeogeophysical method to asses the unknown paths of historical supply lines and the water reservoirs such as the cisterns under the First Hill of ancient İstanbul. The First Hill of İstanbul has been the focal area of historical settlement in İstanbul. Therefore at the same time this is the area where the water infrastructure is most complex but most comprehensively exemplified. It is impossible for several reasons to conduct an archaeo-logical survey/excavation all over the mentioned area. The locations of known cisterns are helpful indications for judging the possible path of the supply line. The aim of the research is to analyse the historical water management applications during, Byzantine and Ottoman era till the XIXth century and reveal the evolution of water engineering through the history. The comprehensive analysis of the historical hydraulic system of the City is compared with the contemporary situation also in order to understand the effects of the climate change and the response of the authorities to the change through history. The ancient technologies which are more environmentally friendly have been analysed to be an inspiration for the new applications. The archaeological survey data, the historical and contemporary maps of water supply and the results of the GPR surveys are applies on GIS modelling which ha. permitted to a deeper understanding of the long term water hydrology of the city.

522. PUBLIC FOUNTAINS OF ROMAN ALGERIA, 3D SURVEYS AND CONSTRUCTION TECHNIQUES

**Contribution format:** Poster  
**Contribution authors:** Daniele Bursich (Università degli Studi di Verona)

Over the last 80 years, research on water and Roman fountains in North Africa has been carried out at various times and with discontinuity. However, among the many works on the subject, one can cite as an example the study by Pierre Aupert from the 1970s on the Algerian area and on the city of Tipasa, but also a valuable and more recent update on the Libyan area by Francesco Tomasello that focuses on the nymphaeum of Leptis Magna. A few years ago, however, a valuable annotated collection on the hydraulic systems of the Roman North African area - by Nicolas Lamare, who also boasts a catalogue of systems and technical sheets accompanied by recent and period photos - has allowed us to lay the general foundations on such a vast and complex topic. This paper aims to further explore Lamare’s work by focusing on the Roman Algerian area, also taking up Aupert’s studies, and at the same time introducing new aspects of research. In particular, the fountains and nymphaeum of Tazoult (Lambaesis), Djémila (Cuicul), Timgad (Thamugadis), and Tipasa will be discussed. Thanks to the 3D scans obtained with various indirect methods, it will be possible to highlight new observations regarding the positions of the fountains in the urban fabric, the construction techniques and innovative architectural solutions, as well as the introduction of new quantitative elements specific to each apparatus, such as volume, capacity, flow rate, and much more.

195 MORE THAN MEGALITHS: BEYOND BARROWS AND HENGES. A GLOBAL APPROACH TO FIRST MONUMENTALITY

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Monumentality, Neolithic, Prehistory, Domestication of Space, Perception, Cognition  
**Session organisers:** Jadranka Verdonkschot – Felipe Criado-Boado (Institute of Heritage Sciences, Spanish National Research Centre (INCIPIT-CSIC)) – Carla Jaimes Betancourt (Bonn University) – Camila Gianotti (University of the Republic of Uruguay) – António Valera (ERA Arqueologia, SA)  
**Session discussant:** Johannes Müller (Kiel University)

SESSION ABSTRACT

This session seeks to explore several aspects of First Monumentality on a global scale. We are interested in understanding first monumentalities on several levels: in their conception and as enduring marks on the landscape. The first monuments did not “appear”. Therefore, rather than tracing an origin story, our focus is on how the earliest monuments represent a moment of culmination, as the materialisations of significant developments within prehistoric communities. These structures reflect not only the practical aspects of planning, organization, and execution—requiring substantial collaboration and communication—but also profound ideological shifts. But monument-building represents more than just a technical achievement. An important shift in how communities perceived and engaged with their environment took place. Early monumentality signifies a transformation in how people related to their surroundings, domesticating space by marking the landscape. The second part of the reflection we would like to invite you to participate in is the life of monuments once they have been conceived and built: the lasting influence of monuments after their construction. How do these structures continue to shape the lives, perceptions, and cognitive frameworks of the people who live with and contemplate them? How does the relationship between communities and their monuments evolve over time? We invite

contributions from colleagues working on First Monumentality across different regions of the world to share their work on us and engage together in a fruitful debate on the material, social, and cognitive implications of these enduring landmarks.

CONTRIBUTION ABSTRACTS

1057. MONUMENTS IN MOTION: THE BECOMING, TRANSFORMATION, AND AFTERLIFE OF MEGALITHS

**Contribution format:** Oral  
**Contribution authors:** Jadranka Verdonkschot – Felipe Criado-Boado (Institute of Heritage Sciences (INCIPIT-CSIC))

This presentation explores some of prehistoric Europe’s earliest monumental expressions: megaliths. Their construction fundamentally reshaped how societies engaged with space and landscape. However, this transformation was not sudden; rather, it was the outcome of a long process of domesticating space, one that began long before its material manifestation. Instead of seeking an origin story, we ask: what changed with megaliths? How did they alter spatial perception, structure human thought, and materialize evolving societal rationalities? Guiding this reflection is the life of a monument—its becoming, use, reuse, shifts in meaning, and the question of whether a monument ever truly ceases to be. Focusing on northwestern Iberia, we examine how monument-building intersects with broader cycles of transformation. Monumentality is not a single act of creation but the culmination of long-term interactions between humans and their environment. From “wild” monuments—striking natural features—to built structures that echo and transform them, from caves in mountains to burial mounds that emulate them, these spaces shape perception and social behavior, contributing to a structured order that both reflects and informs human cognition. This presentation integrates insights from ongoing research in the MILESTONE and Material Minds: XScape projects, which investigate the cognitive and material dimensions of monumentality.

239. ENDURING MONUMENTALITY IN THE SOUTHWESTERN AMAZON: THE CASARABE CULTURE AND THE LAKES OF EXALTATION IN THE LLANOS DE MOXOS, BOLIVIA

**Contribution format:** Oral  
**Contribution authors:** Carla Jaimes Betancourt (Bonn University)

Llanos de Moxos, located in the southwestern part of the Amazon, is one of the most extensive and enduring monumental landscapes in South America. This region has been shaped by nearly 10,000 years of socio-environmental change. The monumental earthen constructions (mounds, ditches, elevated fields, canals, and reservoirs) reflect significant ideological and social shifts as various Indigenous societies transformed the savannah into a complex, domesticated environment. Rather than simple technical achievements, these structures embody the intricate collaboration, communication, and interaction between human creativity and natural systems. This presentation explores the low-density urbanism of the Casarabe culture, recently uncovered by LiDAR research, as a hierarchical network of settlements with monumental civic-ceremonial architecture, extensive causeways, and advanced water management systems. At the same time, we analyze the communities surrounding the Great Tectonic Lakes of Exaltation, whose landscape modifications represent a unique response to environmental challenges, complementing the broader patterns of early monumentality in the region. These case studies highlight how monumental constructions not only redefined the relationships between humans and the environment but also left lasting impacts on both the physical and cultural landscape, influencing how communities adapted to and interacted with these structures over time. This contribution examines the lasting material, social, and cognitive effects of the monumental landscapes in the southwestern Amazon.

1534. MORE THAN RITUAL BUILDINGS : ON FIRST MONUMENTAL STRUCTURES OF EARLY NEOLITHIC UPPER MESOPOTAMIA AND “STONE MOUNDS” REGIONS

**Contribution format:** Oral  
**Contribution authors:** Ali Umut Türkcan (Anadolu Universitesi, Dept. Archaeology)

Early monumentality signifies a transformation in how people related to their surroundings, domesticating space by marking the landscape. Discussion on emergence of monumentalism within the early sedentary hunter-gatherer and later communities seem to be the development of ranking societies as well as the changing social dynamics of early sedentary foragers within their subsistence strategies.in Northern Mesopotamia. the creation of monumental religious structures does seem to be central to episodes of social integration and the formation of wider communities- whether be part of the “Neolithic”, “Urban”, or “Industrial” Revolutions. Public Architecture in the realm of first monumental building. apperared on Stone Mounds region as especially differentiated from residential domestic architecture. To understand The high level of sophistication and technology is also evident in architecture; neither the cult buildings of Karahan Tepe, Nevali Çori nor of Göbekli, adorned with pillars up to 3 m. high, nor the terrazzo floors could have been made by simple craftsmen. With these monumental buildings so

far over one dozen settlements in earliest Neolithic villages, it is seen that the big amount of energy and time could be focused or accumulated through time as seen in monumental projects. Socio religious authority that could be one of the earliest chiefdom society seem to have affirmed itself with greater force in the monumental constructions which continue to be found in Upper mesopotamia between Upper Tigris and Middle Euphrates regions.

1731. MEGALITHIC GRAVES OF THE FUNNEL BEAKER CULTURE AS A MIRROR OF EARLY NEOLITHIC SOCIAL DEVELOPMENT

**Contribution format:** Oral  
**Contribution authors:** Anja Behrens (Lower Saxony Institute of coastal historical Research)

The Funnel Beaker Culture (TRB, 4100-2800 cal BC) marks the introduction of the Neolithic way of life in northern Middle Europe. This development is closely tied to the establishment of megalithic building traditions, which have shaped the landscape to the present day. Recent research in two regions in northern Germany has revealed widespread characteristics in architecture, with regional and local traditions evident within the relatively short construction period. The spatial distribution and clustering of graves allow conclusions to be drawn regarding population sizes and settlement patterns. Over the following centuries, a consistent burial landscape is provable through repeated activities connected to the grave sites. However, pottery analyses and settlement studies also suggest shifting relationships on a regional and supra-regional level. These findings are based on studies conducted on the island of Rügen (TRB North group) and the Elbe-Weser-triangle (TRB West group). A comparison of both regions reveals parallel as well as differentiated developments within the TRB area, setting the stage for a broader understanding of the societies of that time, which shall be discussed.

2415. FROM NEOLITHIC MONUMENTAL ENCLOSURES AND EARTHEN LONG BARROWS TO EARLY MEDIEVAL BURIAL MOUNDS. ENDURING LANDMARKS OF THE MUSZKOWICE AREA

**Contribution format:** Oral  
**Contribution authors:** Agnieszka Przybył (University of Wrocław)

How did the landmarks established in the Neolithic affect the perception of space by successive communities living in the selected region of Lower Silesia? What environmental and cultural conditions influenced the location of special and sacred structures in the area? How did land use change after their establishment, and what impact did this have on prehistoric settlements in the region? And last but not least, can GIS analyses help us answer these questions? These issues will be explored in this brief presentation, which focuses on archaeological sites from different periods in the Muszkowice area, with an emphasis on their significance and continuity as important landmarks. The surroundings of Muszkowice village, located in southwestern Poland in the Sudeten Foreland, are rich in monumental structures from the Neolithic period. These include circular enclosures (rondels) and long earthen barrows. The former are the oldest and most mysterious monuments, while the latter marked the beginning of the funerary use of the selected sites, a practice that continued for many centuries. Due to the scope of this presentation, it is impossible to address many other questions that arise regarding the first monumental constructions in the region. However, the uniqueness of this area provides an opportunity for comprehensive studies on the adaptation to and familiarization with space by the earliest farming societies that inhabited it. Its distinctiveness allows us to examine the long-lasting impact it had on both the generations of builders and their successors.

1015. (RE)CONSTRUCTING SOCIETIES: AN ARCHITECTURAL ENERGETICS APPROACH TO THE STUDY OF THE NEOLITHIC RONDEL BUILDING IN THE LOWER AUSTRIA REGION

**Contribution format:** Oral  
**Contribution authors:** Mateusz Nowak (University of Wrocław)

Even before the erection of the first megalithic monuments in the region, Central Europe conducted its first big attempt on materialization of the idea of monumentality. The structures originated from that phenomenon came to be known as „rondels”. By this name we today recognize the enclosures characterized by rows of concentric V-shaped ditches, followed by circular wooden structures which designate the empty central plaza accessed via gates. These structures can be found in vast areas, stretching from Austria and Hungary, through Moravia, Czechia and Slovakia, up to Germany and the Northern Poland. Due to the lack of structures visible in the current terrain combined with complicated stratigraphy and advanced erosion on sites, the original appearance of rondel still remains a topic of a debate. One of its most reoccurring topics is the question, if those monumental structures were built as a consequence of one big construction event, or were they constructed over long, generations spanning, periods of time by successive adding of the new elements. Because of the lack of fully satisfying explanation to this question I would like to present another approach - the one of architectural energetics. In my speech I will present both the methodology of this approach and the results in the form of person-hours values needed for the construction of specific structures located in the Lower Austria region. I will also address the problems connected

with such calculations on the objects with forms invisible in the current terrain. The acquired data can help us to understand better the capacity of past communities to finish them in one construction event. Furthermore, the acquired data will help to envision the social structure of the rondel-builders by examining how much infra- or intraregional cooperation needed to be gathered for the construction of a rondel.

639. RITUALISED MONUMENTALITY: MEGALITHS IN NEOLITHIC MALTA

**Contribution format:** Poster  
**Contribution authors:** Dawn Saliba (University of Malta)

Malta's Late Neolithic society exemplifies a prehistoric civilisation that utilised the natural world in the conception and creation of ritually-centred structures and artefacts. The islands' ubiquitous limestone (globigerina and coralline) was carved to form megaliths, the literal building blocks of this civilisation's towering 'temples', perhaps inspired by massive rock formations rising from the sea. The architectural layout of many structures was designed to align with celestial events, such as solstice and equinox sunrises. Elaborate hypogea constructed near naturally occurring karstic systems or excavated from living rock exploited naturally occurring fissures, joints, and bedding planes as the basis of internal chambers or rock-cut features. Recurring motifs such as spirals were likely inspired by natural elements such as snail-shells, the swirling water of the sea, or the movement of stars. It is probable that pitted stones within liminal areas were imbued with meaning and served as 'hierophanic' markers. Carvings of animals, such as the snake and fish on the adorned blocks of the Ġgantija and Buġibba Temples, display aesthetic and probable mythic connections to animal-life, as do the myriads of animal carvings within Tarxien. One 'altar' table within the Haġar Qim Temple evokes plant-life. Distinctively coloured red ochre, drawn from the earth, was used to decorate temple walls, symbolically charged statues, and the bones of the dead, while the islands' malleable blue clay was consistently shaped into anthropomorphic and zoomorphic statues and figurines. Finally, the reuse and circulation of materials, such as pottery fragments and bones, further underscores the cyclical nature of their rituals. This study explores this society's sacral engagement between landscape, architecture, and material culture within Malta's Neolithic period, emphasising how these elements were integrated within their ritualised use of space and artefact.

196 STEEP ROADS TO COMPLEXITY: CULTURAL ADAPTATION AND OCCUPATIONAL STRATEGIES IN MEDITERRANEAN MOUNTAINOUS AREAS, FROM LATE BRONZE AGE TO ROMAN UNIFICATION

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Landscape, Mountains, Later Prehistory, Alternatives to Urbanisation, Preroman Archaeology , Mediterranean Archaeology  
**Session organisers:** Elena Scarsella (Barcelona Supercomputing Center (BSC)) – Dario Monti (Université Catholique de Louvain)

SESSION ABSTRACT

As Fernand Braudel once said, the Mediterranean is a sea largely surrounded by mountains. Despite this prominent role, though, Mediterranean mountains and the societies that inhabited them have always been considered marginal, just the periphery of the great urban civilizations that developed at lower altitudes. It is precisely the urban element, or rather its absence in the mountainous context, that has motivated, in the eyes of both the ancients and many contemporaries, the marginality and supposed backwardness of these territories. Although this is slowly changing, such a dismissive attitude has long prevented an unbiased investigation of the specificities of this environment and is also partly responsible for a certain lack of extensive research on it. This session aims to explore the multiple and adaptive ways in which ancient communities dealt with such a difficult and often-times harsh environment, with specific attention to those case studies that investigate communities between the end of the Bronze Age and Roman unification. The session welcomes papers that explore the dialectic relationship between the mountainous environment and occupational strategies, and all the aspects that shape 'culture' and 'society' in the communities that lived there. Particular attention will be devoted to the identification, in all these facets of human societies, of possible general patterns, both in their material and immaterial manifestation. The aim of the session is therefore to restore the due importance and centrality of a landscape that covers such a huge part of th. Mediterranean and to provide a theoretical hub for those studying it.

1960. FORGING CONNECTIONS: METALLURGY, MOBILITY, AND PASTORAL LANDSCAPES IN THE VEZZENA-LUSERNA-LAVARONE PLATEAUS (NORTHERN ITALY) DURING THE LATE BRONZE AGE

**Contribution format:** Oral  
**Contribution authors:** Luigi Magnini (Ca’ Foscari University Venice) – Stefano Pedersoli (University of Sassari) – Armando De Guio (University of Padova) – Cinzia Bettineschi (Pegaso University)

The Vezzena-Luserna-Lavarone plateau, situated in the Trentino Alps, is a compelling case for reassessing the role of high-altitude landscapes in Late Bronze Age economic and social networks. Far from being isolated or marginal, this upland region was actively integrated into broader systems of metal production, pastoral mobility, and interregional connectivity. Archaeometallurgical evidence from copper smelting sites, combined with patterns of transhumance and resource exploitation, suggests a dynamic interaction between human communities and the mountainous environment. This paper explores how metalworking and pastoralism—often considered distinct economic activities—were interwoven within a strategic landscape characterized by seasonal movement and access to essential raw materials. The presence of copper smelting sites indicates specialized metallurgical knowledge and technological adaptation to an upland setting, while the evidence for pastoral activity highlights the importance of transhumant routes linking the plateau to both alpine and lowland spheres. These processes, in turn, facilitated connections with wider trade and communication networks, positioning the Vezzena-Luserna-Lavarone plateau as a key node in Late Bronze Age exchange systems. By integrating landscape archaeology, archaeometallurgy, and mobility studies, this research reassesses the adaptive strategies employed by past communities in high-altitude settings. Rather than viewing mountain societies as peripheral to major centers of power, this study highlights the agency of upland populations in shaping long-term economic and cultural trajectories within the broader Mediterranean and Alpine world.

1060. CONTINUITY, UNIQUENESS, AND TRANSFORMATION IN VALCAMONICA (ITALIAN PREALPS) DURING THE IRON AGE

**Contribution format:** Oral  
**Contribution authors:** Cinzia Bettineschi (Pegaso University (Naples) | Centro Camuno di Studi Preistorici (Capo di Ponte - Brescia)) – Silvana Gavaldo – Cristina Gastaldi (Centro Camuno di Studi Preistorici (Capo di Ponte - Brescia)) – Francesca Roncoroni (Soprintendenza Archeologia, Belle arti e Paesaggio per la città metropolitana di Milano | Centro Camuno di Studi Preistorici (Capo di Ponte - Brescia))

The rock art of Valcamonica, a UNESCO-listed world heritage site, offers crucial evidence of the enduring sacrality of mountain spaces from the Neo-Eneolithic into the late Iron Age (and beyond). Far from being a peripheral or marginal phenomenon, the ritual significance of Valcamonica’s engraved surfaces must be understood within broader patterns of landscape use, mobility, and visibility. The persistence of some figures—ranging from anthropomorphic and zoomorphic motifs to weapons and ritual scenes—suggests a long-term conceptualization of the mountains as liminal spaces of spiritual contact. During the Iron Age, the engraving of the rock surfaces was revitalized and became further entangled with broader religious practices typical of the Alpine and Prealpine environment, including the Brandopferplätze attested in several occurrences in Valcamonica. The association of engraved surfaces with elevated positions above the Valley floor, prominent rock surfaces, and strategic points along connective paths indicates their integration into networks of movement and, possibly, cultural ceremonies, as sometimes hypothesized based on the representation of engraved footprints. Visibility—both in terms of the engravings’ location within the landscape and their relationship to paths, watercourses, rock fractures, and older engraving cycles—suggests that these places were actively maintained as focal points of communal significance, reinforcing a continuity of use. This paper explores how Valcamonica’s Iron Age rock art might fit within a long-standing tradition of highland rituality, demonstrating the resilience and adaptability of sacred practices in response to broader socio-cultural transformations related to the growing Etruscan, Celtic, and Roman influence. By linking cultural expression, visual representations, ritual offerings, and landscape analysis, it reassesses the role of Prealpine rock art sites as central within the ancient Mediterranean cultural framework and as exemplary places of local permeability to broad-ranging external influences.

1443. SUBSISTENCE STRATEGIES AND INTERDEPENDENCE AMONG MOUNTAIN AND LOWLAND COMMUNITIES: THE CASE OF THE CISPADANA (4TH–2ND CENTURIES BC)

**Contribution format:** Oral  
**Contribution authors:** Enrico Caruso (University of Vienna)

With the occupation of the Northern Apennine regions in Emilia Romagna (Italy) during the 4th-2nd centuries

BC by the Celtic groups, the incoming populations had to interact with the local societies within this geographic context. Evidence suggests that, after an initial phase of potential conflict, the different cultural groups might have established at least non-confrontational relations. Based on the archaeological record, this interpretation is further supported by the distribution patterns of the Boii, who did not spread uniformly among the entire mountain region. Instead, they appear to have settled primarily outside the Apennine border, with the notable exception of the well-documented sites located in the Idice and Reno Valleys, extending as far as the Apennine area near Faenza. This newly formed mosaic of communities, consisting of both locals and newcomers, provides an opportunity to identify potential shared or distinct traits in the subsistence strategies required to thrive in mountainous environments. This contribution aims to outline and compare these approaches among the various groups (Ligurians, Celts, Etruscans, and Umbrians) inhabiting these multifaceted region, as well as their connections with the Po Valley. While the local mountain communities may have relied on long-established practices developed over decades, the newcomers had to adjust to an unfamiliar environment, as exemplified by the case of Monte Bibele. The focus will therefore be placed on identifying these strategies through an analysis based on historical sources and the spatial distribution of materials and occupied areas. Additionally, the coexistence of a variety of strategies may also have fostered interdependence among those communities, possibly as a result of their cooperative interactions.

1310. PROTOHISTORIC SETTLEMENT IN MOUNTAINOUS CENTRAL ITALY: DYNAMICS AND NEW APPROACHES TO TERRITORIAL ANALYSIS

**Contribution format:** Oral  
**Contribution authors:** Andrea Conte (Sapienza - Università di Roma)

During the Late Bronze Age, a shift in settlement strategies can be observed: while during the Middle and Recent Bronze Age settlements were predominantly located in lowland areas, this phase saw the progressive occupation of mountainous districts, chosen for their morphometric characteristics favorable for defense. These settlements were often reinforced with artificial structures such as defensive walls or ditches. This study examines selected areas of Central Italy (Monti della Tolfa, Monti Cimini, Colli Albani, and the Umbro-Marchigiano Apennine district) to analyze the settlement patterns of upland sites in Protohistoric times. To this end, a site inventory was conducted, and well-established methodologies, such as LiDAR analysis, were applied to identify and characterize different types of occupation. This approach has made it possible to assess how prehistoric communities adapted to new settlement needs by utilizing mountainous areas. The use of LiDAR has proven particularly valuable in detecting sites concealed by dense vegetation, providing new data on the distribution and morphology of these settlements. The analyzed sites span a chronological framework ranging from the Late Bronze Age to, in some cases, the Early Iron Age and later historical phases. This research is part of a broader PhD project aimed not only at studying the settlement dynamics of the Late Bronze Age in mountain environments through the integration of archaeological and morphometric data but also at developing new methodological approaches. In particular, the use of drone LiDAR sensors enhances the ability to detect and analyze archaeological sites in complex landscapes. The use of these advanced technologies opens new perspectives for studying Protohistoric occupation in mountain areas, refining territorial investigation methods, and expanding the possibilities for reconstructing ancient landscapes.

1787. ALL ALONG THE CASTELLIERI. NEW INSIGHTS ON AN APENNINE PHENOMENON

**Contribution format:** Oral  
**Contribution authors:** Dario Monti (UCLouvain) – Elena Scarsella (Barcelona Supercomputing Center (BSC))

The so-called castellieri, often referred to as oppida, ocri, or more generally as hillforts, are one of the defining features of the mountainous landscapes of central Italy during the 1st millennium BC. These sites are particularly distinctive not only due to the architecture of their often monumental walls but also because of their strategic positioning within the landscape. They are found along the entire Apennine ridge, from Umbria to Samnium. The general lack of systematic excavations means that these sites are still not fully understood in many respects, both chronologically and functionally: were they settlements? Watchtowers? Enclosures for livestock? Or were they rather multifunctional sites, serving these and other purposes simultaneously? Their apparent homogeneity, which seems to disregard the ethnic diversity of the regions in which they are found, suggests that they represent a phenomenon spanning most of the Apennine area. At the same time, their distribution appears to extend beyond the scope of the so-called Italic koinè, indicating that their interpretation should not be confined to this already highly diverse cultural sphere. This paper investigates these archaeological features in a core area of the central Apennine region, specifically in the territories straddling the modern regions of Umbria, Marche, and Abruzzo. The objective is to present a comprehensive analysis of the evidence in this area, focusing on distribution, morphology (shape, size, and architecture), and associated material. By compiling an inventory of the available data, the study aims to propose a broad historical interpretation of this phenomenon, which appears to have been a unifying feature of many mountain communities across the Italian peninsula, regardless of their

cultural and political differences. In this sense, it seems to represent a recurring pattern amongst Italic mountain communities persisting over a long diachronic span.

**1154. FROM PEAK TO PEAK. PRELIMINARY ANALYSIS FROM THE PRE-ROMAN SANCTUARY OF MONTE TORRE MAGGIORE (TR)**

**Contribution format:** Oral  
**Contribution authors:** Nicolò Sabina (Sapienza Università di Roma)

High-altitude cult areas in the Apennines are the most prominent and well-known example of human interaction with the mountain environment in pre-Roman times. However, widespread clandestine excavations in recent decades, coupled with the resulting dispersal of archaeological finds and a scarcity of thorough research, have severely hampered our understanding of these sites. Southern Umbria is no exception. Fortunately, the scientifically rigorous excavation of the Monte Torre Maggiore sanctuary (1121 m amsl) near Terni, conducted by the Soprintendenza per i Beni Archeologici dell’Umbria between 1984 and the early 2000s, offers a valuable case study. Beginning Autmn 2024, a PhD project at the Sapienza University of Rome has commenced a systematic and detailed analysis of the partially published archaeological remains. Preliminary findings suggest a complex and dynamic history, offering insights into various aspects of pre-Roman highland cult areas, particularly the phenomenon of small, schematic bronze votives, which are characteristic of Umbrian religious practice.

**1883. “... THEN HERCULES WILL GO TO THE MOUNTAIN.” NEW INSIGHTS ON HERCULES’ CULT IN 1ST MILLENNIUM BC CENTRAL APENNINE ITALY**

**Contribution format:** Oral  
**Contribution authors:** Loredana Lancini – Dario Monti (UCLouvain)

This paper explores the relationship between the mountainous environment of central Apennines Italy and the cult of Hercules, examining the ways in which this specific landscape may have influenced the practices and beliefs of the local societies. It also seeks to evaluate whether, and to what extent, talking about an ‘Italic Hercules’ has meaning, and what were his main cultic traits. While earlier studies have highlighted the association of Hercules worship with transhumance, this research takes a broader view, questioning whether the mountainous context itself contributed to the development of distinct cultic features in these regions. To do so, particular attention will be given to the spatial and topographical distribution of the cult. The cult of Hercules in central Italy appears, as already proposed by some, to have been shaped not only by pastoralism but also by other forms of mobility, such as trade. By examining both archaeological and epigraphic evidence, this paper aims to investigate whether there were regional patterns in the expression of the cult that may have been linked to the unique characteristics of the mountain environment. It also aims to investigate the types of contacts that could have taken place in areas sacred to him, and the identity of their protagonists. The paper also considers the possibility that the cult’s spread and forms were also partly adapted to the specific challenges of mountainous life, offering new insights into how religious practices were interwoven with the local environment. By addressing the mountain environment’s influence on the cult of Hercules, this paper seeks to contribute to a more comprehensive understanding of the cultural and societal dynamics in these often-overlooked regions of the ancient Mediterranean. In doing so, it highlights the central role that mountain communities played in shaping both religious and social landscapes in pre-Roman Italy.

**2290. BEYOND FORTIFICATIONS: REVISITING LA MESA DE MIRANDA AND THE SHIFTING SETTLEMENT PATTERNS OF THE AMBLÉS VALLEY (ÁVILA, SPAIN)**

**Contribution format:** Oral  
**Contribution authors:** Carmen Ramírez Villadóniga (Terra Levis-MASAV)

The Iberian Peninsula’s orography is characterized by a high number of mountain systems relative to its total surface area. The resulting geographical isolation of these reliefs has fostered the development of numerous cultural variants with own entity and identity throughout Late Prehistory. At the same time, these cultural dynamics have been deeply influenced and shaped by successive migration waves from Europe since the first millennium BC. The research project led by Terra Levis-MASAV in the natural region of the Amblés Valley and the surrounding mountain ranges provides a diachronic perspective on the consolidation and evolution of settlement patterns from Prehistory onwards, with active local community participation as a central element in the shaping of this cultural landscape. The resumption of excavations at the Vetton oppidum of La Mesa de Miranda (II Iron Age) nearly twenty years later opens new avenues not only for the characterization of this type of hillfort settlements. Although this site has been known since the early 20th century, previous research has predominantly focused on its necropolis and defensive structures, to the detriment of habitation areas. As a result, our understanding of its internal layout, including its earliest occupation levels, remains significantly limited. This study aims to explore the abrupt shift in settlement strategies within the Amblés Valley and its highlands, particularly during

the transition from the Late Bronze Age to the Early Iron Age. This will be achieved through the analysis of the geographical, socioeconomic, and cultural factors that may have driven this process. The stratigraphic sequence and preliminary results from one of the test trenches excavated during the first campaign in 2024 suggest that the occupation of the hilltop may predate the Second Iron Age.

**1256. A PERIPHERY BETWEEN THE MOUNTAINS AND THE SEA? SOME REFLECTIONS ON SOUTHERN PHOCIS IN LH IIIB**

**Contribution format:** Oral  
**Contribution authors:** Stefano Ruzza (National and Kapodistrian University of Athens | La Sapienza, University of Rome)

This paper aims to explore how the inhabitants of southern Phocis adapted to the unique characteristics of their environment and how they interacted with the Boeotian palatial societies during the period in LH IIIB (1300-1200 BC circa). Southern Phocis, a mountainous peninsula, can be divided into two areas based on its geography: a western and an eastern section. Both regions featured mountains and the sea as key landscape gateways, intersecting the route that connected Central Greece to the Gulf of Corinth. Within this framework, it is possible to see two main routes. The western route, centered around the sites of Krisa and Gla, appears to have been entirely independent of any palatial authority and forming at the same time a small system. On the other hand, the eastern route, focused on Medeon, may have been more directly engaged with Boeotian authorities, although Medeon itself might not have been directly subordinated to any palatial center.

**1876. ROADS TO NOWHERE, ROADS TO THE WORLD**

**Contribution format:** Oral  
**Contribution authors:** Jelena Celebic (Koc University)

In this paper I discuss “minor” or “marginal” roads of the hinterland of the Bay of Kotor, their longevity, and role in connecting rural production centers to the coast and its market. The data set is composed by the data from the archives of Kotor and Zadar-- documents related to traded goods, and maps representing roads primarily from the early 19th century. Braudel argued that whole Mediterranean consists of movement in space and that maritime and terrestrial routes are the channels of that movement. When it comes to terrestrial roads, he underlined the importance of animals, in particular mules, horses, and “mule paths”. Analogies based on information drawn from archival data and living societies provide plausible comparative data. Ancient writers such as Varro wrote that Illyrians were keen pastoralists, while Pliny the Elder mentioned goods produced in the province of Dalmatia including animal wool, timber, metals, and cheese. These goods are also mentioned in the archival documents from Early modern period and represent typical products of the rural economy: products of the hinterland of the Bay of Kotor. With this research I am also questioning whether we can hypothesize that the pre-industrial economy of the Bay of Kotor and its hinterland, and the economy in early Roman imperial period were similar. Maritime trade and all the other activities that took place in the Bay of Kotor would have been impossible without these “marginal” mule paths. In spite of the existence of numerous data, texts and maps, the direct study of pre-modern roads is difficult due to mountainous terrain. For this reason, as a preliminary approach I apply the method of the least cost analysis using GIS. Establishing the connections between the harbor of Kotor and villages in its hinterland brings to light new data regarding these routes through time.

**197 TEXTILE TOOLS MADE OF HARD ORGANIC MATERIALS: NEW PERSPECTIVES ON TEXTILE PRODUCTION IN EUROPEAN PROTOHISTORY AND ROMAN PERIOD**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** hard organic materials, textile tools, protohistory, Roman period  
**Session organisers:** Vanessa Baratella (University of Padua | University of Ljubljana) – Ricardo Basso Rial (University of Granada) – Margarita Gleba (University of Padua)

**SESSION ABSTRACT**

In the context of European protohistory and Roman period, artifacts related to textile production played a role of absolute relevance in the self-representation codes and in defining social identity. The economic-productive, social, and symbolic value that spinning and weaving activities assumed in protohistory and Roman period have been, particularly in recent decades, the subject of numerous interdisciplinary studies. Among the various indicators belonging to this category, alongside the substantial productions of ceramic spindle whorls and loom weights, there appears a particular class of textile tools – spindle whorls, rods, weaving combs, tablets etc. – made

of Hard Organic Materials (wood, bone, ivory, horn, antler, shell, amber). In productive and technological terms, the introduction of this category of artifacts into the textile landscape can be linked to the need for tools with specific characteristics and performance, perhaps for the creation of particular yarns; from a symbolic perspective, these objects can be recognized as high-quality productions of significant prestige and value. In order to understand the destination and use of these tools, the production processes and the chaîne opératoire related to their use, this session aims to promote the large-scale observation of this phenomenon across European protohistory and the Roman period using interdisciplinary approaches. These range from the typological-morphological study of artifacts - employing both traditional methodologies and Digital Archaeology techniques - to preservation factors, archaeozoological and paleoproteomic characterization of raw materials, and extend to use-wear analyses and experimental archaeology.

CONTRIBUTION ABSTRACTS

50. WEAVING WEAPONS. ORGANIC SCABBARD REMNANTS ON WEAVING SWORDS FROM LATE ROMAN AND EARLY MIGRATION PERIOD NORTHERN EUROPE

**Contribution format:** Oral  
**Contribution authors:** Georgia Gould (Scandinavian Studies Department, University College London)

Weaving swords have been a staple tool used in conjunction with looms as long as the textile technology has been available. These swords have been made in a variety of materials, such as wood, bone and metal. During the Late Roman and Early Migration Period, metal weaving swords with an elongated tip start to be buried with women in Northern Europe. When excavated, usually only the blade remains, but the weaving swords most likely had organic handles of wood and bone. However, less scholarly attention has been paid to the metal weaving swords which appear to have remnants of textile, wood and leather surrounding the blade itself, for example, in female burials from Erga farm, Rogaland and Sande, Agder in Norway. This paper argues that these remnants of organic materials on the blade indicate a scabbard or sheath for the weaving sword, in a similar manner to those used on weapons. This theory can be reinforced with an analysis of the position of the weaving swords in female burials as well as the comparison of organic remnants on weapons from burial contexts. If weaving swords with scabbards were wearable accessories in a similar manner to fighting swords, then it is necessary to discuss the symbolism and status of weaving in Late Roman and Early Migration Period Northern European societies. Using archaeological evidence alongside anthropological methodologies such as Object Biography, Actor-Network-Theory and experimental archaeology, this paper will provide a new interpretation of wearable weaving tools in Northern Europe.

271. BEYOND CLAY: INTERPRETING IRON AGE BONE AND WOODEN TOOLS FROM TWO SITES ALONG THE SAVA RIVER

**Contribution format:** Oral  
**Contribution authors:** Janja Mavrovic Mokos – Julia Katarina Fileš Kramberger (University of Zagreb, Faculty of Humanities and Social Sciences)

Textile production tools made of clay are the most abundant in Iron age Croatia and Bosnia and Herzegovina. However, several newly discovered and analysed wooden and bone artifacts from two sites along the Sava river give insights into another technological – and possibly symbolic – aspect of textile production. At Donja Dolina in northern Bosnia, a small percentage of wooden and bone spindle whorls have been documented in an entire whorl assemblage counting just under 2000 objects. Due to lack of find context information, their interpretation as spindle whorls is intriguing, especially the wooden ones, as no traces of spindle shafts were recorded. Nevertheless, their overall appearance and hole diameter resembles the more common, clay spindle whorls, which suggests a complimentary use of spinning tools made of alternative, organic materials that are unfortunately rarely documented at this site. Upstream the Sava river, at the site of Sveti Križ in northern Croatia, clay textile production tools are the norm. Nevertheless, in recent excavations, a specific, perforated bone tool was found. The tool in question is a finely made and decorated narrow bone object, 4.5 cm in length (with a reconstructed length of possibly about 6 cm). This object features five small perforations visible on the side, which might imply its use as a textile production tool. Based on similar finds from Italy, it might have been used as a warp spacer during loom weaving or tablet-weaving. Interestingly, this artifact was found in an area interpreted as a ritual object due to its stratigraphic structure and the eclectic nature of fine objects found inside. Such context suggests that this find, and textile craft in general, may have had an additional symbolic significance which is not uncommon during the Iron age.

476. TEXTILE TOOLS FROM OLBIA PONTICA: TECHNOLOGICAL AND SOCIAL ASPECTS

**Contribution format:** Oral  
**Contribution authors:** Alisa Semenova (The Institute of Archaeology of the National Academy of Science of Ukraine)

The manufacturing textiles was an important part of economy of Hellenic city-states in Northern Black Sea region; however, the study of this craft has not received much attention from scholars. This is due to the status of the “minor objects” for most tools related to textile production, and limited interest in the so-called “female domain”. The high demand and interest in some specific fabrics contributed to the development of textile production as a specialized manufacturing, which, however, did not replace domestic craft. From written sources, we know that at least 1st century AD, fabric was imported to Olbia. However, numerous findings of tools for textile production indicate local manufacturing, likely within the domestic craft. Wood is rarely preserved in Olbia, and as far as I know, no wooden artifacts related to textile processing have been found so far. This makes bone counterparts of wooden tools, which were presumably the majority, particularly valuable for studying this sector of the economy. Artifacts made of bone and antler from different stages of textile production have been found in Olbia and in settlements within its influence. These include combs for raw material preparation, distaffs, spindles and spindle whorls for spinning, pin beaters for weaving, needles for finishing the final product, and some other tools whose function remains a subject of discussion. In Ancient Greek and Roman society, women were mainly responsible for making clothes for their families. Because of this spinning tool were also tried to women’s roles in society, which is why they are often found in female graves. Tools made from more expensive materials probably indicated the high status of their owners. A thorough analysis of all materials related to this topic helps us better understand not only the technical aspects of textile production but also the social importance of certain artifacts.

608. HARD ANIMAL MATERIALS SPINDLE WHORLS FROM FINAL BRONZE AGE SITE OF FRATTESINA (ITALY): TYPOLOGY AND RECONSTRUCTION OF THE CHAÎNE OPÉRATOIRE

**Contribution format:** Oral  
**Contribution authors:** Vanessa Baratella (University of Padua | University of Ljubljana)

In the context of Italian protohistory, artifacts related to textile production have played a role of absolute relevance in the self-representation codes of the female figure and her social persona. Among the various indicators belonging to this category, a particular class of spindle whorls stands out - absent in previous eras - made of animal hard materials and characterized by a decoration of dice eyes and grooves that directly recalls solar iconography. These artifacts, particularly widespread in the Po Valley and Veneto area, have an immediate development - especially in quantitative terms - in the Final Bronze Age 1-2, persisting until the Early Iron Age 1, and then no longer being attested in subsequent phases. The most significant sample of this category comes from the Late Bronze Age central place of Frattesina (Veneto, Italy), a site where several workshops for high-value productions, as amber, ivory, glass and bronze, are recognized. The function of this class of spindle whorls has not yet been investigated in both historical and productive and technological terms: this work therefore aims to analyze the artifacts from Frattesina from a typological point of view and to reconstruct their chaîne opératoire in order to systematize the data and outline the production processes of this particular class of spindle whorls, perhaps intended for the production of particularly valuable yarns.

642. ZOOARCHAEOLOGICAL ANALYSIS OF DECORATED BONE SPINDLE WHORLS: INSIGHTS FROM THE PROTOHISTORIC SITE OF FRATTESINA DI FRATTA POLESINE (VENETO, NORTHERN ITALY)

**Contribution format:** Oral  
**Contribution authors:** Maria Sofia Manfrin – Umberto Tecchiati (University of Milan, Department of Cultural and Environmental Heritage)

Textile tools made of hard organic materials represent key indicators of protohistoric spinning and weaving activities. Among these, decorated bone spindle whorls provide valuable insights into the selection and use of animal skeletal materials in textile production. This paper presents a zooarchaeological study of a group of spindle whorls, recovered from the site of Frattesina di Fratta Polesine (Veneto, northern Italy), dated between the end of the Late Bronze Age and the beginning of the Iron Age. These artefacts come from the settlement area – where they were found through both excavation and survey activities – as well as from burials in one of the two cemeteries associated with the site. Through the identification of raw materials and the analysis of taphonomic traces, this research aims to reconstruct the selection criteria for skeletal elements and explore post-depositional processes affecting these artefacts. The study integrates traditional zooarchaeological methodologies with detailed microscopic observation to refine our understanding of material choices. By focusing on the faunal component of textile-related artefacts, this research contributes to a broader discussion on the selection and use of hard animal materials in protohistoric craftsmanship and their role within textile production processes.

950. NOT ALL WERE CLAY. PROTOHISTORIC BONE SPINDLE WHORLS IN THE IBERIAN PENINSULA

**Contribution format:** Oral  
**Contribution authors:** Ricardo Basso Rial (University of Granada) – Marta Blasco Martín (University of Valencia)

The spinning process, one of the main activities in textile production, is usually inferred in archaeological contexts thanks to the preservation of spindle whorls, mainly made of clay. However, at certain times and less frequently, other materials such as bone were also used. This is the case in the Iberian Peninsula, where this type of tool was present throughout the 1st millennium BCE. This paper analyses the bone spindle whorls found in the east-ern of the Iberian Peninsula during the Protohistory, from the Late Bronze Age to the end of the Iron Age. An exhaustive compilation of these artefacts is presented, detailing their morphological characteristics, manufac-turing techniques and contexts of finding, with the aim of evaluating their role in textile production during a period of deep social, economic and technological transformations. Most of the bone spindle whorls were made from sawn or cut femoral heads of *Bos taurus*, although there are exceptional cases, such as one specimen made from a remain of *Homo sapiens*. Furthermore, their use is not limited to the Protohistoric period but extends to later moments, such as the Roman times and even the medieval era. In short, this work focuses on the func-tionality of these artifacts within the spinning process, assessing their coexistence with clay spindle whorls in the same archaeological contexts and pointing out their probable use in the production of wool threads, a mate-rial that acquired greater relevance in this period due to the growing textile and livestock specialisation. It also examines the reasons for the selection of bone as a raw material and the implications of its distribution in rela-tion to changes in production and trade dynamics. In doing so, it reflects on the development of textile production throughout the first millennium BCE, drawing comparisons with other geographic areas of similar chronologies.

1625. AMBER DISTAFFS FROM POLAND – A SIGN OF STATUS OR A USEFUL TOOL?

**Contribution format:** Oral  
**Contribution authors:** Magdalena Przymorska-Sztuczka (Archaeological Museum in Biskupin)

On an occasional basis, in the graves inventory from 1st to 3rd century CE in Poland, objects interpreted as distaffs emerged. Approximately a dozen of these artefacts have been discovered so far. Some examples are partially preserved and were made from a wooden shaft connected by cylindrical bronze plates, with amber or glass beads or bronze discs at the ends. Other specimens were crafted from amber beads strung on a bronze rod. Due to their shape, these finds were often referred to in older Polish literature as sceptres, spindles or objects associated with worship, the use of cosmetics, and hairpins. Nowadays, however, these artefacts are identified as textile tools. The distaffs discovered in Poland are similar to objects found in regions of the Roman Empire. It is difficult to determine whether the objects discovered in the graves, especially those made entirely of amber elements, were used in the spinning process or whether they were only a reflection of the high status of the buried women. But one thing does not exclude the other. The experimental work proves that these items could have been used in the spinning process, and the amber material certainly did not limit their function.

558. WOODEN TEXTILE TOOLS FROM THE EARLY-MIDDLE BRONZE AGE SITE OF MOLINA DI LEDRO (TRENTO, ITALY)

**Contribution format:** Poster  
**Contribution authors:** Maria Elena Bertoli (School of Humanities, University of Glasgow)

Some of the earliest evidence of textile production in northern Italy comes from the Bronze Age (c. 2200-1600 BCE) pile dwelling sites. The pile dwellings have produced some of the most important archaeological evidence of textile and fibre production and use during European prehistory since their waterlogged conditions preserve organic matter, such as textiles, balls of yarn, cords, and baskets, and wooden tools. Among the pile dwellings, remarkable for the quality and quantity of excavated materials, is the site of Molina di Ledro (TN). During the excavation conducted by Raffaele Battaglia in 1937, almost 300 textile finds, more than 300 spindle whorls, and almost 200 loom weights were identified. Moreover, in the settlement, a large quantity of wooden artefacts, over one thousand, were excavated. Among these wooden artefacts, it is possible to recognise tools related to textile activities, such as flywheels, spindles, weaving swords, and wooden combs. Wooden textile tools complete the already complex picture of textile production tools made of non-perishable materials, such as clay. Wooden textile tools are crucial for our understanding of the volume and complexity of textile production carried out on the settlement. The wooden textile tools from Molina di Ledro will be compared to other finds from the Early-Middle Bronze Age sites of Fiavè-Carera (Trento, Italy), Polada (Brescia, Italy) and Barche di Solferino (Mantua, Italy).

2235. LATE ROMAN CIVILIAN TEXTILE PRODUCTION IN MILITARY CAMPS IN DACIA RIPENSIS

**Contribution format:** Poster  
**Contribution authors:** Gordana Jeremic – Selena Vitezovic (Institute of Archaeology Belgrade)

Textile production was a significant activity of Late Antique society. It was organised from family crafts to impe-rial court production for different social classes, especially for the army. The invention of the horizontal loom in Late Antiquity contributed to the improvement of the weaving process. Findings of wooden looms in the Balkan Danube provinces have not been registered so far. However, finds of cylindrical bone objects made of deer antlers, with hollow insides and an added rectangular plate, have been interpreted by recent interdisciplinary research as heddle holders. In Late Antiquity, the province of Dacia Ripensis on the soil of the present-day Republic of Serbia represents hilly areas rich in forests and the natural habitat of the red deer. Antlers were an available and frequently used raw material for the production of various objects (combs, parts of weapons, furniture, or elements of looms). Archaeological research in the interior of auxiliary forts from the period of Late Antiquity (the last third of the 4th and the first half of the 5th century) has yielded a wealth of data on life on the Roman border. Based on the findings, it is possible to reconstruct numerous activities of their inhabitants, not only mili-tary in character. Activities included small-scale pottery, glass, bone production, metalwork, and more. Based on the topography of finds related to textile production, we will try to determine their frequency in military forts and raise the question of whether there were specialised workshops for the purpose of making heddle holders or whether they simply loom finds in the forts on the Danube Limes.

198 YOU CAN CHANGE FRIENDS BUT NOT NEIGHBOURS. INTRA-COMMUNITY DYNAMICS AND LOCAL IDENTITIES IN MEDIEVAL EUROPE (5TH–15TH CENTURIES)

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Medieval Europe, Archaeology of power, Every-day life, Intra-community relations, Landscape archaeology, Local identities  
**Session organisers:** Mario Pereiro Fernández (Universidade do Minho) – Leonor Baeza Gomariz – Laura Blanco Torrejón (Universidad de Salamanca) – David Sánchez Serrano (Universidad Rey Juan Carlos)

SESSION ABSTRACT

This session examines the socio-economic dynamics within communities in Medieval Europe (5th–15th centuries) and their role in shaping local and supra-local identities. The primary focus will be on archaeological evidence, while also integrating insights from related fields such as anthropology, epigraphy, history, and palaeography. This interdisciplinary approach will facilitate a nuanced understanding of this complex reality. We seek to explore how social interactions, daily practices, and responses to crises influenced identity formation and community cohesion. Specific areas of interest include the role of power dynamics among various social agents (e.g., fortifi-cations, religious edifices), economic interconnections (e.g., material production, trade), the delineation of the medieval landscape, and gender relations. While traditionally addressed through Political History, these themes are now central to Social and Economic History, yet remain underexplored in archaeological research. Papers are invited that investigate these processes at a sublocal level, emphasizing how internal community relations and external influences shaped identity and resilience. Our goal is to unravel the mechanisms of coexistence, conflict, and transformation within communities, contributing to a deeper understanding of medieval Europe’s social fabric from a ground-up perspective.

CONTRIBUTION ABSTRACTS

234. DOCUMENT ARCHAEOLOGY: LOCAL WRITING PRACTICES IN THE CENTRAL-WEST IBERIAN PENINSULA (5TH–8TH CENTURIES)

**Contribution format:** Oral  
**Contribution authors:** David Sánchez Serrano (Universidad Rey Juan Carlos)

The “Visigothic” slates constitute a unique corpus of documents, accounts, and historical graffiti inscribed on slate, found within early medieval rural contexts in the central-western Iberian Peninsula. As archaeological artefacts, they should be examined through the lens of material culture studies (MARTÍN VISO, 2013), as they provide critical evidence of information production and transmission processes (VIDALE, 1992). This corpus offers unparalleled insight into the everyday realities of local societies, shedding light on their daily practices, social actors, and socio-economic structures. The use and control of writing technology by local elites (GOODY, 1986) not only underscore the significance of literacy in these communities but also reveal a tangible connection with political centers, particularly from the seventh century onwards. This study investigates the dynamics of interaction and conflict within these rural communities, using the Visigothic slates as a primary source alongside

their archaeological context. It explores how inter-community relationships shaped regional social and economic structures and examines the mechanisms through which social conflict arose and was resolved. Particular attention is given to the role of local elites in mediating disputes and consolidating power through the strategic control of writing practices.

**899. MY NEIGHBOUR’S BOUNDARIES: RECONSTRUCTING PEASANT LANDSCAPES IN MEDIEVAL LIÉBANA (CANTABRIA, SPAIN), 9TH-11TH CENTURIES**

**Contribution format:** Oral  
**Contribution authors:** Leonor Baeza Gomariz (Universidad de Salamanca)

The aim of this paper is to study the spatial organization established by different social agents in the Liébana region (Cantabria, Spain) between the 9th and 11th centuries, through the study of its landscape. For a historian, landscape refers especially to the way in which individuals understand, conceive and symbolize a physical space, being this space the basis for all social interactions. Thus, it is a historical document with deep cultural meaning, associated with the symbolic construction of a scenario in which individual and collective identities play out. The landscape acquires, therefore, a biographical character that recalls the traces of past activity and events. All places and landscapes are, as a consequence, part of the social and individual temporality of memory (Tilley, 1994: 27; 2010: 37; Martín Viso, 2016: 10-11; Tosco, 2020:82). The aim of this paper is to insert the local communities in their landscape, by means of a double approach. First, through the analysis of the spatial dynamics of the peasant communities documented for this period. Second, through the phenomenological study of the landscape based on the information preserved in the boundary clauses preserved in the Early Medieval documentation of the monasteries of Santa María de Piasca and Santo Toribio de Liébana. These clauses are important potential sources for studying the organization and perception of space by the actors involved its management and use. This analysis allows for the reconstruction of the traces of everyday activity to a degree that the material record is not always able to show.

**86. REVISITING PERIPHERAL IDENTITIES: AN INTERPRETATIVE AND METHODOLOGICAL CHALLENGE TO TRADITIONAL NARRATIVES**

**Contribution format:** Oral  
**Contribution authors:** Sonia Medina Gordo (Universitat de Barcelona | Centre d’Estudis Martorellencs)

The study of medieval societies often relies on interpretative frameworks shaped by socio-economic models that later emerged as dominant. While these approaches provide valuable insights, they risk imposing predominant narratives on past societies, marginalising alternative configurations of community identity and cohesion. This issue is particularly evident in regions characterised as peripheral, where archaeological interpretations frequently infer economic and social structures based on modern landscape perceptions or prevailing historiographical paradigms. This paper offers a critical reassessment of these frameworks through a case study in the Sierra de la Demanda (Spain), a region where the scarcity of written evidence and ongoing interpretative debates regarding its archaeological materiality have hindered a revision of the narrative surrounding its early medieval past. This research re-examines the sources of information using a methodological approach that emphasises local and contextual dynamics. It critically examines the heuristic frameworks often applied to peripheral regions, challenging traditional assumptions about mountain economies, spatial characterisation, and identity formation. In this sense, the approach transcends retrospective analyses to address elusive scenarios in both the written and archaeological evidence using a digital perspective. Through a process of deconstruction, the study not only reconfigures the narrative of a specific region but also demonstrates the potential of the “decolonial thought” to challenge established imaginaries for medieval society in empirically problematic spaces. By emphasising the interplay between sources and interpretative frameworks, this contribution offers alternative pathways to understanding the socio-economic dynamics of early medieval communities.

**1981. LIVE LIKE A SUEBIAN... DIE LIKE A SUEBIAN? (NOT-SO) GERMANIC IDENTITIES IN THE FUNERARY REMAINS OF NORTHWESTERN HISPANIA (5-6TH AD)**

**Contribution format:** Oral  
**Contribution authors:** Laura Blanco Torrejón (University of Salamanca) – Patricia Valle-Abad (GEAAT - University of Vigo)

The material evidence found in funeral contexts has been used throughout History as one of the main tools to attribute a community to a cultural complex. Still, it has also been linked to a specific social/ethnic group. One of the primary debates within this approach was whether specific late-antique graves belonged to a particular Germanic group based on the typology of the graves, their grave goods and/or the iconographic motifs on their tombs. In this paper, we aim to review these traditional interpretations, focusing on the Suebian population in Hispania and their archaeological remains. We consider their integration within the broader context of the

political and religious dynamics of the time. At the outset of the 5th century, the Iberian Peninsula witnessed the arrival of various Germanic groups, among which the Suebi were particularly notable, establishing themselves predominantly in the northwest region of the peninsula. The archaeological remains from the 5th-6th centuries that have survived to the present day are not particularly extensive, mainly due to the lack of a more detailed study of this period. However, quantitatively, we do have a considerable number of funerary remains. Traditionally, the funerary spaces of these two centuries have been defined as “Suebian necropolises,” a term interpreted not only in its political dimension but also as a break in funerary rites and material culture. An example of this is the so-called laudas de estola, traditionally associated with Christian Suebian individuals’ graves, as this decorative motif is linked with the figure of a praying person. In 2010, authors such as J. López Quiroga pointed out the few differences between the Suebian material culture and earlier periods. And yet the association of a Germanic identity with certain social elements like grave goods is still open to debate.

**1748. TRACING THE ‘MUDAJJAN’: MEDIEVAL ISLAMIC MINORITY ORIGINS AND EVOLUTION THROUGH OSTEOLOGICAL, ISOTOPIC, RADIOCARBON, AND ADNA STUDIES IN TUDELA (SPAIN)**

**Contribution format:** Oral  
**Contribution authors:** Patxi Ramallo (Vrije Universiteit Brussel (VUB) | Max Planck Insitute of Geoanthropology, Jena) – Rodrigo Barquera (Max Planck Institute for Evolutionary Anthropology, Leipzig) – Oscar Sola Torres (—) – Maitane Tirapu De Goñi (Aditu Arkeologia) – Jesús Sesma Sesma – Jesús García Gazólaz (Dirección General de Cultura-Institución Príncipe de Viana) – Bart Lambert – Christophe Snoeck (Vrije Universiteit Brussel (VUB)) – Johannes Krause (Max Planck Institute for Evolutionary Anthropology, Leipzig) – Patrick Roberts (Max Planck Insitute of Geoanthropology, Jena)

Between 2019 and 2021, more than 300 tombs associated with the Mudéjar or Islamic community that lived under the rule of medieval Christian kingdoms on the Iberian Peninsula were discovered at Torre Monreal in Tudela (Navarre, Spain). This Maqbara (Islamic cemetery) represents the largest ever discovered within the territory of the medieval kingdom of Navarre (9th-16th centuries) and is one of the largest ever found in Spain. Our study presents the initial results of a comprehensive, multidisciplinary investigation that integrates osteological analysis, stable isotope data, radiocarbon dating, and ancient DNA (aDNA) research. By combining these methods, we have been able to establish biological profiles, assess health conditions, investigate aspects of genetic origins, and explored dietary changes over time, examining potential differences related to social status, gender, age, and comparing them to their Christian neighbors. All of this is contextualized through burial data (e.g., grave goods and burial types). This dataset enables us to trace transformations within the Mudéjar population during key historical events, including the Christian conquests of Tudela by the kingdoms of Aragon and Navarre in the early 12th century, their development as a minority between the 13th and 14th centuries, and their eventual disappearance by the early 16th century amid political, economic, and social upheavals.

**290. RELIGIOUS MINORITIES AND ZOOARCHAEOLOGY: HOW KOSHER FOSTERED IDENTITY IN MEDIEVAL JEWISH COMMUNITIES. SOME THOUGHTS ON IBERIAN RECORDS**

**Contribution format:** Oral  
**Contribution authors:** Ana Medina Cuesta – Marcos García García (University of Granada)

This paper examines the role of zooarchaeology in understanding Jewish communities of the Medieval Iberian Peninsula through dietary practices. It specifically investigates how kosher laws profoundly influenced social and cultural aspects of life at the time, as reflected in (but not only) archaeological animal remains. The analysis of animal bone assemblages from Jewish sites, with particular attention to the presence of species compliant with Jewish dietary laws—such as the prohibition against pork or rabbit— and the requirement for ritual slaughter and meat purging, illuminates the complex relationship between religious observance and daily life performance within medieval Jewish communities. Insights into these practices reveal the configuration of communal identity and the reinforcement of boundaries between Jews itself and their Christian and Muslim neighbours, encompassing factors such as kosher animal supply, the maintenance of appropriate slaughter and butchery practices, and even the experience of those individuals (mostly women) involved in daily cooking. Urban and frontier Jewish contexts will be used to support comparative analysis of dietary patterns across different regions of the Iberian Peninsula, highlighting zooarchaeological findings that emphasize the varying importance of maintaining religious activities. Ultimately, this work provides a window into the daily lives of Jewish populations who navigated complex interactions within a multi-faith society. In doing so, it contributes to a broader understanding of the intersection between food, identity, gender, territory and religion in medieval Iberia, laying a foundation with implications for the study of religious minorities in other historical contexts.

1616. LIVING IN A COMPLICATED NEIGHBORHOOD: STRONGHOLDS AND COMMUNITIES IN EARLY MEDIEVAL GALLECIA

Contribution format: Oral  
Contribution authors: Mario Pereiro Fernández (Universidade do Minho | Universidade de Santiago de Compostela)

The study of early medieval fortifications in Gallecia (actual Galiza) provides valuable insights into territorial control and its socio-political evolution throughout the period. In recent years, research in this field has deepened, highlighting the proliferation of these structures in the northwest of the Iberian Peninsula from the ninth century onwards, particularly in relation to elites and strategic defense points. Initially conceived for the domination and protection of specific areas, these constructions eventually became integrated into the administration of the landscape and the process of state formation. However, not all known fortifications conform to this framework. Some sites appear to diverge from these power dynamics, offering a unique opportunity to explore communities that operated outside the dominant structures. In times of political turmoil, these communities seem to have chosen fortification as a solution, either in the form of permanent settlements or as temporary defenses used during moments of pressure. The archaeological study of these settlements provides a deeper understanding of early medieval Galician society, particularly those groups whose historical presence was either forgotten or deliberately erased by prevailing powers.

813. NEIGHBOURS AND NETWORKS: CONNECTIONS BETWEEN TOWER HOUSES IN MEDIEVAL IRELAND

Contribution format: Oral  
Contribution authors: Sarah Kerr (University College Cork)

This paper introduces a series of tower houses built by the O’Driscoll clan in late medieval West Cork (Ireland). It uses archaeological, architectural, landscape and spatial evidence to argue that, rather than acting as discrete and self-sufficient settlements, the tower houses worked together as a network to aid the control of Ireland’s south-west coast. Two issues have limited our understanding of tower houses. Firstly, there are vast numbers (>3000) extant across the Irish landscape, with West Cork one of the most densely castellated areas. The extensive archaeological record has encouraged the typification of tower houses and resulted in various ‘types’ based on regional architectural differences. Secondly, tower houses are a variety of small castle. This categorisation has led to assumptions pertaining to the function and use of the tower house, such as being independent and defensive settlements. This paper argues that the tower houses discussed, previously described as the ‘West Cork type’, were not homogenous - rather each was unique. The distinctions are discussed to reveal that each tower house supported different daily practices and interactions. The network as a whole is investigated to demonstrate how each tower house had a distinct socio-economic function in the clan’s control and the maritime culture of the area. It will be set out that one example appears to have been the central node in the network with a serious of close neighbours performing subsidiary roles. It will be explained that only through the creation of intra-community dynamics could the clan control and manage the coastline. This allows a reconceptualization of the late medieval tower house and a deeper understanding of late medieval society.

793. INTRA-COMMUNITY DYNAMICS IN BRAGA BETWEEN THE 5TH AND 15TH CENTURIES: THE RELATIONSHIP BETWEEN THE CITY AND ITS HINTERLAND

Contribution format: Oral  
Contribution authors: Francisco Andrade (UAUM, Lab2PT, UMinho, IN2PAST) – Manuela Martins – Rebeca Blanco-Rotea (Lab2PT, UMinho, IN2PAST) – Maria Do Carmo Ribeiro (UAUM, Lab2PT, UMinho, IN2PAST)

The landscape of Bracara in Late Antiquity has as its main landscape reference the inevitable influence of the city on the entire surrounding region, where the villae, which brought together rural communities, were established as the main landscape references. With the establishment first of the Suevic kingdom, and later of the Visigoth kingdom, a new process of definition of the population centres began, which were now organised around Christian markers in the landscape (monasteries), and which materialised the process of conversion of the populations, promoted by figures such as Martin of Dume or Fructuosus of Braga. Many of them Christianised areas such as the villae and generated new communities that would be crucial in the formation of the Christian kingdoms of the northwest of the Iberian Peninsula. This was a logical consequence of the invasion by Muslim forces, which led to political destabilisation and population disorganisation. The local entities that remained in the region after the invasion seem to have favoured a structure based on higher and easily defendable sites. Its integration into the Asturian-Leonese kingdom provided the necessary border stabilisation for a full occupation of the territory of Braga, establishing new settlement patterns and reorganising the productive fabric and the basis of the natural relations of circulation between the city and the countryside, inherited from Roman times. However, urban life did not experience a re-establishment of the conditions of late antique times. The medieval communities in

Braga were guided by local and supra-local power relations, which were often conflicting, and the several steps of the asserting of the authority of the archbishop of Braga, based in the city, as the main holder of power over the surrounding communities of Braga that were under the archbishopric dependency.

575. MARGINAL YET MEANINGFUL: KERNAVĖ’S HISTORICAL TRANSFORMATION

Contribution format: Oral  
Contribution authors: Mindaugas Pilkauskas – Dovilė Baltramiejūnaitė (State Cultural Reserve of Kernavė)

Kernavė – a UNESCO-protected archaeological site of significant historical importance in Lithuania. Archaeological research at Kernavė has been conducted with a degree of consistency, primarily focusing on the earliest phases of habitation and the town’s medieval period of prosperity. This emphasis reflects broader trends in archaeology, where prehistoric and early historic periods often attract greater attention. In the context of Lithuania, the 13th–14th centuries were a formative era, during which Kernavė functioned as the earliest and one of the significant political, administrative, and cultural centers of the Grand Duchy of Lithuania. However, the attack and destruction of Kernavė by the Teutonic Order in 1390 marked the end of this period of prominence. In the aftermath, Kernavė was overshadowed by other emerging centers within the Grand Duchy and underwent significant transformation. It lost its political and administrative importance and was reorganized into a modest settlement resembling a small town. These limitations have contributed to a gap in the understanding of Kernavė’s post-medieval development. In 2023, the discovery of a 15th-century homestead complex, accompanied by accurately datable archaeological material, provided a crucial opportunity to examine the structural and spatial transformations of the settlement during this period. A synthesis of this new evidence with the findings from over four decades of archaeological investigations revealed notable changes in settlement organization. Socio-economic and institutional factors—including the establishment of a new church, which held land ownership rights, a state manor, and the development of a local town—were identified as key drivers of these spatial transformations. The case of Kernavė underscores the necessity of integrating previously overlooked material evidence to reconstruct the histories of communities that, although politically marginalized, demonstrated resilience and adaptation. This approach contributes to a broader understanding of settlement dynamics and socio-economic processes in the post-medieval context.

199 BENEFITTING PEOPLE AND PLACES: TOWARDS A ‘BEST PRACTICE’ MANIFESTO AND GUIDELINES SUPPORTING ARCHAEOLOGY AND ARCHAEOLOGISTS ASPIRING TO BENEFIT WIDER SOCIETY

Session theme: 6. Intertwining archaeology, heritage, and museums  
Session format: Workshop  
Session keywords: Public benefit, Public archaeology, Societal value, Heritage, Guidelines  
Session organisers: Carenza Lewis (University of Lincoln) – Fedir Androshchuk (Swedish History Museum) – Francesco Ripanti (Trinity College Dublin) – Christoph Rummel (Römisch-Germanische Kommission des Deutschen Archäologischen Instituts) – Almut Schulke (University of Oslo)  
Session speakers: Katharina Moeller (Chartered Institute for Field Archaeologists)

SESSION ABSTRACT

Archaeology has immense capacity to benefit wider society, and ensuring this capacity is both realised and recognised is important for the future of people, places and archaeology itself. This statement is self-evident and uncontroversial to most archaeologists, but many outside the sector are either unfamiliar with this wider social value of archaeology, or sceptical about it. To resolve this, we need to nurture good practice that will generate robust evidence and compelling stories to encourage policymakers, funders and practitioners to support policies and programmes that enable archaeology to benefit wider society. This is a key aim of the EAA Public Benefits of Archaeology Advisory Committee (PBAC). This workshop is organised by the PBAC to present, review and discuss emerging ideas about the principles and practices that inspire, constitute and characterise ‘best practice’ in publicly beneficial archaeology. These are being elicited in consultations throughout 2024-25 with a wide network of EAA ‘champions’ who are committed to achieving, disseminating, extending and promoting the benefits of archaeology to wider society. The aim is to develop a formal EAA ‘Public Benefits of Archaeology: Manifesto and Guidelines for best practice’ that will support, promote and propagate best practice across Europe and beyond. The 2025 workshop will begin with a review of the insights from the EAA consultations and a presentation of the draft Public Benefits Manifesto and Guidelines, which is being developed based on those consultations and EAA sessions exploring related material. The floor will then be open to workshop attendees to offer their thoughts, comments and suggestions. The aim will be that these inputs will enable the draft Manifesto to be developed in

Autumn 2025 into a final document able to inspire, guide and inform anyone interested in delivering, reporting, or finding out about the public benefits of archaeology, across Europe and beyond.

200 HUMAN-ANIMAL RELATIONSHIPS IN A CONNECTED NORTH ATLANTIC, AD 500-1500

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Discussion session  
Session keywords: Human-animal relationships, North Atlantic, Animal Studies  
Session organisers: Helene Benkert (University of Iceland | University of Sheffield) – Grace Cesario – Kristin Robberstad Møller-Nilsen (University of Iceland) – Monica Nordanger Enehaug – Thomas Royle (Norwegian University of Science and Technology)

SESSION ABSTRACT

This session aims to explore the interconnectedness of the North Atlantic regions during the period AD 500-1500 through the lens of human-animal relationships. This period of growing globalisation and expanding connections transformed daily life and impacted human-animal relationships in a variety of ways. Seafaring, despite its challenges, turned the ocean into a connector rather than a divider, allowing for the exchange of people, goods, and knowledge as well as the spread of religion, technology, and culture. In turn, these exchanges had profound effects on the reciprocal relationships between humans and animals in their roles as food sources, companions, work animals, and more. Through a multidisciplinary lens, this session seeks to understand the changing dynamics of animals in human society, ranging from their immediate role in daily life to their more indirect impact via the environment. Using human-animal relationships as a focal point, this session will highlight how the North Atlantic connected people and regions and brought about economic and social change.

CONTRIBUTION ABSTRACTS

1998. EXPLORING CHANGING FISH USE IN NORTHEASTERN NORTH AMERICA THROUGH THE META-ANALYSIS OF ZOOARCHAEOLOGICAL DATASETS

Contribution format: Oral  
Contribution authors: Thomas Royle – Danny Buss (Norwegian University of Science and Technology) – Susan Andrews (IDBones) – Christian Gates St-Pierre (Université de Montréal) – Brad Hatch (Patawomeck Indian Tribe of Virginia) – Adam Heinrich (Monmouth University) – Gabriel Hrynicky (University of New Brunswick) – Helen Kristmanson (L’nuely) – David Landon (University of Massachusetts, Boston) – James Barrett (Norwegian University of Science and Technology)

A wealth of legacy zooarchaeological datasets containing information about the occurrence and abundance of fish taxa exist for Late Holocene sites in northeastern North America. The Eastern North American Synthesis is a ‘big data’ project (part of the wider European Research Council 4-OCEANS initiative) that seeks to compile these data into open-source databases and test socio-ecological hypotheses using data science methods. To date, the Eastern North American Synthesis database includes c. 200,000 identified fish bones from c. 600 assemblages across eighteen provinces, states, and territories in Canada and the United States. Through a series of case studies, this presentation will explore how this database can be used to explore regional-scale spatiotemporal variation in the taxonomic composition of fisheries in northeastern North America. These case studies will highlight how synthesizing fish bone records can provide novel insights about the effects of environmental change and human activities on varied fish taxa, including species currently listed as threatened or endangered. By shedding light on how past fish populations responded to climate change and exploitation, these data have the potential to provide insights into future trajectories of fish populations.

2225. FISH TRADE AND SETTLEMENT IN ARCTIC NORWAY

Contribution format: Oral  
Contribution authors: Monica Enehaug (NTNU University Museum - Norwegian University of Science and Technology) – Anja Niemi – Jørn Erik Henriksen (The University Museum, UiT - The Arctic University of Norway)

This paper presents preliminary result from an ongoing PhD project, exploring trade and trading routes to and from Trondheim. More specifically, fishbones from the following places: Trondheim, Andøya and Borgund. The

focus of this paper is the 2021 archaeological excavation that took place at Andenes on Andøya, located within the arctic circle of Northern Norway. The settlement itself can be traced back as far as to the Viking Age (800-1030CE), continuing into the Middle Ages and onwards. The settlement located here started out as a single farm, but later evolved into a fishing village. In the past, there has been several significant changes in Norway, both religious and economic. By using fish as a proxy, it is hoped that these changes will be possible to identify in the archaeological material, possibly providing clues to the development of this settlement. Special emphasis will be towards cod (Gadhus morhua), as it is a known Norwegian commodity in medieval international trade and the analysis of the fish bones is done through macroscopic species identification, assessment of element representation (head/body fragments) and size. This can contribute to trace commercial fishing activity, resource networks and network dynamics of the people who lived and worked at Andenes.

1115. FROM CETACEAN TO ARTEFACT: WHALE-BONE ANALYSIS FOR UNDERSTANDING EARLY COASTAL SETTLEMENTS IN ICELAND AND NORTHERN NORWAY

Contribution format: Oral  
Contribution authors: Valerio Punzi (University of Iceland | University of Oslo)

This project as part of my MA thesis explores cetacean exploitation in the early medieval coastal sites from the artefact perspective, by comparing Iceland and Norway. The choice to focus on these two regions is informed by recent literature highlighting links between Norway and the first Icelandic settlers in the 9th century CE. Laws, chronicles, and sagas provide us with a wealth of information on cetacean exploitation and whaling activities. Due to the late period of these written sources, their reliability is often questioned. Archaeology can help throw light on the subject. However, existing zooarchaeological investigations are inadequate, as they do not focus on the study of artifacts. For Iceland, we have only a series of archaeological reports or articles, in which objects are briefly recorded. In Northern Norway, comprehensive studies integrating recent investigations remain limited to Thorleif Sjøvold’s catalogue dating back to 1962 and 1974. Recent key contributions include Youri van den Hurk’s 2020 PhD research On the Hunt for Medieval Whales and Andreas Hennius’s 2023 work on Viking Age gaming pieces in Scandinavia, they provide a little overview on artefacts analysis. Online museum catalogues, such as sarpur (National museum of Iceland), or Unimusportalen (Norway) lack detailed documentation. My research will delve in the Viking Age and Medieval whalebone production and processing in Iceland and Northern Norway, trading and (and expansion of trade) in whale bone artefacts and insight into the impact on whales’ biodiversity and ecology in the Viking age and medieval North Atlantic settlements. By combining results from scientific analysis of assemblages (ZooMS, aDNA) and selected site reports, I will highlight the importance of whales in subsistence, trade, and social status, reflecting the communities’ organisation and adaptation to as well as the reliance on marine ecosystems in the arctic outlands and the earlier human-cetacean interactions.

1302. COMMENSAL RODENTS AND SETTLEMENT NETWORKS AROUND THE NORTH SEA AND NORTH ATLANTIC C.500-1500 CE

Contribution format: Oral  
Contribution authors: David Orton – Sarah Everett – George Ellison – Michelle Feider (University of York)

The dispersal of anthrodependent commensal rodents such as rats and mice is intrinsically linked to the emergence and evolution of human settlement networks. This paper explores those links in the context of the late Iron Age and medieval period around the North Sea and North Atlantic. First, we unpack the often vague associations between rats, mice, urbanism, and trade. Drawing on the foundational principles of island biogeography, we examine how changes in connectivity on the one hand, and in settlement characteristics such as size, density, and resource base on the other, are expected to interact to determine the dynamics of commensal rodent populations – and their visibility in the archaeological record. Next, we review the archaeological data for black rats, house mice, and other micromammals across the region, including new identifications and direct radiocarbon dates for some key finds. Several phases of expansion and consolidation are evident for each species, associated with developments in human demographics, settlement, and trade. We conclude by setting out key hypotheses for future research and considering the potential of formal population modelling, archaeogenetics, and geometric morphometrics on rodent remains to provide additional insights into Iron Age and medieval settlement ecologies.

2184. FASTING FROM MEAT IN THE EARLY MEDIEVAL IRISH SEA REGION: THE IMPACT OF THE ROMANO-BRITISH CHURCH

Contribution format: Oral  
Contribution authors: David Spiller (University of Reading | Truro and Penwith College)

Diet and fasting in the early Irish Church has seen considerable study, benefitting from a wealth of both documentary and archaeological evidence that is atypical of the place and period (Sexton, 2003; McCormick et al, 2014; Harney, 2016). Little attention, however, has been paid to the British derivation of fasting practices, demonstrated

through the transmission of the fasting restrictions attributed to Gildas in the penitential ascribed to Cummean. Placed in a context of a period in which people and ideas moved across the Irish Sea, transforming the region, this paper considers the Romano-British origin of Insular Church practices and the place of abstaining from meat in the context of early medieval British and Irish secular elite culture, drawing upon animal bone assemblages and the earliest Welsh and Irish secular poetic and prose texts. The relative liberality of Gildas’s penitent diet and its early Irish successors, excluding only meat and wine in all cases for the former and many cases for the latter, is noted, with the specific proscription on the consumption of animals explored. The paper argues that the tendency to identify abstinence from meat in the penitentials as ascetism (Follett, 2006) is overly simplistic. Monastic and elite secular sites on both sides of the Irish Sea are assessed in terms of animal bone assemblages. These sites are interpreted as centres of animal consumption, and fasting from meat is thus interrogated as exclusion from the norms of human-animal relationships. This contributes to perceiving how attitudes towards the consumption of animals spread across the Irish Sea region, and to understanding the early Cambro-Irish Church as a connected entity.

2228. SOCIAL (RE)STRUCTURING IN NORTHERN ICELAND – A ZOOARCHAEOLOGICAL PERSPECTIVE

**Contribution format:** Oral  
**Contribution authors:** Kristin Linnéa Møller-Nilsen (University of Iceland (HÍ)) – Ramona Harrison (University of Bergen (UiB))

This paper explores the social (re)structuring in and around the two neighbouring valleys Svarfaðardalur and Hörgádalur in the Eyjafjörður area in northern Iceland in the time period from initial Norse occupation through the Medieval period (c. 870-1500 AD). This time period is marked by several major events defining the era, none of which happened in isolation from the rest of the North Atlantic. Periods of immigration to the island, the religious conversion from Norse paganism to Catholicism around 1000 AD, and the waves of the Black Death in the 15th Century all left a mark on Icelandic society. Concurrently with this, or perhaps because of this, Icelandic society saw a shift from a seemingly egalitarian society from the initial settlement around 900 AD, to an increasingly stratified society by the end of the Middle Ages. By studying the zooarchaeological material from farm midden sites in the area, the goal is to identify changes in economic resource and subsistence use reflecting these adapting socioeconomic structures. This paper presents new results from analysis addressing these changes, comparing two different archaeological farm midden sites in Eyjafjörður: Staðartunga farm in Hörgádalur, and the church farm site of Miðgarðakirkja on Grímsey island. By comparing the data from the zooarchaeological analysis with historical data in Iceland and beyond, the purpose is to identify zooarchaeological markers reflecting factors acting upon society during this time and the role human-animal relationships have played in this. This study was undertaken as part of the project “Power, wealth and Plague in Two Valleys – Svarfaðardalur, Hörgádalur and their hinterlands ca. AD 870-1500” led by Árni Daníel Júlíusson (HÍ) and Ramona Harrison (UiB).

482. SVÍNASAGA: A STORY OF ICELANDIC PIGKEEPING FROM THE SETTLEMENT AND BEYOND

**Contribution format:** Oral  
**Contribution authors:** Grace Cesario (University of Iceland) – Kerry Sayle (SUERC)

Cattle and sheep are perhaps the most well-known of the Icelandic domesticates, but pigs were also brought over during the settlement of Iceland, yet they often receive less attention. However, it could be argued that pigs were more economically important than cattle and sheep in the very first decades of settlement. Due to their quick reproduction and omnivorous diet, pigs likely played a pivotal role in supplying the new settlers with sustenance while the other animal herds were allowed to grow. Along with other domesticates, pigs appear in the earliest zooarchaeological assemblages in Iceland. However, unlike cattle, sheep, and horses, pigs become uncommon around AD 1200, though they never seem to fully disappear. This paper will discuss the results of isotopic analysis of pig bones from settlement (AD 877) to AD 1500, in order to understand their diet. The pig remains come from sites across Iceland, of varying size and status. A survey of placenames relating to pigs, including the environmental conditions surrounding the named areas, will also be explored. Pulling these data sources together will tell the story of pigs—how they were fed and kept, what purpose they may have served, and how they made their mark on both the physical environment and social memory.

1679. DIETARY RESTRICTIONS THROUGH THE ZOOARCHAEOLOGICAL LENS - MONASTIC ICELAND AND BEYOND

**Contribution format:** Poster  
**Contribution authors:** Helene Benkert (University of Iceland | University of Sheffield) – Steinunn Kristjánsdóttir (University of Iceland)

Dietary restrictions based on societal or religious perceptions are not an uncommon phenomenon in human history. Horse meat, for example, was considered taboo in various times and cultures and was subject to a number

of papal bans throughout the Middle Ages. The Benedictine Rule prohibited the consumption of four-legged animals for all but the weak and sick. However, such restrictions and prohibitions often were adapted in favour of availability and practicality of food resources, as well as simple preferences for specific meats. This poster illustrates how religious dietary rules were observed in medieval Iceland, in particular at the monastic houses. Using zooarchaeological analysis, it highlights which animal products were consumed during the Middle Ages on the island, where resources were scarce, and how it conforms or contrasts with monasteries on the mainland. This study was undertaken as part of the project ‘Between Man and Nature – The Making of Benedictine Communities in Medieval Iceland’ led by Steinunn Kristjánsdóttir and James G. Clark.

201 BIOLOGICAL AND SOCIAL ASPECTS OF INFECTIOUS DISEASES IN THE COMMON ERA: FROM CASE STUDIES TO POPULATION-BASED STUDIES

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Infectious diseases , Common Era, pathogenic microorganisms, pandemics, epidemics  
**Session organisers:** Ksenija Djukic – Veda Mikasinovic (Center of Bone Biology, Faculty of Medicine, University of Belgrade) – Mario Novak (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb | Faculty of Humanities, University of Primorska) – Tamás Hajdu (Department of Biological Anthropology, Institute of Biology, Eötvös Loránd University)

SESSION ABSTRACT

Infectious diseases represent illnesses caused by harmful pathogenic microorganisms, such as bacteria, viruses, parasites or fungi. Today they are the second leading cause of death worldwide, however, in the pre-antibiotic era they were difficult to stop and, as such, they probably represented the greatest threat to human health. Often causing very high rates of morbidity and mortality, infectious diseases could be recognised as the crucial accelerators for some of the most catastrophic scenarios in human history. Although there is no doubt that morbidity and mortality are the most important consequences, infectious diseases often generated devastation of ancient communities at a social, economic and population level. By conducting a careful study of the causes, the traces they leave on the bones, the method by which they are spread and stopped, we are able to better understand not only the biological aspects but also the social consequences of the diseases. A better understanding of the spread and containment of infectious diseases in the past will not only clarify our understanding of ancient communities but it could also elucidate our perspective of using ancient disease knowledge as an emerging tool for infectious disease research even. The main goal of this session is to bring together researchers dealing with different aspects of infectious diseases in the past. We will aim to enhance our understanding based on previous research, as well as pave the way for fresh perspectives in the research of ancient infectious diseases. This interdisciplinary and multidisciplinary session will welcome case studies from across the globe as important parts of a broader puzzle, as well as population-based studies as tools for building a broader scientific consensus.

CONTRIBUTION ABSTRACTS

792. THE „SICK CEMETERY” OF AQUINCUM – BIOARCHAEOLOGICAL ANALYSIS OF PÓK – NÁNÁSI - VÁROSFAL STREET SITE (AD 3-4TH CENTURIES)

**Contribution format:** Oral  
**Contribution authors:** Krisztián Kiss (MTA-BTK Lendület Momentum Bioarchaeology Research Group | HUN-REN Research Centre for the Humanities, Institute of Archaeogenomics | Institute of Practical Methodology and Diagnostics, University of Miskolc | Department of Biological Anthropology, Eötvös Loránd University) – Anikó Kecskés (MTA-BTK Lendület Momentum Bioarchaeology Research Group | HUN-REN Research Centre for the Humanities, Institute of Archaeogenomics) – Orsolya Mateovics-László (MTA-BTK Lendület Momentum Bioarchaeology Research Group | Archäologischer Dienst GesmbH, St. Pölten) – Orsolya Láng (MTA-BTK Lendület Momentum Bioarchaeology Research Group | BHM Aquincum Museum and Archaeological Park) – Ibolyka Dudás – Ádám Békésy-Szabó (Medical Imaging Centre, Semmelweis University) – István Major (Isotoptech Ltd. | Institute for Nuclear Research) – Balázs Gusztáv Mende – Anna Szécsényi-Nagy (MTA-BTK Lendület Momentum Bioarchaeology Research Group | HUN-REN Research Centre for the Humanities, Institute of Archaeogenomics)

Aquincum, as the capital of the Roman province called Pannonia Inferior was inhabited by a mixed population of Romanized Celtic and Illyrian tribes, as well as by the immigrants of the Roman Empire itself. Today’s Budapest area has yielded several archaeological sites belonging to the military installations, military and civil towns, and also to the villa estates. The Pók-Nánási-Városfal street site is located Northeast of the Civil Town of Aquincum, not far from the settlement’s eastern cemetery called Gas Factory cemetery. Based on the peripheral position of the graves both to the Civil Town and the town’s eastern cemetery the results (dwarfism, signs of infections and hard physical work) of the former paleopathological analysis performed by Éva Tankó the cemetery acquired the nickname of „sick cemetery” not excluding the possibility that individuals who were marginalized by society were buried here. The cemetery was now re-analyzed based on new anthropological and paleopathological methodologies by the Lendület Momentum Bioarchaeology Research Group. Of the 33 examined individuals five showed skeletal signs of infections which we would like to present by a complex bioarchaeological approach including paleoradiological examinations. This research was supported by the Hungarian Academy of Sciences through the Momentum Bioarchaeology Research Group.

**1070. POSSIBLE CASES OF SALMONELLA ENTERICA INFECTION IN A LATE ANTIQUE RURAL POPULATION FROM BELI MANASTIR, CROATIA**

**Contribution format:** Oral  
**Contribution authors:** Mario Novak (Institute for Anthropological Research, University of Primorska) – Mario Carić (Institute for Anthropological Research) – Kennet. Tremblay (University of Central Florida) – Tomislav Hršak (Archaeological Museum Osijek) – Marko Dizdar (Institute of Archaeology) – Orhan Efe Yavuz – Maria Spyrou (University of Tübingen) – Cosimo Posth (University of Tübingen | Max Planck Institute for Evolutionary Anthropology)

During 2020, the Archaeological Museum of Osijek and the Institute of Archaeology conducted protective archaeological excavations of the site AN 2 Beli Manastir / Staro selo on the route of the bypass of the town of Beli Manastir in Osijek-Baranja County, eastern Croatia. The period of Late Antiquity is represented by the remains of a settlement and a cemetery located next to it. In the western part of the site, a cemetery with 26 graves dated to the 4th century CE was investigated. Rectangular inhumation burials contained a number of items of costume and jewelry, ceramic and glass vessels as well as coins, thus confirming the dating of the cemetery. Of particular interest are burials G10 and G26. G10 contained skeletal remains of an adult female while G26 contained the remains of an adult male individual. Both skeletons did not exhibit any signs of infection, just some “usual” pathological changes such as caries, Schmorl’s nodes, etc. Ancient pathogen DNA analysis of teeth samples from these two graves (BEMA005 and BEMA006) showed they are potentially positive to Salmonella enterica, a species of invasive gastrointestinal pathogens that infects both animals and humans. Pathogenic S. enterica are introduced into the human body via the gastrointestinal tract by ingestion of contaminated food, such as water, fish, meat, poultry, egg, milk, vegetables, and fruits. Most people infected by S. enterica develop diarrhea, fever and abdominal cramps, but it can also result in a severe dehydration while life-threatening complications may develop if the infection spreads beyond the intestines. Genomic capture that will follow should assess the phylogenetic placement and possible modes of transmission of S. enterica in this rural community but should also provide new important information about the general health of the inhabitants of this region during the Late Antiquity.

**1394. TRACING INFECTION IN THE PAST: THE ASSOCIATION BETWEEN PERIOSTITIS AND CRANIAL POROTIC LESIONS IN AN AVAR-PERIOD NECROPOLIS (SERBIA)**

**Contribution format:** Oral  
**Contribution authors:** Veda Mikasinovic (Center for Forensic and Applied Molecular Genetics, Faculty of Biology, University of Belgrade | Centre of Bone Biology, Institute of Anatomy, Faculty of Medicine, University of Belgrade) – Ksenija Djukic (Center for Forensic and Applied Molecular Genetics, Faculty of Biology, University of Belgrade)

This study analyses the distribution of periostitis, one of the most common non-specific skeletal indicators of infectious disease, and its correlation with cranial porotic lesions (PLs), specifically cribra orbitalia (CO) and porotic hyperostosis (PH). In paleopathological literature, periostitis is defined as inflammation of the periosteum, the main causes of which may be trauma or infection. This study focuses solely on cases where periostitis is present in the absence of traumatic injuries. Cranial PLs in the archaeological record are generally considered markers of poor health, often associated with unfavourable living conditions or periods of physiological stress, as well as with the diseases of the hematopoietic system. The osteological sample originates from Site 40, Potes Gornje Sajlovo (Serbia), dated to the Middle and Late Avar periods (7th–9th century CE). A total of 199 individuals from 197 graves were analysed, comprising 47 (23.6%) males, 48 (24.1%) females, 90 (45.2%) non-adults, and 14 (7.0%) adults of unestimated sex. Periosteal reactions were identified in 16 individuals, primarily affecting the long bones. In most cases, the periosteal lesions were healed, while active periostitis was observed in five individuals (2 non-adults, 2 males and 1 female). Cranial PLs were present in 72 individuals (36.2%), with CO identified

in 63 cases and PH in 43 cases. Active lesions on the orbital roof were noted in only five individuals. The simultaneous presence of CO and PH was recorded in 15 cases. Correlation analysis between periostitis and cranial PLs revealed a statistically significant but weak correlation, suggesting a complex relationship between these skeletal markers. However, statistical significance was observed when analysing the combined PL variables (CO and PH together) with periostitis, indicating a stronger association when considered together.

**2462. THE PRESENCE OF TUBERCULOSIS IN FOUR PARISH CEMETERIES WITHIN THE DANISH MEDIEVAL TOWN VIBORG**

**Contribution format:** Oral  
**Contribution authors:** Dorte Pedersen (Unit of Anthropology (ADBOU), University of Southern Denmark)

This study takes on a microenvironmental approach to the study of tuberculosis (TB) in medieval Denmark. Bone involvement patterns and frequency of disease are explored in skeletons from four parish cemeteries located in a restricted geographical area in the Danish town Viborg dated ca. AD 1100-1550. Six skeletal lesions indicative of TB (rib pleural surface, ventral vertebral body, lateral body of ilium, acetabular fossa, ilium auricular surface and ulna olecranon process) following the method by Pedersen et al. 2019, were recorded in 341 adult skeletons from the cemeteries of Sct. Drotten, Sct. Mathias, Sct. Morten and Sct. Mikkel. Individual probability of TB was assessed using a probabilistic approach considering the six indicator’s sensitivity and specificity measures (Pedersen et al. 2019). The population frequencies of TB, that is, the prevalence of disease in the mortality sample, was modelled for each cemetery from the individual probability of having the disease. Significant differences in both patterns of bony involvement and population frequency of TB between the cemeteries were found. Sct. Drotten stands out with a point population frequency of 0.69 (CI 0.43-0.87) compared to the other cemeteries with frequencies ranging between 0.11 and 0.42 (CI). The modelled frequencies correspond to 53 of 89 (Sct. Drotten), 22 of 97 (Sct. Mathias), 13 of 122 (Sct. Mikkel) and 3 of 33 (Sct. Morten) with likely TB diagnosis. For all cemeteries but Sct. Morten individuals with a likely TB diagnosis survived longer than those without TB. This is especially evident in the Sct. Drotten that in general outlive their fellow town dwellers in other parishes. These are archaeological samples and preservation and also small samples sizes may affect the results. However, social stratification between the different parishes may also be a likely explanation of the differences seen in the patterns of TB and associated mortality profiles.

**1364. A CASE STUDY OF JUVENILE OSTEOMYELITIS FROM MEDIEVAL SERBIA**

**Contribution format:** Oral  
**Contribution authors:** Dragana Vulovic (Institute of Archaeology, Belgrade) – Ksenija Đukić (Faculty of Biology, University of Belgrade) – Nataša Miladinović-Radmilović (Institute of Archaeology, Belgrade)

The late medieval necropolis of Dublje Iznad Kuće is located about 250 m west of The Church of the Holy Apostles Peter and Paul, in Novi Pazar, Serbia. Archaeological excavations took place from 2017 to 2020; on that occasion, 166 graves were discovered. The anthropological analysis of the skeletal remains from this site showed that infectious diseases were not so common in this population; however, one skeleton caught our attention. In grave no. 146, the skeletal remains of a juvenile male individual were discovered. During bioanthropological analysis, we observed several pathological changes (such as periostosis and maxillar sinusitis), but the most notable pathology condition was progressive osteomyelitis on the medium and distal part of the right femur, followed by probable septic arthritis on the distal end of the right femur, the proximal end of the right tibia, and on the right patella. Periosteal lesions are also visible on the lateral side of the right tibia, indicating that infection has spread to that part of the body. Osteomyelitis is a progressive bone infection accompanied by inflammatory destruction, necrosis, and new bone formation, involving one or more regions of the bone and the surrounding soft tissue. This infection is the result of the introduction of pyogenic bacteria, viruses, fungi, and multi-celled parasites into the bone. In this presentation, we will focus on this infectious disease, the possible causes of this infection, and what this person’s life might have been like.

**1253. SKELETAL EVIDENCE OF INFECTION IN ORTHODOX MONKS FROM THE STUDENICA MONASTERY CEMETERY (SERBIA)**

**Contribution format:** Oral  
**Contribution authors:** Ksenija Djukic – Veda Mikašinović (Center for Forensic and Applied Molecular Genetics, Faculty of Biology, University of Belgrade) – Petar Milenković (Ars Medica, Belgrade)

Between the 14th and 17th centuries, Serbia experienced a turbulent period marked by both internal and external political struggles, wars, and recurrent health crises, including famines and epidemics. These crises affected not only the general population but also the elite and monastic communities. This study presents skeletal evidence of infectious diseases and their patterns in the Orthodox monastic cemetery of Studenica Monastery, a 12th-century

monastery located in the Raška district of Central Serbia. In 2022, protective archaeological excavations were conducted within the yard of the currently active monastery, uncovering 62 graves, dated between the 14th and 17th centuries, and classified into four burial horizons. Bioanthropological and paleopathological analyses were conducted in 2024, revealing 86 individuals (87% male, 3.5% female, and 9.5% of unknown biological sex). All individuals were adults (aged 18 and older), except for one adolescent (16–18 years old) and two children. Approximately 30% of the individuals exhibited skeletal evidence of infectious diseases, with variations in infection patterns across burial horizons. The most frequently observed pathological condition was periostitis, primarily affecting the lower limbs (tibiae and fibulae). Additionally, two individuals exhibited skeletal changes indicative of tuberculosis, including lytic lesions in the cranial vault and the lower thoracic and upper lumbar vertebrae. Furthermore, two cases of extensive osteomyelitis were also identified. The investigation of skeletal material discovered from the aforementioned monastery yard gives us a unique opportunity to look closely into the everyday life of the monastic community. The comprehensive bioanthropological and paleopathological investigation of an orthodox monastic cemetery in Europe has not been conducted thus far.

**2108. MARGINALIZATION, INFECTION OR OUTCAST: WHAT’S UP WITH THE MEDIEVAL GRAVE 43 OF THE MILAVIĆI SITE IN BOSNIA AND HERZEGOVINA?**

**Contribution format:** Oral  
**Contribution authors:** Monika Milosavljevic (University of Belgrade) – Saša Čaval – Lucija Grahek (ZRC SAZU, Slovenia) – Brina Zagorc (University of Vienna . ZRC SAZU, Slovenia) – Krish Seetah (Stanford University)

Among the numerous stećci graves excavated in Bosnia and Herzegovina, grave 43 from Milavići in Dabarsko polje stands out. The grave from a communal cemetery with over 390 stećci tombstones dated from 12th to 16th century, was located within a Late-antique basilica (4th-5th century), beneath a large, decorated stećak. This non-normative burial, with the skeleton discovered in a prone position, is atypical for the time and place. While grave 43 is of an adult, highly likely female and is the most non-normative, it does not stand alone as atypical. It resembles the medieval burials from a nearby transhumant station in Busovača, Nevesinje, and a reclaimed prehistoric mound at Baljci, Bileća. Given the importance of proper burial treatment in medieval Christian communities, such a deviation is particularly noteworthy. Non-normative burial practices may indicate collective social anxiety and tensions. The interpretative possibilities considered range from the hypothesis that the individual was marginalized within their community to a reaction to death from an infectious disease. Against this murky backdrop, bioarchaeological analysis, aDNA pathogen analysis, and archaeothanatological examination are currently underway and shall be completed within the forthcoming months to test these hypotheses. This comprehensive approach will be complemented by a comparative study with other stećci burials associated with suspected infectious diseases. With this presentation, we aim to demonstrate how individual cases are able to provide new perspectives on the broader interpretation of medieval societies through the intersection of biological and social facets. In such cases, the exploration of the non-normative sheds light on the social reaction of the community to the unfamiliar and the unusual.

**951. IDENTIFYING EPIDEMIC EVENTS IN SKELETAL RECORDS: A DEMOGRAPHIC APPROACH**

**Contribution format:** Oral  
**Contribution authors:** Tamás Szeniczey – Tamás Hajdu (Eötvös Loránd University)

Infectious diseases and epidemic outbreaks have profoundly shaped human populations throughout history, influencing demographic structure and social organization. Nonetheless, assessing their impact on past populations presents significant challenges. Paleopathological analysis often fails to detect infectious diseases due to the lack of pathognomic skeletal markers, while age-at-death estimation and sample size introduce additional uncertainties, confounding the evaluation of mortality patterns at the population level. These limitations hinder our ability to identify catastrophic mortality events with confidence. Parametric models of mortality offer a potential solution to this demographic problem by smoothing and correcting variation in age-specific mortality that is produced by small sample sizes and broad age categories. By modelling expected mortality trajectories of catastrophic events and stable populations, then comparing them with mortality patterns obtained from osteological data, it is possible to identify variations that could indicate epidemic-induced mortality peaks. Combining such models with historical data creates a valuable proxy for recognizing past health crises, allowing us to compare statistically derived mortality trends with osteological evidence. This study applies hazard models to Avar Period skeletal populations (represented by 1413 individuals) to assess potential epidemic-related mortality shifts. Integrating demographic modeling with bioarchaeological data provides a novel approach to identifying mortality patterns potentially influenced by epidemics, contributing to broader discussions on health in early medieval populations. This project has received funding from the Hungarian Research, Development and Innovation Office (PD 146612).

**203 FORTIFIED BY NATURE, PROTECTED BY WATER: COMPARING FORTIFICATIONS ON NATURAL AND ARTIFICAL ISLANDS IN LAKES THROUGH THE AGES**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** fortifications, islands, lakes, lake settlements,  
**Session organisers:** Timo Ibsen (Leibniz-Zentrum für Archäologie (LEIZA)) – Jānis Meinerts (Latvian Academy of Culture)

**SESSION ABSTRACT**

Human habitation on natural islands in Europe dates back to “the dawn of time.” Around the 6th millennium BC, communities began constructing lake settlements on stilts and artificially raised platforms, which in some cases evolved into fortified settlements or even strongholds. Both enhanced natural or artificially built fortified islands served as (physically or symbolically) protective bastions during conflicts, providing a strategic advantage and leveraging natural, sometimes modified, water barriers to deter invaders and protect inhabitants and their goods. Fortified lake settlements built on artificial platforms and fortifications made of wood, earth, or stone on natural islands in lakes have typically been examined as distinct phenomena, with little comparative analysis of their location, accessibility, function, and the physical structure of their defences. Despite being well-known and extensively studied in European archaeology, many questions about both types of these intriguing remnants of early human ingenuity and adaptability remain unanswered. When and why did the need for fortifications arise on natural islands? At what point can we classify lake settlements as fortified sites with defensive or military functions? Why and where did early communities prefer this isolated (semi-)insular location to “regular” strongholds, which existed at the same time in the surroundings? Does a diachronic comparison of both types of water-related fortifications offer new approaches to the study of these phenomena? This session seeks to bridge the current research and interpretation gap and invites papers that: (1) explore specific questions related to the fortification systems of insular sites and fortified lake settlements; (2) compare various fortified sites under insular conditions; (3) provide insights into the reasons for fortifying these sites, their functions, and their roles within broader settlement patterns; and (4) present relevant case studies spanning from Prehistoric to Medieval times across Europe.

**CONTRIBUTION ABSTRACTS**

**1611. CONNECTIVITY IN ISOLATION - ISLAND COMMUNITIES IN GREATER POLAND – CASE STUDY KOMOROWO**

**Contribution format:** Oral  
**Contribution authors:** Jan Romaniszyn (Adam Mickiewicz University in Poznań) – Daniel Brüggemann – Sarah Bäumler – Ercan Erkul (Kiel University) – Mateusz Jaeger (Adam Mickiewicz University in Poznań) – Jutta Kneisel – Oliver Nakoinz (Kiel University) – Jakub Niebieszczański – Witold Szambelan (Adam Mickiewicz University in Poznań) – Dennis Wilken (Kiel University)

The present paper investigates the site of Komorowo with its island in the Lake Bytyń, with a focus on the fortifications present at the location. Two of the larger islands are fortified in different periods of prehistory and history, with the oldest traces of a fortified place being the Iron Age settlement of the ‘Biskupin type’, whose unique location on an island sets it apart from other fortifications of that period. On another island, just hundreds of metres apart, the remnants of an early medieval circular rampart were found. Such a structure is not uncommon during the early medieval period, as evidenced by other examples in Ostrów Lednicki. A further circular rampart was constructed on the foundations of the Iron Age rampart, and is believed to represent the most recent fortification. Recent geophysical research on the lake, in conjunction with research diving, has confirmed the presence of a bridge connecting the island to the mainland. The dating of the timbers to the 15th century is likely to belong to the most recent fortification. The site’s significance transcends its role as a fortification, extending to its importance in trade and exchange during all three periods. The Iron Age settlement, in particular, was a pivotal nexus for trade, facilitating the exchange of amber from the rich eastern regions and luxury goods from the alpine areas of the southern continent. The Slavonian fortress, situated along a major trade route connecting Poznań with the western Ottonian sphere, further underscores the strategic importance of the area during this period. This article aims to provide a comprehensive overview of the various fortifications at the Komorowo site, with a focus on elucidating their function within the respective time periods.

1184. FORTIFIED AND UNFORTIFIED ISLAND SITES OF THE SLAVIC MEDIEVAL PERIOD IN NORTH-EASTERN GERMANY

Contribution format: Oral  
Contribution authors: Lukas Goldmann (Brandenburgisches Landesamt für Denkmalpflege und Archäologisches Landesmuseum)

The landscape of the northern lowland of Germany is characterised by numerous lakes and waterways formed during the Pleistocene era. Many of these inland waters – particularly those situated between the Elbe and Oder rivers – contain islands of varying size, many of which are suitable for human settlement throughout the ages. However, statistical analyses of the known sites on these islands show a clear predominance of sites from the early or so-called Slavic Middle Ages. Field surveys, excavations and underwater archaeological research show that these sites had a variety of functions including trade, production and religion as well as control and defence. In view of the conflict-ridden early and high medieval history of the region the above-average use of islands during this period appears to be a reaction to increased military pressure. Many slavic island sites show remains of typical strong walls made of earth and wood, which are also known from contemporary fortifications, in other locations but new archaeological data may indicate that islands did not necessarily need such elaborate defences and may often have been a place of retreat for the common people.

1307. FORTIFIED LAKE-SETTLEMENTS OR LAKE-CASTLES? INTERPRETING 8TH-11TH CENTURY AD LAKE-SETTLEMENTS IN NORTHERN LATVIA

Contribution format: Oral  
Contribution authors: Janis Meinerts (Latvian Academy of Culture)

From late 1950s to early 1970s, the pioneering Latvian underwater archaeologist Jānis Apals surveyed more than 100 waterbodies and discovered 10 lake-settlements in the lakes of Northern Latvia. Excavations conducted in two of these sites – in Ušurs lake-settlement and Āraiši lake-settlement – proved that they were built and inhabited by the Baltic Latgallian tribe during the period between 8th to 11th century AD. The extensive excavations in Āraiši, that spanned for 10 seasons and completely excavated about ¾ of the site, revealed well preserved wooden building remains and gave an insight of unprecedented quality into the architecture and economics of a Viking Age Latgallian lake-settlement. This rich material later became the basis for an in-situ full-scale reconstruction of the settlement. One of the more controversial aspects connected to the interpretation of these sites is the level of their fortification – J.Apals, citing the similarities of Āraiši lake-settlement to contemporary Baltic hillforts (oral tradition, fortifications, type of society inhabiting the site), from 1969 onwards systematically used the term “lake-fortress” (Latvian “ezerpils”) to describe all ten of the known sites and likened their role and status in the settlement pattern to that of hillforts. This paper will aim to investigate the meaning of the term lake-fortress introduced by J. Apals by looking into the arguments put forward by him and interpreting it in connection with the ideas about the roles of hillforts and other types of settlements prevalent at the time and currently. Special attention will be given to the type of fortifications unearthed in the extensively excavated Āraiši site and the settlement patterns in the local micro-regions around both Āraiši and the other nine known Latgallian lake-settlements.

727. FORTIFICATION STRUCTURE AND SETTLEMENT BACKGROUND OF AN ISLAND ON LAKE OSTROWITE (NORTHERN POLAND) IN THE 11TH-14TH CENTURIES

Contribution format: Oral  
Contribution authors: Jerzy Sikora (University of Lodz)

About 2 km north-east of the village of Ostrowite in northern Poland (Chojnice commune, Pomerania province) is a lake now called Ostrowite. Medieval documents refer to it as the Forest Lake. In the 19th century, numerous legends were recorded about the area, describing the first Christian settlement in Pomerania, which occupied the island, and the leather (!) bridge that was said to lead to the island. Excavations carried out in 1993-1996 and 2000-2024 confirmed the presence of traces of a rich medieval settlement both on the island and on the lake shore. Its beginnings are marked by the establishment of an inhumation cemetery on the eastern shore at the beginning of the 11th century. Burial rites indicate an adaptation of the Christian way of burying the dead, since the traditional Slavic burial was exclusively cremation. At the same time, a settlement was established on the island, initially with structures interpreted as relics of pre-Christian religious activity. The island itself was protected by a moat. In the 12th century, there was a significant change in the defensive structures. The moat was filled in. A wooden bridge leading to the island was built (dendro dates: 1160 AD), together with a ring fort blocking the entrance to the island, in order to control traffic. Excavations have revealed many traces of trade and the import of goods. The whole complex lasted until the beginning of the 14th century. The functioning of the settlement complex will be discussed against the background of other similar settlement island complexes in the area of the north-western Slavs, especially in Pomerania, where they are mainly documented for the period between the 9th and 13th centuries. The changes in the spatial organisation and the changing approaches to the fortification

of the island will be highlighted.

2152. THE ARCHAEOLOGY OF KAUPRE – AN ISLAND FORTIFICATION IN THE DAUGAVA RIVER

Contribution format: Oral  
Contribution authors: Timo Ibsen (Leibniz-Institute for Archaeology (LEIZA/ZBSA)) – Agnese Čakare (Faculty of Humanities, Institute of Latvian History, University of Latvia) – Vanda Haferberga (Faculty of Humanities department of History and Archaeology, University of Latvia) – Jens Schneeweiß (Leibniz-Institute for Archaeology (LEIZA/ZBSA)) – Piotr Kittel (University of Lodz, Faculty of Geographical Sciences)

The hillfort Kaupre represents a unique fortification, distinguished by its placement on an in-channel island within the Daugava River in Latvia. The island, rising 7–8 meters above the river, features a fortified settlement enclosed by two linear ramparts, securing a plateau at its northern end. Previous archaeological surveys identified a Late Iron Age burial ground on the island, though its relationship with the fortified settlement remained unclear. Recent investigations conducted in May 2023 in the framework of the project “Interdisciplinary Hillfort Studies at the Daugava River: Merging and Decoding Archaeological, Environmental and Linguistic Data (INHILLDAUGAR)”, including test pits and core drilling, have begun to clarify the site’s occupation history and environmental history. The recent excavations on the plateau within the enclosed area revealed a substantial dark archaeological layer, associated with an Early Iron Age occupation. This layer extends towards the main rampart, indicating contemporaneous construction with the occupation layer. This 3 m high main rampart, primarily composed of sand and stones without timber reinforcement, suggests a deliberate fortification effort. A second rampart, highly unusual due to its stone construction, features large erratic blocks at its base with a dolomite fill. The function and chronology of this second rampart remains unresolved, although it may have been built synchronously with the main rampart. Further complexity arises from the discovery of medieval and early modern artifacts, indicating a prolonged occupation history. Overbank fluvial deposits stratified above the archaeological layer suggest a dynamic environmental context affecting the site’s development. The lecture presents the results of recent field research on Kaupre and serves as an example of a fortification on a natural island in a river.

2481. IRON AGE FORTIFICATIONS AS ISLAND ARCHAEOLOGY – CURRENT RESEARCH ON THE ISLAND OF ÖLAND IN THE BALTIC SEA

Contribution format: Oral  
Contribution authors: Ludvig Papmehl-Dufay (Dept. of Cultural Sciences, Linnaeus University)

In this presentation, research carried out within the eight-year research program “Crisis, conflict and climate: societal change in Scandinavia 300–700” will serve as a starting point for a discussion of how Iron Age fortifications can be studied in an Island Archaeology perspective. The Baltic island of Öland is one of the most archaeologically productive regions in Scandinavia, well-known not least for its wealth of Iron Age remains including some 15 ringforts (e.g. Eketorp, Sandby borg), innumerable burial grounds and the uniquely well-preserved remains of hundreds of open settlements with visible house foundations and stone fences. In the research program, the Iron Age ringforts on Öland are illuminated through data on demographics, diseases, climate and environment, politics and social change to create a coherent understanding of their construction, use and abandonment. In this presentation, their insular characteristics are brought to attention, concerning both their broader geographic setting as well as insularity as seen in their physical separation in space and the metaphysical connotations this might entail.

1417. AN ISLAND OF FORTIFIED ISLANDS - TOPOGRAPHIES AND LONG-TIME BIOGRAPHIES OF BORNHOLM’S FORTIFICATIONS

Contribution format: Oral  
Contribution authors: Sofie Laurine Albris (National Museum of Denmark)

The FORTIS Project, running 2023-2027, investigates the prehistoric fortifications of the island of Bornholm aiming to gather and upgrade our knowledge about the forts. As a rocky island with good overview of the Baltic Sea, Bornholm in itself can be seen as a fortress, nevertheless the population in some periods may have been vulnerable to attacks, and therefore constructed fortifications. An evaluation of Bornholm’s six known prehistoric forts has shown that they all exploited topography in similar ways, being placed on high plateaus above lakes, bogs or in river bends. All the known fortifications show signs of being used in various phases through the periods of history and prehistory, indicating how the topographical settings played a major role in the activities at the sites, which may have been social and religious centres as well as providing protection. The paper gives and overview of the research status of the forts and the approach and progress of the FORTIS-project.

204 FROM CODE TO CULTURAL HERITAGE: ADVANCING AI INTEGRATION IN ARCHAEOLOGY

Session theme: 3. Exploring methods in research, education and communication  
Session format: Regular session  
Session keywords: Artificial Intelligence, GenAI, cultural heritage, Machine Learning, Computer Vision  
Session organisers: Hannah Ringheim (The Swiss Federal Institute of Technology (ETH)) – Gabriele Gattiglia – Francesca Anichini (University of Pisa) – Holly Wright (University of York)

SESSION ABSTRACT

Artificial Intelligence (AI) is reshaping the landscape of archaeology and cultural heritage preservation, offering transformative possibilities in data analysis, discovery, and preservation. However, its application in archaeology is hindered by challenges such as fragmented datasets, ethical concerns, and the complexity of integrating advanced technologies. In this framework, it is worth mentioning the Managing Artificial Intelligence in Archaeology COST Action (CA23141), which addresses these issues, fostering interdisciplinary collaboration among archaeologists, computer scientists, and heritage professionals to develop AI tools that enhance data collection, analysis, and interpretation. This session aims to explore the latest advancements in AI-driven technologies, such as machine learning, computer vision, and generative AI, showcasing their applications in uncovering and preserving the past. From analysing satellite imagery to locate undiscovered sites to reconstructing damaged artefacts and simulating ancient environments, AI is reshaping archaeology and cultural heritage preservation. The session also addresses critical ethical considerations, including transparency, bias, cultural sensitivity, and digital preservation. Ensuring that AI outcomes are understandable and trustworthy is vital, particularly when these tools influence decisions about cultural heritage. Human oversight remains essential to maintaining accountability and fostering responsible AI applications. Looking ahead, the discussion will examine how emerging technologies, such as quantum computing and advanced generative AI models, could revolutionise archaeological practice. These advancements may enhance the interpretation of complex datasets, simulate historical scenarios, and predict areas of high archaeological potential, supporting sustainable and inclusive approaches to cultural heritage. Participants are invited to share insights, methods, and reflections on integrating AI into archaeology. We want to envision innovative and responsible ways to connect with the past and to shape the future of the field, and to discuss case studies that show how these tools bridge the fields of archaeology, cultural heritage, and data science.

CONTRIBUTION ABSTRACTS

510. BREATHING LIFE INTO VIRTUAL ANTIQUITY. AI-DRIVEN IMMERSIVE EXPERIENCE OF ANCIENT EPHEBUS

Contribution format: Oral  
Contribution authors: Ahmet Denker – Arda Yurt – Eray Gunduz – Can Piker – Ayberk Gormus (Istanbul Bilgi University)

The rise of artificial intelligence (AI) has ushered in a new era of interactive experiences of virtual antiquity, where virtual characters play a central role in engaging visitors at reconstructed cultural heritage (CH) sites. This study explores the intersection of Virtual Reality (VR) and AI-driven character creation in enriching the virtual experience of ancient Ephesus at its peak. By integrating lifelike AI-powered avatars, imbued with personality and emotion, we try to showcase that it is possible to bridge the gap between visitors and digital heritage environments. These intelligent avatars, driven by sophisticated algorithms and natural language processing (NLP), serve as interactive guides, fostering immersive and intuitive engagement. They not only respond to user interactions but also adapt their behavior dynamically, enabling deeper, more personalized storytelling experiences. At the core of this innovation is the synergy between AI technologies such as NLP and machine learning, which empower avatars to comprehend and generate human-like responses, recognize emotions, and react in real time. This transformative approach enhances user engagement by offering interactive narratives that bring history of ancient Ephesus to life. Beyond technical implementation, effective character design plays a crucial role in audience immersion. Our approach incorporates storytelling principles, ensuring that avatars possess distinct personalities, motivations, and rich backstories that resonate emotionally with users. Through expressive dialogue, gestures, and nuanced interactions, these AI-driven characters transcend traditional virtual experiences, creating a compelling, memorable journey through the streets of ancient Ephesus. This work demonstrates the potential of AI-driven avatars in digital heritage applications, offering a glimpse into the future of virtual archaeology, where historical reconstructions become not just visual representations, but living, interactive worlds.

775. INSIDE THE WORKFLOW OF AN AI PROJECT IN ENVIRONMENTAL ARCHAEOLOGY

Contribution format: Oral  
Contribution authors: Elisa Paperini (University of Pisa)

The increasing availability of large-scale archaeological and palaeoecological datasets presents opportunities and challenges for data integration and analysis. In this context, artificial intelligence (AI) techniques offer promising tools, but their effectiveness depends on the quality and consistency of the input data. For this reason, data normalisation is crucial to ensuring usability, supporting accessibility and interoperability, and making the data robust and reliable for compatibility with AI algorithms, leading to accurate and trustworthy results. This project explores the methodological challenges (and solutions) for normalising modern and ancient pollen datasets to enable their integration into AI-driven analyses for paleoenvironment reconstruction. Pollen datasets from key repositories (e.g. Neotoma, SEAD, EMPD) were harmonised to create a coherent framework for training AI models in biome classification. The research focused on a European-scale pollen dataset, addressing challenges in standardising data formats, temporal scales, and taxonomic classifications. Following the data normalisation process and subsequent optimisation, Gradient Boosted Trees was applied for predictive classification, achieving 90% accuracy in distinguishing eight biome classes using modern European pollen data (<500 years old). We are extending this approach to predict biomes with ancient pollen datasets. The iterative process between AI outputs and domain expert validation underscored the importance of robust data preparation for enhancing predictive accuracy and interpretability. It also highlighted the need for interdisciplinary collaboration at each stage of system development. Within the project, generative AI tools (e.g. MidJourney, DALL-E) are being integrated to reconstruct ancient landscapes from pollen diagrams and AI-generated predictions. AI-assisted visualisations can enhance education and outreach, making complex datasets more accessible to a broader audience. As the reliability of these methods improves, they may also become valuable for research applications. In conclusion, this contribution highlights the key steps in applying AI to archaeological research, from dataset normalisation to predictive and generative modelling.

1744. AI-DRIVEN MODELING OF LONG-TERM ENVIRONMENTAL IMPACT ON MNAJDRA PREHISTORIC MEGALITHIC TEMPLES, MALTA

Contribution format: Oral  
Contribution authors: Joel Azzopardi – Daniel Micallef – Mantas Valantinavičius – Joann Cassar (University of Malta)

The Mnajdra Prehistoric Megalithic Temples, a UNESCO World Heritage site located on Malta’s southern coast, have faced centuries of environmental challenges, including wind erosion, salt damage, and solar radiation. Built from two types of limestone, including the soft and porous Globigerina limestone, and lacking their original roofing, parts of these temples are severely eroded. Reversible open-sided shelters were installed in 2009 to mitigate some impacts, but understanding the underlying causes of degradation remains crucial. This study aims to model how global environmental conditions contribute to stone weathering within the apses (the temples’ semi-circular “rooms”). Computational Fluid Dynamics (CFD) simulations using the OpenFOAM solver were conducted across multiple resolutions—macro (1m), meso (0.16m), and micro (0.005m)—to capture aerodynamic conditions and surface interactions on the unsheltered temples. CFD provided valuable insights, but its high computational costs made it impractical for long-term analysis. An AI-based solution was therefore introduced. A Convolutional Neural Network was trained based on CFD output at the meso scale to predict the turbulent dissipation rate—an important variable in CFD that uses the Reynolds Averaged Navier Stokes turbulence modelling. By leveraging the ERA5 reanalysis dataset, which provides hourly meteorological conditions since 1940, the model can predict long-term surface conditions and potential degradation patterns. With only 32 CFD simulations available, data augmentation techniques were employed by dividing the input data into overlapping patches. This AI-driven approach drastically cuts computational time, generating downscaled data in less than a minute compared to over 17 hours needed for CFD simulations of 8 scenarios. It highlights areas most vulnerable to weathering. Future work will validate these predictions with in-situ measurements of surface degradation and environmental conditions. The ultimate goal is to identify key environmental factors driving degradation and integrate these findings with known degradation mechanisms and drive further research into deterioration causes.

1589. ARTIFICIAL INTELLIGENCE IN ARCHAEOLOGY: THE MAIA COST ACTION AND ITS TRANSFORMATIVE POTENTIAL

Contribution format: Oral  
Contribution authors: Gabriele Gattiglia – Francesca Anichini (University of Pisa) – Holly Wright (University of York)

The application of Artificial Intelligence (AI) in archaeology is rapidly expanding, yet its full potential remains underexplored. The MAIA COST Action (CA23141) seeks to bridge this gap by fostering interdisciplinary

collaboration among archaeologists, computer scientists, and heritage professionals. By addressing key challenges such as data scarcity, ethical concerns, and the integration of AI into archaeological workflows, MAIA aims to ensure that AI applications remain transparent, ethical, and scientifically rigorous. A major challenge in AI-driven archaeology is the fragmented and incomplete nature of datasets. Traditional machine learning struggles with the small, heterogeneous datasets typical of archaeological research. MAIA is dedicated to addressing these issues by promoting the creation of digital comparative collections and training datasets aligned with FAIR (Findable, Accessible, Interoperable, and Reusable) principles. This facilitates improved AI model training while ensuring data accessibility and machine-actionability. Beyond technical advancements, MAIA also critically examines the ethical implications of AI in archaeology. Focusing on Explainable AI (XAI) enhances transparency and interpretability, ensuring archaeologists retain control over AI-assisted interpretations. By tackling issues of technological agency, bias, and accountability, MAIA advocates for responsible AI integration that complements human expertise rather than replacing it. MAIA also works in synergy to map the current state of AI in archaeology, develop standards for data management, address ethical concerns, and disseminate findings to the broader archaeological community. Through interdisciplinary collaboration, MAIA is shaping the future of AI in archaeology and ensuring that its adoption is both methodologically sound and ethically responsible.

**2254. FROM A “ZERO-CODE” TO A “LOW-CODE” AI APPROACH: AUTOMATING THE PROCESSING OF TOPOGRAPHICAL MAPS FOR ARCHAEOLOGICAL RESEARCH**

**Contribution format:** Oral  
**Contribution authors:** Caterina Paola Venditti (University of Cassino and Southern Lazio | Ministry of Culture (Italy)) – Antonio Leopardi (IACNet)

The analysis of analog cartographic sources plays a crucial role in reconstructing ancient landscapes and understanding territorial transformations. In addition to historical maps, archaeological maps produced from the early 20th century until the advent of digital cartography contain valuable spatial and contextual data. However, manually extracting features from such documents remains a labor-intensive and time-consuming process. This research proposes a workflow that leverages AI to automate the recognition and georeferencing of different cartographic elements from analog supports. The workflow integrates free, open-source, and low-cost tools for object detection. By employing computer vision models, we aim to test and evaluate the performance of CNNs and LLMs such as ChatGPT for object detection, segmentation, extraction of geospatial data, and retrieval of associated semantic information (e.g., symbols, place names, and textual annotations). Our strategy also incorporates GPT-based automation to optimize data annotation and processing. This study explores the combination of both “zero-code” and “low-code” approaches to develop an accessible pipeline for archaeologists with limited technical expertise. Some challenges remain, particularly in adapting AI models to recognize specialized symbols, aligning extracted data with geospatial frameworks, and ensuring accuracy in the automated transcription of textual and graphical elements. While existing AI tools offer significant potential, they may require preliminary dataset annotation and fine-tuning to achieve optimal results. The goal is to automate the transcription of spatial data into vector-based geospatial data, making it ready for implementation in a GIS system while reducing processing time and opening new perspectives for territorial research and diachronic landscape analysis. This paper presents the first results obtained from applying this method to selected cartographic datasets, highlighting its potential while also addressing current challenges that need to be overcome.

**2013. DESCRIPT: ANALYSIS AND DECIPHERMENT OF ANCIENT AND RARE WRITING SYSTEMS**

**Contribution format:** Poster  
**Contribution authors:** Rune Rattenborg (Lund University) – Beata Megyesi (Stockholm University)

The study of historical writings provides critical insights into past cultures, languages, and traditions. However, deciphering unknown scripts remains a formidable undertaking due to their linguistic complexity, degradation of media over time, and the resulting dearth of reference materials available from archaeological excavations. Traditional philological methods, while invaluable, often struggle to overcome such obstacles, while existing digital tools are optimised primarily for well-documented and standardised scripts. Bridging this gap necessitates a new, interdisciplinary approach that combines computational techniques with expert historical and archaeological analysis, heeding the material context of inscribed artefacts as characteristics every bit as important as the contents of the inscription itself. The DESCRIPT project addresses this challenge by integrating artificial intelligence (AI), machine learning, and cryptanalysis with expertise from computational linguistics, philologists, historians, and archaeologists. Building upon previous research on early modern European ciphers, DESCRIPT extends its focus to a wider array of complex historical scripts from all over the globe. The project aims to develop AI-driven tools capable of analysing, transcribing, and translating rare and undeciphered scripts. The primary objectives of DESCRIPT include the creation of a digital corpus of rare scripts, developing advanced recognition models for transcription, and the enhancement of interactive decipherment frameworks. Leveraging AI and a novel combination of linguistic, computational, and archaeological expertises, the project seeks to establish a

robust, scalable and adaptive system for historical script analysis. This project represents a significant advancement in the field of historical linguistics. manuscript studies, and historical archaeology, with the potential to uncover previously inaccessible knowledge encoded in rare historical texts. As the initiative is running from 2025 to 2032, and so is in its very early stages, this poster will outline its primary structure, workflow, and expected outcomes, inviting scholarly engagement and collaboration.

**2175. SEGMENTATION OF ARCHAEOLOGICAL LANDSCAPES USING ARTIFICIAL INTELLIGENCE: ONTOLOGIES, MULTI-SOURCE DATA AND INTERDISCIPLINARY COLLABORATION**

**Contribution format:** Poster  
**Contribution authors:** Rebeca Blanco-Rotea (Landscape, Heritage and Territory Laboratory, University of Minho) – Natália Botica (Unit of Archaeology of the University of Minho | Landscape, Heritage and Territory Laboratory, University of Minho | Associate Laboratory for Research and Innovation in Heritage, Arts, Sustainability and Territory) – Bruno Dias (University of Minho)

This presentation explores an approach for segmenting archaeological landscapes into Landscape Units by combining a landscape ontology with data from satellite imagery, LiDAR surveys, historical maps, and archival documentation. By integrating these heterogeneous data sources, we apply Artificial Intelligence (AI) techniques to automate and support the segmentation process, allowing the identification, delimitation and characterization of Landscape Units with greater efficiency and accuracy, which should be subsequently tested archaeologically. The goal is not only to study and represent the evolution of the landscape over time, but also to create open access training datasets that promote reproducibility and foster interdisciplinary collaboration between researchers from archaeology, architecture, geography, environmental sciences and digital humanities. This methodology offers new perspectives for spatial planning, heritage management, and landscape dynamics research. The research is applied to the study of mountain agricultural landscapes, which present unique geomorphological characteristics in Portugal, which we believe will help in the segmentation of the landscape through this methodology.

**205 COMING TOGETHER: CASE STUDIES ON COMMUNITY COALESCENCE IN BRONZE AGE AND IRON AGE EUROPE**

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Community coalescence, Population aggregation, Bronze Age, Iron Age, Settlement archaeology, Centralization  
**Session organisers:** Marcello De Vos (University of Rome Sapienza | University of Groningen) – Yannick De Raaff (University of Gothenburg) – Rebecca Worsham (Smith College)

**SESSION ABSTRACT**

This session aims to bring together scholars working on aggregated settlements in Bronze Age and Iron Age Europe and to collect case studies for cross-cultural comparison of ‘community coalescence’. This concept, first successfully applied in the archaeological discourse by Kowalewski (2006) and later adopted by other scholars, most notably Birch (2012, 2013, 2018), refers to the process of how small groups of people come together to live in larger settlements. Such processes are noted in archaeological contexts worldwide and seem to occur mostly in cases of societal stress. Coming together in a larger community brings various advantages, such as increased security and access to resources, and as such can be a strategy to overcome threats. Newly founded aggregated settlements do not always last, as larger groups of people living together for the first time result in tensions and a need for socio-political reorganization. However, when they persist, these settlements display complex and dynamic trajectories of development, frequently leading to urbanization and state formation. In this session, we welcome papers that present case studies of community coalescence in Bronze Age and Iron Age Europe. We are interested in investigating the causes and consequences of population aggregation, social strategies for creating cohesive communities, and how these can be detected in the archaeological record through for example changes in the built environment and burial practices.

**CONTRIBUTION ABSTRACTS**

**2293. COALESCING COMMUNITIES IN EARLY BRONZE AGE CRETE**

**Contribution format:** Oral  
**Contribution authors:** Timothy Cunningham (Universite Catholique de Louvain (UCLouvain))

Early Prepalatial Crete provides rich evidence of a variety of strategies for social organization, settlement location, and resource management, with multiple cultural pathways and ‘developmental’ trajectories often overlapping spatially and temporally (Driessen 2001; Whitelaw 2004; Papadatos 2008.) However, these periods (EM I-II) are often subsumed into an evolutionary paradigm, varied in speed, but leading inexorably to the Palace-based civilization/s of the Middle and Late Minoan periods. Paradoxically, the very existence of the later palaces is used to retroactively contextualize and explain earlier evidence. In the EM IIB period, demographic growth, increased trade, and monumental building projects at later palatial sites and elsewhere have been seen merely as a first step toward palaces, despite major disruptions at the end of this period, and major differences between and within the sites in question, with little attention to the mechanisms behind these developments. For example, the far east of the island sees a sharp increase in small habitations and settlements through the FN IV and EM IA phases, with what has been previously termed ‘nucleation’ in EM II. Evidence suggests geographically distributed sites with differing but overlapping traditions ‘coalescing’ by EM IIA into communities that are aware of their own identity as such. I have suggested elsewhere (Cunningham 2023) that Bronze Age Crete belongs to a category of places where social complexity is both managed and driven by the need to attract and retain constituents, through various forms of social entanglement. To escape the trap of evolutionary thinking, I propose a dialectical approach allowing for both increases and decreases in social complexity, freeing the (deeper) past from being contingent on the (palatial) future. A re-examination of the early Prepalatial settlement history of far eastern Crete through the lens of coalescence may thus provide new mechanisms to explain and understand the archaeological evidence.

**2121. COMMUNITY COALESCENCE AND COLLECTIVE ACTION AT THE EARLY MYCENAEAN SETTLEMENT OF MALTHI, GREECE (CA 1700 BCE)**

**Contribution format:** Oral  
**Contribution authors:** Yannick De Raaff (University of Gothenburg) – Rebecca Worsham (Smith College)

One of the core principles of community coalescence as a theoretical concept is that when previously dispersed groups aggregate into larger societies, they must develop new ways of living together and managing potential conflicts. In other words, how do villages deal with the social and economic problems of coresidence (i.e. cooperation)? The solutions adopted are not uniform and may involve, for example, consensual decision-making or the appointment of arbitrators or leaders (Thompson & Birch 2018, 3, 7). Our discussion is based on the village of Malthi in Messenia, southwestern Greece. During the transitional period between the Middle and Late Bronze Age (ca. 1800–1600 BCE), a time of rapid and pervasive social change, this seemingly small and dispersed settlement was reorganised as part of a single, coherent construction project. As is often the case with examples of coalescence, this transformation at Malthi resulted in integrative architecture surrounded by a substantial fortification wall. For a village of approximately 200 inhabitants, this represented a considerable investment of labour and time, likely requiring the aggregated labour of the populace of the surrounding area. It was previously suggested that this shift represents a move away from social structures based on household membership toward the creation of settlement-based (and even supra-settlement) communal identities. In this contribution, we apply architectural energetics to model the involvement of villagers in the construction of each of the architectural structures to study the cooperative dimensions of this project. This enables a consideration of how collective action was organised during this major settlement redesign and how communal interests were negotiated in relation to those of individual households.

**1570. COMING TOGETHER, LEAVING BEHIND: ABANDONMENT AND COALESCENCE IN THE SHAFT GRAVE PERIOD**

**Contribution format:** Oral  
**Contribution authors:** Rebecca Worsham (Smith College)

In many cases, a precondition for coalescence is settlement abandonment. Lamoureux-St-Hilaire and Macrae (2020) have recently problematized settlement abandonment as a single event, emphasizing instead that it is a process that can be drawn out over a fairly lengthy period of time—which they call “detachment from place.” This paper explores coalescence through a pattern of abandonments described by Maran (1995) occurring at the transition to the Late Bronze Age in mainland Greece, the so-called “Shaft Grave” period, around 1700 BCE. In these cases, settlement space is transitioned to funerary use, and the population seems to relocate elsewhere. Although the living settlements are for various reasons hard to identify, the funerary use of the earlier habitation sites implies a continued relationship with these spaces by a group that is still invested in the history/memory of the former settlement. Similar patterns of behavior have been observed for short migrations cross-culturally, including most notably early modern Togo in West Africa (de Barros 2020). This case study is of particular importance because it sheds light not only on the so-called “stressors” and “enablers” involved in mass movements of people—in this case, destabilization brought about by slave raiding and warfare—but also on how relationships with abandoned settlements are maintained. I argue here that the settlement abandonments in Shaft Grave-era mainland Greece may be explained similarly, especially with regard to their afterlives as funerary spaces,

focusing on the well-known pattern of coalescence around Mycenae in the Argolid. Here and elsewhere, coalescence seems to be marked by a sort of partial “detachment” from former settlement space.

**841. UNPACKING THE PROTO-URBAN TURN: COMMUNITY COALESCENCE IN EARLY IRON AGE CENTRAL ITALY**

**Contribution format:** Oral  
**Contribution authors:** Marcello De Vos (Sapienza University of Rome | University of Groningen)

The so-called proto-urban turn is a well-documented phenomenon in central Italian proto-history; around the beginning of the Early Iron Age populations moved from small villages to larger settlements on naturally defended plateaus, that would eventually grow out to become city states. The process of centralization that is noted here is often studied within the context of urbanization, as a looming destiny of these sites, and less attention is paid to the matters of how and why these large settlements so suddenly occurred. To get a better grip on this question, it is important to study the process not as a prelude to urbanism, but as a phenomenon on its own, as population aggregation. The question then is, how can we archaeologically detect the ways and reasons of people coming together in these places? They surely did not start out with the idea of the perfect city in mind. In this paper, I will attempt to deal with this question based on the archaeological evidence from the area of Latium vetus. I will discuss examples of early settlement planning, changing burial customs and settlement strategies as potential clues for community coalescence and seek to gain a better understanding of the proto-urban turn as a social process.

**1738. THE RISE OF EARLY CITIES: NUCLEATION IN FIRST MILLENNIUM BCE CENTRAL ITALY**

**Contribution format:** Oral  
**Contribution authors:** Camilla Zeviani (Kiel University | University of Cambridge) – Simon Stoddart (University of Cambridge)

Recent research highlights the dynamic interplay between social resilience, demographic shifts, and ecological factors in shaping urban development. Drawing on Kopytoff’s internal frontier model and its application to 1st millennium BCE Etruria, this study investigates the mobility and settlement patterns that determined the success or failure of early urban centres. Integrating archaeological science with historical and cultural analyses, this research presents a multi-scalar approach to nucleation. By synthesising biological markers such as aDNA, isotopic analysis, and faunal remains with architectural and survey data, the study reveals patterns of population growth, mobility, and social cohesion. Findings indicate that urban resilience was maintained through social structures, ritual practices, and economic strategies that fostered demographic stability despite external pressures. A critical component of urban sustainability was the interdependence between urban centres and their rural hinterlands. This study employs big data modelling to assess agricultural potential and its role in supporting nucleated communities. While cities attracted new inhabitants through cultural and economic incentives, they also faced competition from peripheral settlements. The case of Etruria illustrates how dominant Etruscan cities outcompeted smaller centres and later transitioned under Roman influence through both coercion and integration. Additionally, this research underscores the impact of selective violence and disease in shaping urban life. Stress markers in human remains suggest that urbanisation was accompanied by significant social and biological challenges. By situating microhistorical case studies within broader demographic trends, this paper advances a comparative framework for studying nucleation processes in global contexts. This presentation will provide fresh insights into the mechanisms of urban resilience and their implications for understanding past and present urbanisation trends.

**255. POPULATION AGGREGATION, URBANISM, AND RESILIENCE DURING THE 1ST MILLENNIUM BC IN THE SOUTH-EASTERN ALPINE REGION**

**Contribution format:** Oral  
**Contribution authors:** Luka Gruškovnjak – Petra Vojaković (University of Ljubljana) – Sašo Porenta (Primož Stergar s.p.) – Agni Prijatelj – Helena Grčman – Branko Mušič (University of Ljubljana) – Barbara Horn (Gearh d.o.o.) – Matija Črešnar (University of Ljubljana)

The southeastern alpine region of present-day Slovenia began to see the advent of aggregated settlements around the turn of the 1st millennium BC, corresponding to the transition between the Late Bronze Age and Early Iron Age. The phenomenon is expressed in the decline of smaller Late Bronze Age hillforts and villages and the emergence of large hillfort settlements that seem to have acted as centres of surrounding territories. These settlements have long been the focus of landscape and settlement studies that revealed their central role within prehistoric landscapes. Until recently, however, there was not enough data on their internal organisation to allow us to study their structuring and lifeways within them. In this paper, we will present three sites where recent excavations and geoarchaeological research have allowed some critical new insights into the inner workings of such settlements: Ljubljana, Pungrt and Stična. We will explore the elements of daily lives, crafts, and the built environment

within them and discuss the implications of their urban structure and resilience demonstrated in their longevity for the political organisation of such settlements.

426. SETTLEMENT PATTERN CHANGE IN BELA KRAJINA, SOUTHEASTERN SLOVENIA: COMMUNITY COALESCENCE IN THE IRON AGE

Contribution format: Oral  
Contribution authors: Lucija Grahek (Institute of Archaeology ZRC SAZU, Ljubljana)

The dynamic shifts in settlement patterns during the Iron Age offer key insights into community coalescence and socio-political transformations. This presentation examines the changes in settlement structures in Bela Krajina, focusing on the processes of aggregation, centralization, and continuity. Through archaeological and interdisciplinary analyses, we explore how external influences and internal dynamics shaped the settlement landscape of this region. Recent research, particularly at sites such as Podzemelj and Vinica, revealed shifts in settlement organization, from numerous minor communities to two major, centralized, and fortified sites. These transformations are partly different from the Iron Age settlement pattern within broader southeastern Slovenia, where similar settlements became focal points of social, economic, and political integration. The evidence from burial practices, material culture, and settlement organization indicates increasing complexity, suggesting mechanisms of adaptation, resilience, and social restructuring in response to external pressures and intercultural interactions. Key findings highlight the role of natural geography, resource distribution, and cultural transmission in shaping settlement choices. The tradition of the Dolenjska Hallstatt cultural circle and Iapodian influences, as well as the impact of the Celtic Taurisci tribe, underscore the interconnected nature of Late Iron Age societies in Bela Krajina. Notably, variations in burial customs and architectural features at different sites reveal the negotiation of cultural identity and adaptation to new socio-political realities. By synthesizing archaeological data with advanced analytical methods, this research contributes to the broader discourse on community coalescence, exploring how small groups united into larger socio-political entities. These findings provide comparative insights for understanding similar processes across Bronze Age and Iron Age Europe, reinforcing the significance of settlement archaeology in tracing long-term cultural transformations.

2299. SETTLEMENT STRUCTURES AND SOCIAL COMPLEXITY IN CASTRO LANDSCAPES: COMPUTATIONAL APPROACHES TO HIERARCHY AND COALESCENCE IN GALICIAN IRON AGE HILL-FORTS, SPAIN

Contribution format: Oral  
Contribution authors: Santiago Tunas-Corzon (University of Cambridge | Spanish National Research Council)

The first millennium BC in north-western Iberia is marked by the absence of burials and open settlements. Hillforts, known in the region as castros, were the only form of occupation on the landscape for more than seven hundred years, from the 9th century BC until Roman domination. From a landscape perspective, the spatial analysis of these sites supports the idea that they were occupied by agrarian communities with egalitarian access to land, albeit with a constant concern for opposition and confrontation. Compared to other European Iron Age hill-forts, castros are much smaller: the vast majority have less than 1 hectare of enclosed area, and never exceeded 2 or 3 hectares during the Iron Age; it is only under Roman influence that this situation changes and larger castros between 5 and 20 hectares appear. The aim of this paper is to assess settlement structures in castro landscapes using a multi-scalar approach, both in terms of spatial extent (regional and local) and units of analysis (sites, households, artefacts). The results of rank-size analysis show that, in most cases, size variation follows a uniform or convex pattern, with only a few exceptions near the southern coast and border with Portugal, where dominant sites appear. However, other statistical methods focusing on households, such as Gini coefficients and Correspondence Analysis, allow for a more nuanced interpretation suggesting that larger castros are not internally different from smaller ones. In addition, this talk will also consider the utility of computer simulations based on models of entropy maximisation to identify areas of potential coalescence. In this case, it is possible to test whether aggregation into larger settlements happened due to internal developments, or as a response to an exogenous effect induced by Roman contact.

206 A PROFESSION IN FLUX: ARCHAEOLOGY. CONFORMITY VS NON-CONFORMITY, FEAR VS HAPPINESS ... HAS POPULAR CULTURE SOME ANSWERS?

Session theme: 4. De nobis fabula narratur: archaeological practice and a profession in flux  
Session format: Workshop  
Session keywords: Learning, Flux, Joy, Coping With Change, Collaboration, Profession  
Session organisers: Emily Plunkett (—) – Mark Spanjer (Saxion University)

SESSION ABSTRACT

Change is inevitable (indeed the only constant (Heraclitus)). Change is something we abhor and whilst simultaneously longing for, often uncomfortable but also sparking joy through creativity and excitement. Indeed to keep ourselves intellectually stimulated we seek change and challenges despite discomfort. However, this discomfort can often result in negative responses such as a loss of ‘leadership’ in favour of ‘dominance’, a retreat due to overwhelm, and don’t forget just plain tiredness. However, if we look at pop-culture influencers we find the following inspiration to counter our discomfort. For example as you change even small things “you start to believe in the future” and “change begins to accelerate” (Marie Condo). As such this workshop will posit that it is time to embrace discomfort, share our concerns, and follow Taylor Swift in admitting that (sometimes) “I’m the problem, it’s me”. And, lest we forget, enjoy each others company and the exchange of ideas. This workshop will allow space to talk about change, responses to that change, and encourage discussion about the joys and fears we experience as professionals. The workshop is an opportunity for the participants to share their experiences and raise awareness of the personal and collective needs/wants that fuel our professional culture. Discussion will be facilitated, via ‘speed dating’, interspersed with papers and feedback to encourage further discussion across two 2-hr sessions and will not be recorded or live streamed to allow a safe space for discussion. Part 1 – Small Fears. Part 2 – Joy and Nourishment. Papers are not invited for this format. Based on the cultural icons, the workshop will seek to better our community by focusing on our group psychology and positive ideas about selfworth. It will gather challenges and solutions from attendees which will form a ‘solutions kit’ which will be published following the conference.

207 PARTICIPATORY APPROACHES IN ARCHAEOLOGY AND MUSEUMS 20 YEARS ON FROM THE FARO CONVENTION’S ARTICLE 12

Session theme: 6. Intertwining archaeology, heritage, and museums  
Session format: Regular session  
Session keywords: participatory practices, evaluation, underrepresented demographics, sustainable business models  
Session organisers: Harald Fredheim (Department of Archaeology, University of York) – Marte Spangen (Museum of Cultural History, University of Oslo)

SESSION ABSTRACT

In 2005, the Faro Convention of the Council of Europe connected heritage to human rights and declared that “everyone, alone or collectively, has the right to benefit from cultural heritage and to contribute to its enrichment.” Article 12, in particular, declared that everyone should be encouraged to participate in identifying, studying, interpreting, protecting, conserving and presenting heritage. While there certainly have been many success stories of participatory practices in archaeology and museums, scholarship has also highlighted that participatory practices tend to operate at the periphery of heritage organisations, often delivered by staff on temporary contracts and funded through fixed-term project grants. 20 years on from Faro, this session invites papers that explore.

- the challenges archaeological and museum organisations face in attempting to embed participatory practices at the core of their work
- methodological approaches to evaluating participatory practices and evidencing the positive and negative outcomes for participants, staff, organisations, local communities and the sector at large
- equitable and creative approaches to ensuring everyone has equal opportunity to participate in archaeology and museums, professionally or voluntarily, with particular reference to source communities, indigenous groups, disabled people and other demographic groups underrepresented in the sector
- innovative ways of positioning participatory practices at the core of sustainable business models for archaeological organisations and museums

CONTRIBUTION ABSTRACTS

2007. HOW DO WE TRACE LONG-TERM PUBLIC PARTICIPATION? AN ANALYSIS OF NORWAY’S DIGITAL ARCHAEOLOGICAL ARTEFACT COLLECTIONS

Contribution format: Oral  
Contribution authors: Irmelin Axelsen (Museum of Cultural History, University of Oslo)

In many European countries, the public has long historical roots of participating ‘in identifying, studying, interpreting, protecting, conserving and presenting heritage’. At the same time, there is little quantifiable information about how the type of public participation detailed in Article 12 of the Faro Convention has developed or changed

before, and after, 2005. This is not surprising, as it is challenging to assess the extent of public participation in heritage institutions. The sources are complex and varied, rarely concerned with the who- or finder-component of, for example, an archaeological artefact’s find history, and only some are digitized and made easily available. In this paper I present some of the key findings from a study of Norway’s digital artefact collections. By comparing data about finds uncovered from the late 1700s to January 2024 I have attempted to trace the long-term practices and development of public participation in the country’s five archaeological museums. One aim has been to explore whether the catalogue texts can in fact aid in providing knowledge about any trends and changes to the public’s participation in collecting and handing in archaeological artefacts and information about the objects. Ultimately, I seek to answer the question: who are collecting archaeological objects, why and how, and, does that knowledge matter for future archaeological studies?

**620. THE FARO CONVENTION, LOCAL COMMUNITIES AND ARCHAEOLOGICAL HERITAGE: SOME REMARKS FROM THE LITHUANIAN PERSPECTIVE**

**Contribution format:** Oral  
**Contribution authors:** Justina Poskiene (Vilnius University, Department of Archaeology)

Lithuania has not acceded to the Faro Convention, although initiatives have been taken. In 2019, a study commissioned by the Ministry of Culture concluded that Lithuanian legislation is fully compliant with most provisions of the Faro Convention, and only a few, including Article 12, are partially compliant. The state system for the protection of cultural heritage (in operation since 2005) has most significantly shifted towards the ‘Faro spirit’ in the listing procedures, but with regard to the archaeological heritage, the role of experts remains central. There is a lack of representative surveys that would reveal the attitude of Lithuanian society at large towards the archaeological heritage. In 2024-2025, semi-structured interviews were conducted with representatives of local communities (under the LMTLT funded project no. S-VIS-23-13), the results of which are presented. It turned out, that the vast majority of respondents do not have a clear concept of archaeological heritage. Some communities place the archaeological heritage in the ethno-cultural tradition and associate it with mythological representations. A deeper understanding is characteristic of those communities whose active members deal (or have dealt) with heritage (in the broadest sense) in their professional activities. Communities that have an indirect interaction with the archaeological heritage (i.e. live “close to the heritage”) consider the archaeological heritage as important for the identity of the local community. Those whose members interact directly with the archaeological heritage (i.e. live “in the heritage”) have expressed that its protection can be an obstacle to local development and quality of life. Although the archaeological heritage is not the main focus of the communities surveyed, the presentation raises the question of how the perceived importance of the heritage and its relevance to people’s local identity can be seen as a potential for participatory practices in archaeological heritage conservation.

**799. CHALLENGE ACCEPTED: EMBEDDING PARTICIPATORY APPROACHES IN DUTCH ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Neelson Witte – Wim Burggraaff (Cultural Heritage Agency of The Netherlands)

Early 2024 the Netherlands signed the Faro Convention and the ratification process will start this year. But work on the Convention began in 2018. At the heart of the Dutch approach is a dynamic, inclusive network that brings together different stakeholders—from policy makers and museum professionals to volunteers and community representatives. We invited everyone interested in heritage to explore the meaning of the Faro Convention through open debates, research, and local dialogues. After three years of collaborative work, in 2022 the heritage sector itself drafted an agenda for more democratic and inclusive heritage practices. A participatory grant system allows network members to co-create and refine project proposals, with particular focus on reaching under-represented communities. In our paper we focus on the challenges of the participatory approach for the archaeological field. How can participation be placed at the heart of the archaeological process based on the Malta Convention? And how can participation in archaeology be organized alongside the formal archaeological process. In recent years we have supported several experiments that have sought to answer these questions. Projects that have experimented, for example, with the regulation for metal detecting and the ownership of private collections. We will discuss the impact of these initiatives on the infrastructure of cultural heritage policy and management.

**1158. AN ARTEFACTS ADVENTURE: FROM STORAGE TO THE STREETS**

**Contribution format:** Oral  
**Contribution authors:** Karla De Roest (Hunebedcentrum | Groningen Institute of Archaeology, University of Groningen)

In 2024, the Cultural Heritage Agency of the Netherlands introduced a grant scheme to examine how the newly implemented Faro Treaty functions in practice. One of the selected pioneering projects is based in Drenthe, a province rich in (pre)history. The Hunebedcentrum, a museum dedicated to archaeological education, initiated

the project in collaboration with volunteer organizations, the province of Drenthe, the University of Groningen, and the archaeological storage facility of the Northern Netherlands. At the Hunebedcentrum, volunteers, interns, staff, and individuals outside the regular workforce participate in the project. While the megalithic monuments attract many tourists to this rural region, many local residents are unaware of the deep history connected to the places where they live or shop. The project’s aim is not only to raise awareness by showcasing archaeological findings but also to foster local ownership of that past. The project manager seeks to facilitate decisions without imposing them on the communities. Temporary exhibitions, driven by local choices, are organized by all municipalities. Residents will be offered the opportunity to visit museums, assist in research facilities, and explore the storage depot. Communities are encouraged to create lasting mementos, such as hiking routes, sculptures, and websites. This approach not only promotes heritage awareness but also stimulates tourism, a vital source of income for the region. However, embedding participatory practices presents several challenges. A key question is how to balance expert authority with community-driven perspectives. The Cultural Heritage Agency and the province require a best-practice guide as outcome of the three year running project. Issues related to authority, professionalism, ownership, diverse identities, and community building are central, as well as how to engage underrepresented groups and overcome barriers such as language, physical access, and socioeconomic constraints. The Hunebedcentrum and its partners strive to enhance public engagement with archaeology and create close-knit communities.

**139. REDEFINING COMMUNITY PARTICIPATION IN HERITAGE: REFLECTIONS FROM ETHNOGRAPHIC AND CITIZEN SCIENCE METHODS**

**Contribution format:** Oral  
**Contribution authors:** Aijia Mu (University of Oulu)

Over the past two decades, public involvement in heritage—especially since the Faro Convention—has attracted growing interest from scholars, community members, and government agencies. Understandings of why communities should participate and how they might do so have continued to develop. However, many researchers still observe that heritage participation remains limited, underscoring the need for more effective methods. Responding to this concern, this paper explores how Ethnographic Methodology and Citizen Science can foster participation in the context of industrial heritage management, using the Wangshiao Coal Mine as a case study. Established in 1961, Wangshiao was once China’s largest and earliest coal mine, underpinning the nation’s industrial growth. It closed after six decades, and in 2016 was converted into a heritage site. Drawing on ten go-along interviews with twelve local residents, alongside a photographic exhibition contributed by over twenty community members, this paper examines the extent of community engagement. The findings suggest that local residents were more deeply involved than officials had anticipated. They demonstrated strong emotional connections to the site, expressed the wish to remain there for the rest of their lives, and shared vivid memories of its remarkable past. This research highlights the value of refining participatory methods to capture local perspectives and strengthen the bond between communities and their industrial heritage.

**1143. ACTIVATING MUSEUM COLLECTIONS – EXPERIENCES FROM MANAGING ARCHAEOLOGICAL COLLECTIONS AT THE MUSEUM OF CULTURAL HISTORY, OSLO**

**Contribution format:** Oral  
**Contribution authors:** Dag Erik Olsen – Silje Mathisen – Kathryn Sæther – Hanne Lovise Aannestad (Museum of Cultural History, UiO)

This presentation will first discuss how the physical and organizational structures of archaeological museums make involving the wider community difficult, as seen from the Museum of Cultural History in Oslo. This is especially relevant for implementing Article 12 of the Faro Convention as museums today are seldom built for public interactions with the collections in storage. We will also show some of the steps taken by the Museum of Cultural History to involve a wider part of the demographic within the possibilities and constraints of the museum. We have an increasing number of requests for visiting the collections from different demographic and occupational groups. Various types of public engagements through guided tours, visits to view archaeological object etc. has become a larger part of our work and is also an important part of communicating our collections. However, few of the staff do this work and is mostly done in a small scale. An example is participating in an art film project that seeks to challenge archaeological interpretations of the earliest invented tools since most organic matter is long gone and all we have left is the stone material. The artist visited and filmed our collections and discussed the subject with archaeologist. The result will be a documentary offering a different perspective on how we can interpret archaeological data from a non-archaeologist’s perspective. This will be screened at film festivals reaching a wider audience than normally. As more focus is directed towards activating the knowledge potential in our collections, bringing people into the museum and storages becomes a valuable way to engage a wider community and is something we will continue doing in the future. This helps legitimize our public mandate, but the work must be further founded in the organization, making this a priority within cultural heritage management.

618. LESSONS FROM EMBEDDING PARTICIPATORY PRACTICES IN BRITISH AND NORWEGIAN MUSEUMS

Contribution format: Oral  
Contribution authors: Harald Fredheim – Stella Basinyi (University of York)

Academic literature on heritage management recognises that sustainable safeguarding of heritage is reliant on support from local communities (UNESCO 1999; Agnew & Demas 2014; Clark 2014; Chitty 2017; Jokilehto 2017; Doyle 2018). Within this context, Nina Simon’s The Participatory Museum is widely celebrated as an example of embedding participatory practices in museums (2010). However, writing about attempts to implement such participatory approaches in UK museums, Bernadette Lynch notes that museums’ participation and engagement work stubbornly remains at the margins of museum practice, often delivered by staff on temporary contracts funded by fixed-term grants (2011; 2015). In this paper, we will present the results of a survey and interviews with museum staff in the UK and Norway about how embedded participatory practices are in their museums. The survey was based, in part, on the Power to the People framework for self-assessment, developed by the Museums Association (2019), which allows museum to assess how embedded participatory practice is in relation to their museum’s mission and values, leadership, decision-making, funding, recruitment, professional development and evaluation. We will highlight challenges museums face in embedding participatory practices, how they work to address these and the lessons that can be learned by archaeological organisations looking to embed participatory ways of working.

208 BRIDGING THE GAPS: MULTI-, INTER- AND TRANSDISCIPLINARY APPROACHES TO ANCIENT EGYPTIAN SETTLEMENTS

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: domestic contexts, urban settlements, ancient Egypt  
Session organisers: Eva Calomino (Center of Studies of Ancient Near Eastern History, UCA) – Uroš Matić (Institute for Classics, University of Graz)

SESSION ABSTRACT

It is well known that in Egyptian archaeology, settlements have received comparatively less attention than temples and tombs. This is due to the dominance of the philological fraction within Egyptology mostly interested in carries of texts that can be found in the latter. The prioritization of funerary pharaonic contexts and architecture in historical and archaeological research in Egypt to the detriment of interest in the study of settlements and domestic contexts, prior to the 1960s, led to little care in precise recording of the provenance of finds related to the everyday life. Although this gradually changed to the better, settlements are still not receiving the same attention as other monuments. Notwithstanding this, the current excavations mainly in the settlements of the Egyptian Delta and in some specific sites in Upper Egypt, such as Tell el-Amarna, Dendera, Edfu, Kom Ombo and Elephantine, give priority to the reconstruction of the daily life of its inhabitants in pharaonic periods. Advances in methods of excavation, documentation and study of settlement architecture and small finds allow for novel research questions to be asked. Following on these recent advances, this session aims to address multi-, inter-, and transdisciplinary approaches to the study of domestic contexts and settlements in ancient Egypt, and seeks to describe, complement and create ways of interpreting the activities carried on in such spaces from the study of objects and structures. We welcome papers from various contexts and from all periods of ancient Egyptian history and surrounding areas (e.g., Levant and Nubia) that contribute to a greater understanding of the urban areas and domestic spaces.

CONTRIBUTION ABSTRACTS

85. THE PIT SITE PARADOX: PERSPECTIVES ON GRAIN STORAGE AND THE STATE IN ANCIENT EGYPT FROM THE NEOLITHIC TO THE OLD KINGDOM

Contribution format: Oral  
Contribution authors: Daniel Alonso-Naranjo (Universitat Autònoma de Barcelona (UAB)) – Víctor Jiménez-Jáimez (Universidad de Málaga (UMA))

In European archaeology, pits are often interpreted as airtight grain storage facilities. Conventional wisdom holds that large concentrations of pits in a particular region are indicative of a substantial agricultural surplus, one that could be readily appropriated by elites for redistributive purposes. Contrary to this, the present paper introduces the notion of the ‘pit site paradox’: the more control a ruling class exerts over surplus, and the greater

the redistributive demands of the state apparatus, the fewer pit sites appear in the archaeological record. We test this hypothesis by examining the role that simple sealed pits may have played in systems of bureaucratic redistribution. As a case study, we draw on evidence from Egypt before, during, and after the emergence of state-level institutions. The Egyptian data show a clear correlation between increasing socio-political complexity and the gradual demise of dedicated pit storage areas, in support of the pit site paradox.

2423. THE IMPORTANCE OF HUNTING AND HUNTERS IN PREDYNASTIC EGYPTIAN SETTLEMENTS. AN ETHNOARCHAEOLOGICAL PERSPECTIVE

Contribution format: Oral  
Contribution authors: Sebastián Maydana (Universidad de Buenos Aires)

It is a generally accepted fact that hunting as an economic activity was already negligible among Nile Valley communities by early Predynastic times (ca. 3900 BCE). This statement is supported by archaeological as well as archaeozoological evidence, but the contemporary iconographic record seems to point in a different direction. Indeed, hunting imagery in varying forms is one of the most common topics of the Predynastic image corpus. Why are hunting and hunters so prominent in the Predynastic visual discourse, yet so inconspicuous in the material culture of Predynastic settlements? Drawing on the available archaeological evidence from Upper Egyptian settlements, and using the important tool of ethnographic analogy, here I propose that it is precisely the rarity of hunters that grants them a relevant status within Predynastic settlements during the Naqada Period. The specific craft and skill required to track and hunt wild animals, possessed only by a select few within settlements with agriculture and herding as their main economic activities, became essential during the frequent dry spells of the Nile and whenever wild animals threatened these riverine peoples’ lives, crops and herds. I would like to explore the possibility that such momentary instances of aggrandisement could have, under the right socio-cultural circumstances, been extended or even made permanent by particularly resourceful individuals. Are the hunters depicted in rock art, pottery and elite artefacts the same leaders that turned Egypt into a unified state society, or did the latter appropriate the symbols and imagery of a prestigious but antiquated group of people?

250. UNSETTLING THE NARRATIVE: TOWARDS A MORE HOLISTIC UNDERSTANDING OF SETTLEMENTS IN NORTHERN SUDAN

Contribution format: Oral  
Contribution authors: Chloë Ward – Julia Budka (LMU Munich)

Like Egypt, archaeology in Sudan has long been biased towards mortuary sites, in part because of the historical influence of Egyptological practices and Eurocentric perspectives. However, significant interdisciplinary and cross-cultural work has started to address this imbalance and re-centre both Sudan and settlements in the archaeology of the Nile Valley. This talk will draw on examples from northern Sudan during the Bronze Age, including so-called temple towns in Nubia, and smaller more ephemeral sites being investigated by the DiverseNile project. Such settlement sites have considerable potential in reaching a more comprehensive understanding, not just on daily life in Nubia at the time, but also of the complex interactions between different groups of people which have often been oversimplified in archaeological narratives. As well as showcasing ongoing interdisciplinary work, this talk will address the important, if problematic, legacy of past archaeological research on methodological and interpretative work today. From a more theoretical perspective, the bias towards mortuary sites, and limited engagement with what can constitute ‘urban’ sites in the Nile Valley, means that many Sudanese settlement sites have not been properly integrated into research on urbanism in the region, let alone in archaeology more broadly. Through examples of sites in northern Sudan, it is clear that existing models of urban sites and their hinterlands, such as core-periphery models, offer a limited perspective on the complexity of these regions. Only by de-centring such narratives, as well as fully integrating past research, data, and ongoing work, is it possible to reach a more holistic understanding of settlement archaeology in the Nile Valley.

1099. RETHINKING ROYAL PROMINENCE: FOOD STORAGE, PRODUCTION, AND CONSUMPTION IN MIDDLE KINGDOM SETTLEMENTS

Contribution format: Oral  
Contribution authors: Leah Neiman (Brown University)

The Middle Kingdom (c.2050-1750 BCE) has produced a proliferation of archaeologically attested settlements that have been traditionally taken as evidence for the direct involvement and authority of the king in shaping the daily lives of Egyptians. Integral to such narratives is the assumption that Egyptians were dependent on grain distribution by a centralized royal administration. This paper investigates archaeological evidence for food storage, production, and consumption at Middle Kingdom settlement sites across the Nile Valley. This study present results from an ongoing doctoral dissertation project that challenges assumptions about the totality of royal power and its omnipresence in daily life within Middle Kingdom settlements by approaching the study of

settlements as, first and foremost, locally specific phenomena. Spatial analysis of the organization of storage structure and food production activities at multiple settlements supports the hypothesis that inhabitants engaged in subsistence activities and modified architecture in ways that reflect their immediate social, political, and environmental factors rather than external direction from the royal administration. This paper demonstrates that taking a data-driven, archaeological approach to understanding the evolution of Middle Kingdom settlements allows patterns to emerge that attest to ways of life without being filtered through the lens of kingship – either by ancient records or modern scholars.

1556. PESTS, FLIES, AND ISLAND LIFE - INSECT FAUNAS FROM ELEPHANTINE

**Contribution format:** Oral  
**Contribution authors:** Eva Panagiotakopulu (School of GeoSciences, University of Edinburgh) – Johanna Sigl (Kommission für Archäologie Außereuropäischer Kulturen – KAAK, Bonn)

Urban settlements in pharaonic Egypt unravel unique details about everyday life. From eroding mudbrick to accumulation of material on floors and from activity areas to storerooms, the unique preservation by desiccation in the Nile Valley allows for detailed examination of fossil insect assemblages from a variety of different sealed contexts from pharaonic settlement. Recent research from the end of the Middle Kingdom, c. 1800 BC, settlement at Elephantine Island in the Nile, at Aswan in Upper Egypt, provides information about a range of different pests, with the endemics *Alphitobius diaperinus* and *Musca domestica* being the dominant species in the assemblages. Other taxa point to the environmental conditions around the site, and resource availability, with evidence for taxa associated with crops and meat. Introductions as a result of trade are also evident from the faunas of the settlement. Comparison of the insect faunas from Elephantine with earlier and later insect records from Egypt provides information as to how the evolution of the insect faunas can give insights into environmental change and resource change in the Nile Valley.

1722. SEALING AND FLINT KNAPPING NEAR THE TEMPLE – ACTIVITIES IN THE SETTLEMENT AREA IN KARNAK NORTH

**Contribution format:** Oral  
**Contribution authors:** Alexander Haidegger – Jelena Gvozdenovic (University of Vienna, Department of Egyptology) – Irmgard Hein (University of Vienna, Department of Egyptology; VIAS - Vienna Institute for Archaeological Science)

Compared to the well-known temple complex at Karnak in Upper Egypt, the settlement remains within and around the complex have received little attention in Egyptian archaeology. Unlike the stone remains of the sacred buildings, they are made of mud bricks and represent either urban residential areas or facilities associated with cultic activities. In the area of Karnak North, the IFAO conducted excavations from 1968 to 1992 and revealed a building of Thutmose I, that can be linked to the institution of the Per-Hedj (“treasury”). This structure is cutting in a multi-phase settlement contemporary with the incipient building stages of the temple. Earliest strata dating to the late Middle Kingdom/early Second Intermediate Period imply the performance of agricultural labour and sealing activities exhibited by seal impressions mainly deriving from a single locus. The IFAO mission ‘Karnak North - the Archives’ (AP 17223), in collaboration with the University of Vienna, aims to complete the recording of finds from these earlier excavations and was carried out from 2013 until 2024. In course of this archival work inventories of seals and sealings have been examined in depth for the first time. Chipped stone tools and macro-lithic objects have been analysed by standards that can be encountered in prehistoric archaeology. The state of documentation left by the former excavators made reconstruction of their respective contexts difficult, however, available records have been converted to computational formats under aid of software like AutoCAD and QGIS, thus enabling more advanced spatial analysis. Within this paper we demonstrate the evidence obtained from seal impressions and stone tools together with re-evaluation of already published data. The interpretation provides new insights into administrative activities and institutionalised domestic tasks that have been performed in the vicinity of the primordial sanctuary of Amun-Ra.

220. STREETSIDE BENCHES IN ANCIENT EGYPTIAN SETTLEMENTS OF THE MIDDLE KINGDOM AND SECOND INTERMEDIATE PERIOD

**Contribution format:** Oral  
**Contribution authors:** Uros Matic (University of Graz)

Despite the increased archaeological focus on the study of ancient Egyptian settlements from various periods, streets in these settlements have often remained overshadowed by studies concentrating more on the interiors of buildings. This is likely due to the false assumption that streets in ancient Egyptian settlements were merely transitional spaces—passages where little activity occurred. However, this view is contradicted by textual sources that suggest streets were vibrant spaces of dynamic social interaction, including activities such as sex-work

and robbery. This paper challenges the notion that ancient Egyptian streets were merely transitional spaces by examining archaeological evidence for streetside benches in Middle Kingdom (ca. 2055-1650 BCE) and Second Intermediate Period (ca. 1650-1550 BCE) settlements such as Abu Ghalib, Tell el-Daba, and Elephantine. An interdisciplinary approach, incorporating the archaeological study of the distribution, size, and materiality of streetside benches, space syntax analysis, and ethnographic studies of street activities and the use of benches in modern rural Egypt, will shed new light on the nature of ancient Egyptian street life.

2325. CONNECTING SETTLEMENTS AND ROYAL MONUMENTS IN NEW KINGDOM THEBES

**Contribution format:** Oral  
**Contribution authors:** Linda Chapon (University of La Laguna (Tenerife))

Since the birth of the discipline, much Egyptological research has indeed focused on temples and tomb contexts, also because they are the best-preserved archaeological contexts in Egypt. However, much recent research has dealt with settlements and their interrelation with other key elements of landscapes and royal edifications, such as temples, tombs, and palaces. The buildings and groups of sites form a network where landscapes can be understood as the interrelation of all these elements. Landscapes are created through time and space and result from many factors, such as people, geographical location, and specific historical events. They reflect different aspects of the social, economic and political organisation, including ideological and religious aspects. This paper aims to approach the issue of settlements from the perspective of the intrinsic relationship and interconnections between royal edifications, such as temples, tombs and palaces and daily life in settlements, including more exceptional activities, such as those occurring in festivities. This also included the way the settlements were organised socially and architecturally. There has been much debate around the role of temples as key points of the space organisation. Indeed, there is evidence, for example, from the Old Kingdom that royal monuments were the focus of highly centralised economic and administrative organisation. The issue is understanding how settlement and cult buildings were interrelated and intermingled, how and when they were formed and how they depended on each other. This paper will focus on New Kingdom Thebes, reassessing current knowledge on the field and seeking to decompartmentalise the often too narrow artificial categories created by the discipline between temples, settlements and other archaeological contexts. The aim is to get closer to the living realities of the Theban population living and working at and around royal foundations on the East and West Bank of the Nile.

363. TELL EL-GHABA’S TOWER HOUSES: UNVEILING THE SIGNIFICANCE OF ARCHITECTURAL ANALYSIS BEYOND SACRED AND FUNERARY CONTEXTS

**Contribution format:** Oral  
**Contribution authors:** Alicia Flores Martín (Independent)

Tower Houses are a unique architectural form that became particularly prominent in Lower Egypt, though they were not limited to this region. Two notable examples of such structures have been uncovered at Tell el-Ghaba, an archaeological site in North Sinai dating to the Third Intermediate and Saite periods. Throughout the history of Egyptology, architectural studies have primarily concentrated on temples and tombs due to their monumental nature and state of preservation. In contrast, the limited remains of domestic and administrative structures present significant challenges for research. However, a deeper investigation into these lesser-known buildings is essential, as they provide valuable insights into the daily life and social organization of ancient Egyptian communities. By establishing a comparison between the tower houses of Tell el-Ghaba and similar structures found in Lower Egypt and beyond, this study aims to analyze their architectural characteristics, functions and historical context to reassess their role within Ancient Egyptian settlements. The Argentinian archaeological mission began to work at Tell el-Ghaba in 1995. Throughout the campaigns carried out between 1995 and 2010, they produced several publications related to their extensive findings, including the Tower Houses. These volumes, along with other key works on non-funerary architecture, offer a solid basis for a comparative analysis of the tower houses that have been identified in different areas of Egypt. The investigation of the tower houses of Tell el-Ghaba within a comparative framework provides us with a better understanding of their function and significance, offering valuable insights into the architectural and cultural history of Lower Egypt and the Delta region.

161. BEYOND CERAMIC OBJECTS: THE CLAY FIGURINES FROM TELL EL-GHABA (NORTH SINAI, EGYPT)

**Contribution format:** Oral  
**Contribution authors:** Eva Calomino (Center of Studies of Ancient Near Eastern History, UCA)

While interest in the study of domestic contexts in Ancient Egypt is growing, primarily resulting in the organization of more specific scientific meetings and sessions on Household Archaeology and Settlement Archaeology, studies focused on urbanism, cities, and housing have not been systematic or comparative. Likewise, activities related to the various external and internal spaces of dwellings and domestic-administrative constructions have not yet been the subject of detailed and exhaustive study. This scenario becomes even more complex when

considering the historical-archaeological evidence of Lower Egypt during the 12th to 6th centuries BCE (ca. Third Intermediate Period-Early Saite Period), periods that have been scarcely addressed in Egyptology in general. At the same time, due to their nature, they provide an excellent opportunity to study these topics. As a way to contribute to the understanding of domestic activities in ancient Egypt, this study presents a comprehensive analysis of the clay figurines found in the urban settlement of Tell el-Ghaba (North Sinai, Egypt). Evidence indicates that this site was occupied between the mid-Third Intermediate Period and the early Saite Period and that its structures were likely the setting for a variety of daily activities. Among the small finds circulating in these activities were figurines made from different materials. This paper focuses on those made of clay, examining their manufacture, characteristics, classification, provenance, function and possible comparisons with others parallels findings from the Egyptian Delta and the Eastern Mediterranean region.

174. FROM ARCHIVES TO 3D RECONSTRUCTION: RECONSTRUCTING THE PTOLEMAIC PATHYRIS

**Contribution format:** Oral  
**Contribution authors:** Aneta Skalec – Wojciech Ejsmond (Institute of Mediterranean and Oriental Cultures of the Polish Academy of Sciences) – Jakub Stępnik (Faculty of Archaeology, University of Warsaw)

The urban settlements of Ptolemaic Egypt, particularly those in Upper Egypt, remain poorly understood due to several challenges, including the scarcity of published results from previous investigations, the continuous occupation of ancient sites, and the destruction of many archaeological remains. Nevertheless, valuable information can be gleaned from archival documentation combined with contemporary fieldwork—an approach this paper seeks to highlight. Pathyris, a town located approximately 30 km southwest of Luxor in the Gebelein micro-region, served as a garrison headquarters and the capital of the local nome during the 2nd and early 1st centuries BCE. It has been studied by several scholars, including Eugène Grébaut (1891–92), Georg Willoughby Fraser (1893), and Ernesto Schiaparelli (1910-1920), among others. Recent efforts by the Ptolemaic Pathyris Project team to reconstruct the settlement’s layout and residential architecture draw heavily on archival sources, primarily unpublished materials from Italian excavations conducted in 1910, and papyrological documents discovered in the town’s ruins. Archival photographs have also been instrumental in refining the reconstruction and providing insights into the site’s appearance during the early 20th-century excavations. A key outcome of this work will be a 3D reconstruction of Pathyris integrated into the site’s Digital Elevation Model (DEM). This interdisciplinary approach not only deepens our understanding of the settlement’s urban planning but also offers a unique perspective on Pathyris’ topography through the eyes of its inhabitants, particularly those who are often under-represented in historical narratives. Papyri provide valuable details about the typical elements of houses, the names of districts and streets, and even the ownership of specific residences, offering glimpses into the lives of the town’s residents. These data will be incorporated into the 3D visualization of the town, creating a vivid and immersive representation of this ancient settlement.

391. PLACES IN TIME: EXPLORING TIME THROUGH ATTACHMENT TO DOMESTIC SPACES AT AMARNA AND NIPPUR

**Contribution format:** Poster  
**Contribution authors:** Alexis Green (Monash University)

Tell el-’Amarna and Nippur are among some of the most extensively excavated archaeological sites across Egypt and the Near East. Despite stark differences in settlement duration, ongoing excavations demonstrate how further work is necessary to fully understand their histories. A review of associated excavation documentation reveals how that duration is often treated as a purely archaeological construct. This construct, or ‘archaeological time,’ often sets up the bigger picture/history of a site but may not fully reflect the occupational or ‘lived time’ experience. So how can we investigate this? One starting point is to use interdisciplinary concepts as productive complements to traditional archaeological analysis. For example, place attachment. Drawing on environmental psychology, this refers to the affective bonds between people and places, developed through habitual action over time, and generating material, social, and emotional meaning. Such places can be of any scale, from an entire city to a single house or room. Understanding how people interacted with domestic space over time, and the attachments this may have generated, could provide key insights into lived time. This poster aims to address archaeological and lived time in reference to domestic contexts. It explores the potential applicability a select interdisciplinary concept for settlement archaeology, and in studies of past persons and their built environments generally.

209 CELTS OF THE EAST: A METHODOLOGICAL APPROACH TO UNDERSTANDING CELTIC PRESENCE IN THE DANUBIAN AREA

**Session theme:** 8. Along and across the Danube!  
**Session format:** Regular session  
**Session keywords:** Iron Age, Celts, Identity, South-eastern Europe, Migrations  
**Session organisers:** Kevin Parachaud (Traces - UMR 5608 (associated member)) – Bianca Miranda Cardoso (Leicester University)

SESSION ABSTRACT

In the history of research on Celtic Europe, southeastern Europe—particularly the Danubian regions—holds a place of primary importance. It was these “Celts of the East” who attacked Greece and Macedonia, and from this area that Brennos’ forces launched their attempt to plunder the sanctuary at Delphi in 279 BCE, as well as those who extended Celtic expansion to the Anatolian plateaus. According to the current research paradigm, these Danubian Celts are themselves considered non-native, with their presence in this region resulting from various population movements across the Celtic world, as recorded in historical sources. Archaeologically, these Celtic presences in southeastern Europe have been associated with the spread of La Tène material culture in these same regions. However, there is a dual epistemological issue in the way we study Celtic dynamics across Europe. On the one hand, we tend to view latenian remains as direct indicators of Celtic identity, which is problematic as material culture cannot be equated with the identity of its bearers. On the other hand, we often interpret archaeological evidence through phenomena attested by ancient authors, running the risk of subordinating our data to ancient literature. In this session, we aim to develop a methodologically focused approach. To refresh current discussions—where La Tène material culture and Celtic presence are often linked without sufficient evidence of causation—we propose to explain methodologically why, how, and within what limits we can move from correlation to causation, examining Celtic presence through archaeological data. This session will also invite a critical retrospective on the prevailing historiographical model concerning Celtic presence in southeastern Europe.

CONTRIBUTION ABSTRACTS

1664. ‘THERE AND BACK AGAIN’: LOOKING AT THE ‘CELTIC BALKAN MIGRATIONS’ BEYOND THE ETHNO-DETERMINISM

**Contribution format:** Oral  
**Contribution authors:** Vladimir Mihajlovic (University of Belgrade-Faculty of Philosophy)

It has been almost 20 years since Danijel Džino questioned the ancient literary narrative of massive Celtic migration to the Southeastern Europe, calling for the abandonment of ‘Brennus model’ and reconsideration of the 4th–3rd c. BCE events in the Balkans. Since then the ‘Celtic migration’ has been also reviewed from archaeological perspective, with scholars from the whole region trying to reassess the issue. The proposed views range from piecemeal colonization; through fusing of autochthonous and immigrant groups; through spread of La Tène material culture within the essentially native population; to ideological, social and cultural dynamics that transformed local communities without the large-scale population shift. Whereas the formerly held explanation of the Celts sweeping through the Southeastern Europe is not as dogmatic as it was, the question remains if this scenario is contested beyond the cursory acknowledgement that the situation must have been ‘more complex than previously thought’. In other words, despite the attempts at new models, most of the regional archaeologists have not renounced the traditional ethnodeterminism, but still actively use it, albeit less explicitly. The categories of the ‘Celts’ as clearly distinguishable people, and the ‘Scordisci’ as Celtic tribe that settled the south Pannonia and the Central Balkans, still features prominently in interpretations of the Late Iron Age material culture. The critiques of reductive and biased nature of such position, as well as the addressed evidential difficulties in sustaining this standpoint are simply being ignored, without offering any counterarguments. For these reasons, building on the previous theoretical and methodological considerations, I will try to further elaborate the alternative interpretational framework by using new and recently published archaeological evidence. I will pay particular attention to transitional period from the Early to Late Iron Age (4th–3rd c.), and revisit data coming from settlements, funerary sphere and bioarchaeology.

1872. GALATIANS – BIASED CHOICES IN INTERPRETATION AND WHAT WE ACTUALLY KNOW

**Contribution format:** Oral  
**Contribution authors:** Bianca Miranda Cardoso (University of Leicester)

The fact that Galatians who settled in Anatolia during the Hellenistic did not produce texts themselves and about themselves is a complicating factor in researching their identity. Literary evidence can hardly be ignored in

humanities, but it also presents its own challenges in interpretation, particularly when it is used to guide archaeological interpretation. The analysis of Greek and Roman texts that mention the Galatians has shown that when ancient authors called them Galatians, rather than Celts or Gauls, that might have been exactly what they meant and it should not need cultural translating. Interesting choices seem to have been made both by the ancient writers and by modern translators. Some of those choices have led to beliefs that ended up being taken as historical and academic consensus about who the Galatians were, particularly when it comes to ethnicity. Attempts to correct the terminology used by ancient writers might have actually made things more confusing than they needed to be because of racialised ideas that might have not even existed in antiquity. This presentation will share some results of my research on Galatian identity by looking at the original terms used by Greco-Roman writers to refer to Galatians, the choices made in the translations of those terms, and comparing them to accounts of the Galatian elite. The objective is to question what we understand as apparent consensus about the Galatians.

1516. THE CELTIC INFLUENCE IN CITIES OF THE NORTHERN BLACK SEA: THE EASTERNMOST FINDS OF LA TÈNE GLASS BRACELETS

**Contribution format:** Oral  
**Contribution authors:** Anzhelika Kolesnychenko (Institute of Archaeology of the National Academy of Sciences of Ukraine | The Cyprus Institute)

In the region between Lower Danube and the Southern Buh (Northern Black Sea region) the Celtic influence is becoming increasingly evident, as demonstrated by the growing number of archaeological finds. Among these discoveries are glass bracelets, which have been found in two key Greek cities: Olbia and Tyras. Until recently, the list of finds comprised: one bracelet fragment from Olbia and four from Tyra. (A. Ostroverkhov). Further research expanded the known sample of bracelets from Tyras and Olbia. To date, 11 fragments have been recorded from Tyras, likely representing eight distinct bracelets. The number of known Olbian finds has increased by two new specimens. These bracelets are different typologically and are made from different types of glass. Most are composed of dark blue glass, while one is crafted from clear glass with a faint yellow tint. They are typically decorated with yellow, white, and blue glass. With these discoveries, Olbia and Tyras mark the easternmost extent of ‘Celtic-type’ glass bracelets. This provides clear evidence of significant La Tène cultural influence in the Northern Black Sea region. However, the nature of this influence remains debated — whether it resulted from the direct physical presence of Celtic groups or from the movement of objects rather than people. The sharp increase in high-quality glass bracelet finds suggests a brief yet intense period of direct interaction.

1768. THE CURIOUS CASE OF THE “ILLYRO-LATENIAN” FIBULAE FOUND IN GREECE

**Contribution format:** Oral  
**Contribution authors:** Kevin Parachaud (TRACE -Toulouse)

This presentation explores an intriguing archaeological phenomenon: the presence of so-called “Illyro-Laténian” fibulae at several sites in mainland Greece, including Delphi, Thisbe, and Medeon of Phocis. These artifacts, although strongly inspired by La Tène models from Celtic Europe, reveal a cultural hybridization characteristic of the Balkans and more specifically the Illyrian area. Typological analysis distinguishes two sub-groups within this corpus. The first exhibits typically Illyrian features, while the second reflects technological and morphological influences from La Tène productions, with decorative elements imitating the characteristic bilateral springs. These distinctions point to a complex dynamic of cultural and technological transfers between Illyrian and Celtic worlds. Beyond their typology, the geographical distribution of these fibulae interrogates the existence of possible networks of goods circulation connecting the Balkans to mainland Greece. The discovery of such pieces on Greek sites, sometimes in sacred contexts, raises questions about their use. This study contributes to a better understanding of cultural interactions between the northern and southern Balkans during the 4th and 3rd century BC. It also demonstrates how the archaeology of adornments can offer valuable insights into cultural contact between Celts, Illyrians and Greeks in the south-eastern Europe.

1451. THE LATE LA TÈNE HORSEMEN WARRIORS OF THE SCORDISCI – POWERFUL SOCIAL AND IDENTITY GROUP IN THE SOUTH-EASTERN CARPATHIAN BASIN

**Contribution format:** Oral  
**Contribution authors:** Marko Dizdar (Institute of Archaeology, Zagreb)

During the Late La Tène phase in the south-eastern part of the Carpathian Basin various items of horse harness were found. This represents a change compared to the Middle La Tène when rare items of horse harness were found. Numerous and diverse items appear most often in the Late La Tène settlements of the Scordisci, while they are very rare in the graves in which on a symbolic level represent the buried warrior as a horseman. Important for the study of Late La Tène horse harness (LT D1) are the finds discovered in Veliki Vetren in south-western Serbia and in the probable context of a ritual site or sanctuary in Osijek in eastern Croatia. Also, can be added finds from

the Mlava river valley in northern Serbia, as well as numerous finds from settlements in the Vinkovci region in eastern Croatia. Along with iron horse bits of the Type XVI, different buttons, separators and buckles made of copper alloy appear. The diversity of the finds as well as the uniqueness of the form indicate that these are products of local workshops. For iron bits, analogies are known in the area of the Padea-Pangjurski Kolonii group, where these items are found in prominent warrior graves, which represents a difference compared to the graves of the Skordisci. For some items (buttons, separators), analogies are found in the south-eastern Alpine region and Central Europe, which indicates social connectivity between the Late La Tène warrior elites. The finds of horse harness at the sites of the Skordisci indicate the importance of Late La Tène horsemen warrior elite who had a prominent role and social importance in local communities. This was confirmed by the ancient sources which described the Scordisci as excellent horsemen warriors who rode horses all the way to the southern Balkans.

210 BURIALS AND TRANSITIONS IN THE MIDDLE AGES

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Archaeothanatology, Transition Periods, Burials, Mortuary practice  
**Session organisers:** Stefan Eichert (Natural History Museum Vienna) – Mária Vargha (University of Vienna) – Ivo Stefan (Charles University Prague) – Nina Richards (Natural History Museum Vienna | Austrian Academy of Sciences)

SESSION ABSTRACT

Burial archaeology, archaeothanatology and connected research such as bioarchaeology, history, material culture or social anthropolog. are particularly interesting and important in, respectively, for times of transition. Societies - just like individuals - are more or less never in a state of equilibrium/homeostasis, and burial customs evolve over time. However, in times of significant transitions these changes might be reflected stronger and manifest more in mortuary practices. The topic this session wants to address i. how we can identify significant changes in burial customs and discuss their possible interpretations in connection with transitions in/of the actors behind the burials, be it on an individual, . local. or on the level of entire communities. Such developments occur throughout human history. However, this session focuses on the Middle Ages in Europe. Accordingly, the session focuses on themes of transitions of unclear impetus, like the change from cremation to inhumation burials in various populations, such as with Slavic “newcomers” in many parts of Europe in the later Early Middle Ages, where it could be connected either to religious reasons or other social evolvements. Another example could be the examination of the social/religious/cultural reasons for the end of the “Reihengräberfelder” in the Merovingian sphere or the ever-ongoing debates about any social transitions that can be made responsible for the end of grave furnishings in the Christian churchyards at the end of the early Middle Ages in the Eastern Alps, where, until the 11th c., at least jewellery was a common find in graves. . While the examples address themes of broad changes particularly from in and around Central Europe, the session is open for any contributions dealing with similar questions in Europe from the late Roman period/migration (~400) period into the beginning of the high Middle Ages (<1200), on a local, regional, or theoretical level.

CONTRIBUTION ABSTRACTS

1188. BACK TO THE ROOTS. MICRO-STORIES OF CHANGE IN LATE ANTIQUE BURIAL PRACTICES

**Contribution format:** Oral  
**Contribution authors:** Irene Selsvold (The Norwegian Institute in Rome, The University of Oslo)

Funerary practices play an essential role in our understanding of the religious transition in the medieval world. So too in the earliest stages of the Christianisation, the period where the narratives of conversion of burial practice and the spread of Christianity are anchored. The account of changing burial practices in the Roman catacombs are closely connected to the account of the emergence and growth of the Christian Church. Recent research has demonstrated that the Church and the Christianisation have had less impact on Late Roman/Early Medieval burial practices, including the Roman catacombs. This talk nuances this narrative by focusing on articulation of variation and difference in Late Roman/Early Medieval burial practices, with the Roman catacombs as its point of departure. In order to contrast and nuance large-scale and institutional narratives, this paper will use an intersectional lens on socio-economic status, gender, religious affiliation, and migration in Late Antiquity and the Early Middle Ages to explore burial practices and change on the micro-level.

372. BURIAL CUSTOMS AND CERAMIC TRENDS IN TRANSYLVANIA`S ROW-GRAVE CEMETERIES (5TH - 7TH CENTURIES)

Contribution format: Oral  
Contribution authors: Barbocz Beata (Babeş - Bolyai University)

Row-grave cemeteries spread across Europe between the 5th and 7th centuries, with Transylvania marking their easternmost extent. These cemeteries are characterized by west-east oriented graves, organized in rows, where the deceased were buried in a supine position (decubitus dorsalis). They were interred with their clothing and grave goods, including weaponry, jewelry, and household items. Pottery played a significant role in funeral rites, serving both ritualistic and practical functions. By analyzing vessel manufacturing techniques, shapes, firing methods, and decorative styles, we can trace changes from the collapse of the Hunnic Confederation to the establishment of Avar rule. These transformations reflect shifts in cultural influences, technological advancements, and burial practices. Through case studies and statistical analyses of cemeteries, combined with pottery research, we can better understand the evolution of Gepid-associated burial traditions in Transylvania. Examining the significance of funerary inventories allows us to reconstruct patterns of social status, trade connections, and cultural interactions. Additionally, considering other grave goods alongside pottery provides a more comprehensive picture of this period, shedding light on broader societal changes during the 5th–7th centuries.

2237. IMPRINT OF SOCIAL, CULTURAL AND ECONOMIC CHANGES WITHIN THE AVAR EMPIRE. THE TESTIMONY OF THE KÖLKED SITE

Contribution format: Oral  
Contribution authors: Zsuzsanna Hajnal (Hungarian National Museum) – Balázs Gyuris (HUN-REN Research Center for the Humanities, Institute of Archaeogenomics) – Norbert Farago (Eötvös Loránd University, Faculty of Humanities, Institute of Archaeology) – Tamás Szeniczey (Eötvös Loránd University, Faculty of Science, Departament of Biolgical Anthropology) – Tivadar Vida (Eötvös Loránd University, Faculty of Humanities, Institute of Archaeology) – Anna Szécsényi-Nagy (HUN-REN Research Center for the Humanities, Institute of Archaeogenomics)

A multidisciplinary study of one of the key sites for understanding the background of diverse, varied material culture of the late 6th - 7th centuries in the Carpathian basin has provide. an insight view into a community, which had strong and intense connections with the late antique Mediterranean but even closer relations to the Meroving West and to the former Germanic traditions of this territory. In Kölked-Feketekapu 1325 burials and five hectares (with more than 500 features) of the community’s settlement were excavated, which could provide a representative section of the Carpathian basin’s social, cultural and economic history between mid-6th - early 9th century AD. Distinctive household system within the settlement and West European type of long houses are unique in the Avar Empire. The circular ditch system presumably for rituals and jurisdiction practices tied to Germanic costumes were observed in the Early Avar period. A Reihengraberfeld and separate burial grounds within the household units belonged to this settlement. A complete change was detected during the last third of 7th c.: the settlement structure, the burial costumes, and even the physical place of the cemeteries were affected. Discernible acculturation and assimilation processes and newcomer communities of different original traditions living side-by-side in the later era, complemented the effects of a social, economic and possibly political change visible all over the Avar Empire as well. Ancient DNA and isotope analyses (360 aDNA, 121 87Sr/86Sr, 75 δ13C - δ15N samples) within the framework of the ERC HistoGenes project complemented the classical archaeological study of the burial rite and grave goods, which were integrated with household archaeology and physical anthropological research. Kölked provides an unpaired possibility by interpreting and understanding the transitional processes in both burials and settlement with enlightening the forming forces behind them and the organizing factors of these changing societies.

1111. BIOARCHAEOLOGICAL ANALYSIS ON AVAR-PERIOD CEMETERY IN CROATIA SHEDS LIGHT ON OSTEOLOGICAL AND DEMOGRAPHIC TRANSITIONS

Contribution format: Oral  
Contribution authors: Angelica Caraballo-Santiago (University of California) – Mario Novak (Centre for Applied Bioanthropology, Institute for Anthropological Research, Zagreb | Faculty of Humanities, University of Primorska) – Josip Burmaz (Kaducej Ltd.) – Goran Skelac (Geoarheo Ltd.)

Between 2023 to 2024, approximately two hundred burials were excavated from a site near the city of Beli Manastir in eastern Croatia, within the Carpathian Basin. Preliminary analysis and observations of the cultural objects, burial practices, and skeletal remains identify this assemblage and site as an Avar-period cemetery, dating to the transition from the Migration Period to the Early Middle Ages (6th-9th century CE). This discovery presents a

valuable opportunity to investigate the biological and cultural characteristics and practices of a population living through this period of transition. This presentation outlines the preliminary osteological findings from an ongoing bioarchaeological analysis, integrating paleodemographic, paleopathological, and osteometric approaches to reconstruct aspects of life, health, and mortuary traditions. The demographic profile of the cemetery, including age-at-death distributions and sex ratios, provides insights into population structure, fertility, and mortality trends. Palaeopathological and osteometric analyses reveal stress, disease, trauma, and biological variation, offering insights into activity patterns and population affinities within the site. By contextualizing this dataset within regional comparisons of Avar and non-Avar sites, we explore emerging trends related to biological sex, age, and social differentiation, shedding light on variations in health, status, and cultural integration. This study represents the first step of a broader interdisciplinary investigation, with future isotopic analyses planned to complement osteological and archaeological data. These ongoing efforts will contribute to larger discussions on health, mobility, and sociocultural interactions in early medieval Europe, deepening our understanding of population dynamics during this transformative era.

564. FROM PAGAN ŽUPANS TO CHRISTIAN FOUNDER TOMBS: SOCIAL, RELIGIOUS, AND POLITICAL TRANSITIONS IN THE EASTERN ALPS

Contribution format: Oral  
Contribution authors: Stefan Eichert (Natural History Museum Vienna)

This paper examines burials from the 7th to the 10th/11th century, interpreting them not only from an archaeological perspective but also within a (cultural) anthropological and sociological framework. The study focuses on sources from the Eastern Alps, where the Slavic principality of Carantania was once located. A particularly significant site for this discussion is Grabelsdorf in southern Carinthia. Here, we can trace the development of a local community from around the year 700, observing various social and cultural transitions. On one hand, burial sites reveal a certain stratification of society, raising the question of whether the evidence suggests an early form of hereditary leadership or supremacy over the local population. Around the year 800, the process of Christianization becomes evident, marking another major transformation—primarily religious but not exclusively so—which had a profound impact on the landscape. This shift is also reflected in burial practices investigated through archaeology. Similar patterns can be observed in other sites across Styria, Lower Austria, and Upper Austria, indicating a population that shared common developments and underwent the same transitions.

1064. REEVALUATION OF THE KÖTTLACH CEMETERY

Contribution format: Oral  
Contribution authors: Martin Obenaus – David Russ (Natural History Museum Vienna)

The cemetery of Köttlach was re-examined as part of a university course at the University of Vienna and subsequently supplemented with hitherto unpublished material. The historical interpretation was formerly based on the incomplete material record from 1943, which is why a new presentation of all known finds from the cemetery area appears justi-fied. The newly published finds could indicate that the cemetery was already in use during the Late Avar period. However, the majority of the materials, most likely originating from graves, still date to the Köttlach II phase according to J. Gies-ler. The biographies of selected objects are presented to explore the possibility of a church location in the vicinity of the cemetery. Other cemeteries with mixed inventories—such as Thunau, Langenschönbichl, Bad Deutsch-Altenburg Kirchenberg, Judendorf-Straßengel, Ptuj, and possibly St. Pölten—are referenced and compared with the finds from the Köttlach cemetery to illustrate the largely undocumented grave contexts. The material remains from the cemetery are embedded within their cultural and geopolitical setting, with a particular focus on connections to the neighbouring Bijelo Brdo region. These connections are used to discuss possible acculturation processes with Conquest- and Árpád-era Hungary before and during the Ottonian expansion of the frontier eastward. Köttlach serves as a model case for examining cultural and religious transitions and disruptions at the boundary between the Alpine region and the edge of the Eurasian steppe at the end of the first and the turn of the second millennium.

326. WEANING AGE AS A HIGH-RISK TRANSITION IN A CHILD’S LIFE

Contribution format: Oral  
Contribution authors: Nina Richards (Natural History Museum Vienna | Austrian Centre for Digital Humanities and Cultural Heritage)

Weaning a child involves a change in diet from breast milk to introducing solids and liquids. The new diet is associated with an increased health risk for the children. Germs are ingested through food and passive immunisation through breast milk is coming to an end. Particularly in pre-industrialised communities, this can lead to illness and, in the worst case, to the death of a child. In the context of the paper, the detectability of the weaning age by analysing stable isotopes will be discussed using the example of the Arpadian cemetery of Oberleiserberg

(Austria). Based on the cemetery of the early 11th century, the implications of this transition will be demonstrated and discussed against the background of other early medieval examples. The Oberleiserberg was used as a burial ground for one or more small communities in the late 10th and first half of the 11th century. The high proportion of children in the graves is particularly striking. Two-thirds of those buried did not reach adulthood, the majority of the buried children died before their third birthday. This makes the cemetery an ideal material basis for analysing the age of weaning as one of the most important and risky transitions in a person’s life in a pre-industrial community.

**456. FAITH IN TRANSITION: THE TRANSFORMATION OF BURIAL LANDSCAPES IN MEDIEVAL CENTRAL EUROPE**

**Contribution format:** Oral  
**Contribution authors:** Maria Vargha (University of Vienna)

The shift from field cemeteries to churchyard burials was one of the most tangible changes brought about by the Christianisation of medieval Central Europe. Yet, this process was far from straightforward. Traditional scholarship has often presented burial transitions in a rigid binary—pagan field cemeteries versus Christian churchyards—ignoring the rich archaeological evidence that reveals a far more complex and gradual transformation. On a closer investigation, transitional cemeteries, where burial customs did not conform neatly to religious categories but instead reflected a period of flux, shaped by local traditions, shifting religious identities, and evolving ecclesiastical structures, can be found across the Medieval landscapes. This talk explores the diversity of these burial transitions within the framework of the ERC-StG project RELIC, which investigates how rural communities on the eastern fringes of the (later) Holy Roman Empire (10th–12th c.) became integrated into new religious and political structures. By examining how church foundations interacted with earlier cemeteries and how burials reflected different stages of religious transition, this research highlights the complexities of medieval faith at the local level. By integrating all available data to contextualise these cemeteries in the landscape, this study investigates the intertwined ways in which cemeteries and the social, economic, religious and physical landscape impacted each other and challenges the idea of a linear Christianisation process. Instead, it argues that medieval cemeteries were dynamic spaces, where faith, authority, and tradition intersected in unexpected ways. By reconsidering transitional cemeteries, we gain a deeper understanding of how religious change took shape beyond the elite sphere—within the burial grounds of ordinary people.

**202. DOWNSTREAM FROM BELGRADE: MEDIEVAL CEMETERIES AND BURIAL PRACTICES IN THE DANUBE REGION OF THE CENTRAL BALKANS**

**Contribution format:** Oral  
**Contribution authors:** Milica Radišić (Institute of Archaeology, Belgrade)

During the medieval period, the Danube region of the Central Balkans (the Serbian Danube region) was a dynamic transitional area, functioning as both a borderland and a contact zone. From the south and east, the region was influenced by the Byzantine Empire, the Bulgarian Khanate/Empire, and the Kingdom of Serbia, while to the north of the river lay the territories of the Avar Khaganate and the Kingdom of Hungary. Its strategic location, combined with shifting administrative boundaries, facilitated the movement and interaction of diverse populations, shaping local social and cultural practices. This paper examines the development of medieval cemeteries, focusing primarily on those from the 9th to the 13th centuries, and analyses how broader historical dynamics influenced local funerary customs. It is important to emphasise that there is no evidence of cremation burials in this part of the Danube region. Inhumation in row cemeteries, often accompanied by the personal adornments of the deceased, remained the predominant burial practice throughout the medieval period. Grave goods such as military items and food offerings are relatively rare. However, over time, significant changes took place, particularly in the spatial organization of cemeteries, along with a gradual decline in the inclusion of attire items in graves. Early medieval cemeteries were frequently situated near or within Late Roman fortifications and buildings, highlighting the continued strategic significance of these sites. By the High Middle Ages, burial grounds underwent significant spatial transformations, with cemeteries often being relocated to new areas. In contrast to the widespread integration of churchyard cemeteries across Christian Europe, burial sites in the Danube region were only occasionally associated with churches, reflecting a distinctive regional pattern.

**2211. THE SAME OR DIFFERENT? PEOPLE AND FUNERAL RITES IN MEDIEVAL MAZOVIA, POLAND**

**Contribution format:** Oral  
**Contribution authors:** Dariusz Blaszczyk (Faculty of Archaeology, University of Warsaw)

One of the areas that were part of Poland in the Middle Ages was Mazovia, a region situated on the central Vistula River. Along with the Christianization of Poland, which began in the 2nd half of the 10th century, inhumation appeared in Mazovia, replacing the previously used cremation rite. However, Mazovia was different from other

regions of Poland at that time in the occurrence of characteristic graves with stone constructions in the form of enclosures and pavements. For some time, it was believed that only this type of funeral rite was used in Mazovia. However, with time, parallel row cemeteries with pit graves without enclosures and stone pavements began to be discovered, the same as those occurring in other regions of Poland at that time. It turned out that graves with stone structures were not the only form of funeral rite practiced in medieval Mazovia. In connection with this, the question arose who were the people who buried their dead in cemeteries with and without stone structures, whether they represented the same or two different populations, and where the idea of stone structures came from. Based on the study of the ratio of stable strontium isotopes <sup>87</sup>Sr/<sup>86</sup>Sr, the issue of mutual relations of the populations burying their dead in two different forms of graves will be discussed in terms of their provenance, mobility, and possible mutual interpenetration. In turn, based on radiocarbon dating, temporal relations will be traced, with particular emphasis on the beginning and end of the use of both types of cemeteries. The research was carried out as part of the project “Populus Masoviae Medi Aevi and the mystery of the century: who was buried in graves with stone enclosures in medieval Mazovia?” (NCN 2019/33/B/HS3/02453).

**493. BETWEEN PAGAN TRADITIONS AND CHRISTIAN CONVENTIONS: BURIAL TRANSITIONS IN MEDIEVAL POLAND**

**Contribution format:** Oral  
**Contribution authors:** Kinga Durczak (Antea Group)

The transition from pagan to Christian burial customs in medieval Poland reflects a broader process of religious, social, and political transformation. One significant yet often overlooked aspect of this shift is the practice of shrouding the deceased, a widespread tradition across different cultures and time periods. While archeothanatological research has explored shrouding in Mesolithic and Islamic contexts, its role in early Christian burial traditions remains underexamined. This study investigates burial transitions in Poland from the late 10th to the 12th century, focusing on the impact of Christianization, state formation, and external cultural influences. Using archaeological data from cemeteries across Greater Poland this research examines key funerary transformations, including the decline of cremation, the standardization of east-west oriented inhumations, and the disappearance of grave goods such as weapons and jewellery under Church influence. Special attention is given to transitional burial types, including so-called “deviant burials” (e.g., individuals buried with stones, bound limbs, or in prone positions), which may reflect lingering pre-Christian beliefs or societal anxieties surrounding death and the supernatural. By applying an archeothanatological approach, this study explores shrouding as an integral part of early Christian funerary customs before the widespread adoption of wooden coffins. Understanding these burial transformations offers insights into the negotiation of new ritual behaviours in the context of religious conversion. By integrating bioarchaeological data with historical sources, this research contributes to broader discussions on how burial archaeology serves as a lens for examining the interplay between tradition and reform in medieval Europe.

**452. TROUBLED LIVES IN TRANSITION. OSTEOBIOGRAPHIES FROM THE EARLY MEDIEVAL BURIALS FROM GRUMENTUM (BASILICATA, ITALY)**

**Contribution format:** Poster  
**Contribution authors:** Eveline Guidi (Department of Ancient World Studies, Sapienza University of Rome | Bioarcheology Service, Museum of Civilizations, Rome) – Viola Cecconi (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome | Bioarcheology Service, Museum of Civilizations, Rome) – Jessica Melchiorre (Bioarcheology Service, Museum of Civilizations, Rome) – Priscilla Zanutel (Independent Archaeologist) – Adele D’Avino (Bioarcheology Service, Museum of Civilizations, Rome) – Alessandra Sperduti (Bioarcheology Service, Museum of Civilizations, Rome | Department of Asia, Africa and the Mediterranean, University of Naples “L’Orientale”)

The Early Middle Ages in Italy was a period marked by significant transition. Following the fall of the Roman Empire, many communities faced political, social, and economic decline. This is evident from the progressive depopulation, de-urbanization, and reduction in economic and trade activities. Additionally, invasions and warfare further destabilized the socioeconomic and political organization in various Italian regions. This downturn is also reflected in the funerary customs of the time, as people abandoned extensive, well-planned necropolises located along major urban roads in favor of smaller burial plots within city walls. These new burial sites were often near disused buildings or places of significance, such as churches or chapels. Several studies also suggest that living conditions deteriorated during this era. In this context, we present archeoanthropological data from the urban center of Grumentum. After a prosperous period during the Roman Imperial Age, the city experienced severe economic decline and gradual depopulation of its urban area. During this time, a small burial ground containing 18 tombs—with both single and collective depositions—was established near the Basilica di San Marco in the southern part of the city. The paleopathological analysis revealed that 80% of the individuals

examined suffered from severe oral diseases, with multiple carious lesions, abscesses, and antemortem tooth loss. Furthermore, 89% of the sample displayed severe signs of periostitis. We also identified cases of spine and sacroiliac ankylosis, osteomyelitis, various traumas (also in subadults), and activity-induced bone alterations. These findings confirm that the living conditions in Grumentum were likely harsh, aligning with the historically noted socioeconomic decline of the city.

211 FOCUS ON RESILIENCE - SUSTAINABLE TOURISM AND CLIMATE-ADAPTED HERITAGE MANAGEMENT

Session theme: 7. Climate Change in the Past and Present  
Session format: Round table  
Session keywords: Resilience, Sustainable Tourims, Climate Change, Heritage Management, Communities  
Session organisers: Sofia Fonseca (Teiduma, Consultacy on Heritage, Culture and Sustainability) – Ben Thomas (Society Of Architectural Historians) – Peter Biehl (University at Buffalo)  
Session speakers: Peter Biehl (University at Buffalo) – Vibeke Vandrup Martens (NIKU – Norwegian Institute for Cultural Heritage Research) – Sofia Fonseca (Teiduma, Consultacy on Heritage, Culture and Sustainability) – Ben Thomas (The Society of Architectural Historians)

SESSION ABSTRACT

This session, co-organized by the Community on Archaeology and Tourism and the Community on Climate Change and Heritage, addresses the critical impacts of climate change, and heritage tourism on actively managed archaeological sites. As heritage sites worldwide face increasing risks from climate-induced factors, the session seeks to build on EAA’s commitment to climate action, as stated in the 2021 Kiel Statement on Archaeology and Climate Change which encourages EAA members to develop recommendations and best practices to confront climate change’s impacts on archaeological heritage. The session will feature panel presentations followed by an interactive discussion, focusing on emerging challenges for archaeological heritage management, identifying innovative solutions that are occurring at the nexus of climate adaptation and sustainable tourism management. Experts from both communities will share insights on preserving archaeological heritage under climate pressure, highlighting case studies and strategic approaches that have proven effective. The discussion will prioritize the role of local communities, integrating their knowledge and perspectives to promote resilient, culturally inclusive heritage tourism practices. As an outcome, participants will collaboratively draft a document tentatively titled the EAA Belgrade Statement on Sustainable Tourism and Climate-Adapted Heritage Management. This statement will outline actionable recommendations to support EAA’s focus on the protection of archaeological heritage especially in vulnerable tourism contexts where resilience to climate threats requires adaptive management strategies. The session will also provide a foundation for future collaborative actions between the EAA communities concerned, fostering a network that can continue to address climate-related challenges and integrate adaptive strategies into the management of tourism at archaeological sites. By bringing together EAA members with diverse expertise, this session aims to produce a set of targeted proposals for future EAA initiatives, strengthening the organization’s influence on heritage preservation in an era of unprecedented climate change.

213 MOVING FORWARD: NEW APPLICATIONS AND DEVELOPMENTS IN ARCHAEOLOGICAL MOBILITY STUDIES

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Regular session  
Session keywords: Mobility, Computational Methodologies, Connectivity, Maritime Movement, Trade and Exchange, Migration  
Session organisers: Andrew Mclean (Institut Català d’Arqueologia Clàssica (ICAC) | Barcelona Supercomputing Center) – James Page (Barcelona Supercomputing Center) – María Coto Sarmiento (Centre for Urban Network Evolutions (UrbNet), Aarhus University) – Adam Pažout (Universitat Autònoma de Barcelona, Department of Antiquity and Medieval Studies)

SESSION ABSTRACT

The approaches available for modelling mobility and connectivity across archaeological landscapes are numerous and diverse. Before the application of more computational and quantitative methodologies the qualitative research was largely restricted to an understanding of where objects and people were and where they later ended up, with little concrete understanding of the journey between the two. In recent years, techniques such as network analysis, agent-based modelling simulations and machine learning have all become far more prevalent across archaeology. This has been accompanied by a wider use of computational techniques in mobility studies. However,

many of these archaeological studies remain mired in basic, and even outdated, techniques, even as mobility studies in other disciplines develop with pace. There is a tendency to use basic Least Cost Path analysis, or use simple cost surfaces, apply them to a study region and move on. There can certainly be significant merit to such studies, but we seek to push the field beyond this and think about more innovative and nuanced techniques and applications for understanding past mobility. We welcome papers focusing on using cutting edge techniques to understand past mobility and connectivity, with no geographic or temporal restriction. Mobility studies should also not be limited to the terrestrial, and so we particularly welcome any papers discussing combined terrestrial, maritime or fluvial studies. New applications for more traditional techniques, such as Least Cost Path analysis, are also welcome. We hope that this session will bring together a diverse range of researchers to share in not only new results from mobility studies, but importantly, on how we can build and expand upon existing techniques and applications of past mobility studies.

CONTRIBUTION ABSTRACTS

962. IDENTIFYING NON-LOCAL INDIVIDUALS AND PREDICTING THE TIME SINCE MIGRATION USING A MACHINE LEARNING APPROACH

Contribution format: Oral  
Contribution authors: Andrea Göhring – Daniyal Kazempour – Jan Bensien – Sweety Mohanty – Claudius Zelenka – Matthias Renz – Peer Kröger (Kiel University) – Gisela Grupe – Amei Lang (University of Munich)

Provenance reconstruction using strontium and lead isotope ratios can produce complex multi-dimensional fingerprints that challenge traditional data analysis methods. Identifying non-local individuals who migrated between sites or regions is a key task, as their isotopic signatures in compact bone are a mixture reflecting the last about 20 years prior to death, and accordingly are a mixture between the local isotopic signatures of the origin and destination environments. However, the detection of early migrants remains particularly challenging due to bone remodeling and the resulting progressive isotopic mixing in compact bone tissues. This study presents a machine learning approach using Support Vector Machines (SVMs) to identify non-local individuals based on their multi-isotope fingerprints. Individuals who migrated between two sites can be understood as so-called “in-between instances” or IBIs between the isotopic clusters representing these two sites. These IBIs exhibit a mixed isotopic signature, resulting from a mixture of the local isotopic signatures of these sites. The isotope fingerprints of individuals who migrated early in life are more similar to the local isotopic signature of the site to which they migrated. Using synthetic data, we show that our model effectively classifies IBIs - and, thus, immigrated individuals - under different conditions, capturing subtle variations in isotopic composition. When applied to an archaeological multi-isotope dataset, the approach successfully identifies non-local individuals, including early migrants. In addition, the method predicts the “level of in-betweenness”, which enables an estimation of the time elapsed since migration (in years before death) by incorporating bone remodeling rates. By providing a quantitative framework for assessing migratory events, this approach refines mobility studies and enhances the resolution of provenance reconstructions.

1068. PROCESS-EXPLICIT MODEL REVEALS MOTIVATIONS FOR ROAD CONSTRUCTION IN PAST SOCIETIES

Contribution format: Oral  
Contribution authors: Joe Lewis – Enrico Crema (University of Cambridge)

The position of past roads in the landscape is a trade-off between a preference for straightness and the influence of slope gradient, conditioned by political and economic motivations of a society. Yet, our understanding of this trade-off and its relationship with political and economic motivations is poor, hindered by qualitative studies that fail to explain the variability of past roads and non-comparative quantitative studies. Here, we introduce a process-explicit model that simulates roads in the landscape to estimate the influence of slope gradient on well-evidenced Roman roads in Roman Wales. Our results reveal substantial variability in this influence, with roads not conforming to a single unifying preference for straightness. We relate the influence of slope gradient with road straightness to predict political and economic motivations for road construction in the Roman Empire. This relationship offers a unified, comparative framework to understand variability in past roads and reveal insights into the political and economic motivations of past societies.

1672. WHAT PROMOTES HUMAN MIGRATION? SPATIAL MODELS TO RECONSTRUCT THE REGIONAL GEOGRAPHIC VARIATIONS IN THE SUB-SAHARAN EIA

Contribution format: Oral  
Contribution authors: Alexes Mes (University of Cambridge)

Behind all large-scale human dispersals lies a body of literature seeking to categorise the movement as demic migration vs. acculturation. The reality in any human movement is far more complex: the units of migration (individuals, families, communities), as well as the localised tempo and direction of dispersal shifted frequently. From around 4,000 BP, large-scale southern migrations expanded throughout sub-Saharan Africa resulting in major subsistence and cultural changes. The dispersal is associated with an ‘EIA cultural package’ consisting -- wholly, or in part, at various times -- of a more sedentary lifestyle, thick-walled pottery, iron metallurgy, cattle-keeping and crop cultivation. Cultural traits and subsistence strategies evolved through multiple interactions and shifting ecological environments. Despite this, some past archaeological studies have implicitly understood EIA expansion in sub-Saharan Africa as an expansion of a single, continuous event; although whether the population spread continuously, in waves, or following a process of jumps remains an underlying question. This paper explores the ‘EIA cultural package’ as a series of regional and complex movements. The arrival times of these traits in geographic sub-regions are examined using a Bayesian ICAR model, where a hierarchical structure is introduced to account for bias introduced by sample interdependence. The use of an ICAR structure allows the model to capture the underlying spatial autocorrelation in the data and provide broad arrival estimates in regions where we have no prior information. This framework is then built on by considering if and how ecological factors – such as temperature and rainfall – resulted in varied frictions to the dispersal. Bayesian wombling methods are used to quantify to what extent these potential drivers explain the observed differences in the dispersal process. Throughout, biases which influence the data – such as uneven spatial and temporal sampling density – are acknowledged and measurement uncertainty is accounted for.

**1052. THE CONSTRUCTION OF THE ANDALUSI LANDSCAPE CONNECTION NETWORK IN THE NORTH-WEST OF THE DISTRICT OF LLEIDA (VIII-XIII CENTURIES)**

**Contribution format:** Oral  
**Contribution authors:** Raul Céspedes (Universitat Autònoma de Barcelona)

Historical roads are the physical trace of the political entities that built them. However, their use comprehends extensive chronologies. Many of the historical roads have been subject to constant transformation as a result of the new economic and political needs that have arisen throughout History. In the Andalusí district of Lleida, the complex network of roads exhibits the will to connect settlements, productive spaces and fortresses. Some specialists determined that the use of the previous roman routes continued. However, in this proposal it will be reviewed the extent of that said continuity and its impact in the established road network between VIII and XII centuries. Although, the construction of new settlements and fortresses led to the creation of new routes. The fortresses, the use of grazing areas and some water collection structures along the roads show us how the hierarchy in the Andalusí cronology was oriented towards the connection of fortified areas to ensure the territorial control. While at the same time, maintaining roads for stationary livestock farming that transitioned between the Llitera plain and the mountain areas of Ribagorça. This study will be under the methodological framework of Archaeology of Landscape. It will determine the Andalusian Road network by fieldwork, the analysis of medieval written, toponymy, the use of aerial maps and old cartography. In this contribution I will analyse the historical landscape of the northwestern territory of the Andalusí district of Lleida as the establishment of a complex connection network that ensures the economical and productive activities along the district.

**466. MODELLING THE BLACK DEATH AND SOCIAL CONNECTIVITY IN MEDIEVAL ENGLAND**

**Contribution format:** Oral  
**Contribution authors:** Tudor Skinner (Durham University)

The Black Death of 1348–9 stands ‘unchallenged as the greatest disaster in documented human history’. Although largely thought to be caused by *Yersinia pestis*, it is still unclear how the disease spread so quickly in a preindustrial society. Durham University’s Modelling the Black Death project applies and adapts the JUNE framework - new individual-based modelling developed in response to the COVID-19 outbreak - to simulate the spread of this disease. While the COVID-19 implementation of JUNE used modern census data about the population and a range of further information about their daily lives, such as work patterns, travel, and social activities, this project revises and reformulates this framework for mid-14th-century England. The ‘static’ part of this model reconstructs major characteristics of the population – location, age, sex and occupation – via historical and archaeological sources. The ‘dynamic’ elements of this model will encode probabilities of everyday behaviour, corridors of movement and differing vectors of infection, with a particular focus on zoonotic reservoirs of disease. Successful modelling of *Yersinia pestis* will shed light on the spread and transmission of what remains a modern-day threat, as well as that of other contemporary and historically-attested pandemics. In tandem with this, the model will also provide new insights into the social connectivity of late medieval society by identifying how people likely interacted with one another during one of the worst pandemics in global history.

**1828. MODELLING LEAST-COST PATH NETWORKS IN THE ROMAN LEVANT: FILLING THE GAPS IN THE ROMAN ROAD NETWORK?**

**Contribution format:** Oral  
**Contribution authors:** Adam Pažout (Universitat Autònoma de Barcelona)

Our understanding of the Roman road network in the Levant (provinces of Syria, Judaea, and Arabia) is heavily skewed to the southern part of the region where most of the previous scholarship was concentrated. The northern Levant (roughly between Taurus Mts. in the north and Aleppo Plateau in the south) was comparatively less studied in the past and the reconstructed Roman road network is much sparser. In this paper an approach to ‘fill the gaps’ in the road network using methods of network science and least-cost path modelling is presented and evaluated. Initially, the Roman road system in the Levant is represented as a graph with nodes representing Roman sites included in the Pleiades dataset. This model is analysed for its network properties, with focus on the node metrics (degree centrality and betweenness centrality) across different types of nodes (cities, settlements, road stations). ‘Under-connected’ nodes in the road network are in this way identified and potential road connections are modelled for them through application of theoretical least-cost networks (TLCN). TLCNs are planar networks defined as Gabriel graph, Relative Neighbourhood Graph and K-neighbour graph, where Euclidian distance is replaced by a cost distance. Cost distances are calculated over a conductance surface representing topographical constraints (slope, topographic position index, local vector ruggedness measure) identified on surviving segments of Roman roads in the region. By comparing TLCN with Roman road network it is possible to identify a) ‘under-connected’ nodes (nodes with low degree centrality), and b) suggest possible connections for these ‘under-connected’ nodes based on the TLCN, where corroborated with additional archaeological or historical evidence.

**540. VISUALISING SARCOPHAGUS TRADE IN THE INLAND BALKANS: A GEOSPATIAL APPROACH**

**Contribution format:** Poster  
**Contribution authors:** Ines Ferjan (University of Edinburgh)

This study employs geospatial modelling techniques to reconstruct and visualise potential sarcophagus trade routes in the inland Balkans. Sarcophagi, often carved from high-quality marble such as Prokonnesian and Thasian, were transported over vast distances from Mediterranean quarries to inland provinces like Moesia Superior. The viability of these transport networks depended on topographical constraints and economic considerations. While previous studies have examined stone trade routes in this region to some extent, geospatial models have not yet been applied to reconstruct potential trade routes. Although fluvial transport along the Danube played a crucial role, many sarcophagi reached their destinations via complex overland networks. By integrating GIS-based movement modelling and ancient road systems, this research identifies optimal trade pathways that may otherwise be overlooked in landscape studies. Key overland corridors, originating from the major hubs along the Adriatic and Aegean Seas, are examined using advanced geospatial approaches, such as network-based modelling (e.g., Circuit Theory), to assess their feasibility as transport routes, taking into account the logistical challenges posed by the heavy cargo of sarcophagi. By incorporating landscape analysis, this study explores how rivers, mountains, and road networks shaped regional economic interactions. However, the accuracy of these reconstructed routes relies on corroborating geospatial predictions with archaeological evidence. Overall, this study provides a novel approach to visualising Roman trade by blending archaeological evidence with computational modelling, offering deeper insights into the logistical challenges and economic decisions that influenced sarcophagus distribution.

**215 AROUND THE BLACK SEA: MIGRATIONS AND MOBILITY THROUGH PLAINS, MOUNTAINS AND SEA IN EARLY HOLOCENE (C.10 000-4 000 BC)**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** The Black Sea, migrations, mobility, Neolithization, geo-spatial archaeology, bioarchaeology  
**Session organisers:** Marta Andriiovych (University of Oxford) – Catalin Lazar (University of Bucharest)

**SESSION ABSTRACT**

The Black Sea was a key region in European Prehistory, mainly due to its special geographical positioning - the contact area between Anatolia, the Balkans, the North Pontic Steppes, the Mediterranean Sea, the Pontic, Caucasian and the Crimean Mountains. The region is home to over 1000 prehistorical sites and features diverse landscapes, including deltas, hills, dunes, coast, mountains and massive grassland steppes that define the Black Sea basin with ecological potential for the spread of early farming and herding. The climate zones range from continental and Mediterranean to subtropical and experienced five major ice rafting events. This setting has

been attractive for human groups since the Paleolithic period. During the spread of Neolithization, the West coast of the Black Sea was crucial for the dispersal of agriculture and husbandry to Europe and Asia. The prehistoric communities that moved along the rivers and valleys of the area, over the mountains and highlands, to find sources, new farming settings, and new places to settle contributed to extending the main route of the Neolithic lifestyle. The session will examine the interplay of environmental, anthropogenic, climatic, and cultural factors shaping prehistoric resilience and mobility around the Black Sea. Subjects for discussion cover wide questions, from the isotopic and paleogenetic data to paleoenvironmental, paleoclimatically and geo-hydrological investigations, from cross-cultural movements and interconnection across the region to local seasonal migrations, mobility connected with the search for resources and climatic changes, and other reasons for humankind being on the move and the spread of innovations in the region in the Early Holocene. We welcome contributions from archaeologists, bioarchaeologists, geoarchaeologists, geneticists and others interested in the Black Sea region through the early-mid Holocene.

CONTRIBUTION ABSTRACTS

1348. ANTHROPOLOGICAL CONTINUITY AND MIGRATIONS IN THE MESOLITHIC-NEOLITHIC OF THE NORTHERN BLACK SEA REGION

**Contribution format:** Oral  
**Contribution authors:** Inna Potekhina (Institute of Archaeology of the NAS of Ukraine)

Our understanding of the origin and anthropological composition of the Mesolithic and Neolithic populations of the Northern Black Sea (North Pontic) Region has been significantly improved by large-scale studies of ancient DNA, the results of which have been considered in a wide range of synchronous groups of Western Eurasia. The genetic continuity of the prehistoric population of the Middle and Lower Dnieper Basin for 4000 years, from the Mesolithic to the end of the Neolithic, in contrast to almost all other parts of Europe, has been revealed. Migration hypotheses regarding the Neolithic tribes of the Dnieper-Donets cultural and historical region have been considered, some of which have traditionally been associated with the arrival of small groups of late Mesolithic hunter-gatherers from Northwestern territories in the Middle and Lower Dnieper regions, which has been confirmed by archaeological and anthropological evidence. New archaeogenetic data have also revealed a possible migration here at the beginning of the Neolithic era from the southwest. In two Neolithic burial grounds in the North Pontic Region, rare for the European Neolithic Mt haplogroups were discovered, which indicate very ancient contacts with groups of Eastern Eurasia. The consistency of the results of anthropological and genetic studies confirms their reliability and allows us to complement and expand the possibilities of studying the prehistoric population of Ukraine using these research methods.

2333. THE SPREAD OF AGRICULTURE TO THE NORTHERN BLACK SEA: SUMMARIZING THE STATE OF RESEARCH

**Contribution format:** Oral  
**Contribution authors:** Marta Andriiovych (University of Oxford)

In the middle of the 20th century, the Neolithic period in eastern Europe was defined above all by the spread of ceramics, including in the northern Black Sea region. In the broad context of world archaeology, however, the most widespread criterion for defining the Neolithic is farming. Recent archaeobotanical research has begun to address a gap in knowledge about the earliest farming in the northern Black Sea regio. In this talk, I will trace the appearance of Neolithic crops (wheat, barley, peas, etc.) in the northern Black Sea region, both through directly dated archaeobotanical remains and impressions on ceramics. The intention is to synthesise available archaeobotanical and radiocarbon data from recent research in the region and to visualise it using geospatial analyses and distribution maps. I use this approach to shed light on longstanding questions in the northern Black Sea region, surrounding the meaning of the terms ‘Mesolithic’, ‘Neolithic’, ‘Chalcolithic’ and the transitions between them.

165. THE COMPLEX OF LAYERS 5/6 OF FATMA KOB

**Contribution format:** Oral  
**Contribution authors:** Manko Valery – Telizhenko Sergiy (Institute of Archaeology of NAS of Ukraine)

The complex of layers 5/6 of Fatma Koba was connected with the first half of Boreal. The complex illustrates the last stage of development of Taubodrakian industry of mountainous Crimea. This stone tool industry is comprised of the following assemblage: the use of direct percussion techniques for obtaining blades; the presence of single and double-platformed flat cores and single-platformed, narrow-surfaced cores, end scrapers, burins on truncated, facett ed blades, angle burins on broken blades. This locales assemblage as included the production of lunates with bipolar retouched arcs, and trapezes and triangles with bipolar retouched sides, as well as the use of the microburin technique for the production of geometric microliths. The origin of the Taubodrakian industry

is associated with the Epipaleolithic of southwestern Turkey. The Karain B Culture of Antalya revealed by the early appearance of lunates and other microliths with bipolar retouching at the turn of Dryas III and Bølling Interstadial. The analogy of the Taubodrakian complexes is the Direkli Cave complex in southwestern Turkey. During the Allerød, the technology of making geometric microliths with bipolar retouching spread to the eastern Mediterranean, Aegean and Black Sea coastal areas. The appearance of lunates with bipolar retouching is also observed in the Late Epigravettian complexes of the Southern Caucasus. Extensive cultural unity is created, the existence of which is supported by migratory flows throughout the Final Pleistocene and Early Holocene. The creation of this system was the prediction of the Neolithization process. The Fatma Koba Complex layers 5/6 contain impurities associated with the Crimean Sviderian, Shpankobian, and Kukrek Cultures. The question of the connection of the Taubodrakian industry with the Neolithization of southern Eastern Europe is considered. The role of the Taubodrakian in the synthesis of the Neolithic Tashairian Culture is discussed.

256. TRAPEZ MICROLITHS AS CULTURAL CONTACT INDICATORS THE TASH AIR STONE TOOL INDUSTRY

**Contribution format:** Oral  
**Contribution authors:** Serhii Telizhenko – Valery Manko (Institute of Archaeology NAS of Ukraine)

The transition to the ceramic Neolithic in some regions of Asia Minor, the Caucasus, and Southern Eastern Europe is associated with the appearance of new forms of geometric microliths. One of these forms were the trapez type with a flat dorsal scar or parallel retouch. This type of microlith appears in the territory of the northern Levant and southern Asia Minor in the last quarter of the 7th millennium BC. For several hundred years, microliths of this type spread over the vast territory of the Levant, Asia Minor, the Caucasus, and southern Eastern Europe. Such rapid spread of innovative technology is associated with both the large-scale processes of population migration, and the movement of small population groups (diffusion). The process of the assimilation of this innovative technology in this or other regions could be associated with the emergence of new technology carriers or with the replication or imitation of the latest technology by the local autochthonous population. The most interesting aspect we observe in the materiality of the Tash Air Cultural sites of Tash Air I, Kaia Arasy, Fatma Koba (Crimea), lies in the typology of geometric microliths from these sites which contain all five types of trapezes with flat dorsal retouch. This circumstance allows us to infer that the formation of the Tash Air culture was influenced by cultural contacts with the populations of several regions, including those of Asia Minor and the Caucasus. The appearance of some types of trapezoidal microliths could be the result of the penetration of small population groups from these regions. As a result of the formation of cultural ties between the population of Crimea and the population of distant regions, many innovations occurred in the Neolithic way of life.

976. FAUNA FROM THE PREHAMANGIA AND HAMANGIA SETTLEMENTS (6TH-5TH MILLENNIA BCE, ROMANIA); CIRCUMSTANTIAL EVIDENCE OF THE BLACK SEA LEVEL FLUCTUATION

**Contribution format:** Oral  
**Contribution authors:** Valentin Radu (‘ Vasile Pârvan` Institute of Archaeology, Romanian Academy | Research Institute of the University of Bucharest, University of Bucharest) – Valentina Voinea (National History and Archaeology Museum, Constanța) – Ana García-Vázquez (Research Institute of the University of Bucharest, University of Bucharest) – Adrian Bălășescu (‘ Vasile Pârvan` Institute of Archaeology, Romanian Academy)

Archaeological researches realized in several Prehamangia and Hamangia sites (5700 – 4650 BCE), located in Dobrogea region (western Black Sea) such as Palazu, Cheia, Techirghiol, Constanța, has revealed a rich fauna represented mainly by domestic mammals. The pastoral way of life of these communities, as recorded by faunal assemblages, persisted until the middle of the 5th millennium BC. During this time span, the Black Sea level was rising due to marine transgression and costal line is constantly evolving. In addition, starting in the middle of the 5th millennium BCE, this region was also affected by major climatic changes (drought) which represented a new challenge for the Eneolithic communities to preserve their agro-pastoral way of life in the region. The presence of the Prehamangia communities, the first Neolithic culture in Dobrogea, as well as later, of the Eneolithic Hamangia in this area between the Danube and the Black Sea, is still a subject discussed by specialists. One of the hypotheses proposed for the colonization of this region is the coastal one. This presentation explore the evolution on animal paleoeconomy during this period affected by major costal transformations. The ecological requirements of certain animals can constitute good ecological indicators. Wild mammals such as wild horses and hemions, seals and various species of dolphins as well as a number of aquatic resources will be the key taxa in our approach. The assemblages also benefited from 14C analyses so that we can also establish a chronology of this evolution. Although considered circumstantial evidence, the results obtained were used to establish scenarios related to the evolution of the coastline in the western Black Sea during this period. This work was supported by a grant of the Romanian Ministry of Education and Research, CNCS - UEFISCDI, project number PN-IV-P1-PCE-2023-1547 (ExLiDo)

318. THE EMERGENCE OF THE NEOLITHIC IN DOBRUJA (ROMANIA) REFLECTED BY THE OSSEOUS INDUSTRY

**Contribution format:** Oral  
**Contribution authors:** Monica Margarit (“Valahia” University of Targoviste) – Adrian Irimia (Museum of National History and Archaeology Constanta | “Valahia” University of Targoviste) – Valentina Voinea (Museum of National History and Archaeology Constanta) – Valentin Radu (National Museum of Romanian History, Bucharest) – Adrian Balasescu (“Vasile Pârvan” Institute of Archaeology, Romanian Academy)

If on the territory of Romania, the oldest Neolithic assemblages appear around 6200 BC, the Dobruja seems to have known the evolution of the Neolithic later and the causes of these archaeological evidences represent a subject long debated by specialists and still unresolved. At the current stage of knowledge, the oldest archaeological finds belong to the Hamangia culture (c. 5000-4450 cal BC) with some recent discoveries (the Prehamangia culture) which seem to push the oldest settlements beyond 5700-5400 cal BC. The archaeozoological study confirmed the pastoral character of the economy, indicated by the high percentage of domestic animals (91%), especially cattle and caprines. The osseous industry reflects the economy type of these communities what is clearly oriented towards the exploitation of Ovis aries/Capra hircus and Bos taurus bones. Technologically processed bones were recovered from household waste, after the slaughter and consumption of these animals. Antler or tooth working is sporadically attested in sites. Unio sp. shells were used as tools in domestic activities, the same as the tortoise carapace. There are also pieces from exotic raw materials (Spondylus, Glycymeris) that illustrate the existence of intercommunity exchange networks. The functional data correlate with the specific economy of these communities: the artefacts are used in domestic activities for the processing of ceramics, vegetable fibres or wood. Acknowledgments This work was supported by a grant of the Romanian Ministry of Education and Research, CNCS - UEFISCDI, project number PN-IV-P1-PCE-2023-1547 (ExLiDo).

1447. MOBILITY AND DIETARY PRACTICES IN THE KGK VI COMMUNITY OF SULTANA-MALU ROȘU (5TH MILLENNIUM BC, ROMANIA)

**Contribution format:** Oral  
**Contribution authors:** Aurélien Tafani – Petra Coman – Ana Garcia-Vazquez (ICUB, University of Bucharest) – Robert Tykot (University of South Florida) – Christophe Snoeck (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel) – Enrico Greco (ICUB, University of Bucharest) – Andreea Toma (School of History, Philosophy and Digital Humanities, University of Sheffield) – Mihaela Golea – Adrian Bălășescu (“Vasile Pârvan” Institute of Archaeology, Romanian Academy) – Cătălin Lazăr (ICUB, University of Bucharest)

This study seeks to explore the potential role of individual mobility and marital alliances as a driving force behind the emergence of the Kodjadermen-Gumelnița-Karonovo VI (KGK VI) material culture in the eastern Balkans during the 5th millennium BC. We performed oxygen and strontium isotopic analyses on the tooth enamel of the human remains found in the Eneolithic graves excavated at the Sultana-Malu Roșu necropolis (Romania) and interpreted the results through to the establishment of a regional bioavailable strontium baseline based on modern plants strontium isotopic values. To obtain reliable sex estimations, proteomic analysis of amelogenin of human tooth enamel were also performed on individuals whose remains were the least preserved. This study also incorporates the dietary profiles of the buried individuals using stable isotope analysis ( $\delta^{13}\text{C}$  and  $\delta^{15}\text{N}$ ) of bone collagen. By comparing human isotopic values with those of faunal remains (both domestic and wild) and archaeobotanical samples from the tell and necropolis, we reconstruct subsistence strategies and dietary variations within the community. By integrating bioarchaeological and funerary data, this research provides new insights into dietary practices, resource management, and social organization in KGK VI communities, contributing to a broader understanding of life and death in prehistoric Southeastern Europe.

1590. PALEODEMOGRAPHIC POPULATION ESTIMATES FOR THE CUCUTENI-TRYPILLIA SOCIETIES

**Contribution format:** Oral  
**Contribution authors:** Ralph Großmann (Kiel University)

The size and density of prehistoric populations are considered important indicators of population conditions. While many relative results on population dynamics are available, absolute population sizes are still under-represented in research. The aim of this project is to conduct a diachronic multi-proxy estimation of absolute population size based on two approaches: the geostatic (Cologne Protocol) and the Bayesian approach. Both approaches will be combined, with the geostatic approach preceding the Bayesian approach. The analyses are carried out in selected regions of Europe. The author presents first estimates on palaeodemographic developments

for the Cucuteni-Trypillia societies located between the Carpathians in the west and the Dnieper in the east. These Chalcolithic societies developed from c. 4800 BC onwards and are characterised by systematically planned villages, a distinct agricultural economy, the use of copper and elaborate material culture. Significant are the mega-sites with a base area of more than 100 hectares, established around 3950 BC.

394. COMPARISON OF ELEMENTAL AND STABLE ISOTOPE ANALYSES FOR STUDYING DIET AT THE CHALCOLITHIC SITE OF GUMELNIȚA (ROMANIA)

**Contribution format:** Poster  
**Contribution authors:** Robert Tykot (Department of Anthropology, University of South Florida) – Ana García-Vázquez – Cătălin Lazăr (ArchaeoSciences, Research Institute of the University of Bucharest)

Elemental analysis of human and faunal remains is used to address dietary patterns during the Chalcolithic period at the site of Gumelnița in Romania. Calcium, strontium, and barium are the main components of the mineral portion of bone, and vary based on trophic level. This method can precede isotope-based interpretations, and be of significant use in cases where bone collagen is not preserved. This study specifically assesses the potential utility of non-destructive XRF analyses by comparing the elemental results with stable isotope data for this site. The precision of the pXRF on most elements of interest is excellent, and calibrations for calcium-based materials (e.g. bone mineral, tooth enamel, marble) have been established, allowing comparisons with analyses done by ICP spectrometry. Elemental analysis, however, has concerns due to potential degradation and contamination of the mineral portion of bone. Also, most previous elemental studies also have been destructive, with samples well-cleaned, ashed, and put into solution for analysis. Over the last two decades, however, non-destructive desk-top and portable (hand-held) X-ray fluorescence (XRF) spectrometers have become widely available to archaeologists. While now regularly used for trace element analysis of obsidian and other lithics, and major element composition of metals, it appears potentially useful for studies of skeletal remains as well. One of the first studies done was on individuals from inland and coastal sites in Florida. The small amounts of variability among individuals at each site suggest little surface contamination, while the clear differences between the sites are most likely due to varying proportions of seafood in the diet. Analyses of many individuals from Gumelnița were compared with published isotopic data (García-Vázquez et al. 2023, Scientific Reports 13:8499, <https://doi.org/10.1038/s41598-023-35129-0>) and the interpretations made about the dietary importance of plant and aquatic resources with any patterns based on sex and status.

1821. REEVALUATING THE SECOND NEOLITHISATION OF THE BALKANS: INSIGHTS INTO EARLY (E) NEOLITHIC IN ROMANIA

**Contribution format:** Poster  
**Contribution authors:** Catalin Alexandru Lazar – Gabriel Popescu – Ana García-Vázquez – Alfred Vespremeanu-Stroe – Cristina Covataru (University of Bucharest)

This study revisits the Neolithisation of the Balkans by focusing on the early (e)Neolithic communities in Romania, particularly the Boian and Gumelnița archaeological sequences. Recent aDNA evidence suggests that these communities originated from a secondary migration of Anatolian farmers, arriving between 5318 and 5301 cal BC on the Mostiștea Valley (Romania). Radiocarbon data from key sites, such as the cemeteries at Curățеști, Sultana-Valea Orbului, and Sultana-Malu Roșu, reveal a gradual northward movement of settlers who established flat settlements and burial sites within the Mostiștea Valley. During the initial exploratory phase (5318-4941 cal BC), settlers focused on establishing early communities, which later evolved into tell settlements marked by inter-regional trade, technological advancements, and the adoption of materials like copper and gold. However, this period does not represent the first evidence of Neolithic populations in the area. Earlier farming groups with distinct, non-local genetic markers appeared as early as 800-700 years prior, though the Anatolian socio-economic tell system did not emerge until the late 6th millennium BC. Previous ceramic studies reveal a shift in mobility patterns over time. The early Starčevo-Criș groups were highly mobile, whereas the later Chalcolithic Gumelnița communities demonstrated increased sedentism. This evolution reflects significant socio-economic shifts, including greater craft standardisation and the development of more stable resource acquisition networks. Contrary to traditional assumptions, Neolithic material culture did not signify the immediate transfer of Anatolian farming models. Instead, their integration into local societies occurred gradually, with a delayed adoption that spanned several centuries. These findings suggest a more intricate, multi-phase Neolithisation process influenced by waves of migration, environmental changes, and adaptive socio-economic strategies, challenging previous linear cultural-historical interpretations.

217 MERC FORUM. BEYOND BOUNDARIES: INTERDISCIPLINARY PERSPECTIVES ON THE FUTURE OF MEDIEVAL ARCHAEOLOGY

Session theme: 3. Exploring methods in research, education and communication  
Session format: Other  
Session keywords: Medieval archaeology, Historical archaeology, Interdisciplinary studies, Research chal-  
lenges, Archaeological theory

Évora)

SESSION ABSTRACT

Medieval archaeology is generally perceived as a discipline which aims to study of human life, culture, and soci-  
ety during the Middle Ages (roughly 5th to 16th centuries) through material remains. It seeks to uncover and  
interpret artefacts, structures, settlements, and landscapes from this period, contributing to our understanding  
of medieval history and culture, often in ways that historical texts alone cannot.  
While broadly accurate, this definition oversimplifies the complexity and nuances of the field. Practitioners know  
that medieval archaeology’s scope and methodologies are subject to ongoing debate, with varying perspectives  
across countries. It also fails to address the discipline’s quite late emergence as a distinct area of inquiry or its  
still contested status within broader academic discourse.  
Until now, discussions on what defines medieval archaeology have largely been confined to its own scholars. This  
forum will take a different approach—inviting historians, art historians, architectural experts, numismatists,  
physical anthropologists, and palaeo-environmental scientists to explore the specificities of the field with us. We  
begin by asking what medieval archaeology shares with these disciplines and, potentially, where they intersect.  
Secondly, we ask what archaeological studies can offer that others do not and, equally, what archaeology can  
learn from these other disciplines. The goal is to address the challenges faced by medieval archaeology, includ-  
ing the influence of the Global Middle Ages concept and the so-called “tyranny” of written sources dominating  
traditional research scopes. In the process, we hope to foster new, more inclusive narratives that integrate both  
the (long) medieval and the archaeology.

220 PREVENTIVE ARCHAEOLOGY IN EUROPE: CONTEXT OF EXERCICE, METHODS AND WORKING CONDITIONS, PART 2

Session theme: 4. De nobis fabula narratur: archaeological practice and a profession in flux  
Session format: Regular session  
Session keywords: Preventive archaeology, Working condition, Development led archaeology, Europe  
Session organisers: Amala Marx (Institut national de recherches archéologiques préventives) – Harald  
Stäuble (Archaeological Heritage Office of Saxony) – Kai Salas Rossenbach (Institut  
national de recherches archéologiques préventives)

SESSION ABSTRACT

Preventive archaeology or development led archaeology is now practiced throughout Europe in a variety of  
legal, institutional and field contexts. Although it produces most of the archaeological data in part of Europe,  
there is still a lack of discussion about the methods and working conditions. Under monetary and time pressure,  
preventive archaeology has developed and is still developing, methods to study archaeological sites in a short  
time while maintaining or even improving the scientific quality of the excavation and post-excavation studies.  
In some countries, the excavation methods used by preventive archaeology are state-ofthe- art and the skills of  
its experienced archaeologists are in demand. However, it is also a field, halfway between business and science,  
where workers are subject to not only the law of the market, but also to competition and the vicissitudes of finan-  
cial crises. Through presentations from different European contexts, this session aims to discuss the context of  
practice, methods and working conditions of the profession in Europe.

CONTRIBUTION ABSTRACTS

1382. 30 YEARS OF ARCHAEOLOGICAL LARGE SCALE PROJECTS IN SAXONY, GERMANY: PREVENTIVE ARCHAEOLOGY BETWEEN CLAIM AND COMPROMISE

Contribution format: Oral  
Contribution authors: Harald Staeuble (Archaeological Heritage Office, Saxony, Germany)

After the fall of the inner-German Wall in the late 80ies of the last century, there was a break in the way large-  
scale interventions were dealt with in terms of archaeological monument protection. This is recognisable above  
all, but by no means only, in the area of open-cast lignite mines. A new approach was necessary, accompanied  
by a comparatively higher demand for land, be it with the numerous new linear projects for a wide variety of  
product lines, new streets, new industrial estates around the major cities and, last but not least, the many new  
development plan areas for housing estates. The legal basis was redefined at the beginning of the 1990s with a  
new monument protection law, in which the polluter-pays principle for major projects was explicitly anchored  
and always interpreted favourably, so that word quickly got around that archaeologists were not obstacles to  
construction, but reliable partners with regard to time and financial specifications, the most important aspects  
for investors. A great deal could and had to be developed on a methodological level in order to work more effec-  
tively and still fulfil appropriate documentation standards. Of course, you always have to compromise when it  
comes to finding the right balance between maximum requirements and feasibility, but always acting in favour  
of scientific research.

744. UNEQUAL MARKET POSITION IN DEVELOPMENT-LED ARCHAEOLOGY AND THE PRESSURE TO REDUCE RESEARCH QUALITY IN THE CZECH REPUBLIC

Contribution format: Oral  
Contribution authors: Robert Antal (Institute of Archaeology of the Czech Academy of Sciences, Brno)

Nowadays, development-led archaeology accounts for almost 100% of all archaeological excavations in the Czech  
Republic. The obligation of developers to finance this type of research creates market competition among archae-  
ological organizations. Unfortunately, this competition is focused almost exclusively on excavation costs, which,  
combined with the unequal position of different organizations, creates pressure to reduce quality of research.  
As archaeological heritage protection is regulated by outdated legislation, some practical aspects are not suffi-  
ciently addressed. First, this contribution will briefly recall the basics of archaeological heritage care in the  
Czech Republic, with a particular focus on the administrative process and relevant legislation, as presented at  
the previous conference. Second, it will introduce the main types of archaeological organizations—museums,  
universities, private companies, and other institutions—and describe their sources of financing. The financial  
aspect is crucial, as different organizations have access to varying levels of resources, which directly influences  
their ability to conduct high-quality archaeological research. Third, the paper will examine the impact of key  
factors, such as the market-driven environment and financial pressures, on excavation costs and, consequently,  
on research quality. The competition between organizations primarily prioritizes affordability and speed over  
thorough scientific investigation, which may lead to insufficient protection of archaeological heritage. Finally,  
the impact of all these aspects on rescue archaeology in the Czech Republic will be evaluated. Potential risks  
to heritage preservation will be identified, and possible improvements to the current system will be proposed.

72. IN PURGATORY BETWEEN HEAVEN AND HELL: PARADOXES OF ARCHAEOLOGICAL HERITAGE MANAGEMENT IN HUNGARY

Contribution format: Oral  
Contribution authors: Gábor Virágos (Independent)

Hungary presents a unique case study in development-led archaeology, characterized by frequent systemic changes  
over the past twenty-five years. This period has witnessed alternating shifts between public and private frame-  
works, alongside oscillations between centralized and localized management approaches. The system undergoes  
significant reorganization approximately every 3-4 years, creating instability for stakeholders and affecting work-  
ing conditions for archaeological professionals. Despite legal provisions earmarking funds for archaeological  
purposes, a consistent pattern of covert fund diversion persists. This creates a paradoxical situation: while devel-  
opment-led archaeology appears to generate substantial resources capable of supporting scientific research, both  
institutions and individual professionals often struggle financially. This dichotomy of apparent abundance versus  
practical scarcity defines the field’s operational reality. Hungary’s comprehensive archaeological preservation  
requirements - mandating the collection of all artifacts and documentation of all features - make it an excellent  
case study for examining the extremes of preventive archaeology’s possibilities and limitations. This presentation  
analyses past developments, current challenges, and future prospects, with particular emphasis on professional  
career trajectories and well-being, while addressing increasingly concerning near-term outlook for the field.

384. IMMOVABLE CULTURAL PROPERTY PROTECTION STUDIES, STEPS TOWARDS PREVENTIVE ARCHAEOLOGY IN SERBIA THE CASE OF THE NOVI SAD-HUNGARIAN BORDER OIL PIPELINE

**Contribution format:** Oral  
**Contribution authors:** Neda Mirkovic-Maric (Intermunicipal Institute for the Heritage Protection Subotica) – Gordan. Topic (Provincial Institute for the Heritage Protection Petrovaradin) – DušankaVeselinov (Institute for the Heritage Protection of the City of Novi Sad)

Although with the signing of the Law on Confirmation of the European Convention on the Protection of Archaeological Heritage (revised) (“Official Gazette of RS”, No. 42 of June 2, 2009) the Republic of Serbia ratified the European Convention on Protection of Archaeological Heritage, it is still poorly administered. Articles 5 and 6 of the Conventions, which deal with the participation of archaeologists in the planning phase of construction projects, were earlier not equally applied on the entire territory of the Republic of Serbia. Positive changes can be seen through the preparation of “ICM (immovable cultural property) protection studies”, which were introduced in 2023 by the Amendments to the Law on Spatial Planning and Construction. During 2024, for the purposes of drafting the Special purpose spatial plan, and before the construction of the Novi Sad-Hungarian border oil pipe-line, a protection study was carried out, covering an area 90 by1 km. Geographically, it is the area of central and northern Vojvodina, which includes the southern parts of the Pannonian Plains, a lowland area intersected by numerous active and former watercourses, a fertile land where life has always been vibrant. For the purposes of the study, an intensive survey of the scope of the plan was carried out, as well as geophysical surveys on several dozen hectares. Within the scope of the Spatial plan, numerous archaeological sites from different periods have been detected, some of which are located on the planned route of the oil pipeline. The results of this research are presented here as an example of good practice but also to shed light on the depth of the problem and the need for reform of the heritage protection system in Serbia.

718. DEVELOPING AND TRANSMITTING PROFESSIONAL SKILLS SPECIFIC TO PREVENTIVE ARCHAEOLOGY: THE CASE OF SWITZERLAND

**Contribution format:** Oral  
**Contribution authors:** Paul Jobin (Office de l’archéologie cantonale de Neuchâtel)

Integrated into the economic sector of construction and territorial planning, the practice of preventive archaeology requires varied scientific, technical and administrative skills that are rapidly evolving. In Switzerland, after the economic crisis of 2008 and the gradual end of federal motorway construction projects, young archaeologists used to develop these skills on temporary contracts as field technicians before finding a permanent position in one of the cantonal archaeological services or leaving the profession. Since a few years, a notable increase in preventive archaeology activities has occurred in Western Switzerland, mainly due to the expansion and densification of the country’s urban centres. In this context, many young archaeologists are now hired to work on archaeological excavations directly after completing their academic studies and without having previously developed any administrative or technical skills related to heritage conservation. As we will see, this situation allows us to define the skills specific to preventive archaeology that cannot be acquired through academic study. We will also analyse the importance of these skills for an effective application of preventive archaeology in land-use planning practices and for defending ours interests during our negotiations with the other various stakeholders involved. Finally, some proposals will be formulated to improve the recognition, development and transmission of the various and exacting professional skills specific to preventive archaeology.

2193. CAMPO DRAGONE (SCONTRONE, L’AQUILA, ABRUZZO, ITALY): PUBLIC-PRIVATE INTERPLAY FOR PREVENTIVE ARCHAEOLOGY IN A QUARRY AREA

**Contribution format:** Oral  
**Contribution authors:** Alessandro Vanzetti (University of Rome “La Sapienza”) – Francesca Del Fattore – Alberta Martellone (Soprintendenza ABAP AQ-TE, Italy) – Wieke De Neef (Bamberg University) – Erika Iacobucci – Maria Perri (Independent Researcher) – Sara Marino (University of Rome “La Sapienza”)

Albeit politics is still trying (2025) to reduce the effectiveness of State archaeological protection Officers, preventive archaeology in Italy is still directly regulated by the Public Contracts Code since 2016 (now: Legislative Decree 36/2023) and therefore it is a compulsory step within the management and organization of public works and utilities and in any work legally subject to the environmental impact assessment, such as, for instance, modern quarries. The aim of this paper is to present the case of the archaeological research at the Pre-Roman and Roman site of Campo Dragone (Abruzzo, Central Italy). In the 1980s/90s, this context was severely damaged by a modern quarry. The archaeological contexts include a burial area dating to the 7th-6th century BCE (Pre-roman early Samnite phase) and a gravel road running north-south, flanked by tombs dating to the 2nd century CE (Roman Antonine period). A historical ‘tratturo’ (transhumance route) is also recorded in this location. In 2017, in the

frame of the new regulations enforcing preventive archaeology, an emergency excavation targeted a part of the context. In 2022, the quarry was planned to expand over the last preserved portion of the archaeological context. A collaboration agreement was therefore signed between the Superintendency of L’Aquila and Teramo, Sapienza University of Rome and the local Municipality (Scontrone village) to support synergically the preventive evaluation, excavation, research and the ensuing enhancement activities. The intervention also included the presence of professional archaeologists and the relationship with the private quarry companies, who directly financed a relevant part of the activities, together with the State. The process was rather linear, but it also shows some of the complexities preventive archaeology faces today, in the interplay between State institutions, local Territorial bodies and Universities, Private stakeholders and professional archaeologists. The clear-cut cooperation is a viable strategy, but not without caveats.

2002. THE ROLE OF ENVIRONMENTAL IMPACT ASSESSMENT IN SAFEGUARDING ARCHAEOLOGICAL HERITAGE

**Contribution format:** Poster  
**Contribution authors:** João Marques (Património Cultural, Instituto Público | CEAACP - Centro de Estudos em Arqueologia, Artes e Ciências do Património) – Alexandra Estorninho – Ana Nunes – José Monteiro (Património Cultural, Instituto Público)

The ratification in 1997 by Portugal of the European Convention for the Protection of the Archaeological Heritage (revised) – 1992, La Valetta, Malta –, institutionalized the widespread application of the principles of preventive archaeology, resulting in an extraordinary increase in archaeological activity under contract. The 2001 law on the protection and enhancement of cultural heritage established that any necessary archaeological interventions must be fully financed by the respective promoters. The growing presence of archaeology in areas as diverse as environmental management policies, land use planning and urban rehabilitation, created the need to adopt a new set of standards and guidelines that would guarantee compliance with procedures and technical methodological precepts to be observed when carrying out archaeological work. The Environmental Impact Assessment (EIA) of public and private projects likely to produce significant effects on the environment constitutes a fundamental preventive instrument of sustainable development policy. Within its framework, the national entity responsible for cultural heritage, including archaeological heritage, established a set of guidelines and methodological work procedures to be carried out within the scope of EIA. Both regulations resulted in the mandatory collection of information to describe the affected environment, in order to identify, predict and prioritize impacts, as well as defining measures designed to avoid, minimize or compensate for impacts and respective monitoring of implementation in subsequent phases of projects (post-assessment). In the current Regulation of Archaeological Work, these activities correspond to minimization actions, integrated into studies, plans, projects and works with an impact on the territory.

2055. BUILDING BRIDGES: COLLABORATIVE APPROACHES IN PREVENTIVE ARCHAEOLOGY AND ACADEMIC RESEARCH

**Contribution format:** Poster  
**Contribution authors:** Cristina Gameiro (Uniarq - Centro de Arqueologia da Universidade de Lisboa) – Nuno Neto (Neoépica, Lda) – Luís Almeida (Uniarq - Centro de Arqueologia da Universidade de Lisboa | Direção Geral de Energia e Geologia, Ministério do Ambiente) – Maurizio Zambaldi (Uniarq - Centro de Arqueologia da Universidade de Lisboa | LaBAAF - University of Trento)

This paper addresses the evolving relationship between preventive archaeology and academic research in Portugal, emphasizing the potential for improved outcomes through collaboration between archaeological companies and universities. As a case study, it presents the collaboration between the PALEORESCUE project and Neoépica, Lda during the excavation of the early Mesolithic sector at Unidade de Execução de Entrecampos (UEE), in Lisbon. The joint effort enabled the implementation of methodologies, such as geoarchaeological and sedimentological analyses, radiocarbon dating, and micromorphological studies. These approaches, not often applied in preventive archaeology, allowed for more detailed insights into the early Mesolithic occupation of the site. Notably, over 11,000 lithic artifacts were documented and analyzed, offering a comprehensive understanding of raw material use, spatial distribution, and site formation processes. While collaboration between the private and academic sectors is common, it is often limited to post-excavation artifact studies. The UEE excavation represents a departure from this norm, as research and preventive archaeology were fully integrated during the excavation process. The project underscores the importance of collaborative frameworks that combine the technical rigor of preventive archaeology with the knowledge and critical mass of academy. Such synergies can enhance knowledge production and promote a more comprehensive preservation of cultural heritage. Ultimately, this study calls for stronger institutional support and standardized protocols to ensure more frequent application of interdisciplinary methodologies in preventive archaeology, advancing both discipline and public knowledge.

221 DECONSTRUCTING NATURE: ARCHAEOLOGY OF “NATURAL SPACES” AND THE “MODERN VISUAL REGIME” IN RURAL AREAS

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Regular session  
Session keywords: Archaeology of Landscape, Political Aesthetics, Materiality, Rural History, Contemporary Archaeology  
Session organisers: Rafael Millán-Pascual – Andrés Menéndez-Blanco (Institute of Heritage Sciences (INCIPIT-CSIC)) – Laura Gago-Chorén (Università di Genova)

SESSION ABSTRACT

In “The Country and the City” Raymond Williams shows the abrupt process that the rural environment went through to adapt to the taste of the bourgeois look. The key was to eliminate the traces of peasant labor accumulated in rural landscapes throughout history. The countryside became a natural setting: an image without people. A similar reading is offered by Jacques Rancière in “The Time of the Landscape”. This book points to landscape art as one of the technical mechanisms that contributed to the culmination of the aesthetic regime of modernity. By this means, nature was detached from history at the cost of being dominated and technically reproduced, as if it were a painting. The rural environment became the stage on which to rehearse the visual regime of modernity. This session aims to deconstruct this idea of nature. The critique of the modern dichotomy between nature and culture occupies a long bibliography, as well as numerous approaches. Ours is different. We start from a material understanding of the modern idea of nature. That is, this idea is not false, as the critique sometimes suggests, because it also has material effects that support it and give it meaning. The idea of nature is constructed, it creates reality, just as it allows itself to be deconstructed. We invite to think archeologically about the human and material costs behind the image of “natural space”. From this perspective, the “clearances”, the effects of forestry policy, infrastructure policies, the creation of natural parks and in general the management of archaeological heritage are mechanisms closely linked to the imposition of this modern visual and aesthetic regime. The aim is to open alternative historical narratives that break with the idea of a “natural” rural environment occupied by the “good savages” of the past and present, i.e. without people.

CONTRIBUTION ABSTRACTS

470. ARCHAEOLOGY, ENVIRONMENTAL HISTORY AND POLITICAL ECOLOGY: KEY CONCEPTS AND METHODOLOGICAL CONFLUENCES FOR DECONSTRUCTING THE NATURALIZATION OF RURAL AREAS

Contribution format: Oral  
Contribution authors: Rafael Millán-Pascual (Institute of Heritage Sciences (INCIPIT-CSIC))

Nature is no longer the passive and aesthetic concept portrayed by bourgeois sensibility and its tourist counterpart. Climate change and the so-called Anthropocene have brought the political dimension of nature back to the forefront. In recent decades, new concepts and methods have challenged the old division between culture and nature to address the complexity of the problem, but in many cases the material aspects are not taken into account. In this talk, I will present an integrated approach that brings together archaeology, environmental history and political ecology to address this material dimension. Rural areas offer a unique perspective from which to explore the limits and possibilities of this interdisciplinary encounter. From clearances to major government interventions, the countryside suffers the material consequences of an ideal and abstract notion of nature that has transformed rural areas into its visual realization. A comprehensive approach to the historical development of this naturalization process must take into account these disciplines in order to restore a more nuanced and equitable way of life in the countryside. In other words, breaking down rural postcards to promote a more social and historical sensibility.

1288. SWEET STORIES, AGGRESSIVE FACTS. THE RESHAPING OF A RURAL COMMUNITY IN NORTH-WESTERN IBERIA BETWEEN THE 19TH AND 20TH CENTURIES

Contribution format: Oral  
Contribution authors: Andrés Menéndez-Blanco (Institute of Heritage Sciences (INCIPIT-CSIC))

The 19th century saw the triumph of the new ideas of modernity and their progressive institutionalisation in European states. With this, a series of bourgeois discourses and perceptions of the rural world or ‘nature’ became widespread. But, of course, the changes went far beyond innocent notions of idyllic landscapes and the ‘good

savages’ who inhabited them. These narratives accompanied (and ‘sweetened’) deeper acts of economic and social transformation. Such processes can be read in the landscape through archaeology, avoiding the limitations of self-interested narratives. In this paper we illustrate this by analysing a mountainous area in Asturias (NW Iberia). We will see how, throughout the 19th century, a symbolic representation of the ideals of the 19th-century bourgeoisie was imposed on the landscape through new monumental architecture. An old village was almost completely destroyed and rebuilt according to a purely urban plan. At the same time, we can see how its promoters gradually appropriated the natural resources and transformed the productive infrastructure in their favour. These changes weakened the local communities, which began a rapid process of destructuring. The aim of this paper is to analyse the effects of these transformations at a small scale and to question the dominant idealising discourses. Ultimately, the aim is to better understand the processes of depopulation of rural mountain areas that are currently affecting south-western Europe.

1758. MODERNITY AND EXTRACTIVISM IN THE INDUSTRIAL LANDSCAPE OF BERGUEDÀ (CATALONIA, SPAIN)

Contribution format: Oral  
Contribution authors: Laia Gallego Vila (Universitat Autònoma de Barcelona)

The industrialisation left an indelible environmental mark on Berguedà, transforming its natural landscape through an extractivist relationship with its resources. The surge in industrial activities, epitomized by the establishment of mining operations and new infrastructure, significantly altered the region’s ecology. The development of animal-drawn trams, overhead cable carts, and the pivotal railway connection to Manresa and Barcelona in 1903 accelerated environmental changes and redefined the region’s spatial dynamics. These infrastructural changes, driven by the energy demands of Barcelona’s factories, reconfigured Berguedà from an isolated rural region into a crucial energy periphery. The environmental impact was profound: deforestation accelerated as trees were felled for mine shoring, and new industrial colonies emerged, significantly altering the valley terrain. The transformation of company towns, such as La Consolació, Sant Josep, and Sant Corneli, resulted in concentrated worker populations, further stressing the local environment. The mining activities in Peguera, Fígols, serve as a stark example of the environmental consequences of extractivism. Rapid deforestation and the exhaustion of coal resources within three decades led to the village’s abandonment by 1960. This episode highlights the autophagic and cannibalistic nature of mining exploitation, with significant environmental degradation and depletion of natural resources. By the 1950s, industrialisation had further entrenched extractivist practices, leading to severe pollution in the Llobregat valley. Successive industries, including cement factories and thermal power plants, exacerbated environmental damage until their eventual closure in the 1980s. The remnants of this industrial era—abandoned factory buildings, industrial waste, and contaminated landscapes—underscore the long-lasting environmental impacts of Berguedà’s industrial past.

1544. THE ASTURIAN RURAL LANDSCAPE: FROM TRADITIONAL FARMING TO AGROINDUSTRY

Contribution format: Oral  
Contribution authors: Santiago Rodríguez-Pérez (University of Oviedo)

The landscape and traditional rural culture of Asturias were shaped over a long historical process, which involved a gradual conversion of the environment into an agricultural ecosystem. The exploitation of this ecosystem was carried out by the basic units of production and consumption, the casería (farmsteads), which formed the basis of rural settlement since the Middle Ages. The house represented the vital and productive space of the peasant family, including domestic spaces, buildings dedicated to agricultural production, lands for pastures, crops, and forests, as well as rights over common lands and neighborhood. At the end of the 19th century, economists, engineers, and other intellectuals promoted the dairy specialization of northern Spain. Policies were developed in favor of milk and meat cattle production, to the detriment of the traditional polyculture practiced on farms. During the 20th century, the processes of agricultural industrialization accelerated, transforming the old rural social structures and the ways of understanding and exploiting the landscape. This led to profound transformations, such as the conversion of old traditional farms into modern industrialized operations; the intensification and hyperspecialization of forage crops; the creation of intensive forest monocultures dedicated to the timber industry; and finally, the social disintegration of the peasantry and rural inhabitants, driven to urban migration. This process of industrialization has had a strong impact on the landscape and has generated other consequences, such as depopulation, dependence on external and international markets, loss of biodiversity and soil degradation, urban speculation, and new landscape uses. This communication explores these historical transformations in the landscapes of various areas of Asturias, as well as their current and long-term perspectives.

1989. FROM THE DISPLAY CASE TO THE FIELD: THE RURAL LANDSCAPE IN REPRESENTATION AND ARCHAEOLOGICAL RESEARCH IN VELVA (LIGURIA, ITALY)

Contribution format: Oral  
Contribution authors: Laura Gago-Chorén (Università di Genova)

The Museo Diffuso di Cultura Contadina di Velv. (Castiglione Chiavarese, Italy) is a museum that houses a rich collection of material culture that reflects the rural life of the area until the mid-20th century. It is located in a mountainous region currently characterized by depopulation and the progressive abandonment of the management of environmental resources and agro-silvo-pastoral practices. Far from being a mere repository, the museum actively contributes to regional cultural revitalization, attracting the interest of locals, academics, and tourists. This presentation uses an interdisciplinary approach integrating landscape archaeology, oral history, and written sources analysis to examine how the museum’s narratives interact with collective memory and tangible heritage. It will explore how the landscape represented is articulated with the historical and material realities of a continuously transforming territory. It also reflects on the heterogeneous memories present in the community, questioning whose memories are represented, how they are shaped, and who seeks to preserve them. By contrasting the museum narratives with the findings from field research, the tensions and harmonies between the cultural construction of the landscape and its historical dynamics are highlighted. Building on this, there is also a reflection on the role of rural museums as agents of cultural mediation: To what extent do they perpetuate a static and nostalgic view of the landscape? How could they better integrate the dynamics of change, abandonment, and resilience to address contemporary challenges. Ultimately, this research contributes to the debate on the archaeology of “natural” spaces and the modern visual regime, questioning idealized representations and proposing new interpretations of the landscape as a dynamic and constantly evolving entity. This analysis is framed within the CLOE Project, an interdisciplinary and intersectoral doctoral program at the University of Genoa (MSCA-Cofund), which addresses themes related to sustainable development and conservation in rural and mountainous areas.

1564. A DISSONANT WILDERNESS: ARCHAEOLOGY, HERITAGE, AND THE CONSTRUCTION OF NATURAL LANDSCAPES AT FROST TOWN, NEW YORK

Contribution format: Poster  
Contribution authors: Alexander Smith (SUNY Brockport)

The concept of “wilderness” has long been at the heart of modern place-making and identity construction in the United States. Proximity to wilderness and engagement within it, via leisure activities, hunting, or extraction have the capacity to create or reinforce regional and class-based identities. New York State is no different, with much of its land outside of urban centers devoted to parks, trails, and nature preserves. The idea of entering wilderness and indeed the implication of many nature-based leisure activities is couched in an escape from human influence and interaction, as the spaces are idealized as untouched by anthropogenic forces. However, these concepts mask the industrial and rural heritage of these spaces, many of which were exhausted and abandoned. This poster will discuss Frost Town Archaeology, a project based in the Finger Lakes Region of New York, which explores an abandoned industrial logging and agricultural town. Thinking through William Cronon’s “The Trouble with Wilderness,” this poster will explore how the idea of “wilderness” is imposed on post-industrial landscapes of abandonment, particularly in rural areas in the United States. Finally, this poster will also contend with modern ideas of “nature” and “wild” from a consumptive perspective, discussing how the use of postcards in the 19th and early 20th centuries changed American perceptions of bucolic rural and natural spaces, whic. arguably led to the fetishization of the “wild” in modern American sentiment. Ultimately, this idea has resulted in the erasure of industrial and settler colonial history, which archaeology can perhaps be used to correct.

223 THE RARE, THE COMMON, AND WHAT EVERYBODY NEEDS: EXPLORING THE VALUE OF AESTHETICS IN THE MATERIAL RECORD OF PREHISTORIC EUROPE

Session theme: 5. Finding the way! Archaeological sciences and opening new research perspectives  
Session format: Regular session  
Session keywords: Aesthetics, Value, Prehistory, Desirability, Agency, Socio-economy  
Session organisers: Michael Brandl (Austrian Academy of Sciences, OeAI) – Lasse Soerensen (National Museum of Denmark) – Christina Tsoraki (University of Leicester) – Tasos Bekiaris (University of Thessaloniki) – Mads Bendtsen (Aarhus University)

SESSION ABSTRACT

This session aims to explore the role of aesthetics in the material culture of Prehistoric Europe as a lens through which to understand the development of value, wealth, and consequently social inequality. We see aesthetics as the sensory impact of objects on humans, derived from properties such as color, sound, and size, as well as the complex interactions between people and the world around them through processes of making and using. Gosden (2001: 166) previously argued, “Each culture creates its own sensory environment, both physically through constructing a material world with its own set of sensory properties and culturally through emphasizing and valuing certain types of sense impressions over others,” highlighting the need for a contextual exploration of aesthetics. In examining objects made from different raw materials, we hypothesize a human awareness of stimulating the senses and promoting specific expressions through features such as brilliance, proportions, functionality and design. These aspects document patterns of fashion, taste, value, and potentially beauty. By analyzing artifacts displaying distinct aesthetic characteristics, such as intricately crafted tools, personal ornaments or decorated objects, we consider how aesthetic choices reflect the emergence of economic disparities resulting in more complex social stratification in different prehistoric communities. Employing contextual and multidisciplinary approaches integrating archaeometry, archaeology and socio-economic theory, we wish to examine how aesthetic expressions served as markers of individual and group identity, and established and communicated social status and desirability. One of the key questions we want to explore is whether patterns of wealth accumulation can be attributed to aesthetic preferences, suggesting that the desire for visually appealing items contributed to the formation of elites and the negotiation of power dynamics within and between groups, thus entangling the fluctuations of inequality in prehistoric societies. Gosden, C. (2001). Making Sense: Archaeology and Aesthetics. World Archaeology, 33, 163–167.

CONTRIBUTION ABSTRACTS

2352. SETTING THE STAGE: WHY AND HOW TO EXPLORE THE VALUE OF AESTHETICS IN THE MATERIAL RECORD OF PREHISTORIC EUROPE

Contribution format: Oral  
Contribution authors: Lasse Sorensen (The National Museum of Denmark) – Michael Brandl (Austrian Academy of Science) – Christina Tsoraki (Leicester University) – Tasos Bekiaris (Thessaloniki University) – Mads Bendtsen (Aarhus University) – Mikkel Nørtoft (University of Kiel)

This contribution will introduce the session The rare, the common, and what everybody needs: exploring the value of aesthetics in the material record of Prehistoric Europe, setting the stage for a discussion on the aesthetic dimensions of material culture in Prehistoric Europe and their broader social implications. By adopting a multidisciplinary approach, we aim to critically examine how aesthetic choices influenced perceptions of value, wealth, and inequality in past societies. We begin by exploring the breadth of the term aesthetics within the framework of Prehistoric archaeology, considering how sensory engagements with objects—through attributes such as color, texture, brilliance, and form—shaped human experiences and social interactions. Moving beyond conventional definitions, we investigate the role of aesthetics in material culture as an active force in structuring economic and social systems. Key questions we want to address include: How did aesthetic preferences reinforce or challenge social hierarchies? In what ways did aesthetic expressions act as markers of identity, status, and desirability? Could the pursuit of visually striking or sensorially engaging objects have driven wealth accumulation, leading to the formation of social elites and the negotiation of power? By addressing these issues, we seek to uncover the entangled relationships between aesthetics, value creation, and inequality. Our analysis integrates archaeometry, archaeology, and socio-economic theory, providing a comprehensive framework to reassess the impact of aesthetic considerations on prehistoric social structures. By focusing on aesthetics as a key factor in material culture studies, this session aims to refine our understanding of how sensory and visual preferences shaped economic and social landscapes in Prehistoric Europe.

829. COMPUTATIONAL ASSESSMENTS OF MESOLITHIC ART

Contribution format: Oral  
Contribution authors: Lasselukas Herskind (Aarhus University, School of Archaeology and Heritage Studies)

The portable art of the South Scandinavian Mesolithic (~9000-4000 BCE) forms an extensive corpus of prehistoric art, characterised by chiefly geometric engravings on a wide range of artefacts. A research-historical devaluation of these engravings as ‘poor’ and ‘hasty’ has contributed to a stagnation in research on this ornamentation practice. Such subjective judgments by contemporary eyes is perhaps telling of a dramatic difference in culture-specific aesthetic preferences between these Mesolithic societies and ourselves. In an attempt to bypass such qualitative biases, the present contribution showcases a suite of computational approaches to this Mesolithic art. The abundance of known portable art objects from this period - coupled with the dynamic developments of the societies

that produced them - render this corpus uniquely suitable for innovative, data-driven approaches to understanding artistic behaviour in prehistoric worlds. Drawing on computational linguistics and cognitive science, the study examines spatiotemporal trends in engraving complexity, syntax, and entropy. The findings demonstrate significant temporal changes in aesthetic traditions that correspond closely to the climatic and socio-economic developments of the period. This novel and multidisciplinary approach does not only qualify renewed discussions on the increasing social complexity of these specific hunter-gatherer societies, but also holds the potential of identifying the originally intended purpose of the Mesolithic art.

1336. BRILLIANCE AND COLOURS: PERSONAL ORNAMENTS IN THE NEOLITHIC

**Contribution format:** Oral  
**Contribution authors:** Selena Vitezovic (Institute of Archaeology, Belgrade)

Prehistoric personal ornaments (pendants, beads, bracelets, etc.) are often assumed to have served as amulets, i.e., that they had prophylactic, apotropaic, curative role, and that they also served as status and prestige items. Usually it is assumed that the rarity of the raw material determined their value, i.e., that the ornaments from certain materials (e.g., imported marine shells, metals) were also signifiers for wealth and prestige. However, their other aesthetic traits could be contributing to and increasing their symbolic value. In the Neolithic period in the southeastern Europe, personal ornaments were produced from a variety of materials: lithic, clay, osseous and possibly perishable organic materials. Osseous raw materials (bones, teeth, antler, mollusc shells) were particularly frequent and their origin from living animal certainly contributed to their symbolic value. But these raw materials also possessed some important physical properties: bright colours, and smooth, shiny surfaces. Their surfaces were often meticulously burnished, thus increasing and emphasizing smoothness and shine. Apart from the smoothness and shine, colours also played an important role, especially white colour. Bone items, when fresh, had bright white colour, mollusc shells used for ornaments were often white, and used lithic raw materials were predominantly white stones. Other colours were also valued (reddish colours of some mollusc shells and clay items, greenish nuances of lithic objects), but white colour seems to have been particularly important for the Neolithic communities. In addition, we may note the presence of skeuomorphism – the same morpho-type of ornament was produced in different raw material (shell, bone, stone) but of the same (white) colour. This suggests that some of the aesthetic traits, especially shiny surfaces and white colour, were rather important; they added value to the personal ornaments and contributed significantly to their role as prestigious items.

1755. THE VALUE OF MATERIALS: EXPLORING STONE AXE AESTHETICS IN NEOLITHIC COMMUNITIES IN NORTHERN GREECE

**Contribution format:** Oral  
**Contribution authors:** Christina Tsoraki (University of Leicester) – Tasos Bekiaris (Aristotle University of Thessaloniki)

One of the defining elements of the Neolithic period in Greece is its rich and distinctive portable material culture (e.g., fine pottery, stone tools, figurines, ornaments) alongside abundant architectural remains. The Neolithic period as a whole evidenced an augmentation in material use and elaboration in production techniques. Existing and newly introduced materials offered new sensory experiences to Neolithic communities providing particular ways to make sense of their material surroundings. The material repertoire of Greek Neolithic communities was extensive and included among others: ceramic containers, and occasionally stone and shell ones; axes fashioned from different types of stone particularly serpentinite and other green coloured rocks; figurines made of clay, marble, and less frequently of shell and bone. Alongside these, we need to consider other material components of a more perishable nature (e.g., wood, hide); although lost today, they were once utilised and held an important role in the shaping of enriched understandings of past material worlds. In this contribution we wish to explore the capacities processes of making (e.g., extend and degree of polishing) had to accentuate the visual properties of materials, to create objects of a distinctive appearance and to enable different sensory experiences. We consider these questions in relation to a large assemblage of stone axes and adzes (amounted to more than 2500 objects) that derive from different Neolithic settlements including the settlements of Avgi, Dispilio and Makriyalos, all located in Northern Greece. Comparative analysis of technological processes and depositional practices in different social contexts (houses, communal areas) within these settlements allows us to explore contextualised and historically situated perceptions of aesthetics and material value.

1930. THE FLEXIBLE AESTHETICS OF EVERYDAY OBJECTS AND ROUTINE PRACTICES: EXPLORING THE ROLE OF DECORATED POTTERY FROM NEOLITHIC DISPILIO, NORTH GREECE

**Contribution format:** Oral  
**Contribution authors:** Evangelia Voulgari (Laboratory Teaching Staff, School of History and Archaeology Aristotle University of Thessaloniki) – Marina Sofronidou (Ephorate of Antiquities of Drama) – Kostas Kotsakis (Aristotle University of Thessaloniki)

In this paper, we explore the role of aesthetics in the decoration of pottery from Neolithic Dispilio. Dispilio is the first wetland site excavated in Greece and has been systematically investigated since the 1990s by the Aristotle University of Thessaloniki. Throughout the multi-layered, diachronic development of the settlement from the mid-6th to the early 5th millennium BCE, we observe various changes in the elaboration of ceramic surfaces. In our analysis, we consider decorative techniques, motifs, patterns, pot shapes, and technological features as interconnected elements of a single process, with no one aspect being considered more important or critical than the others. The motifs do not merely adorn clay surfaces but concrete products of the material culture. Their significance lies in this very characteristic: they do not exist in isolation but are integral to the construction of specific artefacts. From this perspective, we explore “the rare, the common, and what everybody needs” within the ceramic assemblage from the earliest two phases of the settlement. By examining relationships of exclusion, alternative possibilities, and identification in the production of decorated pottery, we aim to reveal changes in how people perceived and experienced their world through everyday objects and routine practices.

1316. THE SEA’S ECHOES. ON GLYCYMERIS ORNAMENTS THROUGHOUT PORTUGUESE TERRITORY DURING THE NEOLITHIC AND CHALCOLITHIC

**Contribution format:** Oral  
**Contribution authors:** Cátia Delicado (Uniarq | Cias) – Rafael Lima (Uniarq | Mna | Fct)

Archaeological evidence from early Neolithic groups in different areas is linked to an increase in the importance of personal ornaments. These objects increased compared to previous periods in terms of technology, variability of raw materials and, in general, quality of finish. Personal adornments, even today, are elements that embody and signify the individual’s identity within a human or cultural group. The presence of altered Glycymeris shells in an archaeological context, whether for making beads, pendants or even ring bracelets, certainly has a distinct meaning, especially when found in remote highland areas. Likewise, their presence in environments other than their natural environment, the maritime area, demonstrates that they are an important element for studying the networks of circulation of goods, as well as the symbolic behaviours and aesthetic preferences of these communities. This research provides an overview of the application of Glycymeris in the manufacture of ornamental artifacts. From the information available on these ornaments – such as chronology, typology and the objects biography –we seek to contribute to a complex intercultural archaeological manifestation related to the spread of the Neolithic and Chalcolithic way of life across the Iberian Atlantic facade.

2227. POTTERY AESTHETICS AND SOCIAL DYNAMICS IN THE GREAT HUNGARIAN PLAIN’S MIDDLE COPPER AGE: THE SIGNIFICANCE OF HUNYADIHALOM CULTURE’S SERVING VESSELS

**Contribution format:** Oral  
**Contribution authors:** Zsuzsa Hegedus (Hungarian National Museum Public Collection Centre | Eötvös Loránd University)

The Copper Age of the Carpathian Basin was a period when prestige objects – mainly made of metal – played a crucial role in communicating social differences, particularly in funerary contexts. However, aesthetic design was not limited to high-status or representative artefacts: everyday objects, such as pottery vessels also played a role in conveying important messages within the community. With no known cemeteries from the Hunyadihalom culture (3900–3700 calBC) in Hungary, the study of pottery becomes especially valuable in reconstructing the social structures and inner dynamics of these communities. In this presentation, I examine the Hunyadihalom culture’s fine pottery, which – despite not being heavily decorated – reflects careful design, craftsmanship and a careful attention to detail. The main focus of the study is on the personal serving vessels, which not only appear in great numbers but also show remarkable uniformity. Their standardised characteristics suggest a possible role in strengthening communal cohesion, particularly in the context of communal meals. The potential role of these vessels in symbolically creating equality in the communities is particularly important in the Hunyadihalom culture, as recent studies indicate their presence across all sites, regardless of their position within the settlement hierarchy.

1638. CRAFTING VALUE? EXPLORING THE SIGNIFICANCE OF EXCEPTIONAL OBJECTS IN EUROPEAN NEOLITHIC SOCIETIES

Contribution format: Oral  
Contribution authors: Michael Brandl (Austrian Academy of Sciences, OeAI)

The role of aesthetics in prehistory is an elusive yet crucial aspect of archaeological interpretation. While archaeologists analyze material culture through various frameworks, contextualizing objects within broader socio-cultural narratives remains essential. One key proposition is that aesthetics may have played a fundamental role in the formation of social and economic value systems, with rare and finely crafted objects serving as what we define as “cultural markers.” These markers are typically distinguished by a multitude of qualities – symbolic, utilitarian, or a combination of both aspects. These include properties of the raw materials such as color, texture, translucency, reflectance, as well as availability and the time and skills invested in their manufacture attested by their final appearance. This paper examines case studies of archaeological objects that stand out from the ordinary in various ways. By analyzing such objects through different interpretative lenses, we seek to explore their potential aesthetic significance and their role in shaping or reflecting systems of value in prehistoric societies. This approach highlights the complexity of assigning function and meaning to material culture and the challenges of integrating aesthetics into the archaeological discourse, particularly in relation to the broader development of value concepts. As such, we might consider that aesthetics functioned as a bridge between social and economic value, reinforcing the desirability of exceptional materials and ultimately contributing to the emergence of more structured distribution systems.

224 LEAVE IT! CREATING RUINS. COMPARING ABANDONMENT PROCESSES IN EUROPE (500 BCE-500 AD)

Session theme: 1. On artefacts and beyond  
Session format: Discussion session  
Session keywords: Abandonment, Processes, Iron Age, Classical Antiquity, Europe  
Session organisers: Carole Quatrelivre (Christian-Albrechts Universität zu Kiel) – Elisabeth Goussard (Evéha | Aoroc UMR 8546 - CNRS) – Anne-Lise Baylé (Université Paris I Panthéon-Sorbonne | Arscan UMR 7041 - CNRS)

SESSION ABSTRACT

What does it mean to leave? How do people leave? Archaeological research often prioritizes the vibrant past of sites, yet the complexities of abandonment processes remain underexplored, particularly in the context of recent Prehistory and early History in Europe. This session seeks to address the multifaceted nature of abandonment from the 5th century BCE to the 5th century AD. Abandonment processes happen on multiple scales, are shaped by human and non-human actions and are key to understanding the formation of the archaeological record. By embracing different types of contexts (settlements, necropolises, ritual spaces), we aim to provide a comprehensive overview of abandonment processes, ranging from conspicuous events like conflict and natural disasters to subtler phenomena such as displacement. Beyond site-specific analyses, the issue of abandonment is also relevant to the analysis of settlement systems. Indeed, definitions of abandonment have consequences on our understanding of the cyclical use of space by human societies. We can thus consider the diversity of factors that drive people to return, whether opportunistic or linked to memories of the past. Therefore, we hope to implement a form of dialectic throughout the session, thanks to contributions dealing with two scales of abandonment: . . . Case studies from settlements, funerary spaces and sanctuaries exploring the intentionality, temporality and gestures behind their abandonment. Papers putting to use new methods (imagery, simulations, experimental archaeology) to support their analysis are welcome. . . . Papers delving into long-term population dynamics. This is an invitation to question the significance of abandoning a site and of coming back, addressing its costs and potential advantages, both on a contextual level (replenishing environmental resources, adapting to the communication system) and on a human scale (symbolic advantages, adapting the social structure).

CONTRIBUTION ABSTRACTS

902. FROM RUBBLE TO REUSE: THE END OF AN ANCIENT CULT PLACE IN GALLIA NARBONENSIS

Contribution format: Oral  
Contribution authors: Alexandre Gouverneur (CNRS, UMR 7041 Archéologie et Sciences de l’Antiquité - équipe GAMMA | Université Paris 1 Panthéon-Sorbonne) – Michel Passelac (CNRS, UMR 5140 Archéologie des Sociétés Méditerranéennes.)

The abandonment and dismantlement processes of cult places during late Antiquity has been the focus of archaeological literature since a few decades, especially within the Western Roman Empire. Although historical sources tend to emphasize key events bringing about an abrupt end to the pagan era, the archaeological record portrays a more nuanced and gradual transition. This evidence suggests that local factors and dynamics played a more significant role than an overarching narrative. As such, research must forgo a “one size fits all” approach and focus instead on the more minute details, studied in context. Located in Gallia Narbonensis, near Tolosa, the settlement of Montferrand (ancient Elusio/Elesiodunum) offers insights into those dynamics and allows for the study of an ancient roadside town over time. From an Iron Age oppidum to a late Republican toll station, mentioned in Cicero’s Pro Fonteio as well as in various ancient itineraria, Elusio is a local hub of some import along the voie d’Aquitaine. It was first excavated in 1955; in 1986, aerial photographs uncovered part of a settlement comprised of storehouses, workshops, and paired temples. The latter, at the locality “Le Berrut”, have been investigated since 2022, revealing a half-collapsed, half-dismantled cult place. This Roman phase supersedes an earlier, protohistoric enclosure, before being dismantled in turn. The material found in various robber trenches, as well as other finds, allows for accurate dating of the dismantlement to the last third of the 4th century AD. During this period an early Christian funerary basilica was constructed approximately 140 m to the east, likely reusing material from the temples at “Le Berrut”. This communication thus aims to detail the processes of dismantlement and reuse at a small cult place in Southern Gaul, within the broader context of the settlement’s development as well as the regional dynamics.

87. THE ABANDONMENT OF THE LATE GALLO-ROMAN TEMPLE OF COBANNUS (BURGUNDY, FRANCE)

Contribution format: Oral  
Contribution authors: Rebecca Perruche (UMR/CNR. 6249 Chrono-Environnement)

The sanctuary of Cobannus, near Dijon, in the Burgundy region, has been excavated since 2019. The site is a fairly typical Gallo-Roman sanctuary with a square temple surrounded by a stone temenos wall. It was built over the rectangular Iron Age ditch, which was presumably used as a container for votive offerings. However, the site is best known for the discovery, long kept secret, of an extraordinary treasure trove of Roman statuary and ritual furnishings. Unearthed illegally in 1977, its contents were sold by its discoverer and dispersed among prestigious American collections. In 2008, shortly before his death, full of remorse, he finally confessed everything. The treasure was buried outside the sacred enclosure in a simple pit covered with tiles. The most valuable artworks were the bronze statue of Cobannus, a local deity who was equivalent to Mars, and a pair of portrait busts of rich young boys from the 1st century AD. It also contained numerous small statues, gold jewelry, metal vessels and at least 7,000 coins, stacked in three separate arcas (offering boxes). The most recent coinage dates from the reign of Julian the Apostate (c.363 CE). This treasure therefore represents the closing deposit of the sanctuary, perhaps hastily created in the mid-4th century. However, this burial did not signify the end for the sanctuary. Coins of Valentinian and Theodosius indicate that it was still used as a pagan temple until the end of the 4th century. All the buildings were then violently destroyed by a fire, which led to the final abandonment of the temple. The aim of this paper is to discuss the question of the end of sanctuaries in the Eastern Gaul, as well as the particular journey of the treasure of Cobannus.

670. THE END OF A PROCESS. ABANDONMENT OF MINIATURE WHEEL DEPOSITS IN GAUL.

Contribution format: Oral  
Contribution authors: Elisabeth Goussard (Eveha - UMR 8546 Aoroc)

This paper explores the process of voluntary abandonment in a ritual context. It will focus on offering deposits from La Tène traditions: deposits of miniature wheels, mainly found in the north and east of Gaul. The forms of these offerings and how they were deposited stem from processes that began in the 3rd century BC. They then accelerated sharply during the phases of Roman crises and conquests. One of the most emblematic sites of these exacerbated deposits is La Villeneuve-au-Châtelot in the Aube. This type of mass deposition has led to their association with a phenomenon of ‘Romanisation’. However, the repositories and the areas that housed them were abandoned during the 2nd century AD, well after the integration of Gaul-Belgium into the Roman Empire. This makes it possible to explore the abandonment of a phenomenon when the processes underway reach their conclusion, rather than following a sudden break caused by external events.

150. THE SO-CALLED PILLAR OF OINOMAOS AT OLYMPIA - NEGLECTED, ABANDONED AND PROTECTED

Contribution format: Oral  
Contribution authors: András Patay-Horváth (ELTE Budapest)

Pausanias (5.20.6-7) gives a detailed description of a pillar standing in the very center of the sanctuary of Olympia. No remains have been discovered so far but many different suggestions were proposed for the interpretation of the lost monument. After reviewing these theories, I suggest looking at some classical vase-paintings which

depict mythical events located at Olympia and argue on the basis of these depictions that the so-called pillar of Oinomaos actually was part of an early archaic votive dedication, a pillar supporting an old statue of a goddess. It stood for centuries in the sanctuary, but was neglected and ended up in a ruinous state. Afterwards, sometime before the visit of Pausanias, presumably during the Roman Imperial Period, the pillar has been reinterpreted as the last standing remain of the palace of Oinomaos, a local mythical ruler and serious measures were taken to protect and to conserve it. This reconstruction of the events is completed by considering the questions, when and why the processes of abandonment and reinterpretation may have taken place.

1811. MULTIPLE ABANDONMENT PROCESSES IN ETRUSCAN NECROPOLISES

**Contribution format:** Oral  
**Contribution authors:** Anne-Lise Baylé (Université Paris 1 Panthéon Sorbonne | ArScAn (UMR 7041))

Etruscan cities and their necropolises are known for the stability of their occupation: the residential and funerary poles that began at the Iron Age were occupied continuously until the Roman era. The necropolises form vast complexes where tombs from all periods seem to be juxtaposed without ever abandoning areas. However, as we zoom in, we observe various abandonment phenomena that question this apparent stability. What processes of abandonment are at work in Etruscan necropolises? The necropolises of Cerveteri and Tarquinia will enable us to explore these degrees of abandonment on the scale of individual tombs and burial quarters. Etruscan tombs are often collective tombs used over a long period. In this context, we will investigate tomb closures, commemoration rites, and their reuse. A few cases of unfinished construction will complete our reflection on the variety of abandonments within necropolises. In addition, some sectors are subject to fluctuations in their funerary vocation, as stone extraction quarries are visible amid the tombs. Finally, we'll examine the spatial evolution of burial cores, highlighting the use of new spaces, reoccupations, and abandonments.

2377. ALTERNATIVE MODELS FOR UNDERSTANDING THE SPATIALITY OF THE SYMBOLIC LANDSCAPE IN IRON AGE BASQUE COUNTRY

**Contribution format:** Oral  
**Contribution authors:** Jagoba Hidalgo-Masa (University of the Basque Country (UPV/EHU)) – Jesús García Sánchez (Spanish School of History and Archaeology in Rome (EEHAR-CSIC))

The stelae of the eastern Cantabrian region (Iberian Peninsula) have traditionally been associated with the fortified enclosures found in this territory, based on discoveries from the fortified settlement of Berreaga, where the highest concentration of finds has been recorded. While this connection is undeniable, this hypothesis fails to explain why many of these stelae have no spatial link to these central settlements and merely suggests a certain diffusion or redistribution of these elements across the territory. In our view, this hypothesis stems from rigid, dichotomous interpretative frameworks—widely accepted and internalised within academic discourse (e.g., empty vs. full, civilised vs. uncivilised)—which attribute all social activity to the space enclosed by walls (the centre) while overlooking the rest of the landscape (the periphery). Therefore, in this paper, we aim to explore the construction of the symbolic landscape of these Iron Age communities through the study of stelae and the involvement of open settlements or villages in this process. We will also approach the process of abandonment of both religious landscape and settlement centers, and the formation process of the archaeological record that produce a new Christian landscapes based on the reutilization of these Iron Age stelae.

264. ABANDONED IN ARCADIA: INSTANCES OF LEAVING AND RETURNING AT ARCADIAN LATE CLASSICAL AND HELLENISTIC SETTLEMENT SITES

**Contribution format:** Oral  
**Contribution authors:** Regina Klöckl-Zoric (University of Graz)

Now as in Antiquity, the region of Arcadia on the Peloponnese, Greece, is dominated by high mountains, whose valleys are often difficult to access. This, however, did not stop people from settling there, creating poleis, walls, and sanctuaries – and leaving them. In some cases, the reasons for leaving seem obvious. The city of Mantinea, for example, was violently destroyed in a well-documented assault. Tegea, located nearby, can serve as an example for the Greek phenomenon of people peacefully leaving their settlements to perform a synoikismos and move together in a new polis. In other instances, the abandonment process is enigmatic, even more so when only part of a town is affected. Such is the case at Pheneos. Activities in a “sacred district” of the Archaic-Classical period came to a halt when the construction of a defensive wall started. The wall was never completed, though, and the area was left shortly after construction had begun. It was not until more than 100 years later, around 150 BC, that people would return: They chose the former “sacred district” to hold a banquet that is currently considered a one-time event, not necessarily of cultic nature. This short-lived return, as well as the general abandonment of the area, could be attributed to the same symbolic meaning. While often people truly left, stories of abandonment were sometimes constructed. In a project funded by the Gerda Henkel Foundation, starting from autumn

2025, the author will investigate truly and allegedly “lost cities” in Arcadia. The current paper, though, focusses on real abandonment processes and instances of coming back in late Classical and Hellenistic Arcadia. Case studies from settlements will ask for a definition of abandonment, addressing its intentionality and temporality, as well as the possible significance of return.

1332. ‘THERE AND BACK AGAIN’ - DEMOGRAPHIC DEVELOPMENTS OF PRE-ROMAN IRON AGE CEMETERIES IN JUTLAND AND NORTHERN GERMANY

**Contribution format:** Oral  
**Contribution authors:** Lynn Stetzuhn (Institute for Prehistoric Archaeology, Freie Universität Berlin)

‘Abandonment’ is one of the central recurring themes of research into the Early to Late Pre-Roman Iron Age shifts (c. 4th-3rd century BCE) in Northern Germany and Jutland. Whether pertaining to cemeteries, settlements or agricultural sites, the desertion and restructuring of Pre-Roman Iron Age landscapes has been linked to a variety of causes and social processes. Most prominently, a connection to mobility and migration in relation to cultural changes in Iron Age Romania and Moldova has been proposed. Cemeteries during this period display a noteworthy range of developments, from continuous occupancy, over hiatuses connected with changes in structuring, to abandonment proper. Their comparable publication quality and status across the region of research makes them, unlike settlements or field systems, a particularly valuable source for comparative research into population dynamics. Through a diachronic (c. 6th century BCE - 1st century AD) evaluation of statistically modelled cemetery occupancy changes and site-specific demographic data, this study aims to evaluate the chronology, spatial patterns, and social impacts of the discussed processes embedded in an anthropological framework of mobility, migration and social change. The results are illustrated through qualitative observations of exemplary cemeteries, discussing common trends but also the diversity of abandonment and (re-)occupation phenomena.

888. A GALLO-ROMAN AGRO-PASTORAL LANDSCAPE FOSSILIZED UNDER THE STATE FOREST OF BROTONNE : ABANDONMENT AND REOCCUPATION PROCESSES OF A NORMAN TERRITORY

**Contribution format:** Oral  
**Contribution authors:** Anaïs Musseau (Université Paris Nanterre | UMR 7041 ArScAn | Labex PasP Les Passés dans le Présent) – Christophe Petit (Université Paris I Panthéon Sorbonne | UMR 7041 ArScAn) – Ricardo González Villaescusa (Université Paris Nanterre | UMR 7041 ArScAn)

The State Forest of Brotonne in Normandy (France) preserves remnants of a Roman-era agro-pastoral landscape which can now be studied through archaeological, paleoenvironmental and LiDAR data. The latter reveal microtopographical anomalies - anthropogenic structures - reflecting the intensity of land use and occupation density in this region during the Protohistory and Antiquity (road networks, field systems, rural settlements, ponds in a water-scarce environment, etc.). While the occupations and the landscape in which they were situated are now well understood, the factors and conditions leading to the abandonment of these sites around the 4th century AD remain unclear. Textual and paleoenvironmental evidence at least suggest a decline in the area, with forest reversion well underway by the middle of the 7th century AD. Although the transition period between Antiquity and the Middle Ages raises many questions, this now-forested area notably saw the founding of two priories, which were later abandoned a few centuries after their establishment. The ancient structures, namely the hundred or so ponds in the Forest of Brotonne, once neglected, also create new opportunities and contribute to increased activity in the region during the medieval and modern periods (sylvopastoralism, hunting, exploitation of forest resources, etc.). The Gallo-Roman occupation of this land has even shaped both the current environment and biodiversity, with the ancient ponds now providing valuable ecosystem services and acting as a significant hydraulic reserve in this area with limited water resources. Thus, the abandonment of ancient agro-pastoral sites and their associated field systems did not mark the permanent desertion of the territory. Rather, the region has undergone complex dynamics of adaptation, transformation, and re-use of spaces over the centuries, responding to the needs of local populations and influenced by social, economic or environmental factors.

652. FARMS ON THE MOVE: QUESTIONING CYCLICAL DISPLACEMENT AND REUSE OF RURAL SPACES (PARIS BASIN, 500-30 BCE)

**Contribution format:** Oral  
**Contribution authors:** Carole Quatrelivre (Christian-Albrechts Universität zu Kiel)

Iron Age societies north of the Alps, pertaining to the La Tène culture, are mostly rural societies, in that wealth and power are derived from land ownership and management. This specificity has led to particular interest in the functioning and lifecycle of farms. Recent data acquired through commercial archaeology have demonstrated the high density of farms and the frequency of their reorganization over the last five centuries BCE. Different scenarios of rural development have thus been described and, in particular, the gradual displacement of farms over the course of time. This phenomenon can be understood as a practical response to social and environmental

constraints, whether it’s the spread of new family nuclei or the search for new areas to exploit. This paper will attempt to pinpoint specific dynamics of the abandonment and cyclical reuse of farms or farmed areas in the Paris Basin between -600 and -30. Environmental tensions will be assessed thanks to a land suitability model combined with a qualitative evaluation of pollen, carpology and climate data, whereas social constraints will be modelled based on textual and archaeoethnological evidence that may apply to Iron Age societies in Europe. The synthesis of both will lead to precise reconstruction of farm displacement scenarios and to deciding whether they should be considered as abandonment processes.

2036. BOBIGNY: A TWICE-ABANDONED SETTLEMENT (PARIS AREA : 4TH C. BC - 4TH C. AD)

**Contribution format:** Oral  
**Contribution authors:** Adonis Jeannès (UMR 8215 Trajectoires | Département de la Seine-Saint-Denis)

Bobigny is an archaeological site located a few kilometers north of Paris. About fourty preventive excavations contributed to the knowledge of an open latenian urban area covering some thirty hectares. In addition to its necropolis containing 515 burials, the site was occupied from the 3rd to the 1st century BC, with some evolutions in the dynamics of occupation. Different craft activites such as butchery, metallurgy (iron, copper alloy), and coin manufacturing formed the economic fabric of this place, integrated into the regional network of Parisii tribe. Abandoned for the first time around the middle of the 1st century BC, a secondary roman settlement developed at the end of the 1st century AD. A new spatial organization is characterized by the construction of several build-ings of various sizes around a crossroad of stone paths, but this occupation was less dense than in the previous period. The peak of this secondary urban area ocured in the middle of the 3rd century AD. Very few remains dated back to the 4th AD century because the site was abandoned once again. Is this linked to historical events ? The first abandonment was around the period of the Gallic War, while the abandonment in Roman times seems to correspond to the beginning of the decline of the empire. Are the reasons more local ? A relocation to another major site in the region ? Although Bobigny was an urban center during the latenian and the Roman periods, it was not occupied until the 20th century. The land was cultivated until it became the focus of urbanization in the inner suburbs of Paris.

2489. JUST TO POP IN. A BRIEF HISTORY OF THE PÚCHOV CULTURE IN THE CZECH REPUBLIC

**Contribution format:** Poster  
**Contribution authors:** Jirí Geršl (Masaryk University in Brno, Department of Museology and Archaeology)

The poster I am going to present will introduce the audience to the Púchov culture and its occurrence in the Czech Republic which is confined to Moravia. The Púchov culture developed under the strong La Tène influence from the original Lusatian culture substrate in the 2nd century BC in the mountainous area of today’s Western a Northern Slovakia. Gradually it spread to the area of current Northern Poland and Eastern Moravia. The main attention will be aimed at a specific settlement strategy based on the rather abrupt appearance in the mountain-ous area of eastern Moravia, the region previously largely uninhabited for hundreds of years. In many cases, the Púchov culture newcomers decided to occupy the very same sites as their predecessors in the early Iron Age. The issue of the coexistence of Púchov culture and original La Tène settlements in the contact zone area will also be discussed with several possible models presented. Last but not least sudden abandonment and withdrawal of Púchov culture after 50 BC back to the territory of today’s Slovakia will be examined offering different views of this event. Ultimately phenomena of much younger Roman coin finds near the former Púchov culture sites will be presented as well as prominent trends of later utilization of these locations in medieval times.

225 THE ARCHAEOLOGY OF ROMAN PEASANTRY. LOOKING FOR NEW RESEARCH FRAMEWORKS, BETWEEN DETECTION AND INTERPRETATION

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Discussion session  
**Session keywords:** Field survey, Ancient landscapes, Roman rural economies, Roman peasantry, Remote sensing  
**Session organisers:** Jesús García Sánchez (The Spanish National Research Council - CSIC) – Devi Taelman (Ghent University) – Fernando Moreno Navarro (Roma Tre)

SESSION ABSTRACT

In recent years, the increasing availability of archaeological data from diverse sources, as field survey, excavation, geospatial data—encompassing data collection and legacy data being made publicly accessible—has enhanced our understanding of the nature of the Roman rural word. This wealth of new data needs to be integrated into

current narratives about the exploitation and management of the Roman landscape. Non-invasive methodologies in general may no longer be cutting-edge topics in archaeology, the vast and growing datasets present interpretive challenges we want to address, especially chronological and functional classification. While large villas remain central in Roman landscape studies, an in-depth exploration requires considering the full diversity of rural sites, ranging from the market-oriented villa system to small-scale farming. It is essential to articulate the questions our archaeological survey data can address and those beyond our current reach. Elements such as the archae-ology of subaltern rural classes, land ownership, and chronological frameworks are particularly challenging. These factors are crucial to constructing nuanced narratives about the exploitation and social dynamics of the Roman rural landscape across Europe and North Africa This session calls for discussions on the Roman rural landscape, emphasizing the need for diverse methodologies, such as non-invasive methods, geospatial data, and field surveys—to deepen our understanding of ancient landscapes, particularly the Roman rural world. We encourage contributions that: •Examine how diverse geospatial methodologies can deepen our understanding of the Roman rural world. •Reflect on the evolution of landscape archaeology (excavation and survey) and new nuanced methods that enhance understanding at both off-site and intra-site scales. •Articulate questions that our archaeological survey data can realistically address and those beyond our current reach, considering elements such as the archaeology of subaltern rural classes, land ownership, and other challenges related to the chrono-logical and functional classification of material assemblages.

CONTRIBUTION ABSTRACTS

2428. BEYOND THE VILLA: APPROACHES TO PEASANT SETTLEMENTS IN THE ROMAN WEST

**Contribution format:** Oral  
**Contribution authors:** Fernando Moreno-Navarro (Roma Tre University | Alicante University)

Roman rural settlements have traditionally been studied through the villa model, which entails a very specific economic and productive structure that is well documented in historiography. Currently, increasing research is focusing on a complex diversity of peasant settlements that do not fit into this paradigm. This paper explores two approaches to characterising the Roman rural world in different geographical contexts: Roman Carpetania (Madrid, Central Spain) and the mountainous landscape of the Monti Lucretili (Lazio, Central Italy). In the Iberian case study, the archaeological record generated by the urban expansion has made it possible to identify a series of peasant settlements that provide a more detailed picture of the economic and social dynamics in the rural periphery of the Roman world. On the other hand, in the Italian case study, a landscape archaeology approach has been adopted to understand the diachronic evolution of the rural and mountainous landscape. This methodology allows for an analysis of land use, settlement distribution, and the relationship between population and natural resources. In both cases, Network Analysis has been used to characterise economic dynamics. In Carpetania, it has been applied to model consumption patterns, goods distribution, and territorial articulation, and reveals the integration of peasant settlements into different exchange networks. In Monti Lucretili, network analysis enabled us to understand of resource accessibility, their reuse, and the organisation of the territory. The comparison of these two case studies allows us to discuss the different methodologies used in the identification of rural settle-ments and the challenges posed by different landscapes in their characterisation. The aim is to go beyond the mere detection of archaeological sites (dots on a map) and address social organization, access to resources, and the diachronic evolution of the landscape.

573. BEYOND THE VILLA: RETHINKING ROMAN RURAL LANDSCAPES IN LIMINAL TUSCANY

**Contribution format:** Oral  
**Contribution authors:** Valentina Limina (FNRS, UCLouvain)

This paper presents the results of the RELOAD Project, which examines the liminal landscapes of northern Tuscany (Volterra territory) between the 3rd century BC and the 5th century AD. Moving beyond the villa-cen-tered paradigm and employing a multifaceted methodological approach, this study reassesses the crucial role of rural landscapes as dynamic hubs of innovation, knowledge exchange, and economic interaction. Through the integration of noninvasive methodologies—including aerial photography, GIS-based predictive modelling, and systematic surface survey data—with place names, literary sources, epigraphy, and legacy data, the research has identified a diverse range of rural site. (from small-scale farms and dispersed agricultural production units to specialized resource exploitation sites), revealing a far more complex and interconnected rural world than previously assumed. A key focus of this paper is the challenges of chronological and functional classification in survey data, aiming to refine our understanding of occupational patterns and long-term landscape evolution. The findings suggest that rural and frontier areas were not marginal spaces, but active laboratories for tech-nological transfer and adaptive strategies, where communities engaged with geomorphologically complex and hydrologically unstable environments. The analysis of material culture, combined with geospatial data, offers a new perspective on land use strategies, mobility networks, and the circulation of goods between rural sites

and regional markets. Moreover, this study highlights the often-overlooked presence of subaltern rural communities, whose land tenure and economic production roles are frequently obscured in traditional archaeological narratives. By integrating diverse methodologies, this research contributes to broader discussions on the inter-connectedness of rural settlements, social hierarchies, land ownership, and the long-term transformation of the Roman countryside across the Mediterranean

1561. CLIMATE VARIABILITY AND RURAL SETTLEMENT DYNAMICS IN NORTHWESTERN ITALY (5TH C. BC - 5TH C. AD)

**Contribution format:** Oral  
**Contribution authors:** Phaedra Criaco (Macquarie University | University of Groningen) – Devi Taelman (Ghent University) – Ralf Vandam (Vrije Universiteit Brussel)

This paper presents the results of an interdisciplinary study aiming to reconstruct the climate of northwestern Roman Italy between the 5th century BC and the 5th century AD. This was done by exploring how far the archaeological, historical and palaeoclimate resources available today can help reconstruct ancient climate and its effect on local agriculture and land-use strategies. Data from two archaeological survey projects in northwestern Italy (Polcevera Valley and the Ager Lunensis) are used as case studies to analyse settlement dynamics, documenting recurring trends or changes like increase or decrease of material scatters throughout time. By reconstructing climatic variability using paleoclimate records from four speleothems in the region, combined with information from written sources and settlement patterns, this study provides insights into the impact of climate on local agriculture and land-use strategies. While a full reconstruction is not yet feasible due to limitations in the available data, like the low spatial and chronological resolution of the palaeoclimate records, the project results indicate a correlation between climate variability and settlement patterns in the rural landscape of northwestern Italy, particularly in marginal areas. This material reality differs from contemporary written accounts on farming, which were authored by and for the elite, reflecting idealised agricultural rather than lived experiences. The contrast between textual sources and archaeological data underscores the potential and need for an interdisciplinary approach integrating diverse datasets to reconstruct the Roman rural landscape exploitation and refine our understanding of climate-driven land-use changes in Roman Italy.

2130. INTERPRETING A NEW ROMAN LANDSCAPE, THE ARLANZON RIVER VALLEY

**Contribution format:** Oral  
**Contribution authors:** Jesús García Sánchez (Spanish School of History and Archaeology in Rome (EEHAR-CSIC))

We will analyze how remote sensing and archaeological interpretation of the Arlanzón River valley, located in the central Iberian Peninsula, can contribute to a revised understanding of the impact of the Roman conquest on the region’s landscape and settlement patterns. This presentation will explore the integration of new data obtained from satellite imagery and aerial photography into existing archaeological and historical frameworks, demonstrating how these methodologies enhance our comprehension of Roman territorial organization and resource exploitation. The dataset originates from systematic aerial surveys conducted along the Arlanzón River, incorporating high-resolution imaging techniques alongside multispectral analysis of key archaeological sites. By employing these remote sensing tools, we can detect subsurface features, and identify spatial patterns of occupation. This approach enables the formulation of new hypotheses regarding the nature and extent of Roman agricultural and extractive activities in peripheral areas, particularly in relation to smaller settlement sites and their economic functions within broader regional networks. Furthermore, this discussion will engage with theoretical models of Roman peasantry, rural agency, and the socio-economic dynamics that shaped interactions between rural communities and urban centers. While extensive research has been devoted to major Roman cities and their administrative functions, the study of secondary settlements and their role in sustaining economic and social structures remains comparatively underexplored. By reassessing these dynamics through remote sensing and landscape archaeology, we aim to refine our understanding of how Roman imperial expansion transformed rural economies and contributed to long-term shifts in land use, mobility, and local agency.

2445. EXPLORING THE ROMAN RURAL LANDSCAPE OF ALENTEJO: NEW PERSPECTIVES ON SITES AND SETTLEMENTS THROUGH AERIAL ARCHAEOLOGY

**Contribution format:** Poster  
**Contribution authors:** Gil Vilarinho (University of Evora)

The occupation and exploitation of rural areas during the Roman period have received considerable academic attention since the early days of archaeological research. Roman villas, in particular, have not only been a topic of recurrent interest but also the most recognisable feature of the Roman rural landscape. Nevertheless, the current knowledge on these sites remains largely determined by several preconceptions and, particularly, the understanding of the rural landscape has become somewhat hindered by a last perspective characterised by a dichotomy

between urban and rural, cities and villas, which presents a rather limited interpretation for the archaeological evidence available. The increasing availability of aerial images and other geospatial datasets has provided a new toolkit to explore the Roman rural landscape, allowing not only the identification of new features but also providing new data for previously unknown sites, sometimes resulting in significant reinterpretations. Analysing several case study sites from the Alentejo region, in southern Portugal, this study presents new archaeological evidence for a complex and dynamic rural landscape. Distinct types of sites suggest different activities across the region and, contrasting aerial imagery interpretation with data from archaeological surveys and excavations, it is also possible to assess changes and transformations over geographical areas and centuries.

226 CONCEPTUALISING LOSS IN A CLIMATE CRISIS

**Session theme:** 7. Climate Change in the Past and Present  
**Session format:** Discussion session  
**Session keywords:** climate change, heritage management, cultural heritage, archaeological management, loss, curated decay  
**Session organisers:** Sarah Miller (Florida Public Archaeology Network, Flagler College) – Edward Pollard (The Discovery Programme: Centre for Archaeology and Innovation Ireland)

SESSION ABSTRACT

Curated decay, managed decline, loss – these are all terms that have permeated rhetoric around management of the historic environment since the publication of Caitlin DeSilvey’s Curated Decay in 2017. The concept of loss of material is central to archaeological work, as the process of archaeological excavation is both and destructive. Archaeologists must balance the potential disturbance of the archaeological record during excavation with the positive outcomes of the new material, information, and interpretation. Our current archaeological methods and heritage management practices developed during the peak period of global warming. Climate change is already exacerbating pre-existing issues of conservation and management, as well as impacting the in situ archaeological record. Recent research demonstrates that the level of degradation underground is accelerating at the same pace as above ground. We invite submission of papers on how climate change impacts conservation and management of the historic environment, cultural heritage, and sustainability. We further invite submissions on how climate is impacting the archaeological record, whether that be in situ sites, sites previously excavated, or the management of post-excavation materials that include soil samples, drawings, photo negatives and digital data. For example:

- How do we adapt our own practices to be resilient in the face of ever-changing climate?
- How can archaeologists and heritage professionals use terms like ‘curated decay’, ‘managed decline’, and ‘adaptive release’ to inform research methods and practices.
- What steps can be taken to make archaeological practice more sustainable going forward?
- Can coastal erosion provide opportunities for archaeological discovery or new ways of heritage management.
- How do we meaningfully engage communities in conversations around these topics? What ethical considerations should be taken into account in these conversations?

CONTRIBUTION ABSTRACTS

523. THE HERITAGE OF LOSS AND THE LOSS OF HERITAGE IN THE VIRGINIA BLUE RIDGE, U.S.

**Contribution format:** Oral  
**Contribution authors:** Carole Nash (James Madison University)

The 18th century diaspora of First Peoples from the Virginia uplands rendered them invisible in settler-colonialist histories, ultimately resulting in the eugenics-influenced paper genocide of the 20th century. The forced removals of 470 families to create Shenandoah National Park in the 1930s, and a federal agency practice of minimizing their presence, rendered these communities invisible to visitors who, today, idealize ‘mountain life’ as part of a tourist experience. The archaeological record, in conjunction with oral histories and documentary research, has been integral to illuminating these pasts of removal and loss. However, as the impacts of climate change compromise the integrity of upland cultural heritage, the multi-millennia stories are again threatened with erasure of a different kind. Contemporary Indigenous communities and descendant heritage groups, active in reclaiming and preserving their histories, look to archaeologists and agency managers to take measures against the threat of tangible heritage loss and the ensuing loss of identities that rely on these resources.

1782. MICRO-CLIMATE MODELLING IN COMPLEX HUMAN-MODIFIED ENVIRONMENTS: EVIDENCE FROM VIETNAM’S NORTHERN LIMESTONE KARST

**Contribution format:** Oral  
**Contribution authors:** Liamog Magill (Queens University Belfast | Bournemouth University | Trang An Management Board / Ban Quản lý Quần thể danh thắng Tràng An | Department for Infrastructure / An Roinn Geilleagair)

This presentation will draw principally on field-data collected within the Tràng An World Heritage Site, Red River Delta, Vietnam – a country highly vulnerable to climate-change stress. The Tràng An property covers almost the entirety of an isolated limestone massif (c. 6300 ha) comprising a geomorphologically and ecologically complex late evolution tower karst landscape. Palaeo-environmental evidence previously obtained from the study area of this application – the Tràng An World Heritage Site, a limestone massif on the southern margin of the Red River Delta, Vietnam – indicates broad vegetational continuity over the last c. 20,000 years. This level of stability suggests that the property’s complex tower karst topography has provided long-term climate-buffering characteristics that have enabled persistence across major climatic and environmental transitions. In view of the highly specialised ecology of tropical tower karst settings, the unique archaeological archives they contain, and the expected dual-impacts of 21st century climate change and urban expansion, there is an urgent need to better understand the relationship between these topographically complex landscapes and the micro-climates they foster. Analysis and modelling will initially exploit a large existing dataset (>100,000 datapoints), tracking temperature, humidity, and dew point at high resolution intervals between Nov. 2019 – Nov. 2020, and utilise (GIS) topographic data of the site, available through QUB. A fieldwork season has been completed in 2024; exploring the landscape in person, retrieving outstanding data loggers and placement of additional loggers. The presentation will report on preliminary results of the study, including data from the 2024 fieldwork.

317. IDENTIFICATION AND PRIORITIZATION OF GULLAH/GEECHEE SITES ALONG THE ST. MARY’S RIVER: PATHWAY TO SPATIAL REPARATIONS AND INCLUSIVE-BASED PRESERVATION PLANNING

**Contribution format:** Oral  
**Contribution authors:** Sarah Miller (University of Florida | Florida Public Archaeology Network)

Gullah/Geechee people have lived in northern Nassau County, Florida, for hundreds of years. Yet, history books and cultural corridors negate their presence. The intentional displacement and erasure of the Gullah/Geechee culture on the landscape is due largely to corporate and federal land use and development in the northeast corner of the state. To add to these obstacles, sea levels are rising 20% faster than the global average on the Atlantic Bight and storm surge threats in the state are ranked highest in Nassau County. This project will use the North American Heritage at Risk (NAHAR) pipeline (modeling, monitoring, meeting, methodizing, mitigating) to gather data for the community to make informed decisions and create a pathway to spatial reparations. Modeling will produce an archaeological triage assessment (ATA) using a variety of environmental tools that predict sea level rise, marsh migration, storm surge, and development of rural areas. Monitoring will inventory and assess site conditions for all known Gullah/Geechee sites in the project area. Meeting includes public engagement strategies, including Community Conversations about Heritage at Risk (CCHAR), interviews and surveys. The final steps of methodizing and mitigating will align project deliverables to the priorities of the community. This paper presents the preliminary findings from the first year of the project.

2163. ASSESSING AND RECORDING THE ERODING CULTURAL HERITAGE AROUND ST. JOHN’S POINT, CO. DONEGAL, IRELAND

**Contribution format:** Oral  
**Contribution authors:** Edward Pollard – Cormac Duffy – Robert Shaw – Rebecca O’Reilly – Hannah Genders Boyd – Anthony Corns (The Discovery Programme: Centre for Archaeology and Innovation Ireland)

Rahan Castle on St. John’s Point in Co. Donegal in NW Ireland is a late medieval tower house and bawn on a small promontory experiencing erosion and collapse. Possibly built on an earlier promontory fort, this castle became associated with the MacSweeney family of Scottish descent who became important galloglasses (mercenaries) in the 14th century in Ireland. A local voluntary community initiative supported a conservation plan in 2022 involving regular maintenance for the structure, determination of extent, and quinquennial inspections. However, the severity of erosion and more recent further collapse suggest the site has a short future lifespan. Although, the castle is most recognised endangered site, the exposed nature of the headland of the surrounding 10km-long St. John’s Point with monuments dating from prehistoric cairns, church, friary, and lighthouse suggested that there could be more unrecorded endangered heritage. A Coastal Zone Assessment to provide an informed assessment of current archaeological resources and any associated hazards and risks was undertaken in 2024. Supported by the local community to access the coast, intertidal survey recorded evidence of landslides,

slumping and rockfalls, along with 138 cultural heritage features. Of these, only nine were already listed in the national inventories. These were ranked into importance, vulnerability to climate change, and cultural value. Sites considered of national importance included potential prehistoric stone-lined mounds and pits, and a medieval slag heap. This has led to making recommendations for future sustainable recording, which has begun with photogrammetry of recent collapse, and Uncrewed Aerial Vehicle modelling. Dissemination of the findings has involved community meetings discussing climate change stories and sites they believe to be important. The landing places associated with the lighthouse, herring and other types of fishing were considered as regional importance, with graffiti and intertidal boundaries of local importance.

228 SARDINIA AS PRAXIS: DECOLONISING EUROPEAN ARCHAEOLOGY THROUGH A JOINT FEMINIST-POSTCOLONIAL APPROACH

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Decolonisation, Colonialism, Feminism, Postcolonialism, Sardinia, Subalterns  
**Session organisers:** Mauro Puddu (University for Foreigners of Siena) – Julia Gustafson (University of Cambridge) – Alessandro Panetta (Consiglio Nazionale delle Ricerche - Cagliari)

SESSION ABSTRACT

At the heart of the Mediterranean network of people and things, Sardinia has endured centuries of exploitative control from Carthage, Rome, Constantinople, the Crown of Aragon, the Savoy house and, ultimately, the Italian Government, whose strategy, as philosopher Antonio Gramsci (1919) claim, amounted to full colonial treatment—worse, even, than that enacted upon the official colony of Eritrea. However, the tension between people in Sardinia and overseas powers have left plenty of material and immaterial signs of creative practices of local communities aimed at claiming their dignity, regaining control of their exploited bodies and language, and curating their social relationships, creating dynamic identities that challenge colonial narratives of stasis. Has this colonial experience been fully considered in reconstructions of Sardinia’s archaeological heritage. From Cicero’s dehumanization of its women to 19th-20th century narrative, ethnographic, and television accounts, Sardinia has survived numerous essentialisms. Although Sardinia’s case is strongly shaped by Italy’s inner traits, such as the Southern question, we suggest that this specific historical situation offers countless opportunities to advance the decolonial agenda of European archaeology. This prepares us to recognize ongoing colonial frameworks and implement decolonisation elsewhere. While often used ambiguously, we define decolonisation as the identification of colonial paradigms and the actions taken to dismantle and unsettle those structures primarily via the implementation of the silenced – women, enslaved, indigenous, rural, subaltern - voices. In this session, we will discuss archaeological case studies in Sardinia from prehistory to the present day, actively engaging with the deconstruction of frameworks that have used colourism, othering, androcentrism, and racial stereotyping to achieve the outright dehumanization of its people as a justification for control of its resources. We want our intersectional focus on subaltern voices to reveal how identities are continuously negotiated and transformed, rather than fixed or unchanging, even in contexts of colonial oppression.

CONTRIBUTION ABSTRACTS

1122. THE SUBALTERN NURAGIC: STUDYING BRONZE AGE SOCIAL DYNAMICS ON A “SMALL” ISLAND

**Contribution format:** Oral  
**Contribution authors:** Emily Holt (Cardiff University)

Archaeology has a developed toolkit for understanding inequality. The lives of the subaltern are written in their bones if nowhere else – archaeologists are skilled at recovering and reading this evidence, becoming witnesses to experience that was systematically hidden or ignored while these individuals were alive. The hybrid identities that promote survival in colonial contexts are captured in objects made in the forms of the colonizers but through the habitus of the colonized – archaeologists are skilled at identifying and interpreting these solidified tensions. The lives of women are reconstructed through spatial analyses, craft studies, isotope analyses, and artistic representations, among other methods, and careful combinations of aDNA analyses and material culture studies can elucidate the contributions of nonbinary genders to past societies. What does it look like for an archaeological dataset itself to be the subaltern? The Nuragic Culture of Sardinia developed as part of the vibrant and interconnected Mediterranean Bronze Age now identified with iconic material culture such as the bull-leaping fresco at Knossos or the funerary mask of Tutankhamun. Ongoing research continues to uncover trade connections between the Nuragic Culture and the wider Mediterranean, demonstrating that Bronze Age Sardinia was not the “periphery in the center” it was once considered to be. With thousands of known sites, the Nuragic Culture

provides a wealth of opportunities to study different paths to social complexity. However, Sardinia’s distinctive nuraghi, though a meaningful symbol on the island, have yet to achieve the widespread recognition of comparable East Mediterranean symbols. This paper considers evidence for the development of social inequality in the Sardinian Bronze Age alongside qualitative reflections on fifteen years of studying the Nuragic Culture, arguing that not only does the Nuragic Culture provide fascinating alternative narratives of social dynamics, simply studying these narratives can be its own act of decolonization.

**1317. TOWERS, BISHOPS, KINGS AND PANS. SALT PRODUCTION IN THE CHESSBOARD OF NORTH-WESTERN SARDINIA FROM THE MIDDLE AGES TO CONTEMPORARY AGE**

**Contribution format:** Oral  
**Contribution authors:** Alessandro Panetta (Institute of Mediterranean Europe History (CNR))

Starting from the 12th century, written sources begin to document with ever greater density the presence along the north-western coasts of Sardinia of productive activities linked to the extraction of salt from sea water. The life of these salt pans, around which the economic interests of various types of subjects gravitate, is intertwined over time, especially starting from the 16th century, with that of the structures and infrastructures linked on the one hand to the military defense of the coasts and production activities (coastal towers) and on the other linked to the transport of goods and people (ports and roads). The research described here has seen the attempt to identify on the ground the material traces that these activities have left, which in turn are the outcome and testimony of power dynamics that go beyond the simplistic binary opposition between external powers and local communities in the perspective of a “historical” colonialism predatory of the island’s resources. The salt pans can be traced back to political and religious institutions, but also to individual owners, while towers and landing places do not respond solely to centralist or top-down logics, but are also sometimes linked to individual initiatives or those of certain social groups. The objective of this essay is to reflect on what the specific sources could be for archeology in investigating these issues and what contribution our discipline can make in documenting and reconstructing these relationships and the dynamics of power starting from the traces of the structures used for localized production along the coasts and for coastal defence. These dynamics are still present today in these areas, from the perspective of patrimonialization, in which institutions of various types and different scales (European, national and local), intertwine, sometimes in a conflictual way, on different levels: environmental, political, economic and cultural.

**2483. FINDING THE SUBALTERNS IN SARDINIAN PREHISTORY: THE CASE STUDY OF MONTE CLARO**

**Contribution format:** Oral  
**Contribution authors:** Luca Lai (University of North Carolina at Charlotte)

Decolonial approaches have been used to interpret typically colonial conditions, in Sardinia typically times of intense culture contact that involved military and economic control based on any of the mainlands surrounding the island (e.g. Phoenician-Punic, Roman age, Iberian conquest in the late Middle Ages). In this contribution, the status and the issues revolving around identifying subalterns in prehistory is discussed, as a necessary condition to begin dismantling colonially-induced narratives and giving a voice to silenced individuals and groups. Archaeologically, establishing the existence of subaltern groups hinges on the reconstruction of social, cultural and political organization. We are far from unambiguously identifying inherited privilege or power in most periods, with some indicators that could be attributed to rank inequalities. Whereas much of the earlier 4,000 years after Neolithization have been commonly considered as fundamentally segmentary, village-based societies, some transition. may be correlated with changing relationships which we could interpret as approaching subalternity. A particularly underexplored period is the Late Copper Age Monte Claro phase (~2700-2350 BC). The presence of stone architecture and a few, outstanding ceremonial sites seems to point to some kind of organizational complexity, in contrast with the lack of radical disparities in residential architecture. The technological and stylistic discontinuity it represents has led to consider the likelihood of immigration vs. ethnogenesis, and their effects in terms of relationships with ‘other’ groups. The burial record provides clues from key individual depositions, which are contrasted with collective burials and the countless cave contexts of uncertain interpretation. Isotopic and genetic data are also considered, to reach a tentative conclusion that the Monte Claro period may have represented greater inequality, possibly on the basis of increased mobility and conflict, and therefore we can suggest the case for subalterns, whose life experiences need to be characterized Gramsci sensu.

**709. MONTE PRAMA: NURAGIC RESPONSES TO A COLONIAL APPROACH**

**Contribution format:** Oral  
**Contribution authors:** Laura Pisanu (University of Melbourne)

The Iron Age Mediterranean is seen as a vibrant melting pot where multiple societies engaged in cultural and economic exchanges. Through economic and cultural networks, products and ideas were traded, consumed, and

shared by each society according to their own habits and their re-elaboration of external, cultural influences. Despite the dynamic nature of the Iron Age connectivity, early scholarship has considered Greeks, Phoenicians and Etruscans as the groups that dominated the economic exchanges and informed the social and cultural trends that emerged. In this light, transformations in Iron Age Sardinia have been linked to the presence of Phoenicians. They would have propitiated technological, social and artistic developments of Nuragic communities since the pre-colonization phase (9th - 8th century BC), even though the archaeological evidence does not support a stable presence of Phoenicians before the 7th century BC. This perspective has been used to describe Monte Prama. a Nuragic necropolis where the use of individual tombs and the presence of statues represented a break with the burial practices previously used by Nuragic people. Thus, Monte Prama has been described as the outcome of either external initiatives or hybrid practices between Phoenicians and the local Nuragic groups that suited the new colonial model represented by the foundation of the Phoenician city of Tharros. Moving beyond a colonial approach, this paper discusses Monte Prama and its statuary as the result of the Nuragic active participation in the creation and shaping of Mediterranean networks. Using the lens of globalisation, changes and new expression of Nuragic cultural identity will be explained as local responses to a more intense maritime connectivity rather than a Nuragic passive acquisition of external trends or hybrid practices happening on a colonial ground.

**2495. ALLUMINIUM FACTORIES AND LUXURIOUS VILLAS: DECOLONISING SARDINIA’S PRESENT FROM ITS COLONIAL PAST**

**Contribution format:** Oral  
**Contribution authors:** Mauro Puddu (University for Foreigners of Siena)

For 19th-and-20th-century European travelers like Gaston Vuiller and John Warre Tyndale, Sardinia was a forgotten, unconquered, and peripheral place. For D.H. Lawrence, a land with “no history, no race, no offering,” one that lay “outside the circuit of civilization.” While these depictions echo broader colonialist and primitivist discourses—akin to those dismantled by Lévi-Strauss’ *Tristes Tropiques*—they also emerge from a much longer history of colonial frameworks. From Cicero’s portrayal of Sardinians as inherently foreign and enslaveable in the 1st century BCE, Sardinia has been persistently cast as the European other. These reiterated narratives have shaped also the material realities of life on the island today: in the *Avanti* (14th April 1919), Antonio Gramsci reminded how Sardinians were heavily colonised, their “bodies were marked by the ferocious labour to which they were forced as young kids by vile and ruthless exploitation”. In contrast, Genovese songwriter Fabrizio De André, reflecting on his own experience of being kidnapped in Sardinia in 1979, wrote that “life in Sardinia is perhaps the best that a human being can wish to live.” This paradox—between exoticized ideal and colonial erasure—defines the lived experience of many Sardinians today. While the island is hyper-visible in international tourism discourse, its people remain structurally marginalized, with limited political representation and chronic underinvestment in healthcare. This paper examines the material consequences of Sardinia’s colonial history through its landscapes of exploitation and exclusion—from the aluminum factories dominating the southwest coast to the elite villas punctuating the northeast. It interrogates how colonial frameworks still shape Sardinian identity, while amplifying the silenced voices of its indigenous and migrant communities. Henceforth, it calls for a decolonial reimagining of its history—one that recognizes the island not as a peripheral object of imagination but as a praxis for decolonizing European alternative historical narratives.

**229 CORES-ON-FLAKES DURING THE MIDDLE PALAEOLITHIC AND MIDDLE STONE AGE: TECHNOLOGY, RAW MATERIALS ECONOMY AND/OR FUNCTIONAL PURPOSES**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Session with keynote presentation  
**Session keywords:** Cores-on-Flakes. Middle Stone Age, Ramification, Integrative Strategy, Recycling, Economy. Middle Palaeolithic & Middle Stone Age  
**Session organisers:** Cyrielle Mathias (Umr 7194 - Histoire Naturelle de l’Homme préhistorique, UPVD | Centre de Recherche français à Jérusalem) – Viola Schmid (Austrian Archaeological Institute, Austrian Academy of Sciences)

**SESSION ABSTRACT**

The use of flakes as blanks dedicated for the reduction as cores to produce small elements is recognised as a significant technical choice and testifies to innovative behaviours in the Middle Palaeolithic and Middle Stone Age. Various strategies exist, with different concepts, methods, and techniques of blank production (e.g., Kombewa, Nahr Ibrahim, Kostienki, le Pucheuil, and even carinated burin-like). Some methods serve distinct production goals, such as Kombewa, which can yield both large flakes for shaping Large Cutting Tools (e.g., cleavers,

bifaces) and small blanks with specific morphological features for direct use. The selection of debitage products may reflect an economic strategy, adaptation to the local mineral environment, or a specific functional purpose. This selection process has been linked to key concepts such as recycling, ramification (or branching economic strategy; Bourguignon et al., 2004), integrative strategy (Mathias & Bourguignon 2020), and the miniaturisation of production. In this session, we aim to discuss and compare this technical choice by situating it within different geographical, temporal and cultural contexts of the Middle Stone Age and Middle Palaeolithic. Case studies employing a technological, techno-economic, techno-functional, and functional approach are welcome. We additionally welcome contributions involving any experimental approach to these research topics.

CONTRIBUTION ABSTRACTS

223. KEYNOTE: BRANCHING STRUCTURES OF QUINA-TYPE MOUSTERIAN: AN INTEGRATED AND POLY-MORPHIC TECHNOLOGICAL AND ECONOMIC STRATEGY

**Contribution format:** Oral  
**Contribution authors:** Laurence Bourguignon (Inrap | UMR 7041 ArScAn / AnTET,)

Over the past two decades, studies on Mousterian industries have highlighted the development of « chaînes opératoires ramifiées », or non-linear knapping strategies. These processes, common in the Middle Paleolithic, involve exploiting flakes from various systems (Levallois, Quina, Discoid) to produce specific morphotypes such as short, wide, or lamellar flakes. These chaînes, widespread in Europe, are characterized by the sequential management of activities aimed at precise technical objectives, often exported, reflecting a pursuit of standardization and functional complementarity. In Quina industries, these branching structures are particularly diverse, explaining the variability of assemblages and diagnostic challenges. Three main types are identified: A, which exclusively exploits the lower surface of a core flake; B, which primarily uses the upper surface (sometimes incorporating the lower surface), including processes such as Clactonian notching; and C, involving plan-convex shaped flakes described as interactive chaînes opératoires. These structures can coexist on the same matrix, often bifacial and plan-convex, providing both versatility and specialization, such as for butchery tasks. Quina matrix combine ergonomics, productivity, and longevity, reflecting sophisticated technology. Their flexibility allows adaptation to various contexts, enhancing mobility and efficiency while maintaining centralized organization. Far from a simple recycling economy, these practices represent an advanced circular economy and optimized resource and territory management. They reflect a complex cultural and social identity marked by exchanges of ideas and objects despite local variations. Quina industries thus exemplify an integrated, polymorphic, and emblematic technological and economic strategy of the Middle Paleolithic.

191. BETWEEN CORES-ON-FLAKES AND SPLITS: MANAGING QUARTZITES AND FLINTS IN THE EARLY MIDDLE PALAEOLITHIC LEVELS OF COUPE-GORGE CAVE (HAUTE-GARONNE, FRANCE)

**Contribution format:** Oral  
**Contribution authors:** Cyrielle Mathias (UMR 7194 - Histoire Naturelle des Humanités préhistoriques, UPVD | Centre de Recherche français à Jérusalem) – Amélie Vialet (UMR 7194 - Histoire Naturelle des Humanités préhistoriques, MNHN)

Coupe-Gorge Cave is a significant site for the Lower and Middle Palaeolithic periods in the French Pyrenees. Originally excavated by L. Méroc in the 1950s, the site revealed a stratigraphic sequence comprising several layers containing faunal and human remains associated with lithics, in an area where few cave sites are preserved. A new research programme (dir. by A. Vialet), has recontextualised the past hominin occupations and led to the re-examination of the lithic collection. Most of the sequence at Coupe-Gorge can be attributed to the early Middle Palaeolithic. The primary raw materials used are quartzite pebbles and cobbles, along with approximately 30% flints, depending on the layer. The flints are predominantly local varieties from the Danian Formation. Technological analysis indicates that the specific characteristics of these materials, such as their initial size and shape, inclusions, and the thickness of the alteration cortex, influenced knapping methods and economic strategies. Cores-on-Flakes and split cobbles/pebbles were thus frequently used as blanks at the site for various purposes. In this paper, we present the different chaînes opératoires involving flake-blanks or splits and their objectives for both flints and quartzites. These strategies are examined diachronically across the seven archaeological units from the early Middle Palaeolithic, highlighting their remarkable flexibility.

661. TECHNOLOGICAL VARIABILITY IN CORE-ON-FLAKE STRATEGIES AT EL ESQUILLEU CAVE DURING THE MIDDLE PALEOLITHIC

**Contribution format:** Oral  
**Contribution authors:** Martín Julio García-Natale (Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid) – Antonio Tarriño-Vinagre (Departamento de Geografía,

Prehistoria y Arqueología. Universidad del País Vasco) – Javier Baena-Preysler (Departamento de Prehistoria y Arqueología, Universidad Autónoma de Madrid)

The El Esquilleu Cave is a context rich in archaeological material, yielding more than thirty archaeological layers that span from the late MIS4 to throughout MIS3. Its record is particularly valuable for understanding the variability in the technological behaviours of the last Neanderthals during the Late Middle Palaeolithic of Northern Iberia, including their raw material management strategies and ways of life in a mountainous context. Here, we present a preliminary study aimed at identifying differences in the core-on-flake strategies within the flint assemblage of the site. We studied flint assemblage of levels from VI to XXXV. In this sequence, flint is scarce, and its outcrops are found no closer than 40 km from the site. This fact adds special interest to the management of non-local materials, particularly their roles, how they are perceived and treated in contrast to local and semi-local raw materials, among other factors. The long sequence of layers at El Esquilleu also allows us to gain a broad view of these processes over several thousand years. At El Esquilleu, we find several different levels associated with Levallois, Discoidal, Quina, and even Laminar lithic techno-complexes (LTC). Differences in specific technical choices within Core-on-Flake technology have also been identified, providing valuable insights into the definition of continuity and discontinuity events, as well as the inherent variability in Neanderthal technological behaviours.

755. THE ROUTE DE BRIAL SITE (SOUTHWEST FRANCE): THE USE OF FLAKING BLANKS FOR PRODUCTION IN A QUARTZ/QUARTZITE CONTEXT

**Contribution format:** Oral  
**Contribution authors:** Clément De Cara (Paléotime - LAMPEA (UMR 7269)) – Cyril Viallet (Paléotime - HNHP (UMR 7194))

The Route de Brial site (Montbartier, France) was recently explored as part of a rescue excavation. Covering an area of 6 hectares, 27,000 lithic artifacts document occupations from a recent Middle Paleolithic phase (probably MIS 4). They took place in a region where the main mineral resources are quartz and quartzite, available as pebbles and cobbles in the alluvial deposits of the Tarn and Garonne rivers. This petrographic component dominates the lithic production of Neanderthal knappers. The pebbles/cobbles are used in a variety of chaînes opératoires: shaping (with several types of LCT) as well as debitage, following Levallois and Discoid concepts, and other methods to produce more or less standardized flakes. However, the blanks selected for shaping and debitage are also flakes or splits. The production of these blanks may involve the use of an anvil. For shaping, cleavers are produced on large quartzite flakes from the Garonne alluvium. This may also be the case for some bifaces. For debitage, the use of flakes or splits as blanks creates asymmetrical volumes. The underside of splits enables the production of flakes with a biconvex cross-section by uni- or bipolar, orthogonal and centripetal methods. The plano-convex cross-section of splits leads to production at the expense of the flat face, generally centripetal, enabling several flakes to be obtained. Whatever the case, the recurrent use of blanks in the form of flakes or splits shows that this is an initialization phase in several chaînes opératoires, rather than an opportunistic behavior.

2037. THE SMALLER THE BETTER – CORES-ON-FLAKES IN THE SOUTH AFRICAN MIDDLE STONE AGE (MSA) DURING MARINE ISOTOPE STAGE 5

**Contribution format:** Oral  
**Contribution authors:** Viola Schmid (Austrian Archaeological Institute, Austrian Academy of Sciences | Human Evolution and Archaeological Sciences (HEAS), University of Vienna | University of the Witwatersrand)

The Middle Stone Age (MSA) of Marine Isotope Stage (MIS) 5 in southern Africa is associated with the appearance of distinct new adaptations, tool types, subsistence patterns, and the use of symbols. This most likely provided a beneficial foundation for technological experimentation as well as the development and diffusion of innovations. However, until recently, research has focused on sub-stages of the MSA considered more innovative, such as the Still Bay and Howiesons Poort techno-complexes, or on specific regions, such as the Western and Eastern Cape Provinces. In the framework of the project “Time of essential changes in human history (TECH)”, three sites, Bushman Rock Shelter, Rose Cottage Cave and Sibhudu Cave that are located in different biomes and previously understudied regions, are analysed. The research aims to draw conclusions about human behaviours during MIS 5, including technology, techno-economy and land use, as well as the occurrence of behavioural novelties, group networking and knowledge transfer. Interestingly, the technological study following the chaîne opératoire approach revealed that the technical system of all three assemblages encompasses cores-on-flakes. However, the toolmakers used diverse strategies, and different intentions concerning either functional or operational aspects may have determined the outcome. In comparison with other MSA sites of MIS 5, the data underpin the eagerness of past societies to experiment as well as to express creativity and thereby finding new solutions for their technological needs.

2406. VARIABILITY AND RECYCLING PRACTICES IN THE MOUSTERIAN EBRO VALLEY: CORES-ON-FLAKES IN THE ASSEMBLAGES OF ROCA SAN MIGUEL AND GABASA SITES

**Contribution format:** Poster  
**Contribution authors:** Ekaterina Shveygert (Universidad de Zaragoza | Instituto Universitario de Investigación en Ciencias Ambientales de Aragón (IUCA) | Grupo de Investigación Primeros pobladores y patrimonio arqueológico del Valle del Ebro (P3A))

Neanderthal technological behaviour is highly diverse, even within the same group, not to mention the variations among different group occupations. This diversity is influenced by the availability and selection of raw materials, which are linked to landscape characteristics, resource exploitation strategies, knowledge and exploration of the territory, site function, and consequently, the domestic activities for which the tools were produced. This variability is reflected in the lithic material found at archaeological sites, which is often challenging to assign to a single technological group, as it may combine characteristics of multiple traditions. Examples of this include retouched tools made on cores or, of course, cores-on-flakes. For this study, we have selected two significant Mousterian sites from the Pre-Pyrenean region in the province of Huesca, Spain: Roca San Miguel (MLP level) and Gabasa (levels f and g). The selected levels from both sites date back to MIS 6, which allows us to explore possible responses to climatic conditions and establish potential parallels. However, the domestic activities carried out at these sites differ, as their functions were distinct: Gabasa Cave is interpreted as a site with short-term occupations related to hunting activities, whereas Roca San Miguel presents evidence of more continuous occupations. Both lithic assemblages contain evidence of recycling behaviour, including Kombewa flakes and cores, cores-on-flakes, and retouched tools made on cores. The analysis and interpretation of these materials are the focus of this study, aiming not only to evaluate their presence at the site but also to reconstruct the occupational dynamics.

230 WHAT A LOAD OF RUBBISH! CHALLENGES AND POSSIBILITIES ON LARGE URBAN ARCHAEOLOGICAL EXCAVATIONS

**Session theme:** 1. On artefacts and beyond  
**Session format:** Discussion session  
**Session keywords:** Large-scale urban sites, Find strategies, Metal detecting, Method development, Finds assemblages  
**Session organisers:** Stuart Whatley (Museum of Copenhagen) – Georg Haggren (University of Turku) – Karen Therkelsen (Museum of Copenhagen)  
**Session discussant:** Simone Mayer (Museum of Copenhagen)

SESSION ABSTRACT

Large-scale urban excavations often produce huge amounts of finds which causes significant challenges but at the same time offers considerable research potential. Whilst the 2023 EAA conference session “All these finds – Challenges and possibilities on large urban archaeological excavations” addressed problems with large scale urban excavations in Northwest Europe, urban excavations have become larger whilst new technologies have made it possible to analyze smaller details such as aDNA and pathogens. New approaches in sampling, 3Ding of finds and structures and new excavation techniques over the last few years have led to the need to address this question again, but in a wider scale from all over Europe. The recent excavations of an Early Modern rubbish dump in Frederiksstadén, Copenhagen led to many challenges in methodology during the excavation. Apart from established fieldwork techniques, new procedures linked to a strategy of collecting big bags of soil led to largescale dry sieving with metal detectors and wet sieving alongside hand collection of finds. The focus will again be related to finds from large rubbish dumps, moat fills, industrial zones or land reclamation places, areas used to redeposit waste from the city. This session aims to discuss strategies related to excavation, sieving, and the recording and collection of finds.

- What should be collected and why, what should be left on site and how should we approach on site conservation.
- Should finds be sorted on site or should this be done in the post excavation phase?
- How important is metal detecting in the procedure, and should it become an important aspect of most archaeological strategies.
- Finally, how do we integrate new technology such as drones and other aspects of photography.

This session welcomes papers on excavation and finds strategies inviting papers that can discuss both in-situ and redeposited materials.

CONTRIBUTION ABSTRACTS

184. LANDFILL LEGACY: EXCAVATING AND INVESTIGATING HISTORICAL WASTE IN FREDERIKSSTADEN, COPENHAGEN

**Contribution format:** Oral  
**Contribution authors:** Karen Therkelsen – Simone Mayer (Museum of Copenhagen)

This paper presents the preliminary findings from a groundbreaking archaeological excavation conducted in 2024 at Amaliegade 44 in the historic district of Frederiksstadén, Copenhagen. The site is situated in a coastal area. It was used as a landfill from approximately 1650 to 1750 and comprises waste from Copenhagen’s residents, providing valuable insights into historical waste management practices in the region. One of the major challenges of the excavation was the need to remove all soil to accommodate upcoming construction. This process involved excavating and transporting the enormous amount of 4.300 cubic meters of soil in 6.000 bigbags to a separate site, where the soil is being systematically examined – a novel scale for Danish archaeology. The paper will focus on the methodologies designed to maximize efficiency on site and during post-excavation with the aim of reviewing the contents of the bigbags by the end of 2026. As the thick layers of waste were rich in exceptionally well-preserved and diverse artefacts, we anticipate the unprecedented amount of approximately half a million objects! In particular, the vast amount of various leather and textiles must be emphasized for their excellent preservation and textiles will serve as an example for the research potential of the material. Preliminary results provide insights into the nuances of everyday life, consumption patterns, recycling, diet, craftsmanship, and globalization in 18th-century Copenhagen. By examining fabric types and weaving patterns, we gain valuable insights into the fashion, gender roles, trade networks, and broader social and economic contexts of the time.

1473. MEDIEVAL AND EARLY MODERN GLASS FROM SLOTTSFJÄRDEN IN KALMAR (SWEDEN). A FINDS ASSEMBLAGE FROM EXCAVATIONS MADE DURING THE GREAT DEPRESSION

**Contribution format:** Oral  
**Contribution authors:** Georg Haggren (University of Turku | University of Helsinki)

During the great economic depression in the 1930s the town of Kalmar (Sweden) started a large job creation project. In 1932 to 1934 the seabed of the Bay of Slottsfjärden in the front of the medieval castle of Kalmar and the former old town was dredged. An area of about 300 x 200 meters was cut off with dams from the surrounding sea and drained so that it was possible to carry out the excavation of the area by methods used on dry land. A rail road was built through the area to make it possible to transport about 100 000 cubic meters of mud from the area. This excavation resulted a huge finds material consisting of e.g. 20 ship and boat wrecks. However, the excavation is probably best known for its large ceramic material consisting of fragments of about 31 200 vessels from the 12th to 17th century. The number includes 800 whole or almost whole vessels put together from the fragments. In contrary to many other early excavations also fragments of glass were collected from the bottom of Slottsfjärden. The most famous of the glass finds is a Bohemian pruned beaker dating to the century. The rest of the glass finds have never been discussed in detail. The aim of this paper is to analyze the glass assemblage from Slottsfjärden and place it to a wider European context. Today, it is also possible to compare these early finds with a large assemblage resulted during a large excavation made within the area of the old town of Kalmar (Arkeologerna/Swedish National Historical Museums).

599. LANDFILL OR VERSATILE SPACE? AN ALTERNATIVE APPROACH TO “EMPTY” SPACES

**Contribution format:** Oral  
**Contribution authors:** Kristine Haugan (Museum of Cultural History, University of Oslo)

This paper examines the often overlooked empty spaces within urban townscapes that are commonly interpreted as landfills or waste dumps. By focusing on the medieval town of Oslo, I use an undeveloped area south of the Bishop’s Road booming in high-status artefacts as an example of how spaces lacking permanent structures—often labeled as “empty” or “open” in medieval townscapes—are frequently dismissed or downplayed in the documentation. Consequently, such spaces are de-prioritized in research. In this paper, I propose an alternative approach to understanding empty spaces, building on recent research. I argue that many urban spaces without permanent structures offer valuable insights into activities that leave minimal archaeological traces, and that these activities can be detected through their versatility and seasonal nature. These spaces can reflect dynamic processes like social gatherings, trade, gardening, and animal movements that enliven urban life. In conclusion, I emphasize that future excavations should employ comprehensive sampling strategies to uncover the multifaceted roles these spaces play in urban society.

1792. ETHICAL DILEMMAS IN RELATION TO DESTRUCTIVE ANALYSIS OF HUMAN REMAINS

**Contribution format:** Poster  
**Contribution authors:** Tanja Madsen (ADBOU: Unit of Anthropology Department of Forensic Medicine, University of Southern Denmark)

Human remains are a unique and irreplaceable resource that can offer contemporary researchers exclusive insights into past lives. In the pursuit of new knowledge, scientific analyses have proven to be effective tools. However, most of these tests are destructive, involving invasive procedures that result in the destruction of human remains. Both during the preparation process and in the sampling itself, the ethical considerations must be carefully weighed against the potential outcomes. When can sampling truly be justified? Is a laboratory result more valuable than compromising the preservation of cultural heritage. The purpose of this poster is to guide the reader on a journey to Denmark, where legislation and guidelines regulate archaeological excavations and the treatment of finds, but where the approach to sampling and ethics is left to individual conscience. The poster aims to offer insight into the challenges and considerations I encounter when sampling human remains at ADBOU -Unit of Anthropology Department of Forensic Medicine, University of Southern Denmark.

232 OTTOMAN ARCHAEOLOGY IN EUROPE: ALONG AND ACROSS THE DANUBE

**Session theme:** 8. Along and across the Danube!  
**Session format:** Regular session  
**Session keywords:** Ottoman Empire, Balkans, Ottoman archaeology, Ottoman heritage, Ottomans in Europe  
**Session organisers:** Tünde Komori (Hungarian National Museum) – Veronika Nikolaeva Nikolova (National Archaeological Institute with Museum, Bulgarian Academy of Sciences)

SESSION ABSTRACT

Following the conquest of Bulgaria by the Ottomans at the end of the 14th century, the Danube River became one of the most vital areas for Ottoman political, cultural, and economic life until the end of the 19th century. This period of approximately five hundred years divided European history into two different worlds and led to the emergence of two distinct material cultural environments: European and Ottoman. Although the symbolic area of this division and interaction was the Danube River and its basin, this region also served as a venue for an intertwined cultural hub, where the two different cultures met and fused with each other. The diversity of Ottoman Europe and the five-hundred-year heritage produced an abundance of Ottoman-period archaeological material in this region, being witness to the intertwined past of Europe and the Ottoman Empire. The systematic excavation and study of this archaeological material started emerging in the past two decades, making the field of Ottoman archaeology young compared to other periods in Europe. Dialogue among scholars and archaeologists focusing on Ottoman archaeological heritage has recently started, and this session aims at continuing and extending this dialogue. We are inviting papers from Europe discussing Ottoman archaeological heritage in one of but not limited to the topics below. Material culture interactions between Europe and the Ottoman Empire Ottoman settlements and archaeology along and across the Danube River Cultural encounters and traffic routes in the Ottoman Europe Commercial activities and material exchange between the Ottoman Empire and Western Europe Borderlands, conflicts, and interactions Development of Ottoman archaeology in post-Ottoman Europe Ottoman-period material culture in museum storages and its past, present, and future Ottoman architecture in modern context: the use and preservation of Ottoman-period buildings in post-Ottoman Europe.

CONTRIBUTION ABSTRACTS

853. RUN, THE TURKS ARE COMING! OVERVIEW OF ARCHAEOLOGICALLY INVESTIGATED SITES FROM THE TIME OF THE OTTOMAN INCURSIONS IN SLOVENIA

**Contribution format:** Oral  
**Contribution authors:** Mateja Ravnik (Institute for the Protection of Cultural Heritage of Slovenia)

The multi-level defence that the Inner Austrian provinces organized against the Turkish incursions was rather specific, ranging from simple refuges provided by rock shelters and forests, which are difficult to document with the use of the archaeological method and place (strictly) in the time of the Ottoman incursions, to the construction of complex strongholds, led by the state and the nobility. No less specific was the nature of the Ottoman incursions, which shook the cumbersome medieval system of warfare and defence at its very foundations. For this reason, the aim of the contribution at hand is not so much to list the locations of uncovered archaeological remains that may be associated with those turbulent times as it is to set forth reflections, questions, and dilemmas that are raised in discussing this topic—that is, from identifying and interpreting archaeological records,

interdisciplinary integration of architecture, art history, ethnology, history, and archival studies (above all to study Ottoman archival sources), to the absence of Ottoman materials and remains, which is indeed striking, given the high number and frequency of their attacks. Surpassing the mere attempt at surveying locations, the contribution highlights challenges and raises the question of not only how to discuss archaeological remains but also how to develop an integral, interdisciplinary approach to interpreting them to improve the understanding of the developments that took place in that period.

1522. “...CHURCHES WHERE SACRIFICES WERE OFFERED TO GOD WERE TURNED INTO BARNs FOR CATTLE...”. ARCHEOLOGICAL TRACES OF OTTOMAN ERA IN CROATIA

**Contribution format:** Oral  
**Contribution authors:** Andrej Janeš (Croatian Conservation Institute)

The Ottoman conquest of the Balkan peninsula is held, in popular belief and historiography, as a turning point of the regional, but also, wider political, social and cultural landscape. It was also held as a devastating blow to the Christian society of the region, including population displacement and indirectly the destruction of the material remains of the “old” culture. These actions were mostly held as a direct point in Croatian archaeological research as the origin of archaeological sites of former medieval settlements, castles, monasteries and churches, on the Ottoman occupied territories of present-day Croatia. This paradigm caused a popular theory among archeologists that all sites with medieval finds had to be abandoned by the second quarter of the 16th century. Modern day archaeological research, mostly due to rescue excavations, brought to light new data that shed new light on the post-Mohacs era, the time of Ottoman conquest and rule in the regions of Slavonia, Dalmatia and other Croatian regions. This paper will present new data from archaeological research in Croatia including settlements that flourished under Ottoman rule, cemeteries used by Christian communities during this period showing no disruption in their use, mostly on the territory of Slavonia, spanning from the late 15th to the 17th century. Archeological excavations and surveys unearthed remains of Ottoman architecture, as the mosques, hammams, türbes, defensive towers in the cases of Osijek and Gorjani (Slavonia), Ilok (Syrmia) and Nadin (Dalmatia). In some cases, new traditions arose, like the burials in mounds in the Dalmatian hinterlands, confirming the arrival of new populations. In the last twenty years Croatian archeology has made significant steps excavating ottoman era sites that will be presented here.

1476. THE HABITATION IN THE FORTIFICATION AND THE SUBURBS OF OTTOMAN TIMIȘOARA (ROMANIA). AN ARCHAEOLOGICAL AND HISTORICAL APPROACH

**Contribution format:** Oral  
**Contribution authors:** Andrei Stavila – Dorel Micle (West University of Timișoara | Interdisciplinary Research Center for Movable and Immoveable Archaeological Heritage “ArheoTim”) – Bogdan Craiovan (National Museum of Banat in Timișoara | Interdisciplinary Research Center for Movable and Immoveable Archaeological Heritage “ArheoTim”)– Ana-Maria Bogdan(West University of Timișoara)

Starting in 2014, the modernization and rapid development of Timișoara have provided valuable insights into the city’s habitation from the 16th century to the early 18th century. Having in mind Heinrich Ottendorf’s (2006) narration, which states that “only the Ottomans lived inside the city walls, while the Christians inhabited the suburbs,” this paper aims to offer a comparative analysis of the intra- and extra muros areas, focusing on the residential structures and their outbuildings. To highlight any potential differences, we will draw upon archaeological findings, narrations from foreign travelers, reports from Habsburg envoys in Banat, and period maps. The decline of Ottoman administration and of the city itself begins in the late summer of 1716, when Timișoara was preparing to defend itself against the Habsburg imperial armies (Hirsch 2021). The first area to be affected was the extra muros housing in the Palanca Mare suburb. The disruptions caused by the siege of Timișoara in the northern part of the city, along with the changes that followed, have been documented in recent years from an archaeological standpoint—these aspects will be addressed in the concluding part of this paper.

2461. BRĂILA IN OTTOMAN AGE

**Contribution format:** Oral  
**Contribution authors:** Niculina Dinu (Braila Museum “Carol I”)

Brăila developed as a border town on the shore of Danube from the Middle Ages. Documentary is mentioned from 1368 but archaeological evidence is earlier. Its development is closed by the two main international routes that link the west and east. When the Ottomans wanted to close Danube navigation, they occupied this town and part of the surrounding territory sometime in 1538-1540. So that part, which was a Wallachian territory, became the border fortress of the Ottoman Empire, from the middle of 16th century to the beginning of 19th century. Historical information is channeled into the political and military situation in the area and information about the

population and economic activity is rarely found in the writings of travelers or official documents. That activity could be documented by archaeological discoveries. These show us certain patterns of residential concentration (houses, workshops or shacks) of religious spaces (place of worship or cemetery). Archaeology can only offer a glimpse into the daily life of a war zone, such as Brăila fortress was: houses and streets, trade activity of city and harbor (main area for international and regional/ local trade). The transformations of the 19th century leave us with a fragmentary Ottoman city, whose history is completed by the household pits discovered during the architectural remodeling of the old fortress (buildings, streets, former industrial spaces in the port area).

**144. HIDDEN HISTORY UNDER THE ROMANIAN GROUND: TRACES OF OTTOMAN HABITATION IN TIMIȘOARA (1552-1716)**

**Contribution format:** Oral  
**Contribution authors:** Adriana Gaspar („Vasile Pârvan” Institute of Archaeology, Romanian Academy)

Archaeological research campaigns that took place in the historic center of Timișoara (Romania) in the last two decades have brought to light several structures that belonged to the Ottoman fortress (1552-1716). Among the discoveries that belonged to the Ottoman city were also parts of dwelling, built entirely of wood. These residential structures, oriented according to the street network, were provided with one or more rooms, often equipped with cellars - used for storing food, household annexes - with various roles in domestic life, but also supply pits - for storing and managing food resources. The houses were built using two distinct construction techniques: foundations were made on groups of wooden pillars and foundations in which rows of wooden pillars were driven into trenches. The presentation discusses the details regarding the architecture of these dwellings, their significance in the urban context of the era, and their implications for understanding daily life in the Ottoman fortress.

**2484. FACING MECCA: MOSQUES AND THE STATE OF OTTOMAN HERITAGE IN BULGARIA**

**Contribution format:** Oral  
**Contribution authors:** Veronika Nikolova (National Archaeological Museum of the Bulgarian Academy of Sciences)

Bulgaria fell under Ottoman rule in 1396 and remained so for a period of almost 500 years until 1878. Situated in the middle of the Balkan peninsula the Bulgarian lands became very important for the Ottomans. The cities gradually gained an Ottoman appearance – the earliest Ottoman buildings date back to the end of the 14th c. Travelers who passed through these lands testify to numerous mosques, caravanserais, hammams and other buildings renowned for their architectural and artistic qualities. After the Liberation of Bulgaria and especially during the communist period some Ottoman monuments were transformed into museums, churches or galleries, while others were destroyed or abandoned. Even nowadays, the methods by which these monuments are managed have no. been fully developed yet. This is both due to the ambivalence of the state in relation to these monuments and to the collective memory that often plays a role in their management. The aim of this study is to present the relation of the Bulgarian state and community towards the mosques that have survived to this day on the territory of Bulgaria from the Ottoman period. Several mosques will be presented, illustrating different ways of how Bulgaria is dealing with this heritage. The first group will include mosques that are now renovated, open to the public and are still places of worship such as Eski mosque (Yambol) and Tombul mosque (Shumen). Other examples like Buyuk mosque (Sofia), Eski mosque (Stara Zagora) and the recently renovated mosque in Karlovo that are currently museums will also be presented as another functionality of these buildings. Mosques that, for various reasons, are not maintained and self-destruct will illustrate the challenges the Bulgarian society faces regarding the management of their Ottoman heritage.

**1305. EMBODYING CONQUEST: COMMEMORATING THE BATTLE OF KOSOVE POLE IN THE OTTOMAN AGE**

**Contribution format:** Oral  
**Contribution authors:** Petar Parvanov (National Archaeological Institute with Museum)

In the words of Noel Malcolm everything but the basic facts about the battle of Kosovo (AD1389) is uncertain and yet this remains one of the most critical episodes in the rise of the Ottoman empire. The special significance of the battle and its location in the Serbian national myth and identity is well known. Despite the tactical stalemate and the deaths of both leaders, Prince Lazar and Sultan Murad, the outcome of the battle favored the Ottomans in the long term. Their control over the area is manifested in the interconnected memorial and religious landscape. This presentation will elaborate on the Ottoman heritage related to the battle of Kosovo pole and the special place of sultan Murad in the materialization of this cultural narrative. At first glance, the body of the sultan is venerated and manipulated according to the Ottoman funerary custom for the creation of his türbe in the outskirts of Mazgit. However, this tomb is at the center of complex memorial network encompassing architectural monuments in Bursa, Pristina, and the battlefield itself. As elsewhere in the Balkans, these buildings

are considered the earliest known examples of Ottoman architecture in the region. The symbolic geography is further emphasized by the journey of the royal corpse back to the core Ottoman lands combining warfare and religion in an intentional political display similar to some funerary performance in medieval European practice. Its effectiveness is best demonstrated by the memorial transformations of this conflict heritage starting already in the fifteenth century.

**2378. ARCHAEOLOGICAL AND ANTHROPOLOGICAL DATA ON THE CHRISTIAN NECROPOLIS AT THE SITE “TRAYANOVI VRATA” (15-16 C.)**

**Contribution format:** Oral  
**Contribution authors:** Vladislav Todorov – Nadezhda Atanasova (Institute of Experimental Morphology, Pathology and Anthropology with Museum (IEMPAM))

The aim of this report is to present the data from archaeological and anthropological investigation of the sit. “Trayanovi Vrata” pass, which is located in Sofia District. The name of the pass comes from the famous Trajan's Gate, which was erected in antiquity at this location. The main goal of the archaeological excavations, conducted in 2016, was to discover the ruins of the famous Trajan’s Arch. Nine boreholes were laid during the research. Architectural remains and part of a necropolis were registered in borehole No. 2. 15 burial structures were discovered with a total of 19 individuals of both sexes and of different ages identified. All of them were buried according to Christian custom, in a stretched position on their backs and heads oriented to the west some of the graves were disturbed secondarily, as a result of which human bone remains were registered and re-deposited on site. Based on the found ornaments, the necropolis is relatively dated to the 15th-16th century. A large part of the human bone remains are fragmented. In none of the cases are the skeletons completely represented. A completely preserved skull was found in only 1 case (grave No. 9). Of interest is grave No. 10, where bones of a fetus (9.5 – 10 lunar months of pregnancy) were identified, as well as graves No. 6 and 13 with the remains of babies under 1 year of age. The identification of cranial porous bone lesions in some of the buried adolescents and adults is indicative of the presence for anemic diseases in the studied population.

**485. WHAT’S ON THE PLATE. A ZOOARCHAEOLOGICAL PERSPECTIVE ON DIET AND ANIMAL USE IN OTTOMAN BELGRADE**

**Contribution format:** Oral  
**Contribution authors:** Simeun Srdanovic – Teodora Mladenović (University of Belgrade - Faculty of Philosophy) – Milorad Ignjatović (Belgrade City Museum, Belgrade)

The archaeological site at the corner of Kosovska and Vojkoviće streets in Belgrade was excavated in 2023 during protective research conducted by the Belgrade City Museum. On this occasion, alongside layers from antiquity, remains of structures from Ottoman-period Belgrade, dating to the early 17th century, were uncovered. A diverse assemblage of portable finds – including pottery, clay smoking pipes, and small metal objects – was unearthed within these structures. Notably, faunal remains were also identified, providing a rare and valuable insight into animal use and dietary practices during this period. The distribution of skeletal elements, butchery marks, and represented taxa suggest that these remains primarily derive from food consumption. The assemblage includes a variety of mammals, birds, fish, molluscs, and reptiles. Among mammals, domestic species predominate, particularly sheep, goats, and cattle, alongside additional finds of equids, dogs, pigs, and camels. Wild species, such as wild boar and roe deer, are present but scarce. Poultry is primarily represented by chicken, with occasional occurrences of geese. Aquatic resources include fish, notably carp and catfish, and freshwater mussels of the genus Unio. A single fragment of a turtle shell represents the only reptile specimen. Given the still-developing fields of Ottoman-period archaeology and zooarchaeology, and the scarcity of published faunal assemblages from the Balkans, this study represents a significant contribution to regional research. It offers insights into dietary habits and animal exploitation strategies within Belgrade and the northern parts of the Ottoman Empire.

**1612. OTTOMAN BUILDING ON A MEDIEVAL CASTLE WALL – THE CSÓKAKŐ MOSQUE IN THE MOSQUE ARCHITECTURE OF OTTOMAN HUNGARY**

**Contribution format:** Oral  
**Contribution authors:** Bianka Kovács (ELTE Research Centre for the Humanities, Institute of Archaeology, Budapest) – Gábor Hatházi (Ministry of Culture and Innovation (KIM)) – Ágnes Kolláth – Gyöngyi Kovács (ELTE Research Centre for the Humanities, Institute of Archaeology, Budapest)

The starting point for our presentation is the remains of a mosque built in the Ottoman-Turkish period. of Csókakő Castle near Székesfehérvár, the centre of the Central Transdanubian region. In the castle on a southern ridge of the Vértes Mountains, the mosque was built on a demolished section of the medieval castle wall. We will present

the written, pictorial and archaeological evidences for it, and then use examples from Balkan and Anatolian architecture to explore what it might once have looked like. The fate of the building after the Ottoman period and the current state of the ruins will also be discussed. The rest of the lecture will examine the place of the mosque in Ottoman mosque architecture in Hungary, and the extent to which its architectural characteristics were unique or generalizable in the period. In Ottoman Hungary, fundamentally new mosques were built mainly in towns and larger castles, less often in smaller places. The main types and the remains are illustrated with examples, including their 18th-20th-century building- and research history. The written and pictorial sources prove beyond doubt that there were mosques of simpler design in many smaller and larger settlements and castles. It was typical that a medieval church or a part (e.g. the sanctuary) of it was converted into a Muslim place of worship. In all respects, the remains of the mosque in Csókakő can be considered unique in the Hungarian monumental material. The location, small size and form of the mosque were determined by the circumstances of the fortress, but it was a typical Ottoman building with Ottoman architectural features.

1407. EARLY KÜTAHYA WARE IN OTTOMAN HUNGARY

**Contribution format:** Oral  
**Contribution authors:** Tünde Komori (Hungarian National Museum)

Kütahya coffee cups throughout the Ottoman empire are generally dated to the eighteenth century and later, primarily based on written evidence. At the same time, earlier production is sporadically mentioned in secondary literature, but no archaeological finds have been dated to earlier than the eighteenth century. Archaeological material, on the other hand, is only published from contexts that do not rule out earlier dating; still, all the material is dated after 1700. The proposed presentation discusses a find material of Kütahya ware, specifically coffee cups, presenting the preliminary results of the study of a large find material and their archaeological contexts. This study included the first-hand research of c. 1800 ceramic sherds of Chinese porcelain, Iznik and Kütahya ware, and Persian faience from eleven settlements in Hungary and Bulgaria, supplemented with the study of further c. 700 sherds in publication from other settlements in Romania and from Belgrade in Serbia. The primary goal of the presentation is to offer a revised typochronology of Kütahya ware, which also concerns previous typologies of the so-called Persian faience, as well as the widely used dating of certain Kütahya types in Turkish and Romanian publications. The presentation challenges partly the identification of certain types as Persian in the Hungarian material, and partly their dating to the eighteenth century, suggesting an earlier, seventeenth-century dating instead. The basis of the revised typochronology is the archaeological context of certain Kütahya types which suggest their earlier dating, especially in sites located in present-day Hungary, where Ottoman occupation ended by 1699.

1448. SPECIFICATION AND TYPOLOGY OF CHINESE EXPORT PORCELAIN FROM ARCHAEOLOGICAL SITES IN CRISTIAN EUROPE AND THE FORMER OTTOMAN EMPIRE

**Contribution format:** Oral  
**Contribution authors:** Agnieszka Pudlis (Archeological Museum in Gdańsk)

Chinese porcelain is found in several European and extra-European sites. It is considered that the production dedicated to Europe was different in many details from the production dedicated to the Eastern markets, including the Ottoman Empire. In recent years, thanks to the interest dedicated to modern archaeology, the number of publications presenting ceramic finds from the post-Medieval period has grown. Among these objects are often found numerous fragments of Chinese porcelain dating from the 16th to the end of the 18th century. Belief that porcelains exported to Western Europe and the Ottoman Empire represented different typologies were made by examining the most important museum collections - including Topkapi Palace and other royal collections in Europe. In fact, there are a large number of pieces (vases, bowls, plates etc.) decorated with Arabic writings, or with typically Christian designs. Although the same considerations can be used for the most common porcelains, which more often ended up in ditches and other garbage dumps? Can we perhaps say that special production was reserved for courts and “individual” buyers, but did the “bourgeois” porcelains, used by corporations, monasteries or spread throughout the cities, represent similar or identical types in all the places examined? We want to deliberate it carefully, indicating some new lines of interpretation. In fact, in the Baltic Sea basin (Danzig, Copenhagen, Gotteborg etc.) there are found several pieces of Chinese porcelains, which may be similar to those found along the Danube.The decoration technologies (gilding, enamelling, engraving etc.) will be taken into consideration together with the iconographic subjects (character, floral motifs, religious etc.) and shapes. Presentation will be widely illustrated by images of Chinese porcelains found in various sites, many of which have not yet been published.

1661. BURIED HISTORIES: AN ANTHROPOLOGICAL EXPLORATION OF A LATE OTTOMAN CEMETERY FROM CONSTANȚA, ROMANIA

**Contribution format:** Poster  
**Contribution authors:** Andreea Toma – Elizabet. Craig-Atkins – Mirela Ivanova (School of History, Philosophy and Digital Humanities, University of Sheffield) – Gabriel Vasile – Raluca Dobrogeanu (Romanian Academy, “Vasile Pârvan” Institute of Archeology) – Constantin Băjenaru – Marius Lascu – Ingrid Petcu Levei (Muzeul de Istorie Națională și Arheologie, Constanța)

Between 2019 and 2020, an archaeological investigation was conducted in the Constanța–Boreal area to identify potential burial sites. This research led to the discovery of 314 graves within a Muslim cemetery near the former settlement of Palazu Mare, now incorporated into the Constanța district in Dobrogea, southeastern Romania. The Ottoman-period cemetery, situated on a locally significant hillock, has been radiocarbon dated to the 18th to 19th centuries. A detailed analysis of the graves revealed that all exhibited either a rectangular or oval shape, with a lateral niche excavated towards the southeast, a characteristic feature of Islamic burial traditions. Of the 314 graves documented, 292 individuals were subjected to anthropological examination. The primary objective of this study is to reconstruct the demographic profile, health status and lifestyles of the Ottoman population in Dobruja by analysing sex and age distribution using a combination of metric and non-metric anthropological methods and assess skeletal indicators that provide insights into overall health, disease prevalence, and physical activity. Special attention is given to dental and bone pathologies, which offer valuable evidence of dietary habits, nutritional deficiencies, and general well-being. Additionally, markers of biomechanical stress are analysed to infer repetitive physical activities, reflecting occupational patterns and daily life. The findings of this research contribute to a broader understanding of the social and biological characteristics of Ottoman-era populations in southeastern Romania. By integrating archaeological and bioanthropological data, this study enhances knowledge of historical demographic structures, health conditions, and cultural practices, offering a comprehensive perspective on the lived experiences of past communities in the region.

1732. BAKING BELLS ACROSS THE OTTOMAN PERIOD IN HUNGARY

**Contribution format:** Poster  
**Contribution authors:** Orsolya Zay (Institute of Hungarian Research)

The baking bells were widespread in the Carpathian Basin during several archaeological periods, but they almost completely disappeared from the culinary culture of the Hungarian Kingdom in the Middle Ages. Therefore, it is well-marked that they reappeared during the 16th and 17th centuries with the incoming Balkan population. In the summer of 2022, we conducted an archaeological excavation over more than 2000 square meters in the economic courtyard of the Archbishop’s Palace in Eger. The area of the courtyard has not been disturbed since the 18th century, except for a couple of pipelines, aside from the paving. A massive amount of ceramics, metal, stone, and organic remains - such as leather shoes or wooden structures - were uncovered in the muddy, damp soil, primarily from the Early Modern period. From one of the wicker-walled wells, which had been filled with garbage, distinctive Balkan ceramics - mainly cooking vessels and utensils - we discovered a nearly intact, robust baking bell with the signs of long utilization and renovation. The excavation which was located on the main street of Eger highlights through the well-preserved finds the multicultural relations that developed in the city during the 91 years of Ottoman rule. In addition, we had the opportunity to reconstruct and test the baking bell as a contemporary cooking tool within the framework of an experimental archaeology project.

233 IRON, POTTERY, QUERNSTONES: THE POLITICAL ECONOMY OF PRODUCTION AND TRADE IN THE EUROPEAN MIDDLE AGES

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Political Economy, Medieval, Production, Trade, Elites, Hierarchies  
**Session organisers:** Michael Lebsak (Institute of Archaeology of the Czech Academy of Sciences Brno | Masaryk University Brno | Albert-Ludwigs University Freiburg) – Michal Hlavica (Institute of Archaeology of the Czech Academy of Sciences Brno) – Arne Kluge (Eberhard Karls University Tübingen) – Monika Kaminska (Independent)

SESSION ABSTRACT

This session explores the political and economic relationships between elite and non-elite actors in Medieval Europe (500–1500 AD), focusing on the production, distribution, and consumption of both mundane goods and

high-status valuables. Elites—such as monarchs, chiefs, and clergy—exerted significant influence on commodity flows through mechanisms such as land ownership, violent restrictions, and market bottlenecking, enabling them to shape both local economies and broader trade networks. Control over resources and labor allowed elites to sponsor production centres and regulate access to existential materials like iron, foodstuffs, salt and wood, while also ensuring that luxury items such as weapons and jewelry remained symbols of power and status. The impact of elite actors can be identified through archaeological and historical evidence indicating specialized production areas, elite-sponsored workshops, and controlled distribution channels. Elite-sponsored craftsmanship further illustrate how control over skilled labor was used to reinforce social hierarchies, as well as maintain economic and cultural dominance. Despite this, autonomy existed among non-elite producers and traders. Archaeological data, such as independent workshops and evidence of local exchange, suggest that artisans and merchants could operate independently, creating distribution systems outside elite oversight. These autonomous exchange activities reflect a negotiated space wherein non-elites could engage in both local and regional trade, contributing to a dynamic economy that extended beyond direct elite control. This session aims to contextualize these interactions and seeks to present recent interdisciplinary studies that can combine, for instance, archaeological, archaeometric, historical or economic anthropological studies to explore the dependencies and independencies in Medieval European economic systems. Through this approach, we seek to deepen the understanding of how elite influences intersected with the agency of producers and traders, thereby shaping the distribution and accessibility of both mundane commodities and valuables.

CONTRIBUTION ABSTRACTS

490. BEYOND ELITE DESPOTISM AND CONTROL: THE POLITICAL ECONOMY OF IRON PRODUCTION AND TRADE IN THE CENTRAL EUROPEAN EARLY MIDDLE AGES

**Contribution format:** Oral  
**Contribution authors:** Michael Lebsak (Institute of Archaeology of the Czech Academy of Sciences)

The rise of institutionalised power in the European Middle Ages was driven by efforts of aspiring elites to centralise authority, control military and economic resources, and legitimise hierarchical rule. Political economy, drawing from Marx’s concept of the economy as a social structure, often focuses on how elites shaped an important aspect of economy: Specialised craft production and trade. This top-down perspective tends to depict non-elite actors as passive subjects of surplus extraction, reinforcing an image of despotic or absolute elite control. However, medieval economies, especially in small-scale and fragmented proto-state political entities of the Early Middle Ages, were shaped heterarchically by both elite strategies and non-elite cooperation. This paper challenges the notion of total elite dominance by highlighting the active roles of artisans, traders, and rural producers. Using archaeological and historical case studies, particularly from the Early Middle Ages of Central Europe and the iron industry, it explores the interaction between power structures and non-elite economic dynamics. By integrating the relation between elite and non-elites, this approach offers a more nuanced understanding of medieval production and trade. The study also introduces Political Economy as a valuable framework for analysing medieval economies beyond rigid hierarchical models.

301. IRON AS A COMMODITY AND CURRENCY IN 9TH-CENTURY MORAVIA

**Contribution format:** Oral  
**Contribution authors:** Michal Hlavica (Institute of Archaeology of the Czech Academy of Sciences, Brno)

Iron played a vital role in the early medieval Moravian polity, which emerged in the eastern part of Central Europe during the 9th century and collapsed at the beginning of the 10th century. Iron tools were essential for agricultural intensification, supporting the growth of emergent central places. Weapons and military equipment facilitated predatory resource extraction, primarily through the activities of Moravian mounted warrior bands. In the form of currency (axe-shaped bars of various sizes and weights), iron served as a medium for social accounting and pre-monetary exchange. Later, it may have also functioned as a form of monetary token, used at nodal points within the nascent Moravian market system. Given the multifaceted role of iron in 9th-century Moravia, this presentation will explore what the archaeological record reveals about its integration into the political economies of Moravian elites and how it helped sustain the complexity of social, economic, and political relations within this early medieval polity.

987. WAS THERE AN INDEPENDENT IRON PRODUCTION IN EARLY MEDIEVAL MORAVIA?

**Contribution format:** Oral  
**Contribution authors:** Roman Mikulec (Masaryk University, Faculty of Arts, Department of Archaeology and Museology, Brno | Institute of Archaeology of the Czech Academy of Sciences, Brno)

Iron production played a crucial economic role in medieval Europe, and it was no different in the territory of today’s

Czech Republic. During the existence of the 9th-century polity known as Great Moravia, iron was an essential commodity for the two most important pillars of its economy and power: the intensifying agricultural production and cross-border raids of armed groups, among whom mounted warriors represented the elite stratum of society at the time. Despite the importance of this commodity, our knowledge of iron production remains limited. One major question arises in particular: how was iron production organized, and to what extent was it regulated and controlled by the elites. Current research indicates that elites undoubtedly sponsored iron production. In the Moravian Karst, an uninhabited forested peripheral region close to the early medieval fortified centre of Staré Zámky in Brno-Líšeň, evidence of intensive iron production has been discovered. Subsequent iron processing then likely took place at other Moravian central places, with the most abundant finds coming from the former primary power centre in Mikulčice, where hundreds of kilograms of smithing slags were found. However, close to the Moravian Karst lies another iron production region with a different pattern of evidence, the Boskovice Furrow. This area, beyond the direct reach of main power centres, shows signs of parallel, independent, small-scale production activities. Ironworking sites there are much smaller and located near rural settlements. Their production thus most likely primarily served local communities, and to some extent possibly also for exchange. This talk presents current state of archaeological research on iron production in the Boskovice Furrow, and how this research can contribute to completing the picture of early medieval Moravian economy and its changes over time.

1309. IRON, SILVER AND LEAD. ECONOMICAL EXPLOITATION AND POLITICAL STRATEGIES IN EARLY MEDIEVAL COLLINE METALLIFERE (SOUTHERN TUSCANY ITALY)

**Contribution format:** Oral  
**Contribution authors:** Luisa Dallai – Giovanna Bianchi (University of Siena)

The close link between the exploitation of mineral deposits of southern Tuscany (from Colline Metallifere and the Elba island in particular) and the development of the area’s social, economic, political and infrastructural patterns is a well-known research topic of major historical interest. Although intensive ironworking started in pre-roman times declined round the half of the 1st century BC, mining activities are attested until Late Antiquity. From the 6th century AD on, it is traditionally accepted that the circulation of iron from Elba island stopped, and the economic and commercial dynamics linked to iron and other minerals (mixed sulphides of copper, lead and silver) begun to fade. Contrasting this traditional perspective, new data acquired thanks to archaeological research and a solid multidisciplinary approach (<https://neu-med.unisi.it>), highlight the still distinctive role played by mineral resources (iron in particular) in the economy of southern coastal Tuscany between the 6th and the first half of the 11th century. Moreover, from the 8th century onwards, archaeological research has identified signs of a resurgence of economic interest in mixed sulphide ores (i.e. deposits of copper, lead and silver), testified by settlements located in the heart of the mining areas; archaeometric analyses have shown that in the 9th century, lead from the Colline Metallifere was certainly used in glazes for pottery. All these new data indicate a well designed strategy of mining exploitation; unlike the traditional historical approach, which qualified mining activities in the early Middle Ages as episodic, today an overall strategy has been recognized, as well as a crucial role played by public authority in its development.

447. VILLA FORENSIS “STARE MESTO” NEAR ZDAR NAD SAZAVOU: RECONSTRUCTION AND BROADER CONTEXT

**Contribution format:** Oral  
**Contribution authors:** Dominika Václavíková (Charles University in Prague)

The village with market right, “Stare mesto” near Zdar nad Sazavou, represents a unique archaeological site in the Czech lands. It is the only settlement of this type, whose vast part has been archaeologically investigated during five archaeological excavations. The settlement was already present in this area during the first half of the 13th century, but the village with market right was constituted later in connection with the foundation of the Cistercian monastery in 1252. The locality in its original location did not last long. The settlement was moved to the opposite bank of the Sazava River as early as 1267, where it transformed into a town during the 14th century. Due to the translocation, the original location was almost untouched by subsequent human activities, so the site was preserved for the most part, which made such detailed knowledge possible. The study of this site employed an interdisciplinary approach, combining analyses of written sources, archaeological research, petrographic analysis and, after that, spatial analysis. These methods enabled the reconstruction of the overall picture of the village and its surrounding economic framework. The paper is divided into two parts. The first part focuses on the reconstruction at the level of the village with market right. The basic image of the village will be reconstructed, and individual production districts (pottery, iron, stone, and wooden objects production) will be presented. The second part places the site within the broader economic context of the nearby monastery, addressing the distances between the village and the monastery, other production sites, sources of raw materials, and transportation routes.

1067. BETWEEN HOUSEHOLD SUBSISTENCE AND EARLY URBAN MANUFACTURING – CRAFT-ORGANIZATIONAL ASPECTS OF HIGH AND LATE MEDIEVAL POTTERY PRODUCTION IN SOUTHERN GERMANY

Contribution format: Oral  
Contribution authors: Arne Kluge (Eberhard Karls Universität Tübingen)

Utilitarian ceramics have represented one of the most significant sources in medieval archaeology since the beginnings of the discipline’s history. The aim to establish a comprehensive and fine chronological subdivision of ceramic material has so far yielded highly variable results across southern Germany. In the parts of the region that are farther from the Rhine, particularly in the Bavarian regions, no wheel-thrown pottery existed until the late High Middle Ages. During this period, ceramics were mostly coiled and wheel-coiled. The transition from this type of pottery, which from various perspectives suggests primarily household or semi-professional production contexts, to the subsequent relatively uniform wheel-thrown ware primarily occurred during the 13th and 14th century—a phase marked by both social and craft-related transformations. This contribution aims to present the spectrum of ceramic production from this transitional period using the city of Nuremberg as a case study. Furthermore, the specific backgrounds and driving forces as well as the concrete processes of the productional development from both a technical and an organizational perspective will be examined.

1216. WAS SALT THE „WHITE GOLD” TO ALL? THE CASE OF THE PRE-INDUSTRIAL STEPPE ZONE OF EASTERN EUROPE

Contribution format: Oral  
Contribution authors: Monika Kaminska (Independent)

The main aim of the presentation is to try to compare the significance of salt in different cultures according to its accessibility and consumption in different parts of Eastern Europe as reflected in the historical sources. In other words, the presentation will demonstrate the links and differences between the worlds, of sedentary Slavic (but also Turkic) and nomadic societies of Eastern Europe emphasizing the use of salt, as a commodity essential not only in the culinary arts and for the proper functioning of the human body, but also widely used in food preservation, animal husbandry as well as in the folkloric customs, magic, and medicine. In the broad territory of Eastern Europe, from Prehistory, salt was mainly obtained by evaporating brine (the main way of extracting salt in the Carpathian zone) or by collecting salt deposited on the banks of the salty lakes or lagoons. There are early medieval sources on salt production and trade in both the Slavic and Turkic environments. Salt produced in the Steppe came from salty lakes and it was used not only by nomads such as the Khazars or Tartars but also by Slavic merchants of the Middle Ages and the Early Modern Era. During the centuries of wars, migrations, and colonisation, the region between the Carpathian and the Ural Mountains developed a specific cultural mosaic of peoples maintaining political, cultural, and commercial contacts with each other. However, since the salt itself is one of the least tangible of material goods in the archaeological context, one has to combine geographical knowledge with the analysis of the historical, archaeological, cartographic, and even iconographic sources of 10th-16th centuries, in order to illustrate the uneven dynamic between the Steppe and Slavic environments reflected in their salt production, use and consumption, and trade.

234 BETWEEN ACADEMIC IVORY TOWER, INTELLECTUAL HEDONISM, AND SOCIAL RESPONSIBILITY. DEBATING THE WIDER MEANING OF ARCHAEOLOGICAL RESEARCH AND HERITAGE MANAGEMENT

Session theme: 4. De nobis fabula narratur: archaeological practice and a profession in flux  
Session format: Regular session  
Session keywords: motivation, enthusiasm, social relevance, archaeological practice  
Session organisers: Friederike Kranig (Römisch-Germanische Kommission | Georg-August-Universität Göttingen) – Wenke Domscheit – Alexander Gramsch (Römisch-Germanische Kommission) – Ivan Radman-Livaja (Arheološki muzej u Zagrebu)  
Session discussant: Filomena Sirovica (Archaeological Museum Zagreb)

SESSION ABSTRACT

For decades, numerous projects have investigated the context of archaeological practice and the motivation of archaeologists. They ask about the social setting of archaeology, whether archaeologists find their jobs meaningful, how they assess their career opportunities, or how we can make our profession more attractive (cf. the EAA working group ‘ACE’ [A. Marciniak et al. (eds), Contemporary Faces of the Past (Poznań 2011)]; DISCO [https://

landward.eu/disco/]; N. Schlanger, K. Aitchison [eds], Archaeology and the Global Economic Crisis [Tervuren 2010]; s. a. https://www.careerexplorer.com/careers/archaeologist/satisfaction/). As these questions never lose their relevance and should be reconsidered for each generation, we seek to maintain this tradition. In a new approach to the wider meaning of archaeology, both for society and for the discipline itself, we aim to discuss whether and how our profession goes beyond the academic ‘ivory tower’ that frames our thinking and doing. It is often our enthusiasm that allows us to overlook the lack of career prospects. Such enthusiasm forms an ever-present lowest common ground in the inter-archaeological exchange, which is able to bridge wide-ranging differences – both between the various archaeological disciplines and approaches and between archaeologists and the public. But excitement is not the main or only motivation to carry on. Archaeology should make sense, shouldn’t it? It should have meaning beyond the hedonistic fun we may have doing what we are doing. In this session, we want to encourage a discussion on what archaeology is, what it could be, even what it should be. Where would you want to see archaeology going? We invite participants to present both general considerations and case studies that discuss motivations for doing archaeology in the context of contemporary social, political, economic, and environmental issues.

CONTRIBUTION ABSTRACTS

1825. QUIET ACTIVISM - CHANGING ARCHAEOLOGICAL PRACTICE FROM WITHIN

Contribution format: Oral  
Contribution authors: Laura Coltofean (EAA Education, Training and Professional Development Advisory Committee | Archaeology and Gender in Europe (AGE) Community of the EAA) – Bisserka Gaydarska (Archaeology and Gender in Europe (AGE) Community of the EAA) – Alexandra Dolea (Freelance archaeologist | European Mentoring and Coaching Council | Professional Women Network)

Diverse. Inclusive. Safe. Slow. Focused on well-being. Self-reflective. Open to dialogue. Relevant. This is how we imagine the archaeology of the future. In this paper, we review several of the pioneering projects that we have carried out in the past few years to change archaeology from the inside out. We present the initiatives in which we were involved as co-chairs of the Archaeology and Gender in Europe Community of the EAA between 2020 and 2022, such as the issuing of the EAA 2020 Statement on Archaeology and Gender; the revision of the EAA’s Code of Practice; the creation of the EAA’s Appeal and Anti-Harassment Committee; the publication of the illustrated booklet Gender Stereotype in Archaeology (Coltofean-Arizancu et al. 2021); and contributing to the EAA’s 2022 Safe Space Policy. This is followed by a discussion of our work within the EAA to raise awareness about and prevent harassment, assault, bullying and intimidation (HABI) in archaeology; to promote a slower archaeology; and to show that alternative, non-academic career pathways within the discipline are possible and can be equally fulfilling. Our involvement in these projects stems from the challenging situations that we have encountered on our personal and professional paths (e.g. autoimmune and chronic illnesses, cancer, HABI, financial instability, non-permanent and contractual academic work, freelance work, multiple international relocations) in various social, political and economic contexts in Southeastern and Western Europe. We took full responsibility for these challenges and turned them into strengths and action. Having the belief that change begins with us, we have embarked on a journey to create a supportive, nurturing archaeology where we, our challenges, and our unconventional views and research have a place. Besides our passion for exploring the human past, it is our activist work that has motivated us to keep pursuing archaeology against all odds.

2381. THE RESPONSIBILITY OF MUSEUMS IN PRESENTING ARCHAEOLOGICAL HERITAGE

Contribution format: Oral  
Contribution authors: Tatjana Cvjeticanin (National Museum of Serbia | Faculty of Philosophy, University of Belgrade)

Archaeology should make sense, shouldn’t it? As a museum professional, I dare say that archaeological exhibitions even more so. Museums often claim that they present the past as it was, neutrally, through objective facts and data. Leaving aside that the past is constantly altering in the specific relation and connection with today/present, exhibitions are always situated in time, and always personal. Archaeological exhibition should be more than an authoritative professional (ivory tower) voice stating facts, or an appealing arrangement of precious artifacts. Creating connection between past and present societies – the act of interpretation – calls for opening social, political, ethical or cultural questions important for the present. The case study from the National Museum of Serbia: the exhibition From Polytheism to Christianity: The Rotunda in Stojnik, organized in 2024, may serve as an example. This could have been a seemingly neutral presentation of the only Late Roman Early Christian church preserved in the territory of modern Belgrade and its lavish mosaic floor with votive inscriptions. Instead, as the Rotunda is in the territory of the Roman imperial mines at Mt. Kosmaj, it became the story about the exploitation of both nature and people.

483. FROM PASSION TO PURPOSE: DIGITAL LEARNING, MICRO-CREDENTIALS, AND THE SOCIAL RELEVANCE OF ARCHAEOLOGY IN THE 21ST CENTURY

Contribution format: Oral  
Contribution authors: Irena Vesevska (Ss. Cyril and Methodius University in Skopje (UKIM))

Archaeology has long been fueled by intellectual curiosity and enthusiasm, yet the profession faces challenges related to career sustainability, limited job opportunities, and the increasing need to demonstrate its relevance beyond academia. While passion sustains many archaeologists, ensuring that archaeology remains a viable and socially meaningful discipline requires innovation in education, professional training, and public engagement. This paper explores how digital learning, micro-credentials, and online training, particularly through initiatives like DigiArcheoSpace, can provide new opportunities for career sustainability, interdisciplinary collaboration, and public outreach. It also examines the conceptual reconstruction of the Episcopal Basilica in Stobi as a case study in how digital archaeology bridges academic research and public engagement. By integrating digital tools and alternative educational models, archaeology can move beyond the ‘ivory tower’ and actively contribute to contemporary societal needs. Through structured online learning, archaeologists can gain specialized skills, increase employability, and enhance public understanding of cultural heritage. This paper contributes to the ongoing debate on the future of archaeological practice, emphasizing the balance between passion, professional viability, and social responsibility in the digital era.

1147. ARCHAEOLOGY AND OTHER CLASSICAL STUDIES AT THE BEGINNING OF THE NEW MILLENNIUM

Contribution format: Oral  
Contribution authors: Zorica Kuzmanovic (Faculty of Philosophy - University of Belgrade)

The paper explores the status and role of classical archaeology and the broader humanistic tradition of classical studies within contemporary academic and social contexts. A key question arises: how can the relevance of archaeology and other classical studies be articulated in the wake of the postmodern turn? Here, the postmodern turn serves as an umbrella term for radical self-critical perspectives that challenge and interrogate the tradition of classical studies in terms of socio-political, epistemological, and ontological issues. More specifically, the paper examines the impact of certain radical strands of postmodern critique on the academic and scientific status of classical archaeology, which is viewed as an integral part and formative element of the humanistic tradition of classical studies. The discussion of this, as well as other trends shaping the contemporary scientific and academic field (e.g., the growing interest in STEM sciences, increasing scientism, and the technologization of science in the context of global neoliberal techno-capitalism), leads to a conclusion that calls for the re-affirmation, expansion, and deeper engagement with the humanistic tradition of classical studies.

389. WHAT HAS ARCHAEOLOGY EVER DONE FOR US?

Contribution format: Oral  
Contribution authors: Tomasz Gralak (Institute of Archeology, University of Wrocław)

Archaeology is about the past, but unlike history, it deals mainly with things, not words. This gives us a unique opportunity to explore areas of human activity that have never been described. In this sense, archaeology gives a voice to perfectly unknown communities and individuals. Of course, the question arises whether this has any value. For many societies, however, knowledge is a value in itself - this is why universities were established. . It may be surprising, but working with material objects also provides unique opportunities to explore ways of thinking and philosophy. The reason is the same as in the case of history – what was not recorded in writing was expressed through exercised things. Taking the hylomorphic point of view, before any material object is made, a plan is needed – what it should look like, how to make it, and how to use it later. In this sense, it is a record of human thought. . This phenomenon can be illustrated by the so-called cognitive revolution at the beginning of the Neolithic. It was when houses, for the first time, began to be built on plans composed of repeating rectangles and squares. A similar composition was recognized in the case of geometric ornamentation of ceramic vessels. Most likely, it was transferred from previously used wickerwork vessels; the mats, commonly made at that time, were probably similarly decorated. So, the widespread use of basketry technology has influenced how ornamentation and spatial organization were considered. The principle of constructing a whole from repeatable parts (modules) also influenced the way we perceive the human body. This is when strongly geometrical representations of human bodies appear. Thus, by analyzing various products of material culture, we can recognize the basic paradigms of thinking and understand the causes of this phenomenon.

1687. DOES ARCHAEOLOGICAL RESEARCH MATTER? THE VALUE OF ARCHAEOLOGY FOR HERITAGE NARRATIVES

Contribution format: Oral  
Contribution authors: Moritz Kinzel (Deutsches Archäologisches Institut, Abteilung Istanbul)

Archaeology provides a backdrop to a variety of economic sectors, including cultural tourism and the film industry, as well as to the social constructs of national identities. It is evident that archaeology is a significant field of study, as it provides the basis for heritage narratives, which in turn provide the foundation for social entities, such as communities and wider societies. These entities are all in need of a past to which they can refer. Identities require a narrative that is rooted in the past. The role of archaeology as a key discipline in providing information about the past is indisputable. However, it is important to acknowledge the inherent subjectivity of archaeological findings, which are open to interpretation. Interpretations can be influenced by various factors, including the manipulation of evidence to support or negate a particular narrative. The creation of narratives is intrinsically linked to the identification of heritage, which is a crucial aspect in the formation of identities. Identity, in turn, serves as the foundation for communities and societies. The capacity of archaeology, through its multidisciplinary research, to verify, falsify, or re-interpret narratives is therefore significant. Therefore, cultural heritage does not exist on its own. It needs recognition. Cultural heritage is ultimately only valued when there is a perceived risk of loss. Archaeology is dealing with the constant loss of knowledge. Our understanding of the past is incomplete, and every archaeological research project aims to reduce the gaps. However, with each excavation, the destruction of findings is inevitable. The contribution seeks to explore the contradictory nature of the recovery and loss of knowledge, and the role of archaeology in the creation, communication and preservation of cultural heritage.

2457. AN ARCHAEOLOGICAL SEARCH FOR MEANING AND A SENSE OF RESPONSIBILITY IN THE EXCESS OF HEREDITAS DAMNOSA AND EXSISTENTIAL VACUUM

Contribution format: Oral  
Contribution authors: Anna Zalewska (University of Lodz)

The presentation address the legitimacy of thinking deeply about the meanings and senses that drive archaeological activities and of public revealing, and naming them. The interconnectivity between archaeologists’ sense of curiosity, concern, and social or humane duty and the ways in which material remains (including dispersed necroheritage) are handled, interpreted and re-presented will be addressed. At an empirical level, the specific nature, meaning and (cognitive and social) value of two types of archaeological data will form the basis of reflection. Both are related to the materiality of a troubled recent past. The first, at once unwanted and socially neglected (as hereditas damnosa), concerns the fate of individual soldiers and specific attitudes towards phenomena entangled with the recently developed subjects of archaeology (WWI Eastern Front Archaeology). The second, which for decades is considered the focal point of contemporary archaeology at least in Poland, is concerned with the turbulent endurance in time of material witnesses to the life and death of collective subjects - the victims of the mass killings (Katyn Archaeology). These different cases show that many situations, motivations, and actions in archaeology are open and entangled in extraneous, dynamic and fluid conditions. We can respond to them either by acknowledging them, being aware of their impacts on, taking responsibility for them or by ignoring them and pretending to avoid their influences on us and those around us. The driving force behind archaeological actions can be the hope that we can act in a caring, meaningful and responsible way in response to what life throws at us and demand from us. Perhaps this can help to protect at least some of us and/or material witnesses from meaninglessness or drowning in the existential void that is so common in the 21st century and which robs so many of their power to act.

552. ARCHAEOLOGY AS ESCAPISM: A PSYCHOLOGICAL CRITIQUE

Contribution format: Oral  
Contribution authors: Thomas Meier (Heidelberg University | Forum Archäologie in Gesellschaft)

When asked about the benefit or purpose of archaeology, we rarely look inward and consider what we, as archaeologists, gain from pursuing this field. In cases we take this inward look, the response often focuses on satisfying our own curiosity or interest in history. We then often feel guilty about indulging in our hedonistic pleasures at the expense of taxpayers. However, the research topics in archaeology speak a different language: they are often closely tied to current societal challenges and reflect them in history. And many archaeologists are, in fact, vigilant contemporaries. So, not so much ivory tower, after all? But why then do we retreat into the depths of history? I’d like to offer a psychological interpretation: by engaging with the pressing issues of our time and examining them through historical material, we answer the question of the meaningfulness of our field and, above all, our own actions and lifetime. At the same time, the distant past provides a safe distance: we can control the problems through our interpretations, they are too far away to threaten us directly, and we can turn them off when they become uncomfortable by referring to our lack of knowledge, further research needs, or the constructed nature

of all history. Archaeology allows us to bathe in the good conscience of high social relevance without getting wet, as the temporal distance and scientific method protect us. And at the same time, we control access to this bath of significance: we decide how history is read and interpreted, because only we, the initiated, possess the skills to read the arcane knowledge contained in the traces of the past and reveal it to society.

235 THE ARCHAEOLOGY OF FOOD PROCESSING: INNOVATIVE APPROACHES FROM CASE STUDIES AROUND THE WORLD

Session theme: 3. Exploring methods in research, education and communication  
Session format: Regular session  
Session keywords: Ancient foods, Cooking techniques, Archaeobotany, Zooarchaeology, Residue studies, Experimental archaeology  
Session organisers: Clarissa Cagnato (Ca’ Foscari University of Venice) – Aurélie Chantran (UMR 7041 - ArScAn, équipe GAMMA)

SESSION ABSTRACT

Studying food and foodways can tell us a multitude of things about daily life, social structure, access to resources, but also ideology. While determining the individual ingredients used in past foods has become increasingly more systematic, apprehending the steps in the processing of ingredients (plant- and animal-based), for example in food and drink preparations, or for conservation, is a more complex task that requires a set of specialized tools and techniques, often used in combination. The way food is cooked can be an important testimony of cultural specificities that can change depending on the time, the geographical location, and the social context. However, studies on the subject are relatively few in number compared to studies that solely present th. species consumed. In this session, entitled “Archaeology of food processing: innovative approaches from case studies around the world”, we seek to bring together scholars working in different parts of the world and on different time periods to present their recent advances on the topic of food processing and how they are approaching this topic in light of their unique contexts and set of questions. We encourage presentations that include a range of specializations (e.g., archaeobotany, zooarchaeology, ceramic analysis, residue studies, use-wear analysis, experimental studies, ethnographic and ethnohistorical studies, etc.), among others.

CONTRIBUTION ABSTRACTS

2396. PORTSAL. - THE ROLE OF SALT SPRINGS IN THE ORIGINS OF SALT EXPLOITATION IN PORTUGAL

Contribution format: Oral  
Contribution authors: Luís Jesus (Autonomous University of Lisbon | Estoril Higher Institute for Tourism and Hotel Studies)

Sayings like “He is not worth his salt” or the Latin *salarium argentum* emphasize salt’s essential role since the earliest written records, suggesting that its significance likely extends even further. As a vital resource for humanity, salt has been a key research subject, as demonstrated by numerous ethnographic, archaeological, and historical studies. Despite being essential for millennia, salt remained largely overlooked in Prehistoric and Protohistoric Archaeology for decades. The discipline’s evolution led to a shift in focus, sidelining the study of salt. However, recent advancements—such as the rise of multidisciplinary research, the development and accessibility of analytical instruments, and the move beyond traditional typological and technological artifact analysis—have made salt a more intriguing and viable subject of investigation. Portugal has extensively exploited salt throughout history. At the very least, large-scale production dates back to Roman times, when *garum* manufacturing along the Tejo and Sado river basins and the Algarve coast fueled demand across the empire. Nevertheless, various archaeological sites present indirect evidence—particularly linked to briquetage—that has been cautiously interpreted as early salt production. The PortSalt project aims to explore the origins, extraction, usage, and distribution of salt in the diet, economy, and daily life of Prehistoric and Protohistoric populations in western Iberia. Additionally, it seeks to investigate the proximity between saltwater sources and known archaeological sites, assessing their potential connection to salt exploitation. Ultimately, it aims to identify patterns of continuity and change in food habits, shedding light on how taste and dietary choices evolved over time.

637. FOOD PRACTICES IN THE NEOLITHIC OF THE CENTRAL BALKANS: EVIDENCE FROM THE MORAVA RIVER VALLEY, SERBIA

Contribution format: Oral  
Contribution authors: Ivana Dimitrijevic (Institute of Archaeology, Belgrade)

The Neolithic in the Central Balkans (Starčevo and Vinča culture, 6200-4500 BC) evidenced the first permanent settlements in the area and the introduction of domesticates. Subsistence strategies were mainly based on crop and animal husbandry, although wild resources were also widely exploited. Therefore, the diet of Neolithic communities included meat from a wide spectrum of species – cattle, sheep, goat, pig, red deer, wild pig, etc. In this study, we present data on food procurement and processing from two large Neolithic sites in the Morava River Valley – Drenovac and Pavlovac-Gumnište, located in the central and southern Serbia, respectively. Both sites contain large, representative faunal assemblages, which allow for detailed analyses of animal remains. Here we will focus on zooarchaeological data: taxonomic representation; butchery marks; burning patterns; distribution of skeletal elements; age-at-death data, in search of food pathways from procurement to the preparation and consumption of meat. The study also includes discussion of thermal structures – ovens and hearths, the exclusive (preserved) means for meat processing in this period. Additionally, we provide insight into milk exploitation, based on the organic residue analyses on pottery. Through this multiple approach, we aim to illustrate how the Neolithic people in the Central Balkans provided and prepared animal source food as part of their daily routine activities.

675. NEOLITHIC CROP PROCESSING THROUGH THE LENS OF ARCHAEOBOTANY. A CASE STUDY FROM CENTRAL AND SOUTHERN POLAND.

Contribution format: Oral  
Contribution authors: Dominika Kofel (Nicolaus Copernicus University in Toruń)

The archaeobotanical studies of plant macroremains comprise an important source to recognize the basics of agriculture activities. The research often helps establishing both the crop processing schemes and the seasonal agriculture calendar. Archaeobotanical samples were collected at four sites: Browina site 4, Kałdus site 4, Małe Czyste site 20, and Kietrz site 25. Browina, Kałdus, and Małe Czyste are located to the north of Toruń, Kuyavian-Pomeranian Voivodeship. In contrast, Kietrz is located to the west of Racibórz, Opole Voivodeship. This presentation includes results of carpological and anthracological analyses of plant macroremains preserved as charred in soil samples and as imprints in pottery sherds and daub fragments. Materials were collected from features associated with Funnelbeaker culture. Assemblages collected from features in Browina comprised barley (*Hordeum vulgare*) and einkorn wheat (*T. monococcum*) grains along with abundant hulled wheats (*T. monococcum/dicoccon/spelta*) chaff. Additionally, there were finds of seeds and fruit of ruderal and segetal plants. Meanwhile, materials from Kałdus contained highly fragmented grains of indeterminate cereals (*Cerealialia* indet.), hulled wheat glume bases, and seeds and fruit of segetal and ruderal plants. Hulled wheat chaff as well as fragments of grass blades and/or leaves of indeterminate cereal and/or wild grasses (*Cerealialia/Poaceae* indet.) were the most common imprints noted in materials from pottery and daub from Kietrz and Małe Czyste. Additionally, the materials were tempered with fragments of bones. Based on the undertaken research, the following questions arose: 1) what stage of crop processing did we grasp? 2) is it possible to reconstruct the process and the agriculture calendar? 3) were the crops cultivated at the site or brought to? Some of the questions will find answers during the presentation as studies of plant macroremains, even sparse, might bring to light interesting insights into activities undertaken by Neolithic farmers

1582. BEYOND HOUSE SIZE: EXPLORING SOCIAL COMPLEXITY THROUGH VESSEL USE IN EARLY FARMING COMMUNITIES AT LBK SITE IN TĚŠETICE-KYJOVICE (CZECH REPUBLIC)

Contribution format: Oral  
Contribution authors: Peter Tóth (Masaryk University) – Veronika Brychová (Czech Academy of Sciences) – Johana Malíšková – Miriam Nývltová Fišáková (Masaryk University)

Organic residue analysis of pottery vessels serves as a powerful archaeological tool, offering unique insights into past human activities, including economic patterns, culinary traditions, and social interactions. This analytical approach proves particularly valuable in studying the Neolithisation process when communities transitioned to farming lifestyles. While broad regional narratives dominate current research, detailed site-specific studies remain underrepresented, despite their potential to reveal nuanced patterns of early agricultural societies. This study examines vessel utilization and cooking practices at the LBK settlement of Těšetice-Kyjovice (Czech Republic, 5300-5000 BCE) through an integrated approach combining lipid residue analysis of pottery with zooarchaeological data. The research addresses three central questions: 1. What patterns of food processing and cooking practices can be identified at the site? 2. How do household-level differences manifest in vessel use and food preparation techniques? 3. To what extent do the organic residue data correlate with the zooarchaeological evidence. The methodology involved analysing 73 pottery samples collected from four houses of varying dimensions (small, medium, and large). The sampling strategy prioritised rim fragments from vessels associated with food preparation and consumption. Lipid extraction and subsequent analysis involved GC-FID, GC-MS and GC-C-IRMS techniques, with results compared against the faunal assemblage. This integrated analytical approach aims to enhance our understanding of household dynamics within Neolithic communities.

2431. ORGANIC CONTENTS OF BRONZE AGE HORIZONTAL-RIM VESSELS IN FUNERARY CONTEXTS FROM NORTHWEST PORTUGAL: A NEW CASE STUDY

**Contribution format:** Oral  
**Contribution authors:** César Oliveira (HERCULES Laboratory | In2PAST | University of Evora) – Ricardo Erasun (Arqueoges, Lda, Guimarães) – João Back (University of Minho)

Bronze Age horizontal-rim vessels are ceramic containers characteristic of the northwest Iberian Peninsula, including both Portugal and Spain, notable for their distinctive, outward-projecting rim along the upper edge. These vessels have been found in a variety of archaeological contexts, including domestic and ritual/funerary settings. Some evidence indicates that in funerary contexts, they may have played specific roles in burial practices, such as holding food, liquids, or ritual substances. However, chemical evidence regarding the contents of these vessels remains limited, based on a small number of recent studies conducted on a few individuals from scattered locations. The Atouguia settlement (Guimarães, Northwest Portugal) is an archaeological site covering an area of nearly 9,000 square meters, with some contexts attributable to the Bronze Age. The site has been meticulously excavated, revealing remnants of a residential area, a storage zone, and a funerary area containing burial pits with probable single inhumations. Approximately two dozen vessels were recovered, mostly intact, which makes them less susceptible to leaching, offering a unique opportunity to conduct a comprehensive analysis of a representative number of vessels from a single, well-contextualized site. The vessels were carefully recovered following best archaeological practices to facilitate organic residue analysis and were studied using gas chromatography-mass spectrometry (GC-MS) to identify biomolecular residues. Preliminary results indicate strong evidence of ruminant fats preserved within the vessels. This work marks a significant advancement over prior research, as all samples originate from a single location, which eliminates inter-site variability and allows an integrated interpretation of the archaeological site. The materials were collected in the field with minimal handling and subsequently excavated and scraped in a controlled laboratory environment, ensuring the best possible conditions to prevent contemporaneous contaminations.

1013. FROM LIPIDS TO FLAVOURS: A MULTI-PROXY APPROACH TOWARDS RECONSTRUCTING ROMAN FOOD PROCESSING AND PRACTICES IN THE WESTERN PROVINCES

**Contribution format:** Oral  
**Contribution authors:** Theoni Baniou (Landscape Archaeology Research Group (GIAP), Catalan Institute of Classical Archaeology (ICAC)) – Akshyeta Suryanarayan (Faculty of Asian and Middle Eastern Studies, University of Oxford | McDonald Institute for Archaeological Research, University of Cambridge) – Joan Villanueva – Nuria Moraleda-Cibrián (Institut de Ciència i Tecnologia Ambientals (ICTA-UAB), Universitat Autònoma de Barcelona) – Núria Romani Sala (Serra Hünter Fellow, Autonomous University of Barcelona) – Laurent Bouby (Institut des Sciences de l’Evolution de Montpellier (ISEM), Université de Montpellier) – Alexandra Livarda (Landscape Archaeology Research Group (GIAP), Catalan Institute of Classical Archaeology (ICAC))

Iesso (presently known as Guissona, Catalonia, Spain) is a Roman town with a broad chronological occupation, extending from 120 BCE to the 7th century CE. The combination of the archaeobotanical analysis, ceramic Organic Residue Analysis (ORA) and Geomorphometric (GMM) analysis on key crops (grapes) allow us to shed new light into the culinary and agricultural practices in the western Roman provinces, and in this case in the site of Iesso. The ORA component of this research specifically targeted lipids from animal and plant fats to reconstruct the processing and use of these fats, and to identify food processing and cooking methods. Complementing these biochemical findings, archaeobotanical analysis provided a broader picture of the plant assemblage present at the site. Indeed, due to the unusual preservation conditions for the Mediterranean region (waterlogged), a rich archaeobotanical material has been preserved, allowing the preservation of materials (e.g. spices, herbs) that shed light on one more aspect of the culinary traditions of the inhabitants of the site, adding detail and context into the food processing practices identified by ORA. Finally, the GMM approach employed high-resolution imaging and statistical shape analysis to quantify the morphological variability of grape pips indicating both their origin and use (i.e. for table consumption or for the production of wine). The findings of these analyses combined together offer a broad perspective for understanding the ancient foodways while adding new information on Roman food practices.

610. COOKING WARE AND FOOD IN BYZANTINE PALESTINE: NEW CONTRIBUTIONS

**Contribution format:** Oral  
**Contribution authors:** Laura Vié (Institut français du Proche-Orient)

The question of food during the Byzantine period in the southern Levant is still a relatively unexplored subject.

The main studies carried out on the subject focus on one type of source: ancient written sources. There are many written sources that mention food issues, particularly Jewish texts (Talmud, Mishna) and Christian texts (lives of saints). However, until now, researchers have made very little use of a more global approach that takes cooking ware into consideration. An in-depth study of cooking ware from the southern Levant during the Byzantine period offers a different and complementary approach to the subject. Some shapes are clearly designed for boiling and stewing, while others are more suited to frying. Some of these shapes are mentioned in ancient texts, along with their function. Cooking ware sheds light on the food habits of local populations. The shapes of cooking ware also allow us to identify changes in cooking methods. The marked increase in the number of open shapes (cooking bowls or ‘coquelles’) in the Byzantine period seems to indicate a change in food practices compared with the Roman period.

157. INVESTIGATING MOCHICA DIETARY PRACTICES (NORTH COAST OF PERU, 4TH-9TH CENTURIES AD): THE CONTRIBUTION OF FUNCTIONAL ANALYSIS OF POTTERY

**Contribution format:** Oral  
**Contribution authors:** Pauline Coat (University of Paris 1 Panthéon-Sorbonne | cnrs - umr8096 ArchAm)

The social structure and cultural identity of the Mochica, a pre-Columbian society settled on the north coast of Peru between the 4th and 9th centuries AD, are still subject of numerous debates. While the resources consumed by these people have been well studied, the ways in which they were processed, consumed and stored remain poorly documented. Yet the choices made by societies for these different activities are a strong cultural and social marker. Thus, from a cultural perspective via food traditions, I am developing an integrated functional approach, combining typometric, use-wear, and physico-chemical analyses of Mochica pottery. This approach enables me to concretely address cooking methods and the preparation of fermented beverages. In order to identify chronological evolutions and regional variations that reveal the cultural and social dynamics of the Mochica group, I have selected archaeological pottery from sites representative of the entire period and area of Mochica occupation. The construction of ethnographic and experimental frames of reference in Peru enables me to interpret the use-wear identified on this archaeological corpus. In this way, I propose an innovative approach to Mochica food traditions, shedding light on the identity of this cultural group through its food processing methods.

814. NEW INSIGHTS INTO MAYA CUISINE: AN EXPERIMENTAL APPROACH TO RECONSTRUC. ANCIENT TAMALE RECIPES

**Contribution format:** Oral  
**Contribution authors:** Clarissa Cagnato – Giusi Sorrentino – Andre. Brunelli – Laura Longo – Alessandro Bonetto – Matteo Parisatto – Antonio Marcomini – Elena Badetti (Ca’ Foscari University of Venice)

Tamales, prepared traditionally from masa (maize dough) filled with meat, vegetables, and/or fruits before being wrapped in leaves and steamed, are believed to have been consumed by the ancient Maya. Epigraphically, tamales were represented by the glyph wa or wah, and were also depicted in Classic Maya iconography, from murals to polychrome ceramic vessels. Besides the Dresden Codex (Maya book), which mentions the use of some meat products in the preparation of Maya tamales, the types of plants used in their elaboration remains much more elusive, as is any direct archaeological evidence of such foods. To understand under what conditions archaeologists might be able to recover evidence of these foods we developed a reference collection through a set of replicative experiments. The tamales were prepared using a range of ingredients available to the ancient Maya, and were subsequently exposed to varying thermal conditions for different periods of time. The combination of imaging techniques– optical microscopy, scanning electron microscopy, and synchrotron radiation-based phase-contrast X-ray computed microtomography– allowed us to identify a set of diagnostic elements that could help refine the identification of ancient complex foods. Our results can be of use to archaeobotanists working in the New World, and the established methodological approach can be of value to a broader audience.

114. ORGANIC RESIDUE ANALYSIS TO RECONSTRUCT THE CHOCOLATE RECIPE IN EL SALVADOR

**Contribution format:** Oral  
**Contribution authors:** Estelle Praet (The British Museum) – Katie Sampeck (University of Reading) – Rebecca Stacey – Danny Zborover (The British Museum)

Investigations of cocoa use and consumption have mostly focused on the identification of cocoa in iconography and in ceramic residues, particularly on the presence of the theobromine and caffeine biomarkers. While these studies contribute to understanding the spread of cocoa trade, consumption and its associated material culture, they tend to overlook the extraordinary diversity of recipes using cocoa beans, pulp and pod. Insights from epigraphy, historical sources and ethnography suggest a variety of drinks and foods using cocoa in different states and ways, adding ingredients such as maize, chili and flowers. This paper focuses on one recipe in particular, the

recipe of “chocolate” appearing among the Pipil in Izalcos, Salvador. While the region became the most important cocoa producer in the colonial period, it has been overlooked in studies. This paper presents the results of organic residue analysis undertaken, for the first time, on vessels from archaeological contexts in El Salvador. To contextualise these results within the broader Mesoamerican context, they are compared to organic residue analyses that explore the uses of cacao in vessels from the Postclassic site of Isla de Sacrificios, Veracruz, Mexico.

**1743. CULINARY HABITS IN MEDIEVAL SPAIN DURING THE ‘GREEN REVOLUTION’: CHEMICAL INSIGHTS FROM 10TH-CENTURY POTTERY AT THE MOZARABIC SITE OF TÓZAR**

**Contribution format:** Oral  
**Contribution authors:** Jasmine Lundy (University of York) – Luca Mattei (Universidad de Granada) – Cristina Martinez-Alvarez (Polish Academy of Sciences) – Becca Howarth – Alexandre Lucquin – Bronwen Kennedy – Betsie Hall (University of York) – Guillermo Garcia-Contreras (Universidad de Granada) – Michelle Alexander – Oliver Craig (University of York)

Organic residue analysis (ORA) of domestic cookware offers direct chemical evidence of the resources used in daily culinary practices, providing valuable insights into food availability and preparation methods. This study presents the first results from ORA of pottery vessels from the rural Christian site of Tozar, Granada, focusing on pottery use in the 10th century AD. The research aims to identify key resources utilised in such settings and contributes to a broader study of pottery use throughout medieval Spain. ORA has revealed important information about the types of products processed in these vessels, with notable distinctions emerging between different forms and fabrics in the assemblage. Identified residues include primary animal meat products, secondary dairy products, and plant-based ingredients. Building on a large-scale study of medieval Sicilian culinary practices, we explore how ORA can enhance our understanding of Islamic cuisine in Medieval Spain, suggesting new avenues for research. Specifically, we advocate using high-resolution mass spectrometry techniques to better identify dairy species and specific plant products. This approach has great potential in answering important questions regarding resource use during the medieval Islamic Green Revolution and its impacts on daily culinary practices.

**1913. PALAEOPROTEOMIC INSIGHTS INTO MEDIEVAL FOODWAYS: ANALYSIS OF “PIETRA OLLARE” VESSEL RESIDUES FROM NOGARA, NORTHERN ITALY**

**Contribution format:** Oral  
**Contribution authors:** Dario Monaco (University of Verona) – Jessica Brandi – Daniela Sorio – Daniela Cecconi – Fabio Saggioro (University of Verona)

Food provides a unique lens through which we can observe everyday and social behaviours, linking physiological needs with economy, society, and culture. The study of food in past societies is an increasingly dynamic and innovative field of research that combines archaeological methodologies with disciplines like physics and chemistry. In this study, we employed a palaeoproteomic approach to analyse food residues found on “Pietra ollare” (soapstone) vessels from the medieval village of Nogara, located near Verona in Northern Italy. The samples were recovered from layers within and around two houses that date back to the 9th and 11th centuries. Building on our previous research presented at the last conference, this contribution highlights the progress made in recent months through our proteomic protocol. Our analyses successfully extracted and identified a range of animal proteins preserved in the charred residues, providing new insights into the dietary habits of the village’s inhabitants. These findings complement existing archaeobotanical and archaeozoological studies, enriching our understanding of food consumption in the settlement. Although our results are preliminary, they contribute to a deeper understanding of dietary practices in Nogara and offer a glimpse into the daily life of a rural settlement during the Early Middle Ages in Northern Italy.

**1234. MEDIEVAL COOKING PRACTICES: AN EXPERIMENTAL APPROACH TO ARCHAEOLOGICAL TRACES**

**Contribution format:** Oral  
**Contribution authors:** Aurélie Chantran (UMR 7041- ArScAn | université Panthéon-Sorbonne)

Cooking traces are frequently observed on archaeological materials, yet their potential for reconstructing medieval culinary practices remains underexplored due to a lack of dedicated studies. To address this gap, an experimental project applied various cooking techniques to ceramic, faunal, and plant materials, establishing a reference dataset of diagnostic traces. These references facilitated the development of an analytical framework to identify specific cooking practices and distinguish regional and social variations in culinary traditions during the late Middle Ages. Preliminary results were obtained from comparing the experimental reference collection to archaeological materials recovered from different contexts and regions in France. These data seem to reveal some regional and social specificities that can be related to the cooking recipes written in the same periods. Integrated with other archaeological approaches at Orville Castle, near Paris, this method has yielded a high-resolution reconstruction of the site’s cuisine. This innovative approach is applicable to a broad range of ceramic

types and could be extended to other European contexts, providing insights into the emergence and diffusion of cooking practices over time.

**183. EXPERIMENTAL INSIGHTS INTO COOKING, PROCESSING, AND PRESERVATION OF RABBITS DURING THE PALAEOLITHIC**

**Contribution format:** Poster  
**Contribution authors:** Anna Rufà (ICArEHB, Universidade do Algarve | PACEA-UMR 5199, Université de Bordeaux, CNRS, MCC) – Milena Carvalho (ICArEHB, Universidade do Algarve) – Jonathan Haws (University of Louisville, Louisville | ICArEHB, Universidade do Algarve) – Leopoldo Pérez (Universidad de la Laguna | IPHES-CERCA) – Alfred Sanchis (Museu de Prehistòria, Servei d’Investigació Prehistòrica, Diputació de Valencia) – Cristina Real (Universidad de Valencia)

The archaeological record from southwestern Europe, particularly the Iberian Peninsula and southern France, highlights the consistent inclusion of small prey, especially rabbits (family Leporidae), in the subsistence strategies of both Neanderthals and Anatomically Modern Humans during the Middle and Upper Palaeolithic. However, a key challenge in studying small game lies in the fact that these animals can often be processed without the use of lithic tools. This means that the absence of processing marks does not necessarily indicate they were not exploited. Conversely, the presence of cut marks or similar evidence on small game bones may also reflect specific secondary processes rather than the primary butchery itself, as tools are not always required depending on the cooking method employed. To address these complexities, an experimental study was conducted, examining three cooking techniques—roasting, smoking, and drying—with the latter two also serving as preservation methods. Eight rabbits were subjected to each experiment, and the resulting bone modifications were analysed taphonomically. The findings are compared to archaeological assemblages from the Mediterranean Iberian region to better interpret small prey use and the broader economic behaviours of Palaeolithic populations and to figure out preservation techniques potentially used by past human populations.

**825. THE ROLE OF STARCH AGING IN RECONSTRUCTING PREHISTORIC DIETS**

**Contribution format:** Poster  
**Contribution authors:** Giusi Sorrentino – Clarissa Cagnato – Laura Longo (Department of Environmental Sciences, Informatics and Statistics, Ca’ Foscari University of Venice) – Francesca Porpora – Emiliano Carretti – Luigi Dei (Chemistry Department “Ugo Schiff”, University of Florence) – Elena Badetti (Department of Environmental Sciences, Informatics and Statistics, Ca’ Foscari University of Venice)

Ground stone tools (GSTs) preserve evidence of past human activities such as resource processing that include the elaboration of plants for nutritional purposes. Residues, such as starch grains, provide evidence of these activities. These micrometric grains (1–100 µm) are identified by their morphology and size, which vary by plant species and organs. The presence of different starch grains on a single GST suggests the processing of multiple plants, potentially reflecting multi-ingredient dishes. Organic residues, however, face preservation challenges in archaeological contexts, making careful recovery and identification crucial for accurately reconstructing ancient diets. In particular, archaeological starch grains are typically altered by time, burial conditions, and ancient processing methods such as heating or grinding. In the framework of the SMarT4BioArCH project [1], we developed a reference collection of starch extracted from various plant organs that may have been available for Homo sapiens consumption during MIS 3 (60-25 ky BP). Multiple aging tests were conducted on the modern starches and using various imaging techniques, we observed the impact of these different treatments on starch granules. Comparing the morphology of modern damaged granules with the ancient ones can further aid in their identification, in turn revealing a wider range of plant resources that may have been utilized in prehistoric diets than previously recognized. [1] Ministero dell’Università e della Ricerca of Italy, Project PRIN2022 2022XX8BRT PNRR, CUP Master B53DZ3014020006. Next Generation EU, is gratefully acknowledged for financial support.

**881. BONE FAT PROCESSING AT BADANJ – GRČIĆI: FAUNAL RESEARCH INTO SUBSISTENCE IN THE EASTERN ADRIATIC**

**Contribution format:** Poster  
**Contribution authors:** Signe Aspengren (University of California, Santa Barbara) – Emil Podrug (Šibenik City Museum) – Sarah McClure (University of California, Santa Barbara)

This research aims to better understand food processing and subsistence in the Eastern Adriatic Copper Age by identifying animal bone fat exploitation through faunal fracture patterns. The Croatian site of Badanj – Grčići, associated with the Nakovana Culture, dates to the Early Copper Age (3500 B.C.E.). The site has a highly

fragmentary faunal assemblage that suggests people extracted bone fat, likely due to its high caloric content, nutritional role in metabolizing protein, and reliability in times of resource stress. The two main methods of fat extraction – marrow processing and grease rendering – require different amounts of energy and resource investment. Bone marrow can easily be accessed by several blows to a long bone diaphysis, whereas grease rendering requires cancellous bone to be comminuted prior to boiling for several hours. Trade-offs between calorie maximization and labor minimization may occur depending on resource availability. As a result, the degree to which animal bones have been processed can be used as a proxy for subsistence stress. Ignoring potential food resources that are more tedious to obtain is a sign of luxury. However, if a resource is exploited intensively, as is required for grease rendering, it may indicate subsistence stress as additional labor and fuel resources are converted to calories. Bone breakage patterns between cortical and cancellous bones at Badanj are used to identify evidence of marrow processing and grease rendering. Results indicate that more marrow processing occurred at the site than grease rendering. This suggests that primary animal resources were not used as extensively as possible. This may be due to increased reliance on proteins and fats from secondary animal products such as milk or cheese. This research allows for the interpretation of a highly fragmented faunal assemblage and provides greater insight into the foodways and animal economies in the eastern Adriatic.

**1329. DINING WITH THE SARMATIANS: AN ARCHAEOZOOLOGICAL PERSPECTIVE ON DIET STRATEGIES AT NOVI KNEŽEVAC – SITE 97**

**Contribution format:** Poster  
**Contribution authors:** Simeun Srdanovic (University of Belgrade - Faculty of Philosophy) – Mladen Mladenović (Institute of Archaeology, Belgrade) – Teodora Mladenović (University of Belgrade - Faculty of Philosophy) – Neda Mirković-Marić (Intermunicipal Institute for the Heritage Protection Subotica)

This study examines the diet strategies of the settlement at Site 97 in Novi Kneževac (northern Banat), based on animal remains recovered during rescue excavations in 2023. The faunal assemblage, dating from the 3rd to 5th centuries AD, is likely associated with Sarmatian occupation and includes a variety of mammal, bird, fish, mollusk, reptile, and amphibian species. Domestic mammals dominate, with sheep/goats, cattle, and pigs being the most common. Chicken bones prevail among bird remains, catfish is the most frequent fish species, and Painter’s mussel is the dominant mollusc. These findings offer significant insights into the dietary practices and subsistence strategies of the settlement, particularly focusing on animal husbandry and meat consumption. Given the scarcity of archaeozoological studies on animal remains from Sarmatian settlements in Serbia, this research aims to address that gap and contribute to a deeper understanding of the dietary patterns at the site in particular, but also in the Sarmatian world and Late Antiquity in general.

**236 METAL DETECTED ARTEFACTS IN THE PLOUGH ZONE: INFORMATION LOST OR FOUND**

**Session theme:** 1. On artefacts and beyond  
**Session format:** Regular session  
**Session keywords:** Plough zone, Artefacts, Metal detecting  
**Session organisers:** Kiara Beaulieu (Universiteit Antwerpen) – Tuuli Kurisoo (Tallinn University) – Maria Smirnova (University of Tartu) – Michael Lewis (British Museum)

**SESSION ABSTRACT**

Thousands of archaeological sites lie within the plough zone, where agriculture has a direct impact on the preservation of valuable information. Many of these sites have been discovered by metal detectorists, sparking an ongoing debate as to whether they are rescuing artefacts from degradation or inadvertently compromising the limited information contained within ploughed soils. While such discussions are undeniably important, and largely dependent on the laws and practices governing metal detecting in different countries, this session focuses primarily on the informational value of plough-soil finds. The session invites papers that consider how different search method techniques and legal restrictions affect our understanding of potential sites within the plough zone, and how metal detecting and other fieldwork methods complement each other to maximise this understanding. Papers may also consider what types of find assemblages are considered indicative of potential archaeological sites, and introduce current research projects focusing on the plough zone and the (metalwork) artefacts it contains. Another important focus will be the impact of public finds recording on our knowledge of the archaeological landscape, how public finds databases can be productively analysed, and how this practice has enriched or limited interpretations of artefact distribution. Presenters will also be encouraged to consider whether artefacts and their find contexts within the plough zone are often ignored because of assumptions that

this layer contains limited information or whether challenges arise instead from certain biases, such as the fragmentation and limited accessibility of artefactual and contextual data. This session is organised through the European Public Finds Recording Network (EPFRN).

**CONTRIBUTION ABSTRACTS**

**753. FROM METAL DETECTOR FINDS TO SETTLEMENT DISCOVERY. SOME ASPECTS OF THE ARCHAEOLOGICAL RESEARCH ON THE KALININGRAD (SAMBIAN) PENINSULA**

**Contribution format:** Oral  
**Contribution authors:** Jaroslaw Aleksei Prassolow (Leibniz Zentrum für Archäologie (LEIZA-ZBSA)) – Konstantin Skvortsov (Independent)

One of the characteristic traits of the Iron Age settlement area of the Old Prussians prior to the Teutonic Order period of the local history was an extremely high-density network of the settlement and burial sites. In spite of the more than 150 years long research history of the Sambian (nowadays Kaliningrad) Peninsula many of them remain undiscovered i.e. still not known to the official science. However, in the last decades more and more unfortified settlements appear on the archaeological map of the peninsula, partially due to the intensive use of metal detectors by professional archaeologists during their surveys as well as indirectly as a result of the illegal activity of the modern treasure hunters. Monitoring of their destructive activity in online social networks and forums sometimes leads to the identification of the finds-rich micro-areas, which after their investigation by the scholars often appear to represent the territories of ancient unfortified settlements. The paper focuses on the latest both typical and positive examples of the discoveries of the settlements of the so-called late heathen period (2nd half of the 11th – first half of the 13th centuries) and demonstrates different aspects of the metal detectors usage: starting with single finds detection in the ploughing horizon, followed by application of geological survey methods and subsequent performance of full-scale excavations of the archaeological sites and ending up with comparative result analysis of all applied research methods. Taking in account the fact that metal detectors will most probably remain one of the most efficient field research tools for discovery of single metal artefacts in the plough zone for the next decades working out a realistic attitude to their usage and research results interpretation is discussed in frames of the paper.

**1546. A DANISH PERSPECTIVE: ON THE INTERACTION BETWEEN METAL DETECTOR USERS, MUSEUMS AND THE PRESERVATION OF LOOSE CULTURAL HERITAGE**

**Contribution format:** Oral  
**Contribution authors:** Rikke Søgaard (National Museum of Denmark)

The widespread use of metal detectors has transformed plough-zone archaeology, with thousands of artefacts reported each year. However, the research value of these finds depends not only on what is discovered but also on how they are recorded and interpreted. Drawing on 2024 survey data from over 200 Danish detectorists, this paper presents how recording practices, collaboration, and data accumulation shape the understanding of plough-zone finds in Denmark. Furthermore, the growing volume of found and reported artefacts presents an ongoing challenge for local museums and the National Museum, raising concerns that the rapid growth of detector finds may marginalize less ‘spectacular’ artefacts and reinforce collection biases in how the plough zone is interpreted. Digital platforms like DIME improve documentation, but inconsistencies in recording practices continue to influence the archaeological narrative. Objects of high cultural or monetary value are often prioritized in the legislation, while more mundane items—despite their potential to reveal insights into everyday life—are overlooked. This raises critical questions about what is considered significant and what gets excluded in the process. The exclusion of everyday items may marginalize historical minority groups and lower socio-economic classes. The paper also raises essential questions about the thresholds for documentation: How many finds are enough to create a meaningful narrative? And what defines their value—cultural significance, rarity, or their role in understanding everyday life?

**1578. A FIELD FULL OF RUBBISH: A CASE STUDY MITTERDORF, AUSTRIA**

**Contribution format:** Oral  
**Contribution authors:** Raimund Karl (Universität Wien)

Excavations 2024 in Mitterdorf, Austria, were supported by over 40 metal detectorists, who not only worked as volunteers on the excavation, but also surveyed the surrounding field, searching an area of c. 1 hectare for a total of well over 400 hours. The excavation uncovered three badly trashed Urnfield cremation burials and the remains of two (or possibly three) late Hallstatt houses (one containing a loom which had burnt down in situ). The metal detector survey on the surrounding c. 1 hectare recovered well over a 1000 metal (and a number of other) finds from the Roman period to the present from the ploughsoil. Of the metal detected finds, just one, discovered in

the spoil removed during excavation (rather than in the ploughsoil), was of a late Hallstatt date and thus probably relates to the excavated house remains. None of the others, discovered in a field that, until quite recently, was in the middle of nowhere (and arguably still is) relates to any activity on it that left any interpretable archaeological traces. Yet: the rubbish collected from that field contains over 10 silver coins - 3 Roman, several mediaeval and early modern ones, and several from the 19th century, including one from the Napoleonic Kingdom of Italy - quite a haul of pilgrim crosses and medals, and that on top of the usual farming-related rubbish you would expect in any field. Even if only the finds deemed ‘interesting’ by the detectorists would be reported: what, if anything, can they tell us about anything (other than farming) that was going on in that field? What more (or less?), if (as we did) all finds were recorded and reported?

**1692. PRELIMINARY RESULTS OF FOUR LANDSCAPE SURVEYS OF SITES DISCOVERED BY METAL DETECTORISTS IN ESTONIA**

**Contribution format:** Oral  
**Contribution authors:** Maria Smirnova (University of Tartu) – Tuuli Kurisoo (Tallinn University) – Ulla Kadakas (Estonian History Museum)

In Estonia, dozens of archaeological sites are discovered by metal detecting enthusiasts every year, most of them are located in the ploughing zone. It is important to understand the nature and the state of preservation of these sites to determine what archaeological information can still be obtained after decades or centuries of cultivation. As a part of our ongoing project to improve knowledge of the archaeological heritage discovered by the local metal detecting community, we are undertaking small-scale fieldwork at such sites. Our research aims to assess whether in situ contexts have been preserved, to define site boundaries, and to determine whether these sites should be officially listed. In addition, we hope that our fieldwork will help to establish the most effective methods for investigating such sites in Estonia, which could be used by the National Heritage Board. This presentation will present the results of surveys conducted at four sites in 2024 and will illustrate the insights that can be gained from archaeological sites within the Estonian ploughing zone.

**2192. THE MORE THE MERRIER? METAL DETECTING RALLIES IN FLANDERS**

**Contribution format:** Oral  
**Contribution authors:** Pieterjan Deckers (KU Leuven) – Emma Yskout (Histories vzw)

While the metal detecting hobby has long been the subject of debate within the archaeological discipline, detector rallies have only recently come to the fore as a topic worthy of consideration for both professional archaeologists and heritage managers (Wessman et al. 2022). These social events are usually organized by the hobby community and bring together large numbers of detectorists over one or more days. They are increasing in number and scale in a number of countries, especially those with permissive legislation towards hobby detecting. Consequently, it is timely to discuss the nature and potential impact of such events, as well as to consider professional and policy responses. Building on observation at rallies and collaboration with organizers, the MA research conducted by one of the authors (EY), and official data, this paper will explore the background, nature and impact of rallies in Flanders (Belgium), where metal detecting by the public is allowed since 2016. Furthermore, it will report on an ongoing project at Histories (the support organization for heritage volunteers in Flanders) to develop a consensus protocol regarding rallies amongst relevant stakeholders, from organizers to heritage authorities.

**2354. THE WILD EAST? METAL DETECTING IN UKRAINE: CHALLENGES, ETHICS, AND COLLABORATION IN A CHANGING LANDSCAPE**

**Contribution format:** Oral  
**Contribution authors:** Dmytro Nykonenko (University of Turin)

Metal detecting in Ukraine occupies a complex and often controversial space, straddling private collecting, the illicit antiquities trade, hobbyist activities, and volunteer archaeological efforts. This situation is largely shaped by the country’s legal framework and the specific regulations governing archaeological heritage, including metal detecting practices. This study explores the development of metal detecting communities, the challenges posed by the illegal market, and the prejudices and stereotypes that shape interactions between detectorists and the academic community. It also examines cases of responsible engagement, where metal detecting contributes to the study and preservation of archaeological heritage in plough zones, providing a comprehensive perspective on the issue. The report focuses on the theoretical value of artifacts and contextual information recovered from arable land, as well as the potential for their scientific analysis. Additionally, it highlights cases where significant archaeological sites and objects have been identified through metal detecting activities. By addressing these topics, this study contributes to the broader debate on balancing heritage protection with the realities of metal detecting, offering insights from the Ukrainian experience that align with global discussions on public engagement in archaeology. Furthermore, the paper considers the unique challenges of metal detecting in wartime, examining

how conflict conditions have reshaped the field and introduced new risks and ethical dilemmas.

**239 FROM HISTORIES OF RESEARCH TO HISTORIES OF KNOWLEDGE? THE STATUS AND FUTURE PERSPECTIVES OF THE HISTORY OF ARCHAEOLOGY**

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Regular session  
**Session keywords:** history of archaeology, theory, methods, sources, interdisciplinary studies, history of science  
**Session organisers:** Laura Coltofean (Research Cluster 5: History of Archaeology, German Archaeological Institute) – Aleksandar Bandović (National Museum of Serbia) – Kerstin Hofmann (Romano-Germanic Commission of the German Archaeological Institute)

**SESSION ABSTRACT**

This session discusses the status and the future of the history of archaeology as a research field. After significant developments in the mid-1990s and early 2010s, the field has reached a standstill in the past decade, addressing the same research themes and using the same analytical frameworks, methods and sources. There have been some theoretical and methodological intersections with, e.g., the history of science, sociology and network studies, but these are rather the exception than the norm. Research on the history of archaeology has mainly been carried out in isolation in small networks whose members interact and collaborate between themselves, largely divided by regional specialisms and as a secondary ‘hobby’ interest. In addition, the interest of younger generations of scholars is reduced due to unpromising career prospects and limited funding possibilities. Moreover, the history of archaeology is still mainly practiced in Western Europe and Northern America and is not even recognized as a subdiscipline in various archaeological traditions across the globe. All this indicates that the field needs critical assessment and a redefinition. We welcome papers that reflect on the following topics and more:

- Reasons behind the current status of the field and viewpoints that challenge it;
- What contributions have histories of archaeology made to archaeology, other disciplines and societies so far?
- New research themes, theories, methods and sources for the history of archaeology;
- Case studies examining theoretical and methodological interactions between the history of archaeology and other archaeological subdisciplines and research fields (e.g., the history of science, interdisciplinary studies, sociology, philosophy);
- The presence of the history of archaeology at conferences and non-academic events, in funded projects, different publishing venues and university curricula globally;
- Strategies for increasing research interest in the history of archaeology in European (e.g., Central and Southeastern Europe) and non-European areas.

**CONTRIBUTION ABSTRACTS**

**2129. LOOKING INTO THE MIRROR: A CRITICAL ASSESSMENT OF THE HISTORY OF ARCHAEOLOGY AS A FIELD IN THE PAST DECADE (2015-2025)**

**Contribution format:** Oral  
**Contribution authors:** Aleksandar Bandovic (National Museum in Belgrade) – Laura Coltofean (Research Cluster 5: History of Archaeology, German Archaeological Institute) – Anna Gustavsson (Rio Göteborg)

This paper assesses the status of the history of archaeology as a research field at an international level in Europe in the past ten years (2015-2025). It examines the status of the field by reviewing the existence of publications related to the history of archaeology in various international publishing venues (e.g. European Journal of Archaeology, Antiquity, Oxford University Press, Springer, Oxbow, Archaeopress); by offering an overview of the main themes that have been explored in these publications; by evaluating the presence of the history of archaeology in sessions at international conferences (e.g. EAA, UISPP, WAC) and in funded projects (e.g. ERC projects); and by providing an overview of the existing networks of historians of archaeology, their scope and functioning. It argues that the history of archaeology has reached a standstill in the past decade and, although it is an undeniably useful pursuit (at least for its practitioners), its real value and impact are insufficiently felt and recognized within the wider archaeological discipline. It reflects on the consequences of this situation, along with the possible reasons behind it. Finally, it proposes a few solutions that might increase the relevance of the field and the interest in it.

2409. THE USE (AND ABUSE?) OF A HISTORY OF ARCHAEOLOGICAL THOUGHT IN CONTEMPORARY SCHOLARSHIP

Contribution format: Oral  
Contribution authors: Thea De Armond (New Mexico State University)

Bruce Trigger’s A History of Archaeological Thought is perhaps the most influential work of Anglophone scholarship on the history of archaeology. Its first edition was among the first—if not the first—syntheses of worldwide archaeological thought. Its second edition, according to Kenneth M. Ames, “would be the largest jewel in the crown of any scholar’s career”; although it is now nearly twenty years old, it continues to be heavily cited. Given this outsized influence, A History of Archaeological Thought might be regarded as emblematic of the uses and reception of the intellectual history of archaeology, more broadly (at least, of its best-known strain). This paper thus examines citations of Trigger’s second edition of A History of Archaeological Thought since its 2006 publication (as of this abstract, Crossref reports 430 citations). My aim is to ascertain how scholars are engaging with histories of archaeology—who is citing Trigger? What do they see fit to cite from Trigger? How does Trigger’s History of Archaeological Thought shape their work—or is it only cited cursorily? In contemplating scholars’ relationship to Trigger, I hope to better characterize the place—both potential and actual—of histories of archaeology within the scholarly (particularly, archaeological) discourse.

2133. THE LACK OF EDUCATION IN HISTORICAL METHODOLOGY AMONGST ARCHAEOLOGISTS AS AN ISSUE IN THE DEVELOPMENT OF THE HISTORY OF ARCHAEOLOGY

Contribution format: Oral  
Contribution authors: Crtomir Lorber (Independent researcher)

The history of archaeology is often overlooked as an academic subdiscipline, most notably in Central, Eastern and Southeastern Europe, which leads to lack of resources and career prospects. These issues mean students are often introduced to the history of archaeology as a historical lecture during their bachelor’s studies rather than as a possible field of specialization, which hinders their interest and capability to conduct research in the field, which is history in its’ methodology and research approaches not archaeology. We feel that this fact is often not considered or understood by archaeologists and historical methodology is often not a standard part of curriculum in archaeological departments. One could argue that this hinders the development of the history of archaeology as potential researchers are not introduced to this methodological distinction and the unique place of the history of archaeology in the wider context of archaeology. We propose showcasing these observations by analyzing our previous research, focusing on our PhD thesis, dealing with the history of the Archaeological Society of Yugoslavia (1949–1991). We intend to highlight the methodological and conceptual issues we faced during our research and hope to identify crucial methodological issues, most notably the lack of education of archaeologists when dealing with archival collections, constructing a taxonomy of historical sources and lack of intuitive understanding of the relationships between different types of written historical sources. Through this deconstruction of a research project dealing in the history of archaeology, specifically in the history of a multi-national archaeological association, we hope to support an argument that any strategy which seeks to improve the standing and prospects of the history of archaeology must include an approach to include its methodological principles into the methodology curricula of modern archaeological departments.

2346. (OVER)LIVING THE HISTORY OF ARCHAEOLOGY: MEMORIES, EMOTIONS, FEELINGS AND (IN) VISIBILITIES

Contribution format: Oral  
Contribution authors: Ana Cristina Martins (IHC-Universidade de Évora / IN2PAST)

Unlike in other European contexts, the history of archaeology has gained some ground in Portugal, albeit very gradually and timidly. It has been incorporated into university archaeology courses and led to the creation of specific working groups in research units. However, only one researcher continues to devote herself almost exclusively to the history of archaeology, possibly because most archaeologists, especially older generations, see the history of archaeology as restricted to drawing up ‘State of the Art’ academic essays. This position results, first and foremost, from a lack of knowledge about the polysemic and polyphonic role that the history of archaeology must play in the different layers of archaeological activity itself. In this sense, the efforts made in recent years to demonstrate the importance of the history of archaeology in recovering the memories, emotions, and feelings of different actors in the whole process of producing archaeological knowledge and heritage are beginning to bear fruit. This is especially true as it seeks to implement a truly transdisciplinary exercise, bringing together local and regional curiosities, interests, and needs, and in this way, also contributing, among other things, to increasing the self-esteem of individuals and communities and giving voice to different types of invisibility. This effort is beginning to be translated into master’s dissertations, doctoral theses, temporary exhibitions in museums and elsewhere, and research projects, most of which are part of ‘citizen science’ actions. With this paper,

we, therefore, intend to present success stories in this field and reflect on the extent to which the survival of the history of archaeology will depend on this logical and desirable relationship with the present of each geography, assisting in its sustainable development, always in close collaboration with other areas of knowledge and representatives of civil society.

602. A PURPOSE FOR THE HISTORY OF OUR DISCIPLINE

Contribution format: Oral  
Contribution authors: John Carman (University of Birmingham)

This paper poses a simple question: what is the study of the history of archaeology for. This is not a question to ask lightly, and it is not posed here to suggest that we should not study the past of our field. Rather, it goes to the heart of any field of study that is carried out professionally and (largely) at public expense. It is related to the larger question of what archaeology itself is for – what does it provide to the world that is not otherwise available. Recent work suggests that archaeology is more than the study of the past, although it is that as well. Instead, it is offered as a field that matters in the world because it provides a model for the kind of interrogative approach to the world that is vital for a thriving public realm and especially to the creation and maintenance of progressive and democratic ways of life as promoted by organisations such as the EAA. The paper will suggest how the abandonment of assumptions about how the field came about and what it concerns can indicate the significance of studies of its past and present to its development in the future.

2200. BEYOND THE FIELD: DISCUSSING CHALLENGES IN STUDYING THE LEGACY OF OLD CYPRIOT EXCAVATIONS

Contribution format: Oral  
Contribution authors: Francesca Meneghetti (University of Cyprus)

Obsolete archaeological practices and poor field documentation often leave old excavations understudied and poorly published. Moreover, a discipline’s belief that equates archaeology to digging dismisses studying the history of archaeology as a vital part of normal archaeological practice. Researchers also feel intimidated to approach old excavations and rehabilitate their legacy data due to general academic disinterest, limited funding, and further institutional support. These issues further enlarge research gaps and marginalise scholars working on legacy archaeological data and, more generally, the history of archaeology. Enkomi and Athienou-Bamboularitis Koukounninas are two Late Bronze Age (1750-1050 BCE) sites namely dug by a French (1934-1973) and Israeli mission (1971-1972). Despite their archaeological significance, both for reconstructing the Late Bronze Age Cypriot society and material culture, and the history of archaeological explorations on the island, these sites, the history of their excavations, and their results remain severely under-published and understudied. Moreover, they have been located since 1974 in the occupied part of Cyprus and the buffer zone, respectively, and are, therefore, inaccessible to new archaeological field enquiries. This further calls for scholarly approaches that go beyond field archaeology and are more related to the history of archaeology. The paper reviews how the integration of archive and museum archaeology is beneficial to studying the history of archaeological explorations. It analyses archival material from the 1958 season at Enkomi and the Israeli mission at Athienou and discusses the challenges of studying the history of old Cypriot excavations and their legacy data. The aim is to shed light on the history of foreign archaeological excavations in Cyprus and their excavation practices, how they (mis)shaped the understanding of the Cypriot past, and to increase research interest in this archaeological subdiscipline.

808. THE NECESSITY FOR AN ARCHAEOLOGY OF ARCHAEOLOGY

Contribution format: Oral  
Contribution authors: Gert Van Wijngaarden (University of Amsterdam)

The history of archeology often takes the form of narratives on great discoveries and influential persons, including biographies. See for example the great book by Brian Fagan in 1978: Quest for the Past. In addition, there have been several important studies on the theoretical background and paradigm shifts in archaeology, such as the seminal works by Bruce Trigger and Matthew Johnson. Also, we have seen studie. focusing on the political and social orientation of archaeology, such as that by Margarita Diaz-Andreu. What has been lacking is a material approach in the history of archaeology. In a successful session at the EAA of 2024 we explored the ways in which the material remains of old excavations can shed light on the production of knowledge in the field. Excavations consist of series of choices, which are to some extent determined by academic goals and predetermined strategies. However, due to the nature of a site and its context, excavations can hardly be considered controlled research contexts. There are many physical factors that influence decision making in the field: weather, tools, sloping, vegetation, hardness of soils, presence of subterranean walls etc. The remains of old excavations can inform us about what actually happened in the field. In this paper, I will discuss the possibilities and limitations when investigating remains of old excavations. Using examples from the Amsterdam Troy Project, I will give various examples where

the material remains at the site of Troy in Turkey give complementary information to archives and publications. I will argue that a material approach is necessary to understand the knowledge produced during excavations.

**376. PAST EXPLORERS, FUTURE MINDS: ENGAGING YOUNG AUDIENCES WITH THE HISTORY OF ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Bonnie Nilhamn (Helsinki University)

The history of archaeology is a valuable tool for engaging the public and encouraging curiosity, yet its presence in education remains limited and often focused on discoveries rather than their historical contexts. This paper discusses how I use findings from Berenice Troglodytica (Berenike) and the stories of its early explorers in my teaching to help children understand how past ways of thinking—about archaeology, exploration, and the world—continue to affect us today. By portraying early explorers not just as historical figures but as individuals shaped by their time, their stories become more tangible and meaningful to younger audiences. Berenike, an important Red Sea harbour founded by Ptolemy II in 275 BC, has long fascinated scholars. Identified in 1541 by João de Castro and later rediscovered by Giovanni Battista Belzoni in 1818, it attracted numerous 19th-century explorers. More recent excavations (1994–2025) have revealed extensive trade networks, religious diversity, and a pet cemetery. My work at the Isis Temple (2015–2025) has shown that this temple serves as a historical time capsule, preserving ancient remains alongside traces of early explorers, looters, and archaeologists—offering insight into their presence and activities. While many recognise the artefacts these early explorers moved to European museums, fewer are aware of the traces left at excavation sites—marks revealing perspectives, values, and colonial mindsets of their time. Integrating these remains and historical narratives into teaching shows how the history of archaeology can extend beyond academic research and engage wider audiences. Presenting archaeology to young audiences requires avoiding the antiquarian trap of focusing only on “artefacts.” It is not the golden mask that will be remembered or that inspires future archaeologists, but the adventure surrounding it. Making archaeology accessible and linking past worldviews with present practices ensures its continued relevance.

**109. PLASTER CAST MUSEUMS IN THE HISTORY OF ARCHAEOLOGY: FROM GATEKEEPERS OF THE CANON TO GATEWAYS TO ARCHAEOLOGICAL NOVELTIES**

**Contribution format:** Oral  
**Contribution authors:** Agnes Garcia-Ventura (Universitat Autònoma de Barcelona)

Plaster cast museums have been mainly considered from art history, heritage studies and the history of collections, and only sporadically they have been considered in the framework of the history of archaeology. However, they were privileged gateways to trends and archaeological novelties. Furthermore, they were nurtured by academic networks involving archaeologists. Given these circumstances, I defend that a historiographical approach to plaster cast museums has much to offer to the history of archaeology. In this communication I will reflect on the potential of plaster cast museums to provide new sources and new research themes to the history of archaeology on the basis of two case studies. First, I will discuss the case of the Olympia sculptures which were unearthed during the archaeological campaigns of 1875 and 1877, and whose plaster casts reached the “Museo de Reproducciones Artísticas de Madrid” as early as 1881. Second, I will focus on the stele of Hammurabi’s Law Code, rediscovered in 1901-1902, and on its early dissemination in Spain through the press. Besides, the commission of its plaster cast for the “Museo de Reproducciones de Bilbao” in the 1930s will allow us to see how an archaeological novelty became, in few years, part of the canon in a country, such as Spain, without a tradition on ancient Near Eastern studies at that time. With these two case studies I aim to show that plaster cast museums were much more than mere transmitters of the canon: they were also privileged gateways to trends and archaeological novelties, two crucial themes to be analysed in the light of the history of archaeology, and so far neglected.

**455. INTERNATIONAL/UNIVERSAL EXHIBITIONS IN EUROPE AND THEIR IMPACT ON THE KNOWLEDGE AND DISSEMINATION OF ARCHAEOLOGICAL DISCIPLINE (19TH-20TH CENTURIES)**

**Contribution format:** Oral  
**Contribution authors:** Santiago Olcina-Lagos (University of Alicante) – Trinidad Tortosa-Rocamora (Spanish National Research Council)

The Universal/International Exhibitions, held in Europe and America during the mid-19th and early 20th centuries, were significant events in which each country presented its most important industrial, scientific and artistic innovations, as well as its traditions and the most representative elements of its identity as a nation. In this sense, archaeology played an important role in the representation of those countries on the world stage. It was used as a tool for the elaboration of their historical discourses. Furthermore, international congresses were organised at these Exhibitions, where not only new discoveries were presented but also the new ‘forms and contents’ of the discipline were debated, turning these events into true forums for scientific debate. However, despite the

interest of this aspect, since the 1980s, research on the Exhibitions has generally focused on providing answers to questions related to technical and architectural innovations, etc., relegating the involvement of the archaeological discipline to studies with specific objectives and perspectives. In the last few decades, the granting of several national and regional research projects in Spain, led by the Institute of Archaeology of Mérida-CSIC, has allowed us to broaden our focus towards the analysis of the evolution of archaeology in these Exhibitions. This has initiated an innovative line of research -begun at the Spanish School of History and Archaeology in Rome and currently consolidated-, composed of an international group of researchers (Spain, France, Italy and Portugal) and with an exnovo methodology that is offering us excellent results on the dissemination and treatment of archaeology in these important forums of knowledge. In the following presentation, we will analyse the progress of this line of research, present its most relevant results and its challenges and future objectives.

**2435. HISTORIES OF ARCHAEOLOGY BEFORE ARCHAEOLOGY - THE WORLD OF EARLY MODERN ANTIQUARIANISM**

**Contribution format:** Oral  
**Contribution authors:** Kirsten Eppler (Gotha Research Centre of the University of Erfurt)

Most Histories of Archaeology deal with archaeological theory or practice in the 19th and 20th century, and occasionally even in the 18th century. Using specific examples of early antiquarian and archaeological practices of the 17th and 18th centuries, this article aims to show how both the concept of praxeology used by the historical sciences for the analysis of early archaeological activities and concepts of the history of ideas for researching the emergence of early notions and theories about prehistorical objects and their original contexts can be made fruitful in order to write other histories of knowledge of archaeologies before today’s often Eurocentric archaeology. The paper argues that since humans have encountered and have been surrounded by archaeological objects to a greater or lesser extent at all times, the term archaeology in its current definition is too narrow and cannot encompass all archaeological movements or impulses in the past. How did scholars, priests and collectors in the early modern period classify these objects, integrate them into their collections, study them and engage in scientific exchange about them? What did the primary finders, like farmers or workers do who partially integrated those objects into their everyday lives, using e.g. Bronze Age urns as containers for swept-out fire ashes, or putting them over posts of their fences to protect the wood from weathering, at the same time defending the area inside the fence from evil in the sense of a cultural or religious practice? Why were early medieval tree trunk coffins or fossilized mammoth teeth reinterpreted as relics and thus religious symbols. In early modern times, such practices and ideas did not have to exist permanently or be constantly developed further, but could emerge, be further developed or disappear again like little bricks of knowledge or particles of ideas floating in space.

**61. THE CONTRIBUTION OF ARCHIVE SOURCES IN THE RECONSTRUCTION OF ARCHAEOLOGICAL CONTEXTS: THE CASE OF GEORG ZOEGA**

**Contribution format:** Oral  
**Contribution authors:** Gianluca Cabula (Tor Vergata University of Rome)

Often blamed for its mere “cultural history” approach, the history of archaeology has instead proved particularly useful for the reconstruction of lost archaeological contexts, providing documents that can add valuable information to archaeological maps and current excavation data. In this perspective, the study of antiquarian sources is not only an important chapter in drawing a “social” history of archaeology, but has been able to dialogue with field archaeology to complement its visions. In the last two decades, this has been particularly true, for instance, for certain contexts of Latium (Anzio, Tivoli, Ostia, etc.), whose knowledge has been significantly enriched by historical studies. The largely unpublished masterpiece by the Danish archaeologist Georg Zoega, “The Ancient Bas-reliefs of Rome” (1808), of which hundreds of manuscripts are preserved in Copenhagen, is an emblematic case study of evidence that can both depict the political and cultural environment of the early Restoration and at the same time help reconstruct destroyed or forgotten landscapes of ruins and collections.

**378. HISTORY OF ARCHAEOLOGY IN EGYPT: RECENT TRENDS, CURRENT RESEARCH, AND CHALLENGES**

**Contribution format:** Oral  
**Contribution authors:** Maximilian Georg (Austrian Academy of Sciences)

My paper analyses how the history of modern archaeology in Egypt, commonly held to have begun with Napoleon Bonaparte’s Egyptian expedition in 1798–1801, has developed since about 2010. After Egyptology had long neglected its history, the latter has now become a relatively vibrant field driven by Egyptologists and archaeologists as well as historians, anthropologists, and other disciplines, and by international as well as Egyptian researchers. Topics include archaeologists and other individuals involved; individual archaeological sites and projects; Egyptological institutions in Egypt and abroad; the legislation governing Egyptian antiquities; and the antiquities’ reception and “use” in Egypt and abroad. My paper discusses the field’s central themes, key publications and events, sources

and archives, ongoing projects, but also shortcomings and problems. One important trend is the shift away from Western archaeologists towards Egyptians involved in archaeology, also as excavation workers. These have been essential for archaeology but long been invisible in publications, due to colonial work structures and a lack of sources. In recent years, however, information has been gleaned from traditional archives; new, Egyptian archives have been discovered; and today’s archaeological workers have shown active interest in the history of their ancestors in the same profession. Such research may contribute to the “decolonization” of Egyptology, since the latter emerged in the context of Western imperialism during the long nineteenth century. However, Egyptologists and historians of the discipline disagree on whether and how such a “decolonization” is possible or appropriate. One difficulty here may be a lack of exchange between the history of Egyptology/of archaeology in Egypt on the one hand, and on the other hand theories, methods, and fields such as reflexive archaeology, postcolonial studies, global history, and the wider history of science.

**1848. AN ONGOING INQUIRY: AN INTERSECTIONAL ANALYSIS OF WOMEN IN THE HISTORY OF ARCHAEOLOGY**

**Contribution format:** Oral  
**Contribution authors:** Carito Tavera-Medina – Tianyi Dong (Universitat de Barcelona) – Fedra A. Pizzato (University of Verona) – Jorge Del Reguero – Valentina Valiente (Universitat de Barcelona) – Margarita Díaz-Andreu (ICREA-Universitat de Barcelona)

Has research on the history of women in archaeology reached a standstill in the past decade? The first edited volumes on this topic were published in the 1990s and 2000s. However, the apparent decline in interest during the 2010s suggested that the subject had been exhausted. In this paper, we argue that, far from being complete, this field still holds significant potential for further exploration. Firstly, there is considerable room for expanding the geographical scope of the discussion. Early debates, primarily during the periods mentioned above, remained largely focused on a few English-speaking countries in the Western world, leaving the contributions of women in other regions overlooked. This paper examines how gendered historiography has evolved in regions where such approaches have only gained traction in recent years. In particular, we explore new research from regions like Latin America, China, and countries such as Italy. Moreover, new methodologies and perspectives are being applied to the study of women’s roles in the history of archaeology, often from an interdisciplinary perspective. Methodologically, we highlight the growing use of oral history and more rigorous archival research. In terms of perspectives, we emphasize the importance of interdisciplinarity, decolonial theory and moving beyond the “great women” narrative to explore the diverse practices women have been involved in, often uncovering hidden labor. We also address issues such as intersectionality, as well as credit theft. Our study is part of the ArqueologAs/Herstory project.

**1592. HISTORY OF KNOWLEDGE - MORE THAN JUST ANOTHER HISTORY? INSIGHTS GAINED FROM FOUR PROJECTS**

**Contribution format:** Oral  
**Contribution authors:** Katja Roesler – Kerstin Hofmann (Romano-Germanic Commission)

Archaeologists initially often only wrote so-called research histories; a more intensive examination of the history of archaeology only began with the development of the history of science. In recent years, however, there has been a shift from a more academic history of science to a more universally understood history of knowledge. This has also had an impact on the scope and objects of investigation, the embedding in (funded) research projects and interdisciplinary collaboration. Using four case studies, we would like to illustrate the role history of knowledge and its questions, concepts and methods can play in various institutionally anchored ancient studies projects: 1) a thesis on classification practices and discourse analysis of the academic school of the prehistoric archaeologist Jens Lüning (2006-2012); 2) the change in the embedding of the history of science and knowledge in the research of the Berlin Cluster of Excellence TOPOI (2007-2019); 3) an experimental study on implicit knowledge in the context of sorting celtic coins, conducted in the ClaReNet-Project (2021–2023), 4) research on history of knowledge as an integral part of the long-term project “Disiecta Membra. Stone Architecture and Urbanism in Roman Germany” (2023-2046). These studies deal with knowledge practices, technologies, research traditions, the development of terminology and specialist languages as well as with thought collectives in the sense of academic schools. They are characterized by a stronger link to specific research that makes the interplay of theory and practice, epistemologies and empiricism in knowledge production more comprehensible and also can have direct effects on the respective fields of research. Histories of knowledges can be essential for more reflective archaeological research and for better understanding the recent ‘digital revolution’, but alongside new perspectives there are also numerous challenges, which we would like to discuss.

**240 URBANSCAPE AND RURALScape TRANSFORMATION DYNAMICS BETWEEN THE END OF THE ANCIENT WORLD AND THE MIDDLE AGES: NEW METHODOLOGICAL APPROACHES**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** City, Rural, Late Antiquity, Medieval, Methodology, Landscape archaeology  
**Session organisers:** Raquel Bujalance Silva – Marta Torres Cortés (Inaph - Universidad de Alicante) – Nicola Delbarba (Università degli Studi di Verona)

**SESSION ABSTRACT**

The session aims to delve into the study of territorial occupation in Europe, the Near East, and the Maghreb between the 4th and 13th centuries, with a particular focus on the interaction between rural and urban settlements and their development over time. The dynamics between these two types of settlements evolved and are reflected in the configuration of the landscape and its components: communication routes, urban planning, and the geographical environment, among other aspects. These transformations are influenced by various contextual factors, such as cultural, economic, and political elements. This line of research can be approached through diverse multiscalar methodological perspectives that have been refined over the years, ranging from traditional methods such as archaeological excavations to more innovative techniques like geophysical surveys and virtual reconstructions. Advances in these methodological tools offer a richer and more detailed understanding, not only of the relationship between urban and rural areas in Late Antiquity and the Middle Ages but also of the administrative network that structured the territory. The session welcomes studies exploring these issues, with a special emphasis on the methodological approaches employed and the results derived from their application.

**CONTRIBUTION ABSTRACTS**

**62. MULTISCALAR APPROACHES TO THE ROMAN AND LATE ANTIQUE COUNTRYSIDE IN ITALY. THE CASE OF ORATORIO DI SAN VINCENZO (SESTO CALENDE)**

**Contribution format:** Oral  
**Contribution authors:** Emanuele Intagliata – Lorenzo Zamboni – Amedeo De Lisi (University of Milan)

The scope of this paper is to investigate the benefits and challenges of a multiscalar approach for the study of rural settlements using the site of Sesto Calende – Oratorio di San Vincenzo as a case study. The site, which is situated in northern Italy by the Ticino River and along a crucial commercial artery connecting Milan to Lake Maggiore and the Alps, has been known since the 1980s. Already then, excavations within and in close proximity to the church of S Vincenzo yielded archaeological evidence that confirmed the occupation of the area from the 1st century AD to at least the end of the 11th/beginning of the 12th century. New excavations conducted by the University of Milan at this site in 2024 have concluded that the area was occupied as early as the late republican period. By integrating geophysics and geospatial analyses with these excavations, the team has also been able to cast light on the site’s previously unknown topography and contextualise the remains using a *longue durée* and regional-wide perspective.

**1796. BETWEEN INCAPACITY AND RESILIENCE: THE AGENTS OF STREET OCCUPATION AND PRIVATIZATION IN ROMAN CITIES OF THE IBERIAN MEDITERRANEAN**

**Contribution format:** Oral  
**Contribution authors:** Manuel Cañadas (University of Alicante)

Among the multiple urban change phenomena that took place in Roman cities over time, the occupation and privatization of streets is one of the processes that most directly materializes the transformations of Roman society between the Classical and Late Antiquity periods. Based on this premise, and with the purpose of understanding how the road networks of Roman cities along the eastern coast of the Iberian Peninsula evolved, this paper aims to present the results of a comparative study, based on the analysis and processing of a set of archaeological data which prove the occupation of sidewalks and roads was a fairly common and early reality in the development of Roman urban communities. Going one step further, this study intends to go beyond the material evidence of this urban change phenomenon to explore the social and economic meaning that explains why certain domus appropriated the porticoes, privatizing part of them, or why some streets were closed to vehicular traffic and became reduced to mere pedestrian passageways. In this sense, some hypotheses regarding the roles of different social groups as actors in the road occupation process are presented, focusing on the agency of municipal authorities and their capacity to maintain urban structures in the Late Antiquity. Whether regulated or spontaneous, the occupation of streets did not lead to their definitive disgregation, with many of them keeping their layout and

function; thus, the final part is dedicated to assess the «resilience» of the urban network in the cities under study. To achieve the proposed goals, spatial analysis methodologies -such as Space Syntax and Geographic Information Systems (GIS)- constitute great potential techniques to advance in socio-urbanistic studies.

112. TO STAY OR TO MOVE? CHANGES IN THE SETTLEMENT PATTERN BETWEEN LATE ANTIQUITY AND EARLY MIDDLE AGES IN ALBACETE

Contribution format: Oral  
Contribution authors: Marta Torres Cortés (University of Alicante)

Traditionally, Archaeology in the Peninsula Iberica has focused either on Roman rural settlements, generally villae, or on Visigoth villages or cities. However, there were a few studies interested in understanding or analysing where people lived during the time between the Late Antiquity and the Early Middle Ages. Did the abandon the Roman villae and villages? Did they move to new settlements in altitude such as castum? Or are new settlements founded on the plains similar to the Visigoths hamlets documented in other parts of Europe? Currently, there are several research projects that try to answer these questions. This is the direction that this communication will follow. We will try to analyse the patterns of settlement in the rural world during the transition between the Late Antiquity and the Early Middle Ages. To do so, we will focus on four cases of study situated in the current province of Albacete: Camino Viejo de las Sepulturas (Balazote), Agra, Zama and Torre Uchea (Hellín). These examples will help us to understand whether in the rural world there is evidence of a break in settlement patters, or on the contrary there is evidence of continuity in the use of settlements with transformations of these spaces. Moreover, we will try to look for some of the causes that may explain the settlement patterns in this transition period.

1547. CHRISTIAN TOPOGRAPHY OF MAURETANIA SITIFENSIS BETWEEN THE 4TH AND 7TH CENTURIES AND ITS RELATIONSHIP WITH THE SETTLEMENT NETWORK

Contribution format: Oral  
Contribution authors: Michal Kuzminski (Pontifical Institute for Christian Archaeology)

The presentation examines key aspects of territorial changes in the province of Mauretania Sitifensis, established by the administrative reforms of Emperor Diocletian. The research focuses on the evolution of the province's Christian topography, analyzing its development in relation to various factors and broader shifts in settlement patterns between the 4th and 7th centuries. Geographic Information Systems tools will be employed to analyze and visualize these transformations. For this analysis, two comprehensive databases were created: one containing all known archaeological sites within the province and another specifically documenting sites with evidence of Christian presence. Each site was categorized by key attributes, including geographical location, chronological range, and natural conditions such as altitude and soil type. Additionally, distances from water sources and major communication routes were considered to assess the most favorable conditions for settlement development in the province. To evaluate these conditions, the weight-of-evidence method was applied. This approach uses the main factors as tools to calculate the areas with the highest likelihood of settlement presence. The same methodology was also applied to Christian sites to determine how factors like proximity to episcopal seats or administrative centers may have influenced the establishment of Christian communities at specific locations. In North Africa, many ancient dioceses are only documented in written sources. By comparing spatial analysis data for both general settlements and those with Christian presence, the study will identify areas with the highest likelihood of locating episcopal seats attested by historical records but not yet archaeologically confirmed. These areas are characterized by a relatively low number of episcopal seats compared to settlement density, highlighting potential locations for further archaeological investigation.

786. FROM THE CAPITAL OF GALLAECIA TO METROPOLITAN DIOCESE IN THE VISIGOTHIC KINGDOM: BRACARA AND ITS TERRITORY IN LATE ANTIQUITY

Contribution format: Oral  
Contribution authors: Diego Machado (UAUM | Lab2PT | Laboratório Associado IN2PAST | Universidade do Minho) – Francisco Folgueira Ríos (Universidade de Santiago de Compostela)

Throughout Late Antiquity, the city of Bracara (Braga, Portugal) not only experienced urban and cultural transformations but also established a close and dynamic relationship with the surrounding territory. With Diocletian's administrative reform, the northwest of Hispania was united into the new province of Gallaecia, with Bracara as its capital. This promotion resulted in increased investment in the housing of the political elites within the city and the territory. The Suevic conquest in 411 brought a new political reality to the city, which became its capital, but it also represented significant social and economic continuities, evidenced by the preservation of domestic architecture and the exploitation of the region's resources, rooted in Roman traditions. From the 6th century onwards, however, archaeological evidence shows a significant reduction in preservation, which complicates the study of the changes that occurred in the city. Drawing on the actions of the bishops of Bracara, particularly

St. Martin (6th century) and St. Fructuosus (7th century), interpretations of Bracara during this period highlight substantial social and cultural continuities. These were facilitated by the role of the Bracara diocese in maintaining urban life, as well as its administrative and economic functions, supported by the organisation of the diocesan settlements. The relationship between the city and its territory would be reflected in the establishment of Christian centres in the urban peripheries, such as churches and monasteries, as a strategy to consolidate the Metropolitan's presence and influence over the territory. This paper aims to reassess this interpretative framework in light of recent advances in the study of Bracara and its territory. The integration of diverse data enables the construction of a new narrative that rethinks the processes of change within the city and its relationship with the territory, revealing a more complex picture of Late Antiquity in the northwest of Hispania.

2169. THROUGH EIO AND ILICI: APPROACHING EARLY MEDIEVAL SETTLEMENTS DYNAMICS USING MOBILITY AND VISIBILITY ANALYSIS

Contribution format: Oral  
Contribution authors: Victoria Valero – Marta Cortés (University of Alicante)

The interrelation of the habitat and the individual has generated numerous questions that Landscape Archaeology has tried to answer. The why, how and when come to our mind when observing the settlement in the immediate surroundings of ancient cities. The cases of Eio (Tolmo de Minateda, Hellín, Albacete) and Ilici (La Alcudia, Elche, Alicante), situated in two different landscapes but deeply intertwined with each other, are not an exception. Both of them were occupied since the Bronze Age and they played a key role in Antiquity as Roman cities, focusing our investigation on their role during the Early Medieval period. For decades, the two urban areas have been the focus of research, knowing part of their internal dynamics within the political and social context throughout the centuries in which they were populated. However, what were the dynamics of occupation between the city and its immediate surroundings? Did these cities work as the backbone of the territory or were they just landmarks in the landscape. In this communication we will try to answer those questions that the inhabitants of a given landscape leave us in their passage through it. It is proposed to make a new approach to the rural settlement in the hinterland of Eio and Ilici during the High Middle Ages through Geographical Information Systems (GIS) tools using specifically some of them related t. mobility analysis (MADO) and visibility analysis. By doing so, we will gain a more comprehensive understanding by incorporating two additional pieces of the puzzle, enabling us to better grasp the relationships between the various settlements across the two territories. This investigation highlighted the amount of possibilities that the new technologies, specifically the network and visibility analysis, have to study some archaeological data that with traditional methods will be almost impossible due to its limitations.

242 NEW DEVELOPMENTS AND PERSPECTIVES IN THE METHODOLOGICAL APPROACH OF ARCHAEOENTOMOLOGY

Session theme: 3. Exploring methods in research, education and communication  
Session format: Discussion session  
Session keywords: Archaeoentomology, Quaternary entomology, Methodology, Funerary Archaeoentomology, Palaeoecology  
Session organisers: Pedro Henríquez-Valido (Universidad de Alcalá) – Nick Schafstall (Nature Research Centre (Vilnius)) – Giuseppina Carta (Università degli Studi di Genova)

SESSION ABSTRACT

Archaeoentomology has regained popularity in recent years as a relevant discipline for the in-depth interpretation of archaeological contexts. This discipline, derived from forensic entomology and Quaternary entomology, is based on the analysis of insect remains to obtain data on a wide variety of questions. The most significant data they can provide include: - Reconstruction of past ecosystems, such as details about the landscape that surrounded a settlement or burial ground.- Evidence of site abandonment, settlement patterns, and ecological stresses - Evidence surrounding burials, such as the season of mortuary deposition and the environment in which the deposition took place, as well as possible post-mortem movements of the corpse. - Identification of human subsistence strategies, including food storage and waste management. - Human-animal interactions and the spread of ectoparasites and diseases. However, despite their increasing relevance, there is still a notable scarcity of archaeological sites that systematically collect samples to allow the extraction of entomological remains. This scarcity of data is a pressing issue that limits the scope of archaeoentomological studies and, thus, their potential to contribute to the knowledge of the formation of the archaeological record. Your work in this field is crucial to addressing this issue. The aim of this session is to: - Address and analyse methodologies related to collecting samples in archaeological contexts, considering the particularities of each site and conservation conditions. - To encourage debate on the minimum criteria to guarantee a reliable archaeoentomological analysis. - To discuss

the techniques for extracting, identifying, and quantifying arthropod remains. This Discussion session aims to generate new perspectives and approaches to broaden the knowledge from entomoarchaeology in any archaeological context. The aim is to gather contributions from different regions, periods and types of archaeological sites to encourage collaboration between specialists to generate and improve methodological criteria in archaeoentomological analysis.

CONTRIBUTION ABSTRACTS

2019. ARCHAEOENTOMOLOGICAL STUDY OF THE CRYPT OF SANTA MARIA MAGGIORE (VERCELLI): INSIGHTS INTO BURIAL PRACTICES AND DECOMPOSITION PROCESSES

**Contribution format:** Oral  
**Contribution authors:** Giuseppina Carta – Aurora Nigro (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa) – Roberta Fusco – Marta Licata (Department of Biotechnology and Life Sciences, University of Insubria) – Cecilia Bertoletti (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa) – Stefano Vanin (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa | IAS-CNR, Genoa)

Funerary archaeoentomology applies the theories and methods of forensic entomology to archaeological contexts, particularly to funerary settings. The knowledge about the entomofauna (biology, ecology, and distribution) from archaeological sites, provides valuable informations about the post-mortem history of the buried individuals. The analysis of entomological remains helps reconstruct key aspects of burials, including the season of death, pre-burial exposure, post-mortem relocations, and environmental conditions. The presence or absence of insects may indicate the use of repellent substances, while certain taxa provide evidence of wooden coffins or offerings. Insects colonize corpses at different decomposition stages, leaving identifiable traces. In Italy, this field has gained significant interest, with several burials studied through a multidisciplinary approach. This study aims to describe the entomological community associated with the burials located in the crypt of the Church of Santa Maria Maggiore in Vercelli (Northern Italy 18th – early 19th centuries). Sediment and other materials collected from the burials were sieved, and entomological remains were isolated and identified using stereomicroscopy, dichotomous keys, and reference collections. Diptera puparia were the most abundant specimens, especially those belonging to the Muscidae and Phoridae families. These taxa are characteristic colonizers of bodies buried in hypogean or underground environments. Additionally, adult specimens of Coleoptera were identified, including xylophagous species from the Curculionidae, Mycetophagidae, and Ptinidae families, which caused damage to the wooden coffins. Other beetles, such as those from the Cleridae and Histeridae families, were more directly associated with the decomposition of organic matter. Finally, the presence of Lepidoptera specimens from the Tineidae family, as well as a Chrysomelidae specimen, was linked to clothing and offerings or environmental elements. This study highlights the role of archaeoentomology in reconstructing burial conditions and post-mortem processes, offering valuable contributions to our understanding of funerary practices and environmental factors influencing decomposition in hypogean contexts.

2024. BUGGING THE ABANDONED: TRACING ENTOMOFAUNAL CHANGES IN AN APUAN ALPS SHELTER

**Contribution format:** Oral  
**Contribution authors:** Matilde Stelli – Claudia Sciuto – Gabriele Gattiglia (MAPPA Laboratory, Department of Civilizations and Forms of Knowledge, University of Pisa) – Linda Abenaim – Augusto Loni (Department of Agricultural, Food and Environmental Sciences, University of Pisa) – Philip Buckland (Environmental Archaeology Laboratory, Umeå University)

The Apuan Alps, in northwestern Tuscany, were historically shaped by mining, agricultural, pastoral, and forestry activities. However, since the post-World War II period, these mountains have undergone significant depopulation, leading to the abandonment of land and structures. Archaeoentomology provides valuable proxies for reconstructing the history of this landscape. This study focuses on an abandoned shelter in Pomezzana, located beneath a natural cave, where two shovel tests were conducted. Soil samples collected from different stratigraphic layers were processed to recover insect fossils using standard techniques: organic components were separated from inorganic material through water flotation with a 300 µm sieve, and the resulting fractions were examined under a low-power binocular microscope. Identified insect fossils were compared with modern reference collections. Additionally, six pitfall traps were placed inside and outside the shelter to investigate the present entomofauna within the abandoned structure. By comparing insect assemblages from different layers and pitfall traps, this research explores changes in entomofauna across the site’s phases of use. The results provide insights into the history of the archaeological site and, more broadly, contribute to understanding human-environment interactions in an area shaped by abandonment.

2509. THE TAPHOMUMMY PROJECT: EXPERIMENTAL APPROACH TO FUNERARY ARCHAEOENTOMOLOGY FOR THE UNDERSTANDING OF INDIGENOUS CANARIAN CAVE BURIALS

**Contribution format:** Oral  
**Contribution authors:** Pedro Henríquez-Valido (Área de Prehistoria - Universidad de Alcalá) – Jean-Bernard Huchet (UMR 5199/CNRS – PACEA, University of Bordeaux | UMR 7209/Archéozoologie, Archéobotanique: sociétés, Pratiques et Environnements, MNHN | UMR 7205/CNRS - Institut de Systématique, Evolution et Biodiversité) – Amelia Rodríguez-Rodríguez – Jonathan Santana Cabrera – Idaira Brito Abrante – Aitor Brito Mayor (G.I. Tarha. Dpto. de Ciencias Históricas. Universidad de Las Palmas de Gran Canaria)

Insects are crucial in cadaveric decomposition, although they are only considered when their preservation is evident. Nevertheless, they can provide crucial information to understand the funerary archaeological record better. In the Canary Islands, where the climatic conditions allowed the preservation of entomological materials, the indigenous population used caves to deposit their dead. However, there is debate about some issues regarding the funeral rite, such as whether or not the bodies were exposed to the elements for an indeterminate period of time before burial. In this work, the conditions of indigenous burials in caves have been recreated using traditional techniques to wrap a pig carcass in a vegetal bundle. During this experiment, samples were collected of insects that arrived around the cadaver from the first minutes of the deposit up to a year after the beginning. The results have allowed us to make contrasting hypotheses about whether the bodies were deposited immediately after death. For this, quantitative factors have also been taken into account, allowing archaeological deposits in caves to be reconstructed, both in the Canary Islands and other Palaearctic regions.

2520. SMALL PARTS CAN TELL A WHOLE STORY: INSECT REMAINS FROM A NEOLITHIC WELL IN EASTERN BOHEMIA

**Contribution format:** Oral  
**Contribution authors:** Nick Schafstall (Nature Research Centre, Quaternary Research Laboratory, Vilnius) – Petr Vrána (University of Hradec Králové, Philosophical Faculty)

A Late Neolithic well was discovered near the town of Klenice in northeastern Bohemia and subjected to a multi-proxy study, to find out more about the history of the well and its immediate surroundings. Pollen, plant macrofossils, sedaDNA and insect remains have been studied, but not all results are finalized yet. This presentation shows the results from the identification of beetles (Coleoptera) from three bulk samples from different depths within the infilled well. All three samples contained remains of dung beetles and granary weevils, but preservation of the remains differed considerably between samples. While at first around five liters of each sample were examined, later examination of the remaining volumes of sample rendered high additional numbers of insect remains from one of the samples, including better preserved specimens. The observations made during this study show how random sampling from archaeological deposits can affect the quality of the results.

1749. ARCHAEOENTOMOLOGICAL STUDY OF A REDUCTION BOX FROM THE CRYPT OF SANTA MARIA MAGGIORE (VERCELLI)

**Contribution format:** Poster  
**Contribution authors:** Giuseppina Carta – Aurora Nigro (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa) – Roberta Fusco – Marta Licata (Department of Biotechnology and Life Sciences, University of Insubria) – Martina Carlassara – Lucrezia Falchi – Alessia Santonastaso (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa) – Stefano Vanin (Department of Earth, Environment and Life Sciences (DISTAV), University of Genoa | IAS-CNR, Genoa)

This study focuses on the entomological analyses of a wooden reduction box containing the remains of two adult individuals, discovered in the crypt of the Church of Santa Maria Maggiore in Vercelli (Northern Italy 18th – early 19th centuries). The remains were placed on a pillow composed of plant-based materials, providing an environment favourable for the presence of various insect species. The entomological investigations highlighted the presence of dipteran insects belonging to the Phoridae and Muscidae (*Hydrotaea capensis*) families, which are typically associated with the decomposition process of buried bodies. However, the presence of many puparia of blow flies (Calliphoridae) and Muscidae of the genus *Muscina* reveals that the bodies were exposed before the burial, potentially as part of the funerary rituals. Additionally, beetles from the Curculionidae family (Cossoninae subfamily) were found, likely linked to the plant-based pillow and wood coffin structure. These beetles are known to be associated with plant decomposition and may provide important information to the environmental conditions and materials used in historical burial practices. The presence of mold, developed on the plant-based material but also on the remains is documented by the presence of mycetophilous species in the families Mycetidae

(Mycetaea subterranea) and Cryptophagidae (Cryptophagus sp.). The findings of this study contribute to the understanding of burial environments and post-mortem insect colonization, offering valuable data for forensic and bioarchaeological research. The identification of insect species associated with both decomposition and plant material degradation highlight the importance of entomological analysis in reconstructing past funerary practices and environmental conditions. These results not only enhance our knowledge of funerary archaeology but also emphasize the role of insect activity in the decomposition process within enclosed burial settings. Future research integrating entomological, botanical, and taphonomic analyses will be essential for a comprehensive interpretation of burial environments in historical contexts.

**2531. TRACING DEAD: ARCHAEOENTOMOLOGICAL INDICATORS OF DISTURBED FUNERARY CONTEXTS. THE CASE OF CUEVA DE LOS MURCIÉLAGOS OF ALBUÑOL (GRANADA, SPAIN)**

**Contribution format:** Poster  
**Contribution authors:** Pedro Henríquez-Valido (Universidad de Alcalá) – Jonathan Santana (Universidad de Las Palmas de Gran Canaria) – Rafael Martínez-Sánchez (Universidad de Córdoba) – Miriam Cubas Morera (Universidad de Alcalá) – Maria Herrero-Otal – Ingrid Bertin – Raquel Piqué Huerta (Universitat Autònoma de Barcelona) – Francisco Martínez-Sevilla (Universidad de Alcalá)

Cueva de los Murciélagos of Albuñol (Granada, Spain) is a karstic cave located 7km from the current coastline of the southeast of the Iberian Peninsula. The site is crucial in the Prehistory of the region due to the exceptional preservation of organic materials through desiccation. As a result of the extraction of bat guano during the first half of the 19th century, at least 68 individuals were discovered and distributed in different areas, but most of them are currently missing. However, some of the materials that attracted the most attention were the plant fibre and wooden based objects that likely accompanied the burials, which were dated to the Early and Middle Holocene (Martínez-Sevilla et al., 2023). Most of the archaeological superficial remains have been altered by different historical activities. To recognise the context in which the bodies were deposited, series of systematic sampling were carried out throughout the cave, generating a considerable number of new findings, including materials associated with archery dating from the Early Neolithic (Bertin et al., 2024). Archaeoentomological analysis of the sediments has revealed the presence of both cadaveric entomofauna, which could be directly related to the decomposition of the corpses, and other insects, which could be linked to the rest of the organic materials present in the cave. Among them, the puparia of Diptera (Calliphoridae: Calliphora vomitoria) and the exoskeletons of Coleoptera (Dermestidae: Dermestes sp.) stand out. Some of these puparium remains were dated between the 3rd and 4th millennia BCE, closely related with the baskets. Others were documented with human remains and were dated in the 10th millennium BCE. These data not only suggest the use of the cave as a funerary space since the Early Holocene. They also allow us to try to recognise the use of the spaces in an archaeologically disturbed context.

**243 OBJECTS, MOBILITY, AND CREATING BELONGING IN ARCHAEOLOGY: NARRATIVES REVISITED**

**Session theme:** 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
**Session format:** Regular session  
**Session keywords:** Materiality, Objects, Mobility, Belonging, Narratives  
**Session organisers:** Martina Seifert (University of Hamburg) – Ewdoksia Papuci-Wladyka (University of Warsaw) – Francesca Fulminante (University of Bristol | University of Roma Tre) – Giulia Pedrucci (Comenius University in Bratislava)

**SESSION ABSTRACT**

The mobility of people and objects and the related changes in social, political and spatial terms are a current subject of social debate that is as controversial in the present as it was in the past. In archaeology, research on wandering movements, migration or colonization has led to long-lasting narratives that have dominated concepts and interpretations in a stereotypical manner for decades. These include, for example, the so-called Dorian migration, the so-called great Greek colonization in the Mediterranean region or the so-called Romanization of provinces. The theoretical perspectives on migration and belonging range, for example, from the idea of acculturation to trans-locality or transtemporality. In light of the background outlined above, the session will address the question of how ancient societies produce, maintain and change belonging in the course of mobility and migration. We are looking for contributions that deal with the significance of materiality in the aforementioned contexts and the diverse overlaps of socio-spatial practice. This includes built materiality as well as objects that have been appropriated in new places and social spaces. Interdisciplinary contributions from all disciplines of ancient studies discussing different geographical areas and architectures or objects from different periods are most welcome.

**CONTRIBUTION ABSTRACTS**

**2412. A TALE OF TWO CITIES?: MARKERS OF MOBILITY AND ADAPTATION IN REPUBLICAN CENTRAL ITALY**

**Contribution format:** Oral  
**Contribution authors:** Melissa Ludke (Florida State University)

The Latin colony of Cosa was founded in 273 BCE within a seemingly “hostile” territory on the western coast of the Tyrrhenian Sea in central Italy. Despite the city being surrounded by Etruscan settlements, the promontory and future site of Cosa has remained absent of any prior habitation beyond a few tombs scattered on the hillside. As a result, early scholars dubbed the city a “typical ex novo colony” and one that emulated Rome in every way, including a model of classic ‘romanization.’ However, shortly after the colony’s establishment, it quickly began importing goods from the immediate region, especially Tarquinia, which continued into the second and first centuries BCE. Furthermore, while the relationship between Cosa and Rome has been thoroughly investigated, the connections between the colony, the territory’s Etruscan cities, and regional mobility have been relatively ignored. This research initially examines epigraphic evidence from the Republican period of Cosa. Then, the onomastic links between gentes associated with the colony and central Italy are compared to the import of regional products and export of Cosa’s coins, outside the direct purview of Rome. It is well known that the mobility of objects tends to emphasize the movement of humans. Thus, through a materiality approach, this paper argues that the appearance of regional goods at Cosa, and their intersection with the potential origins of these individuals, reflect the choices and motivations of Cosa’s early inhabitants, and its neighbors. Lastly, the results of this project ultimately indicate regional interaction and potential migration at a time when Cosa was thought to have been relatively isolated, as well as the colony’s attempts at integration through appropriation and adaptation within a well-established Etruscan territory.

**295. DOES CIRCULATION AND CONSUMPTION OF OBJECTS REFLECT CULTURAL, POLITICAL AND ECONOMIC NETWORKS BOUNDARIES? THE CASE STUDY OF EARLY ROMAN EXPANSIONISM**

**Contribution format:** Oral  
**Contribution authors:** Francesca Fulminante (Bristol University | Oxford University | Cambridge University | University Roma Tre) – Daniela Engelhart (Independent)

Is there a mark of Roman expansionism in the cultural and economic imprint of interaction and trade in Etruria and Latium vetus before and after the beginning of Roman expansionism? Do Etruria and Latium vetus work as separate blocks or connected units either before or after the conquest of Etruria from Rome? Which is the role in these interactions of cultural transmission and economic trade of the settlements of different degree of density or ranking? Does cultural transmission happen more easily and often in primary or secondary order settlements? Do primary settlements act as central places and re-distribution centres? By using Central Italy from the Final Bronze Age to Republican Period as a case study we will try to address these questions using a network exploratory approach. Our method will be based on the analysis and theoretical considerations in the paper of Nakoinz et al (2020). There, the typology and location of fibula are used to calculate an adjacency matrix to gain a network, on which to do further analysis on. In our case, we will build three comparable matrices, one from sites in Etruria, one from sites in Latium vetus and finally, one in which both regions are combined, with a much larger and more diverse number of types. With the created networks, Centrality measures, such as degree and betweenness, can then be calculated in order to get an insight into the interaction of the sites in the two different regions to answer the previously asked questions.

**2040. PERSPECTIVES OF BELONGING. THE URBAN DEVELOPMENT OF LILYBAEUM IN ANTIQUITY**

**Contribution format:** Oral  
**Contribution authors:** Aylin Güngör (University of Hamburg) – Mauro Lobrutto – Antonella Mandruzzato – Aurelio Burgio (University of Palermo)

Since 2005, the Universities of Palermo and Hamburg and the Parco Archaeologico di Marsala have been working together to explore the ancient city of Lilybaeum in Sicily. The foundation of Lilybaeum is documented in written sources in the years 397/396 BC, following the destruction of Punic Mozia under the leadership of Dionysios of Syracuse and the subsequent resettlement of the surviving population characterised by different groups. The western Sicilian sea fortress of Lilybaeum (Greek: Lilybaion) was an important base for the Carthaginians and Romans during the Punic Wars and was subsequently a flourishing Roman trading town. As a cultural centre between Sicans, Elymians, Punics and Romans, Lilybaeum is distinguished from other Sicilian and North African cities by its continuous settlement from the 4th century BC to the 5th century AD, which shows the historical importance of Lilybaeum in the context of north-western Sicilian cities. Therefore, Lilybaeum in particular provides an opportunity to consider the question of belonging and differentiation from a variety of perspectives. How do

the archaeological remains reveal belonging in the individual cityscapes and organisation of the city? How does the community create, maintain and change belonging? How does this affect the social space, and how does the cityscape transform over time with changing belongings? This paper further engages with the prevailing concepts within the research field. Since 2017, the DFG-funded project “Lilybaeum. Basic urban layout” has been engaged in the creation of an archaeological map of ancient Lilibeo/Lilybaeum in different time phases in order to reconstruct its development. This process facilitates the identification of different urban functional areas in the different phases, as well as the verification of the research narrative concerning a differentiable cityscape. This approach contributes to a comprehensive understanding of the urban landscape and facilitates the elucidation of its intricate layers.

655. WHERE THE DEAD BELONG. MULTILOCALITY AND AFFILIATION OF THE DEAD IN ANCIENT GREECE

**Contribution format:** Oral  
**Contribution authors:** Thorben Frieling (University of Hamburg)

Migratory movements of and the connections between population groups are closely linked. And even death cannot change these. Instead, new affiliations are formed: the deceased is now part of the afterlife but is still considered a part of the oikos and the responsibility of their relatives. Furthermore, they belong to the oracle of the dead – the nekyomanteion – when they are summoned for divination and guidance. Through rituals at these oracle sanctuaries, like at Tainaron and the Acheron, affiliations between the dead and the living emerge. The living migrate to the dead by means of the katabasis or nekyia, while the dead are grasped from the underworld to impart their wisdom on to the living. The same happens – though in a much less liminal setting – at the grave through sepulchral rites. The care for graves is an integral part of Greek society as elaborate grave stelai and painted pottery from the Archaic and Classical periods suggest. The dead is tended to even long after their death and takes part in these rituals – although as a silent actor. These ritual performances also create a group identity between the living through shared beliefs and ritualistic practices. Classical sepulchral scenes from Greek poleis in southern Italy show great resemblance to those found in the Greek motherland due to their shared heritage and relation as apoikiai and metropoleis. So shouldn't it be “Till Death do us unite” instead? Mobility and connections between dead and living can be assessed via the material finds at the oracle sites and analysis of pictorial scenes in which dead and living interact. Combining this with the definition of “belonging” as Joanna Pfaff-Czarnecka postulates – based on shared knowledge, goals and believes – creates the means to close in on an answer to this question.

873. REINTERPRETING BELONGING: THE TRANSFORMATIONS OF FEMALE FIGURINES IN RITUAL AND FUNERARY CONTEXTS

**Contribution format:** Oral  
**Contribution authors:** Giulia Pedrucci (Comenius University in Bratislava)

During a recent research trip to Athens, I examined several kouroi/terracotta figurines—or more precisely, kourophoroi—in local museum collections. These terracottas were not originally intended to depict figures carrying infants. Instead, they were later modified, with crudely hand-modeled infants added to their laps or feet. Some even feature unnaturally extended arms to accommodate this secondary adaptation. While the exact provenance of many remains unknown due to their status as collector's items, they seem to be Attic productions, yet some of them have been found beyond Attica, attesting to their movement across different regions. This phenomenon of post-production reinterpretation speaks to the fluidity of meaning and belonging in material culture. The figurines, initially representing enthroned women in a hieratic posture—possibly goddesses, yet distinctly non-maternal ones—were later recontextualized to embody nurturing roles. A parallel case emerges in Hellenistic-period tombs in Northern Greece, where terracotta statuettes of Aphrodite with Eros were deposited as funerary offerings. As Rudhardt has noted, Greek goddesses were rarely maternal toward their offspring, yet Aphrodite with her son became a prominent funerary figure for women and children, seemingly symbolizing an idealized, divine, somehow unexpected bond. The movement of these figurines—whether through trade, personal devotion, or other forms of mobility—highlights how objects, much like people, acquired new meanings as they traversed different socio-spatial contexts. Once displaced from their original settings, these artifacts were not merely passive carriers of artistic traditions but active participants in the construction of new narratives of identity and belonging. By adapting and repurposing these figurines in new ritual and funerary settings, ancient communities reshaped their relationships with both the divine and the deceased, negotiating cultural memory and continuity through materiality.

851. ANCIENT DNA AND THE RETURN OF THE CULTURE = PEOPLE HYPOTHESIS

**Contribution format:** Oral  
**Contribution authors:** Maxime Bami (Johannes Gutenberg University Mainz)

Ancient DNA is transforming European prehistory, reviving old narratives such as the invasion by ‘steppe folks’ of third millennium BC Europe. However, concerns arise that prehistory is being hastily rewritten as a deep history of mass migrations, with ‘pots’ and ‘people’ inextricably linked together, like in the heydays of culture-historical archaeology. Ideas long thought outdated and fantastical, such as ‘massive migration’ and ‘wholesale cultural change’, are back on the archaeological agenda. In this seminar, I examine why old narratives are coming back through the latest revolution in science. I highlight how the use of untested, potentially obsolete culture-historical groupings for statistical modelling of genomic variation perpetuates relatively simple migration replacement scenarios. New interfaces of archaeology and genetics are needed to parameterize the material record in the most objective manner and revisit archaeological taxonomies used in genetics. I present some results of the DFG project CO-MOVE (2021-2025), including our work on AI-assisted classifications of material culture.

245 LAND USE IMPACT ON ARCHAEOLOGICAL HERITAGE. WHAT’S GOOD, WHAT’S NOT AND HOW TO MONITOR THIS?

**Session theme:** 7. Climate Change in the Past and Present  
**Session format:** Regular session  
**Session keywords:** Archaeological Heritage management, Policy, Impact, Land use change  
**Session organisers:** Karl Cordemans (Flemish Land Agency) – Jose Schreurs (Heritage Agency)

SESSION ABSTRACT

Recent evolutions in policies influencing the land use, such as the European Nature Restoration law, LULUCF, farm to fork, the Green Deal etc., together with the changing climatic conditions have led to many changes in land use. Land is afforested, new nature is being developed, farmers are growing other crops such as energy crops, starting paludiculture etc. It seems like this is a good moment to make a state of the art. In this session we like to examine the effects of different land uses (agriculture and nature) on the preservation of archaeological remains. Which crops, cultivation methods and management practices are preferable and which are inadvisable? Factors that play a role here include depth and nature of archaeological remains, soil conditions, laws and regulations, costs and traditions in working methods of land and nature management. How can the effects be monitored and mitigated? Which instruments are currently being used to prevent the damaging effects of some crops or practices.

CONTRIBUTION ABSTRACTS

1227. LAND USE AND PHYSICAL CONDITION ARCHAEOLOGICAL NATIONAL MONUMENTS IN THE NETHERLANDS

**Contribution format:** Oral  
**Contribution authors:** Marie-José Schreurs (Cultural Heritage Agency of The Netherlands)

In order to protect archaeological sites from developments and to insure the information they keep is saved when threatened, the Dutch government has listed about 1460 archaeological monuments which consist of more than 4000 individual sites. To gain insight into the current state of the protected monuments, to monitor changes and trends, and to be able to take measures aimed at the sustainable preservation of the stock of monuments, an Archaeological State Monuments Monitor was carried out. After all, the starting point for the designation of archaeological national monuments is their sustainable preservation. In this presentation, the methodology used and results of the study will be discussed, focusing on the relationship between land use and the preservation of archaeological sites. In addition, examples of land use, methods and techniques of management and tillage are presented focusing on their effects on the archaeological remains. It concludes with best practices and recommendations to achieve the most archaeology-friendly land use and management of archaeological heritage.

1026. MONITORING OF AFFORESTATION IMPACT ON ARCHAEOLOGICAL HERITAGE

**Contribution format:** Oral  
**Contribution authors:** Karl Cordemans (Flemish Land Agency)

Lots of parcels will be afforested in Flanders in the coming years as a result of European policies such as Biodiversity, Afforestation and Nature restoration targets. Archaeology and landscape are often not taken into account because no planning permission is required, or the planting of trees is not considered to be earthmoving (which is triggering the archaeological trajectory). As the effects of afforestation (positive and/or negative) is still unclear, there is definitely a need for more clarity on this issue. In response to this, the Flemish Land Agency and the Heritage Agency are jointly launching a monitoring study on a plot of land containing a variety of archaeological features, that will be afforested in the near future. As this plot will remain the property of the Flemish

Land Agency, long time monitoring can be set up. The ultimate goal is produce a guidance booklet, based on the findings of this project.

**2115. WASTELANDS RECLAIMED: THE IMPACT OF 18TH-CENTURY LAND USE TRANSFORMATIONS ON ARCHAEOLOGY AND LANDSCAPE IN THE CAMPINE AREA (BELGIUM)**

**Contribution format:** Oral  
**Contribution authors:** Pieter-Jan Reynaert – Bart Vanmontfort (KU Leuven) – Pieter Roggemans (Flemish Agency for Agriculture and Fisheries)

Over the past few centuries, the Campine area in northern Flanders (Belgium), has experienced a profound transformation of its landscape. While dominated by extensive heathlands and marshes during the late middle ages and early modern period, little of this remains today. Starting in the mid-18th century, these so-called “waste-lands” were subjected to an extensive government-driven reclamation campaign. Also in the centuries that followed, these “economically worthless” lands continued to be a source of frustration for central authorities. Several historical maps bear witness to the gradual conversion of these wastelands into more productive lands. With the help of deep-learning (AI) image classification, the land use depicted on these maps has been accurately digitised, allowing for high-detailed tracing and quantification of the reclamation processes. In times when in situ archaeological heritage faces increasing challenges related to climate change and sustainable land use, the reclamation history of the Campine area offers valuable lessons. It is beyond doubt that past land use changes have shaped the preservation of archaeological remains, with both positive and negative outcomes, but have they also contributed to the region’s increased sensitivity to drought? This paper explores the long-term effects of 18th-century land use legacies in the Campine area, uncovering its impact on both soil archive and landscape, while drawing lessons for future management and policy.

**2218. CULTIVATING A PLACE FOR ARCHAEOLOGICAL CONSERVATION IN REGENERATIVE AGRICULTURE: REFRESHED THINKING FROM ENGLAND ON RISKS AND OPPORTUNITIES**

**Contribution format:** Oral  
**Contribution authors:** Jez Bretherton (Historic England)

Since Brexit, English farming policy has been guided by the Agricultural Transition Plan. Where this impacts on archaeological conservation varies within the detail of the new Environmental Land Management schemes comprising the Sustainable Farming Incentive, Countryside Stewardship and Landscape Recovery. Historic England are engaged with Defra and others in the development and delivery of this new suite of agri-environment schemes. Agricultural policy changes reveal new challenges in understanding risk and opportunities to conserving archaeology, and new challenges for archaeologists to understand techniques of “regenerative agriculture”. The session aims to demonstrate the correlation and contested aims of these approaches in a way that can be better understood by archaeologists with an interest in land management. In this session we will take a refreshed look at the conservation of archaeological sites under arable systems, through the lens of the COSMIC risk assessments - a methodology developed in collaboration with Historic England, and practiced by among others, Worcestershire Archaeology. Robin Jackson of Worcestershire Archaeology, and Jez Bretherton, from Historic England, will use COSMIC risk assessment case studies, recent research into cropping and cultivation impacts, to provide insight into these challenges, and pose questions around the perennial issues of how archaeologists and conservation practitioners can engage in better shared understanding and communication with farmers to achieve sometimes elusive “sustainable agriculture” goals.

**2100. IMPACT OF RECENT WEATHER EVENTS ON THE CULTURAL HERITAGE OF THE SENSITIVE LANDSCAPE OF CALABRIA: IS CLIMATE CHANGE IMPACTING?**

**Contribution format:** Oral  
**Contribution authors:** Sara Marino – Alessandro Vanzetti (Sapienza University of Rome) – Paola Mercogliano – Giuliana Barbato (Euro-Mediterranean Center on Climate Change)

This contribute aims to focus on a specific Mediterranean Region, Calabria (southern Italy), a landscape where the long-lasting problems of drought, erosion, landslides, but also of coastal plain subsidence and stream flooding are considerable. In particular, the effects of extreme rainfall often have repercussions on valleys and plain areas, causing flooding, also of archaeological sites open to the public. Through this contribution we would like to try to draw attention to some of the main current and expected risk scenarios, precisely set into the territory in question, through the use of satellite datasets and high resolution climate projections over Italy. Indeed climate change may have a particularly strong effect on such a fragile environment, through induced soil erosion, weather induced landslides and overflowing, presently acting together with widely uncontrolled increase in land use and consumption (anthropogenic activities): sediments have always been transported and deposited due to rainfall, runoff, snow melting, but anthropic climate change and other human activities (such as agricultural or

irrigation practices, overbuilding the soil, quarrying, etc.) act as multiplier factors. Our analysis will try to define whether current and expected climate change is reflected in recent impacts on the archaeological sites and to identify the situations of major resistance/resilience, in front of the most vulnerable cases, calling for specific protection initiatives.

**2046. FRAGILE HERITAGE: THE IMPACT OF CLIMATE CHANGE ON ARCHAEOLOGICAL SITES IN THE FOREST ECOSYSTEMS OF UPPER LUSATIA, CENTRAL EUROPE**

**Contribution format:** Oral  
**Contribution authors:** Anna Wierzgon – Jędrzej Horodecki – Mateusz Krupski – Aleksander Misiurny – Gracjan Mielczarek – Katarzyna Biernacka – Barbar. Kwiatkowska – Pawe. Konczewski (Wrocław University of Environmental and Life Sciences)

The Fragile Heritage project addresses the growing impact of climate change on archaeological sites, particularly in Central European forests, a largely unexplored area in this context. Led by the Landesamt für Archäologie Dresden and Wrocław University of Environmental and Life Sciences, the project examines threats from extreme weather events, such as wildfires and prolonged droughts, to sites in Upper Lusatia. Unlike agricultural areas, forests have received little attention regarding climate-induced heritage degradation. Research from other European regions shows that soil erosion, organic material decomposition, and shifting vegetation dynamics can cause irreversible damage. In Upper Lusatia, climate-driven processes may prevent forests from recovering, accelerating the disappearance of archaeological sites, as seen in Prędocice, Białogórze, and Trzciniec. The project aims to monitor extreme weather effects, explore conservation technologies, and propose strategies like climate-adaptive reforestation. It also considers EU heritage protection policies, assessing funding mechanisms and technological innovations for site preservation. Additionally, the project highlights the need for interdisciplinary collaboration and public engagement, raising key questions about establishing a European monitoring network and effective conservation strategies. By integrating archaeology, environmental science, and policy, Fragile Heritage seeks not only to understand climate-driven degradation but to develop actionable solutions for safeguarding cultural heritage in a changing climate.

**246 ARCHAEO-ANTHROPOLOGY AND BUILDING ARCHAEOLOGY: WHAT DIALOGUE FOR WHAT COMPLEMENTARITY?**

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Round table  
**Session keywords:** Building archaeology, Archaeo-anthropology, Spaces, Dating, ,  
**Session organisers:** Charlotte Boyer (Museum National d’Histoire Naturelle - UMR7206) – Emilie Comes Trinidad (Service archéologique départemental de l’Ardèche-MuseAI) – Aurélie Terrier (Ecole polytechnique fédérale de Lausanne)  
**Session speakers:** Magdalena Fraser (Uppsala University) – Vivi Deckwirth (University of Helsinki,Aalto University)

**SESSION ABSTRACT**

Building archaeology is a relatively recent discipline whose methods for characterizing spaces and dating construction and evolution phases are based on several sources: written and graphic sources, stylistic elements/clues, stratigraphic relationships between sedimentary and construction units. In this research of understanding and dating spaces, burials—sometimes relegated to the margins of study—seem to constitute valuable material. This session intends to focus on the links between archaeo-anthropology as natural or hard science and building archaeology throughout five topics.  
1 - the investigation of the mutual contributions between archaeo-anthropology and building archaeology from Antiquity to the modern period through several approaches/lines of reflection;  
2 - the dating of construction phases and the characterization of spaces through the typo-chronological study of burials and/or their grave goods;  
3 - the physico-chemical dating as a means of absolute dating for bones, burial structures and element of construction;  
4 - the characterization of inhumed/buried populations (bio-anthropological, paleogenetic, biogeochemical studies, etc.) as an interpretive element for sepulchral structures and, more broadly, for the use of spaces;  
5 - the study of the spatial arrangement of burials and their evolution as an essential complement to understanding changes in the purpose and use of buildings or rooms.

247 RURAL ARCHAEOLOGICAL HERITAGE – A CHALLENGE TO SURVIVE -

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Discussion session  
**Session keywords:** rural archaeology, rural heritage, landscape, museum, visitor centre,  
**Session organisers:** Clara Masriera-Esquerra (Universitat Autònoma de Barcelona) – Johanna Niederkofler (ArcheoParc Schnalstal | Val Senales)

SESSION ABSTRACT

The knowledge transfer of archaeological heritage has been predominantly centered on urban areas, where population density and accessibility facilitate the study and exhibition of historical narratives. However, archaeological heritage of rural regions, often remain overlooked. This session aims to investigate the archaeological heritage of less populated rural areas, examining whether these regions possess significant historical narratives worthy of display. We will explore the financial challenges faced by these areas in maintaining museums and visitor centers, as well as the demographic composition of local and visiting communities that engage with these sites. Furthermore, we will analyze the types of activities and communication strategies employed to promote awareness and appreciation of rural heritage. By sharing diverse experiences from around the globe, this session seeks to illuminate the rich, yet often hidden, histories of rural areas. We aim to foster a dialogue on the importance of inclusive heritage practices that recognize and celebrate the past of all communities, regardless of their size or accessibility. Through this exploration, we hope to highlight innovative approaches to heritage management that can enhance the visibility and sustainability of archaeological sites in rural contexts, ultimately contributing to a more comprehensive understanding of our shared human history.

CONTRIBUTION ABSTRACTS

44. CENTERING RURAL LANDSCAPES: COMMUNITY-BASED ARCHAEOLOGY FOR CULTURAL HERITAGE DEVELOPMENT IN TRANSYLVANIAN RURAL LANDSCAPES

**Contribution format:** Oral  
**Contribution authors:** Elizabeth Arnold (University of California, Los Angeles) – Colin Quinn (University at Buffalo) – Horia Ciugudean (Muzeul National Al Unirii din Alba Iulia)

Communities constantly produce and reinforce notions of cultural heritage in their expressions of identity and memory. Heritage preservation greatly influences senses of social, cultural, and historical identity at individual, community, and national levels. Especially in rural communities, heritage is deeply rooted in communities’ experience with landscape. However, as contexts that express a unique sense of place, rural traditional landscapes encounter threats to their heritage in the face of modern development, unemployment, and changing policies. In this paper, we explore the potential for community engagement rooted in archaeology and how it can play a role in the sustainable development of rural landscapes. In particular, we present several ongoing projects focused on prehistoric archaeology in Alba County, Transylvania. Drawing on theories of placemaking, memory, and monumentality, this paper explores the strong connection between people and place over time as a justification for drawing upon archaeology to reimagine how communities engage with landscape in the present and future. We highlight the potential for community-based cultural heritage revitalization as a way to promote sustainable development in Transylvania’s rural landscapes. Knowledge of how people of the past engaged with landscape gives the opportunity to reinterpret how communities interact with their environments and build cultural heritage. Projects geared towards sustainable cultural heritage preservation ignite cultural pride and encourage cultural expression, maintained through social memory creation and key economic opportunities and benefits across different scales. Ultimately, archaeology in concert with community-engaged cultural heritage outreach efforts can be useful to counterbalance urbanization and enhance investment in rural communities.

1264. DIG-NITY OF MARGINALITY: PRESERVING CULTURAL IDENTITY OF AGRO-PASTORAL ITALIAN LANDSCAPES

**Contribution format:** Oral  
**Contribution authors:** Sara Zecchinato (Università degli Studi di Sassari) – Luigi Magnini (Università Ca’ Foscari Venezia) – Marco Milanese (Università degli Studi di Sassari)

For decades, the process of depopulation of small villages and rural areas has been an increasingly difficult problem in Italy. The dramatic consequences of this population decline is the progressive loss of historical and archaeological heritage, but most of all the cultural identity that these rural spaces represent and preserve. This can be attributed to the limited number of attempts in Italy over the years to explore the dimensions of rural archaeology. Moreover, the few investigations conducted often focused on the analysis of material culture

associated with a specific chronological event, rather than examining the impact of human actions over time on the landscape. As a result, environmental resource management and land use have long been overshadowed by the ‘site domain’ and urban space, both in archaeological studies and in conservation strategies, causing a gradual loss of dignity for their historical narratives and the contexts in which they exist. This contribution intends to present the preliminary results of the territorial investigations carried out within a PhD project that analyze the procedures for the valorisation of marginal cultural contexts. This project aims to reconstruct and valorize the cultural heritage of two Italian rural contexts: the Marcesina Plain, in Veneto, and the Logudoro region, in the central-eastern part of Sardinia. Both cases represent abandoned agro-pastoral landscapes naturally marginalized from major urban centers. Despite their isolation, they reflect a remarkable territorial resilience, shaped by a historical collective memory that has been carefully preserved and handed down through generations. This narrative is evident in the archaeological record and the historiographical sources that have been explored. By examining the landscape historically and analyzing land use patterns, we aim to propose solutions that prioritize the revitalization and of these areas; ultimately, we aspire to preserve their social, and cultural significance, affirming the dignity of their identities.

1932. ARCHEOPARC VAL SENALES AS A CASE STUDY

**Contribution format:** Oral  
**Contribution authors:** Johanna Niederkofler (archeoParc Val Senales)

This presentation explores how the study and interpretation of archaeological heritage can contribute to the holistic development of remote regions, using the archeoParc Val Senales as a case study. Located at 1500 meters above sea level in the Italian Alps, close to the Iceman’s discovery site, the archeoParc is dedicated to understanding the lives of our Neolithic ancestors, particularly those from the Copper Age. By immersing visitors in the culture, tools, trade, and daily activities of the Iceman and his contemporaries, the archeoParc fosters a unique approach to learning through experiential engagement with the past. The archeoParc stands as a testament to the difficulties and the potential of archaeological research to not only inform us about ancient societies but also to revitalize rural communities. The park creates jobs, fosters local tourism, and provides educational opportunities in a region threatened by emigration. Through workshops, guided tours, and collaborations with institutions safeguarding cultural heritage, the archeoParc contributes to both the intellectual and economic life of the region. This presentation aims to provoke discussion on how the study of archaeological heritage in remote regions can foster a deeper appreciation for the sustainability and adaptability of rural communities throughout history and challenge our perceptions of the past while simultaneously contributing to contemporary rural development.

1492. REDISCOVERING THE PAST: PRESERVING RURAL ARCHAEOLOGICAL HERITAGE IN HIGH-ALTITUDE LANDSCAPES

**Contribution format:** Oral  
**Contribution authors:** Clara Masriera-Esquerra – Anna Bonet-Peláez (Universitat Autònoma de Barcelona)

Archaeological research in rural high-altitude areas is essential to understanding how humans have historically adapted to extreme environments and transformed landscapes over time. Despite this, research has often focused more on lowland and urban areas, contributing to the misconception that high-altitude mountains were uninhabited during prehistory. This has led to a gap in research and recognition of the significant human activities, like the pasture of flocks, that have shaped these landscapes for millennia. Transferring the findings of this research to the general public is crucial for fostering appreciation and awareness of rural archaeological heritage. Effective dissemination can be achieved through educational programs, museum exhibitions, interactive digital platforms, and community engagement initiatives. Encouraging public participation in archaeological projects, such as guided site visits and hands-on workshops, can help bridge the gap between academic research and local communities. Additionally, leveraging social media and documentary storytelling can further enhance accessibility and interest in the historical significance of high-altitude human activity. By making this knowledge widely available, it becomes possible to promote conservation efforts and encourage sustainable interaction with these cultural landscapes. In this paper, we want to explain a project idea between the National park of Aigüestortes i Estany de Sant Maurici (PNAESM) and the research group in High-Altitude archaeology (GAAM) from the Prehistory department of Universitat Autònoma de Barcelona.

1791. HERITAGE MONITORING AND ENFORCEMENT IN SCOTLAND’S HISTORIC ENVIRONMENT

**Contribution format:** Poster  
**Contribution authors:** Luke Dale – Catherine Parker – Louise Roger – Sheila Clark – Chris Barrowman – Bob Will (Historic Environment Scotland)

Historic Environment Scotland (HES) maintains a list or ‘schedule’ of monuments considered to be nationally important, ranging in age from the Mesolithic to the Cold War era. There are over 8000 scheduled monuments in

Scotland, ~80% of which are on agricultural land and are impacted by (commercial) land management practises. Scheduled monuments situated in forestry also present challenges in terms of long-term land management. This paper outlines HES’s approach to monitoring and enforcement and the vital role played by education, encouragement and engagement with rural landowners in underpinning an efficient regulatory regime based on the Ancient Monuments and Archaeological Areas Act (1979). Monitoring sites using a variety of methods is particularly important, as it allows HES to track changes in the condition of monuments over time, to identify potential risks and unauthorised works at an early stage, and to provide an opportunity to give management advic. to land-owners (and discuss potential funding opportunities). Education, encouragement and engagement are shown to reduce the need for enforcement and are vital for the long-term preservation of Scotland’s historic environment.

248 INTERDISCIPLINARY APPROACHES TO HEALING PRACTICES FROM PREHISTORY TO HISTORY

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Prehistoric and ancient medicine, Archaeological breakthroughs, Dental calculus, Coprolites, Material culture, Plant-based remedies and drugs  
**Session organisers:** Emanuela Cristiani – Elena Fiorin (Sapienza University of Rome) – Lisa-Marie Shillito (Newcastle University)

SESSION ABSTRACT

This session invites contributions exploring the evolution of medicinal practices across prehistoric and historical periods through recent methodological breakthroughs in archaeology. We are interested in the relationship between ancient human communities and their natural environment. We focus on how they used natural resources for sustenance and as therapeutic agents, uncovering the roots of early medicinal practices and healing systems. Prehistoric humans survived injuries and illnesses, implying that medical care was essential for survival. The prevalence of cranial trepanations and amputations further suggests an understanding of pain relief and trauma treatment. However, reconstructing ancient medical practices poses challenges, as many treatable conditions leave no skeletal traces, and the line between food and medicine is often blurred. Interdisciplinary methods grant researchers access to hidden features of prehistoric, protohistoric, and historic medicine by analyzing dental calculus, coprolites, pottery residues, and sediments. When applied effectively, these methods provide new insights into ancient ailments and treatments. While metagenomic analyses reveal information on ancient pathogens, parasitological studies on sediments suggest that plant-based remedies were used as early as Europe’s Neolithic and Bronze Age. Pottery residue analysis indicates drug use, with evidence of psychoactive plants like psilocybin mushrooms for pain management in Medieval contexts. Dental calculus offers insights into early health practices, showing Neanderthals used anti-inflammatory plants. Forensic analyses of modern dental calculus aid in interpreting ancient metal pollutants, with pathogen reconstruction supported by aDNA analysis. We welcome interdisciplinary contributions to redefine our understanding of ancient healthcare, highlighting how new archaeological techniques broaden insights into medicinal practices. Leveraging aDNA, metagenomics, paleogenomics, proteomics, ICP-LCMS, entomology, microarchaeology, and microscopy, we invite studies on bioarchaeological remains (e.g., bones, teeth, dental calculus, coprolites), sediments, and material culture. These sources offer a broader perspective on health and healing practices, providing evidence for curative practices in prehistoric and early historical communities.

CONTRIBUTION ABSTRACTS

1760. UNCOVERING THE ROOTS OF PREHISTORIC MEDICINE: INTERDISCIPLINARY APPROACHES TO HEALING PRACTICES AND ECOLOGICAL KNOWLEDGE

**Contribution format:** Oral  
**Contribution authors:** Emanuela Cristiani (Sapienza University of Rome)

Why study prehistoric medicine? Despite the lack of direct evidence and written records, exploring the healing practices of early human societies is crucial due to the evolutionary significance of medicinal knowledge. Prehistoric medicine was essential for survival and a key element in the cultural and technological development of early humans. Evidence suggests that prehistoric humans used plants, animals, and minerals to treat injuries, infections, and diseases. The roots of self-medication, observed in both humans and animals, indicate that early humans likely learned to identify natural therapeutic resources through experience and observation. Recent interdisciplinary methods, such as the analysis of dental calculus, metagenomics, and proteomics, have opened new doors for understanding prehistoric medicine. Dental calculus, in particular. has preserved traces of medicinal

plants like yarrow and chamomile, showing how early humans managed pain and inflammation. These findings challenge the strict division between food and medicine, suggesting that early humans saw these resources as interchangeable. Further evidence from pottery and tools points to the use of psychoactive substances like psilocybin mushrooms for both medicinal and spiritual purposes. In this presentation, I will explore archaeological, bioarchaeological, and biochemical methods that can help shedding light on the origins of pharmacological practices and how early prehistoric societies used ecological knowledge to shape their survival strategies. By integrating theoretical insights from ethnography, anthropology, and ethnoscience, I will examine how an interdisciplinary approach enhances our understanding of prehistoric healing systems, highlighting the differences between these ancient practices and our modern concepts of healing.

1708. IDENTIFYING ANCIENT MEDICINAL PRACTICES THROUGH COPROLITE ANALYSIS

**Contribution format:** Oral  
**Contribution authors:** Lisa-Marie Shillito (Newcastle University) – John Blong (Washington State University)

Coprolites have become increasingly recognised as a valuable source of information on ancient health and diets. Compared to other forms of archaeological evidence, they can offer high resolution snapshots into individual ‘consumption episodes’ with specific microscopic items such as pollen, seeds and plant tissues, bone fragments, along with biomolecular residues resulting from the individuals’ digestive system, reflecting both the gut biochemistry and diet. A key challenge is distinguishing between deliberate and incidental consumption. Some particles found frequently in coprolites, such as microcharcoal and mineral grains, are not clearly linked to food. They may alternatively be a result of incidental consumption through food preparation, or possibly inhalation of smoke from the environment. One activity that has not been widely considered is that particles and residues in coprolites may be related to consumption for medicinal purposes, rather than nutrition. The use of charcoal for medicinal purposes for example is known from written sources and ethnographic studies. This paper reviews the occurrence of charcoal and other non-nutritional contents in coprolite assemblages from several early prehistoric sites, and considers whether these may be related to deliberate consumption for medicinal purposes.

1765. WORK, STRESS, AND LIFE HISTORIES: OSTEOBIOGRAPHICAL ANALYSIS OF THREE WOMEN FROM THE NECROPOLIS OF OSTIA ANTICA

**Contribution format:** Oral  
**Contribution authors:** Ileana Micarelli (Department of Environmental Biology, Sapienza University of Rome) – Prisca Solaini (Parco archeologico di Ostia antica, Servizio di Antropologia, MIC) – Giovanna Cataldo (Department of Mental and Physical Health, and Preventive Medicine, University of Campania) – Flavio De Angelis (Department of Mental and Physical Health, and Preventive Medicine, University of Campania | Department of Biology, California State University Northridge) – Alfonso Reginelli – Anna Russo (Department of Precision Medicine, University of Campania) – Paola Francesca Rossi (Parco archeologico di Ostia antica, Servizio di Antropologia, MIC)

Bones serve as biological archives, where intersecting factors and structural inequalities impact both physical and osteological health. Roman medical knowledge was widespread and advanced, with a clear understanding of female-related pathologies, as evidenced by votive offerings and, to some extent, by stature. This investigation seeks to highlight the importance of intersectionality by examining the interactions between social status, vulnerability, and gender within an archaeological context. Ostia Antica was one of the most significant centres during the Roman Imperial period, with the funerary area dated the 1st-2nd centuries CE. This study presents the reconstruction of three women to explore their pathological conditions, healing practices, and the consequences thereof. Several morphological features are shared by these three individuals, including short stature, enamel hypoplasia, and, in at least two cases, anterior curvature of the left femur and fractures. However, while one case suggests that the curvature resulted from an old healed fracture, another appears to show a severe case of osteomalacia. The third individual, despite being in poor preservation, displays a clear bone callus (on the right humerus) as a result of a right-sided fracture. These cases tell three distinct osteobiographies. Their survival in the face of nutritional stress, infections, fractures, and biomechanical dysfunction suggests the presence of medical knowledge that not only facilitated survival but also enabled individuals to live with their pathological conditions. Likely, this knowledge was aimed at improving their quality of life despite the challenges they faced.

1209. MEDIEVAL MERCURY EXPOSURE: BIOARCHAEOLOGICAL INSIGHTS FROM DENTAL CALCULUS

**Contribution format:** Oral  
**Contribution authors:** Elena Fiorin (DANTE-Diet and Ancient Technology Lab, Sapienza University of Rome) – Vincent Perrot (Research Unit: Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel)

Mercury (Hg) is a highly toxic heavy metal featuring a complex biogeochemical cycle and exists in various forms throughout the environment. Historically, Hg has been employed for artistic, industrial, and medicinal purposes, including treatments for syphilis and leprosy in medieval Europe. While archaeological research has analyzed Hg levels in bones and teeth to assess past exposure (cultural, environmental, poisoning from food or medical treatment), its presence in dental calculus (DC) has largely gone unexplored. Since DC has been shown to be of particular relevance to trace ancient diets and environmental contexts of ancient populations, this study investigates Hg concentrations in DC from individuals interred in late medieval cemeteries (11th–16th centuries), mainly focusing on sites associated with leprosy. Comparative samples from cemeteries not linked to leprosy were analyzed to evaluate potential differences in Hg exposure. Additionally, soil samples from burial contexts were examined to assess possible post-mortem mercury contamination. Trace amounts of Hg were measured in soil using atomic absorption spectrometry (AMA-254) and in dental calculus using cold vapour fluorescence adsorption spectroscopy (CV-AFS). Results revealed significant mercury variability between sites, with dental calculus from leprosaria cemeteries displaying notably higher concentrations than those from non-leprosaria cemeteries. This indicates that individuals affected by leprosy may have been exposed to Hg-based medicinal treatments. The exclusion of soil as a source of Hg in dental calculus strengthens this hypothesis. This study provides new insights into the role of Hg in historical medical practices, highlighting the potential of dental calculus as a valuable proxy for reconstructing past therapeutic interventions. Further research is essential to constrain better Hg exposure pathways and their implications for medieval healthcare practices.

981. MERCURIAL TREATMENT OF DEFICIENCY DISEASES IN 17TH-19TH CENTURIES FRANCE

**Contribution format:** Oral  
**Contribution authors:** Alexandra Zinn – Isabelle Pianet (UMR 6034 Archéosciences, Bordeaux Montaigne University) – Antony Colombo (UMR 6034 Archéosciences, Bordeaux Montaigne University | École Pratique des Hautes Études - PSL University)

The French industrialisation has been accompanied by economic and social transitions. With it, an epidemiological transition led to the emergence of diseases as respiratory and cardiovascular diseases and changes in the prevalence of deficiency diseases such as rickets (vitamin D) and scurvy (vitamin C). Meanwhile, major scientific advances, particularly in medicine and pharmacy, have led to changes in the treatment for deficiency diseases treatments. The medico-historical literature reports plant-based and animal-based treatments but, interestingly, also treatments containing metal elements, especially mercury. Mercury is now recognised extremely toxic, but has been widely used in many forms for medical purposes since the 17th century. The paleopathological analysis conducted on several osteo-archaeological collections from metropolitan France (n=4) dated to the 17th–19th centuries has revealed numerous individuals exhibiting skeletal signs of multiple deficiencies attributable to rickets and/or scurvy. These individuals (n=59) were subsequently subjected to an archeometric investigation for mercury detection with Energy Dispersive X-ray Fluorescence (ED-XRF) and Cold Vapour-Atomic Absorption Spectrometry (CV-AAS). Performed on bone and dental samples (molar, phalanx, vertebra), this paleopharmacological analysis revealed abnormal high mercury concentrations, suggesting severe ante-mortem intoxication (value as high as 9.373 mg/kg). Here, we discuss the hypothesis of mercury-based medical treatment through a thorough assessment of other potential sources of mercury contamination (soil metallogeny, environmental factors, occupational mercury exposure), in the socio-cultural context of the studied sites during the 17th–19th centuries. This study, is highlighting the relevance of the paleopharmacological approach within the framework of the archaeology of health and provides valuable insights into past therapeutic practices and their evolution over time.

698. THE CASE OF ST. TEODOR CHURCH (CROATIA): PRELIMINARY RESULTS OF ARCHAEOLOGICAL AND PALEOPATHOLOGICAL ANALYSIS

**Contribution format:** Oral  
**Contribution authors:** Sinisa Pamic (Croatian Conservation Institute) – Natasa Sarkic (Aita Bioarchaeology)

The remains of St. Teodor church are located in the Municipality of Marčana, Istria County, Croatia. Since 2018 archaeological campaigns and conservation-restauration works have been implemented. Researchers identified several construction phases. The oldest dates back to the late antiquity. The church was expanded in the 13th century when burials around the church began. Due to the large number of burials, side entrances were walled up in the 15th century. The church was abandoned in the 19th century and was quickly ruined afterwards. Around the church, 50 graves with multiple deceased were excavated, dating from the beginning of the 13th to the mid-16th century. The oldest burials were on the native rock without coffins, followed by burials built and plastered tombs, while the youngest ones were vertical slab tombs with stone lids covering. While the burial practices and objects found in the graves at the St. Teodor necropolis resemble those of other Christian necropolises from the same period, the results of anthropological and paleopathological analyses were unexpected. The demographic population in this necropolis is unusual, as there are significantly more adult men than women and

children. Many individuals had remarkable congenital or acquired deformities, along with chronic illnesses, that necessitated constant care. The existence of trepanations and other surgical procedures, as well as their successful outcomes, indicates the presence of medical care. In this presentation, we will combine traditional methods such as macroscopic analysis with advanced techniques like CT and mCT scanning, paleoparasitology, and the analysis of ancient DNA pathogens. This integrated approach will enhance our ability to detect pathologies that are not visible to the naked eye, ultimately providing a better understanding of health and healing practices within this unique community.

251 KINSHIP SYSTEMS AND THEIR IMPACT ON PAST HUMAN COMMUNITIES

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** social kinship, aDNA, biological relatedness, community organisation, biosocial archaeology  
**Session organisers:** Zsuzsanna Siklósi (Eötvös Loránd University) – Domnika Verdianu (Department of Prehistory and Historical Archaeology, University of Vienna | Austrian Archaeological Institute, Austrian Academy of Sciences) – István Koncz (Eötvös Loránd University) – Wolfgang Haak (Max Planck Institute for Evolutionary Anthropology)  
**Session discussant:** Domnika Verdianu (Department of Prehistory and Historical Archaeology, University of Vienna, Austrian Archaeological Institute, Austrian Academy of Sciences)

SESSION ABSTRACT

The huge increase of aDNA data in recent years reveals in previously unimaginable detail the biological relatedness between individuals in the past and, through them, the networks of biological organisation of communities. At the same time, it is becoming increasingly clear that (1) biological relatedness cannot capture the full spectrum of social kinship systems, and (2) there is a complex interrelationship between different cultural networks and kinship systems. The ability to generate genomic data from entire cemeteries has only become possible in recent years. The resulting studies reveal the complex relationship between biological relatedness and social kinship and its varied impact on community formation and development. While many studies focused on the presence of ‘pedigrees’ (i.e. sets of closely biologically related individuals), the quantitative and qualitative analysis of biologically unrelated individuals also provides critical information on other contributing factors. This again raises the question of how representative these funerary communities are of the world of living, what ordering principles governed who was buried in a cemetery, and whether we can discern similar kinship systems and social rules in culturally similar sites. The study of kinship systems, community organisation and the choice of burial places is inextricably linked to understanding residence patterns, individual and group mobility and several social rules (e.g. marriage, childcare, consanguinity). The examination of these interrelated elements requires the integration of diverse research methods and disciplinary perspectives. We welcome inter- and multidisciplinary research that approaches the study of kinship systems and community organisation from multiple perspectives and discusses some of the interrelated topics.

CONTRIBUTION ABSTRACTS

1402. “MATERIAL AFFINITIES”: BIOLOGICAL TIES AND MATERIAL CONNECTIONS AT ÇATALHÖYÜK

**Contribution format:** Oral  
**Contribution authors:** Camilla Mazzucato (Department of Life Science and System Biology, University of Turin | University of Copenhagen) – Michele Coscia (IT University of Copenhagen) – Ayça Küçükakdağ Doğu (Department of Biological Sciences, Middle East Technical University, Ankara) – Scott Haddow (University of Copenhagen) – Muhammed Kılıç (Department of Health Informatics, Middle East Technical University, Ankara) – Eren Yüncü – Mehmet Somel (Department of Biological Sciences, Middle East Technical University, Ankara)

Archaeogenomic research at Çatalhöyük has revealed complex patterns of genetic relatedness and unrelatedness between individuals buried underneath the floor of houses at the site (Yüncü et al. 2024). Biological relatedness appears to be only one of the factors that determines the selection of individuals to be buried within the same building. Recent research on kinship patterns and practices of relatedness at Çatalhöyük made use of Network Science as a way of synthesizing and analyzing a heterogeneous and complex dataset composed by archaeogenomic and material culture data (Mazzucato et al. 2025). Network methods highlighted the importance of materiality in constructing and reproducing kinship bonds and revealed that biological relatedness correlates

with material culture similarities and concentrates in space. For the current study we aim to further investigate the dynamic and complex relationship between material culture and practices of relatedness at Çatalhöyük and to explore the role of the different material categories in determining links between buildings and their relations with genetic bonds on site.

**2189. VARIABILITY OF KINSHIP PRACTICES AND SOCIAL ORGANISATION IN THE EARLY COPPER AGE OF THE EASTERN CARPATHIAN BASIN**

**Contribution format:** Oral  
**Contribution authors:** Zsuzsanna Siklósi (ELTE Eötvös Loránd University, Institute of Archaeological Sciences | MTA-ELTE Lendület “Momentum” Innovation Research Group) – Cristian Virag (Satu Mare County Museum) – Anna Szécsényi-Nagy – Kristóf Jakab (HUN-REN Hungarian Research Network, Research Centre for the Humanities, Institute of Archaeogenomics) – Tamás Keszi (Hungarian Natural History Museum, Hungarian National Museum Public Collection Centre) – Zsuzsanna Virág (Budapest History Museum, Aquincum Museum) – Tamás Hajdu (ELTE Eötvös Loránd University, Department of Biological Anthropology) – Sándor Évinger (Hungarian Natural History Museum, Hungarian National Museum Public Collection Centre) – Ron Pinhasi (University of Vienna, Department of Evolutionary Anthropology) – David Emil Reich (Department of Genetics, Harvard Medical School | Department of Human Evolutionary Biology, Harvard University | Howard Hughes Medical Institute | Broad Institute of MIT and Harvard)

We present the results of 116 newly sequenced genomes from six contemporaneous Early Copper Age sites (4500-3900 cal BCE) from the eastern Carpathian Basin using population genomic and identity-by-descent (IBD)-based biological relatedness estimations. Early Copper Age communities lived in small-scale, farm-like settlements throughout the eastern Carpathian Basin. Formal cemeteries were first established at the beginning of the Copper Age in this region, and besides these formal burial grounds, the tradition of settlement burials continued. We found that Tiszapolgár-Basatanya and Urziceni-Vamă cemeteries, lying 100 km from each other and sharing several cultural elements such as mortuary rituals and material culture, reflect different kinship practices and community organisation. Tiszapolgár-Basatanya could be a burial place for a strongly connected, closed, patrilineal and patrilocal community in which first-cousin unions frequently occurred, and close relatives were usually buried next or close to each other. On the contrary, Urziceni-Vamă indicates a significantly larger, open community where close relatives were not buried next to each other and did not follow the patrilineal organisation. We found biological relatedness between the analysed contemporaneous sites using IBD-based network construction. Our presentation discusses the shared cultural traditions and differences in mortuary practices and material culture and focuses on the sociocultural interpretation of diverse community organisations and kinship practices.

**795. GENETIC RELATEDNESS AND KINSHIP IN CORDED WARE AND BELL BEAKER COMMUNITIES FROM CENTRAL GERMANY**

**Contribution format:** Oral  
**Contribution authors:** Sandra Penske (Max Planck Institute for Evolutionary Anthropology) – Adam Rohrlach (Max Planck Institute for Evolutionary Anthropology | School of Biological Sciences, University of Adelaide) – Torsten Schunke – Jonathan Schulz – Jörg Orschiedt – Harald Meller (Landesamt für Denkmalpflege und Archäologie Sachsen-Anhalt) – Wolfgang Haak (Max Planck Institute for Evolutionary Anthropology)

The Late Neolithic (~2800-2400 BCE) was a time period of major genetic and social changes. With the emergence of the Corded Ware Complex (CWC) (~2800 BCE) in Central Germany, steppe-related ancestry and new burial practices were introduced to the region, such as sex-specific grave goods and orientation of the dead. Around 2500 BCE a new cultural complex, the Bell Beaker Phenomenon (BBP) appeared. Being partially contemporaneous with the late CWC, individuals associated with the BBP show a distinct genetic profile and phenomenon-specific burial rites. However, practices surrounding social organization during the Late Neolithic in Central Germany are largely unknown and possible differences or similarities between the CWC and the BBP have not yet been studied at a site with spatial and potential temporal overlap. Here, we present genome-wide data from 23 individuals from the Central German site of Oechlitz: five from a multiple burial associated with the late CWC and eighteen from a partially contemporaneous burial ground associated with the BBP less 100 m apart. We find close genetic relationships between the individuals associated with the CWC, and also between those associated with the BBP, but not between the culturally-associated groups. Pedigree reconstruction suggests a tight-knit community in Oechlitz during the BBP. The results of this study will yield new insights into the social organization of these two genetically and culturally distinct phenomena Late Neolithic groups and broaden our understanding about possible variations between them.

**571. PATRILINEALITY AND FEMALE EXOGAMY IN A LATE CHALCOLITHIC MOUNTAIN COMMUNITY AT THE EASTERN PYRENEES**

**Contribution format:** Oral  
**Contribution authors:** Núria Puig i Riera (Universidad del País Vasco (UPV/EHU)) – Celia Díez-Canseco (Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA) | Muséum National d’Histoire Naturelle) – Miguel Ángel Moreno-Ibáñez (School of History, Classics and Archaeology, University of Edinburgh) – Rosa Soler (Institut Català d’Arqueologia Clàssica (ICAC-CERCA) | Universitat Rovira i Virgili (URV)) – Swapan Mallick (Harvard Medical School | Broad Institute of MIT and Harvard) – Nadin Rohland (Harvard Medical School) – Carlos Tornero (Universitat Autònoma de Barcelona (UAB) | Institut Català de Paleoeologia Humana i Evolució Social (IPHES-CERCA)) – David Reich (Harvard Medical School | Broad Institute of MIT and Harvard | Harvard University) – Iñigo Olalde (Universidad del País Vasco (UPV/EHU) | Harvard University | Ikerbasque–Basque Foundation of Science)

Roc de les Orenetes (Queralbs, north-eastern Spain) is a burial cave in the high Eastern Pyrenees mountains (1840 metres above sea level) containing a collective inhumation. At least two differentiated phases of use between the 3rd-2nd millennia BCE have been described according to archaeological, anthropological and radiocarbon analyses. In this study, we generated genome-wide data for 65 exceptionally well-preserved individuals belonging to the Late Chalcolithic phase (2500-2300 BCE). We were able to reconstruct a pedigree with 38 closely related individuals, organised around five sub-families likely descending from five brothers and following a strong patrilineal structure, with the remaining individuals connected to the main pedigree via distant familial relationships. There seems to be a particular funerary treatment for women, brought to light by the significant sex ratio imbalance in favour of male individuals (3.75:1) and the absence of daughters from the clan in the cave, even before reaching reproductive age. This could be partially explained by the practice of female exogamy and the exclusion of subadult girls from the burial rite. The absence of recent endogamy in the genome of these individuals, thought to be isolated due to their peculiar location, suggests that they were part of a broader highland community. Despite being contemporaneous to the earliest presence of steppe-associated ancestry in Iberia, the Roc de Les Orenetes community lacked this ancestry component, highlighting that social organization around patrilineality and female exogamy were ongoing before the large-scale demographic change that took place in the Iberian Peninsula during the Early Bronze Age.

**702. LANDSCAPES OF SOCIAL AND GENETIC RELATIONS IN THE AUVERGNE REGION OF PRESENT-DAY FRANCE DURING THE BRONZE AGE**

**Contribution format:** Oral  
**Contribution authors:** Wolfgang Haak – Adam Rohrlach (Max Planck Institute for Evolutionary Anthropology, Leipzig) – Frédérik Letterlé (UMR 5138, Laboratoire ArAr - Archéologie et Archéométrie, Lyon) – Ivy Thomson (Centre de recherches archéologiques Inrap, Clermont-Ferrand) – Patrice Brun (Université de Paris 1 Panthéon-Sorbonne)

Recent methodological and analytical advances in archaeogenetics permit the generation and analysis of ancient human DNA data from entire burial sites. When fully integrated into the archaeological and anthropological contexts, the resulting combined data lends itself to the estimation of biological relatedness and exploration of social kin relation between individuals buried at the same site. Expanding the data to broadly contemporaneous nearby sites or regions, and leveraging the power of shared identity-by-descent (IBD), holds the potential to explore the complex interplay between genetic and cultural networks and the social organization of prehistoric communities at local and regional scales, and how these are embedded in their respective landscapes and economies. Here, we present new data from ~170 Early Bronze Age individuals from the Auvergne region from five different sites located in the valley near today’s Clermont-Ferrand, along and around the lake marshes of the Allier River (an area of about 200 km<sup>2</sup>). We observe a substantial number of closely related individuals, which allow for the reconstruction of a number of small or medium-sized pedigrees for each burial site. Critically, via shared IBD analysis we also find a large proportion of individuals that are genetically related to individuals from other sites from the region, resulting in a network that includes all five sites. Moreover, the remaining fraction of unrelated individuals indicates an even wider network of Bronze Age communities. We present and discuss the current stage of the project, its relevance for Bronze Age archaeology of the Auvergne region and the potential for expansion and cross-regional contextualization, and insights from comparisons with published funerary sites in Neolithic and Bronze Age Europe.

2120. FROM THE EURASIAN STEPPES TO CENTRAL EUROPE. A STUDY OF ENTIRE BURIAL COMMUNITIES IN THE AVAR PERIOD

**Contribution format:** Oral  
**Contribution authors:** Zsófia Rácz (Institute of Archaeological Sciences, Eötvös Loránd University) – Guido Alberto Gneccchi-Ruscone (Archaeo- and Palaeogenetics, University of Tübingen) – Luca Traverso (Max Planck Institute for Evolutionary Anthropology) – Levente Samu (Institute of Archaeological Sciences, Eötvös Loránd University) – Tamás Szeniczey (Department of Biological Anthropology, Eötvös Loránd University) – Balázs Takács – Tivadar Vida (Institute of Archaeological Sciences, Eötvös Loránd University)

Archaeogenomic analyses of entire burial communities have been a scientific novelty in recent years. As part of the HistoGenes project, analyses have been carried out on several Avar-period cemeteries from different parts of the Carpathian Basin. This presentation will focus on new findings to demonstrate the potential of these methods for studying the society of the Migration Period. What can (and cannot) be learned about the organization, kinship networks, and marriage strategies of people and communities in this period? How did various communities from different cultural backgrounds interact within the Avar Khaganate? We will also try to show the social changes that took place between the end of the 6th century and the turn of the 8th and 9th centuries at the level of smaller communities and on a larger scale. This analysis will be conducted by comparing archaeological finds, the spatial arrangement of cemeteries, pedigrees, and individuals who do not belong to biological kinship networks. Regarding transformations within the broader political entity, we aim to highlight phenomena observable across the entire Avar Khaganate.

1674. BIOLOGICAL RELATEDNESS OF KÖŞKHÖYÜK NON-ADULTS

**Contribution format:** Poster  
**Contribution authors:** Ekin Saglican (Middle East Technical University)

Köşkhöyük is an archaeological site situated in Turkey with the oldest Neolithic level dated to 6340-6080 cal BC. Köşkhöyük’s strategic location between the Levant and Central Anatolia makes it an intriguing site, showcasing unique cultural connections to both regions. For example, skull modification practices commonly seen in Levant Region are also present in this site considering it is located in Anatolia near the Taurus Mountains separating these two regions. The remains of 97 infants from this site have been studied for aDNA with 70% success rate. Preliminary results show that 83 pairs of individuals are biologically related in various degree, including siblings, half-siblings, cousins or avuncular relations. These initial findings allowed as to construct pedigrees of five biological families with 4,5,6,7 and 8 related individuals. Although biological relatedness is not enough to grasp the social organization of the population, maternal or paternal connections between related individuals, the presence of half-siblings and mating of biologically related individuals detected via aDNA can provide insights about the kinship systems.

252 TRANSHUMANCE IN THE MEDITERRANEAN WORLD

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Session with keynote presentation  
**Session keywords:** Transhumance, seasonal pastoralism, animal husbandry, Mediterranean  
**Session organisers:** Saša Caval (Zrc SAZU | University of Primorska) – Francesco Carrer (Newcastle University) – Miloš Petričević (Museums of Kotor) – Edin Bujak (University of Sarajevo)

SESSION ABSTRACT

Transhumance, an umbrella term for seasonal pastoralism and animal husbandry practices, refers to the cyclical migration of livestock between summer and winter pastures, optimizing the use of available natural resources while allowing the land to recover during off-seasons. These practices are rooted in local traditions and showcase an understanding of ecosystems, demonstrating sustainability over generations. The livestock are moved based on climatic conditions and the availability of water and grass. With animal husbandry encompassing animal care, breeding, and management to support human communities, transhumance has developed into a global economic activity, transcending geographical and chronological boundaries. The cultural significance of transhumant practices extends beyond mere survival; they are embedded with social rituals and community ties that foster a sense of identity and belonging within the community, reinforcing the interconnectedness between people, animals, and the land. Herders possess a deep, ancestral knowledge of their environment. Through careful stewardship and traditional ecological knowledge, transhumance contributes to sustainable land use and environmental conservation, providing valuable lessons for modern agricultural practices. Transhumance is a common feature of the

Mediterranean region. It has shaped the landscapes around the Mediterranean since prehistoric times and has become an important tangible and intangible heritage. With this session, we aim to discuss how archaeological studies of transhumance are advancing our understanding of the traditional pastoral practices that survive today in Mediterranean countries. We invite colleagues to present diverse topics in this context. We welcome a wide range of approaches, including onomastic methods, scientific micro-elemental analysis, ethnographic studies of transhumance, and assessments of environmental impacts on soil. We look forward to abstract submissions that utilize archaeological and multidisciplinary evidence of sustainable resource exploitation within specific Mediterranean landscapes at various times and places. Any perspective is valued and encouraged, enriching our understanding of these complex practices.

CONTRIBUTION ABSTRACTS

2524. KEYNOTE: ETHNOARCHAEOLOGICAL REALITIES AND SCIENTIFIC FACTS FOR THE PASTORALISMS OF THE PAST

**Contribution format:** Oral  
**Contribution authors:** Claudia Chang (Institute for the Study of the Ancient World, New York University | Sweet Briar College)

This address shall begin with a biographical sketch of my ethnoarchaeological research on village pastoralism in the Northeast Argolid of Greece (1978-1981) and pastoral transhumance in the Grevena region of Northern Greece (1989-1993). This early work on the material culture of Greek pastoralism such as the presence of animal folds, corrals, milking pens, herder’s huts, watering places, paths and other markers for documenting sheep and goat herding on the Greek landscape will serve as a backdrop for examining the contemporary scientific advancements in the fields of pastoral archaeology and ethnoarchaeology of the Mediterranean and other regions. There are two theoretical areas I shall focus on: (1) emerging evidence for the presence of pastoral transhumance in the Alps and the Pyrenees that extends back into the Neolithic period; and 2) how the ethnoarchaeological data collected in upland areas of the Mediterranean has now refined and strengthened our ethnographic analogies and actual pastoral site interpretations. The methodological areas that will be introduced but no doubt will be fleshed out by today’s archaeological practitioners in this session are: (1) uses of plant and animal isotopes for tracing pastoral mobility; (2) contributions of aDNA studies on animals and human skeletal materials that trace more than origins; 3) archaeochemistry of sediments associated with animal enclosures (dung deposits, middens, etc); and 4) the role of radiometric dating in re-visioning our models for mobility, pastoral transhumance, and its effect on the changing social evolution of Neolithic through Medieval and present-day pastoralism in the Mediterranean. Other theoretical and methodological paradigms will be invited from the participants in this exciting and ground-breaking session.

1970. ANATOLIAN TRANSHUMANCE: THE ENDURING INTERPLAY OF CULTURE, ECOLOGY, AND HERITAGE

**Contribution format:** Oral  
**Contribution authors:** Selin Karaca – Ayşe Güliz Bilgin Altınöz (Middle East Technical University Faculty of Architecture)

Transhumance represents a unique way of life that bears the cultural traces of seasonal and recurrent migration as well as animal-oriented production, which are reflected on the landscape. It is a millennia-old livelihood practice that contains diverse historical layers. Moreover, it is the common heritage of humanity practiced in many parts of the world especially in Mediterranean. The Taurus Mountains have witnessed the transhumant way of life for centuries, and the remnants of pastoral activities and highland settlements in the region suggest that transhumance practices may have also existed in antiquity (Takaoğlu, 2020; Hammer & Arbuckle, 2017; Hopwood, 1991). Having been a longstanding tradition for centuries, it is hard to sustain this way of life under current conditions. Additionally, the limited tangible traces of this culture further complicate its conservation. In this context, the Sarikeçili tribe, one of the last communities maintaining the traditional transhumance culture in the Taurus Mountains—a region where this practice has persisted for centuries—have been the focus of this study. The aim is to explore the dynamics of the transhumant landscape, providing a deeper understanding of transhumance culture by examining both its tangible and intangible heritage values, as well as the challenges it faces. In this regard, field studies were conducted to understand the physical and social environment through participant observation. Additionally, in-depth interviews were carried out to gain knowledge regarding the lifestyle, traditions, migration routes and rituals, production techniques, herding habits, problems and challenges, etc. This study highlights how the legal and administrative aspects along with top-down decisions significantly threaten the continuity of this culture. Rather than conserving it through multiple legal statuses, there is much to learn from the resilience and sustainability that form the core components of transhumance culture.

597. TRANSHUMANCE PRACTICES IN BRONZE AGE CRETE: THE EVIDENCE FROM THE UPLANDS

**Contribution format:** Oral  
**Contribution authors:** Yiannis Papadatos (National and Kapodistrian University of Athens) – Tina Kalantzopoulou (Belgian School at Athens | National and Kapodistrian University of Athens) – George Ntzoufras (National and Kapodistrian University of Athens)

Despite the abundance of indirect evidence about the importance of pastoralism for the palatial economy of Bronze Age Crete, the direct archaeological evidence is very poor for several reasons. First, pastoral activities, including transhumance, do not leave a strong archaeological imprint on the ground. Second, archaeological research in Crete is oriented towards the excavation of palatial and urban centers in the lowlands, while mountains still remain a highly neglected and scientifically marginalized area of systematic archaeological study. Based on the results of the resent work of the University of Athens on the Dikte mountains (East Crete), which includes archaeological surveying and ethnographic study of modern pastoral communities, this presentation aims at providing a history of the exploitation of the mountains for pastoral activities and transhumance throughout the Bronze Age (3rd and 2nd millennium BCE). The available evidence shows an important shift in the occupational history of the mountains in the Second Palace period (1700-1450 BCE), which might be related to changes in transhumance practices, and connected to deep transformations in the organization of pastoral economy due to palatial intervention. Considering that the mountains were not densely inhabited or intensively exploited in the earlier phases of the Cretan Bronze Age, our effort is to identify the ways by which the palatial system instigated, enabled or controlled initiatives to exploit the demanding mountainous terrain and promoted pastoralists to occupy marginal mountain areas and abandon traditional transhumance practices.

2523. KEYNOTE: TRANSHUMANCE IS GOOD TO THINK WITH

**Contribution format:** Oral  
**Contribution authors:** Dimitrij Mlekuž Vrhovnik (University of Ljubljana)

Transhumance, a form of nomadic pastoralism, involves the seasonal movement of people and animals between summer and winter pastures to ensure year-round grazing. This movement can be classified as either vertical, in the ‘lesser’ transhumant movement between valley floors and neighbouring uplands, or horizontal, in the ‘greater’ transhumant movement between distant agro-ecological regions. However, its many forms and appearances have led Fernand Braudel to caution against rigid classifications, emphasizing its fluid and context-dependent nature. Rather than attempting to fix and stabilize transhumance and look for its residues in the archaeological record, I argue that it is more productive to see it as an assemblage — a process, a practice of bringing together, joining, and traversing separate elements that form archaeological record. Movement is central to transhumance. To move through the world is to perceive it, engaging with a multiplicity of things. Transhumant movement is not just a response to the environment but a way of orienting in the world, shaping both meaning and material reality. Particular transhumant movements carry distinct social, political, and ecological significance. Movement does not happen in an empty space; it creates and alters space and place, makes relations and constructs time itself. Transhumance unsettles notions of human-animal relations. The movement of transhumance challenges the perceived autonomy of “the human,” demonstrating how human and non-human identities and bodies are inherently multiple, relational, and dependent on other presences. Transhumant movement, at once individual and collective, produces, resists, and sustains social orders while being constrained, directed, and limited by social structures, traditions, and political forces. It involves attractions and avoidances, intentional paths and imposed restrictions. Thus, the performativity of mobility — the ways in which movement is enacted, embodied, and experienced — becomes crucial to understanding transhumance.

2537. KEYNOTE: TRANSHUMANCE IN MONTENEGRO: RESEARCH ON HERITAGE-BASED LIFESTYLE

**Contribution format:** Oral  
**Contribution authors:** Ivan Lakovic – Olga Pelcer-Vujačić – Tatjana Koprivica – Aleksandra Kapetanović (Historical Institute, University of Montenegro)

Until the middle of the 20th century, the Montenegrin population lived predominantly within rural communities, pursuing agricultural practices suitable for local edaphic and climatic conditions. Given the lack of arable land and harsh summer droughts, the transhumant way of cattle rearing became the common way to go, establishing the system of different categories of tangible and intangible heritage that thoroughly defined such a society. In that context, special attention should be paid to katuns, seasonal settlements at mountain pastures, as the nuclei of lifestyle created on such a basis. Developed through vertical and horizontal transhumance, the Montenegrin katuns were the means for survival during the dry periods, a source of acquiring surpluses of the products for winter reserves, trade and marketing, and bases for developing new villages. Current societal tendencies render the katuns mostly abandoned and their areas depopulated, inevitably leading to the loss of related cultural and historical heritage. This is particularly problematic in the categories dependent on continuous

human maintenance, such as drystone and wooden constructions, traditional traffic directions and water-supplying infrastructure. Presented results emerged from research on case studies of Durmitor, Kući Mountain and Sinjajevina, conducted within the series of projects since 2015 and onwards, archaeological evidence, historical sources, and relevant literature.

526. ON A PASTURE IN THE MOUNTAIN DURING THE LIA: A LOCAL CASE OF PASTORAL MOBILITY NEAR RUPCHA, SOUTHEASTERN BULGARIA

**Contribution format:** Oral  
**Contribution authors:** Petar Minkov – Denitsa Sandeva-Minkova (National Institute of Archaeology-Bulgarian Academy of Sciences)

The study focuses on a recently discovered Late Iron Age settlement in southeastern Bulgaria. During its excavation various types of archaeological structures were found - ditch, pits, dug-in dwelling, hearth, etc. The materials that were found are scarce and include pottery sherds, both from hand-made and wheel-made vessels. Among the identifiable fragments are various open bowls, jugs, storage vessels, and an amphora base, probably of Thasos origin. Towards them can be mentioned two preserved vessels as well - a bowl and a tray, animal bones and a limited range of single finds. These include a spindle whorl, flint plate, stone pestle, and a small piece of a glass bracelet fragment. The finds, as well as the pottery, are in a fragmentary state, indicating that they were probably abandoned on leaving the settlement. All this and the characteristics of the landscape of the region and the features allow the excavated site to be interpreted as a Late Iron Age pastoral settlement.

1945. ECHOES OF MOVEMENT: ARCHAEOLOGICAL EVIDENCE OF PREHISTORIC MOBILITY IN THE MONTENEGRIN KARST

**Contribution format:** Oral  
**Contribution authors:** Milos Petricevic (Museums of Kotor)

The Dinaric Alps (Dinarides) represent a challenge for researchers across various scientific disciplines. Their inaccessibility and geographical isolation have made them one of the least archaeologically explored Montenegrin regions to this day. The high-altitude landscapes of Montenegro have often been regarded as remote, isolated and marginal environments by the Montenegrin archaeologists. The established views of the prehistoric activity in the High Karst zones remains limited, but recent discoveries have begun to reshape this narrative. Among the most significant findings are archaeological sites situated at nearly 2,000 meters above sea level—some of the highest-altitude sites ever recorded in Montenegro. From the newly uncovered petroglyphs in the Prokletije mountain range to previously unknown burial mounds in the high-altitude zones of Sinjajevina, these findings challenge established views on human presence and adaptation to extreme conditions. A number of previously unknown burial mounds and hillforts has been discovered using remote sensing techniques. However, without archaeological excavations, it remains impossible to precisely date these sites, leaving the question of when the burial mounds of Sinjajevina were erected. Recent archaeological investigations in these high-altitude regions not only shed new light on the adaptability of prehistoric communities but also provide critical insights into the early origins of transhumance in Montenegro. These discoveries testify to the capacity of ancient societies to endure and thrive in isolated, harsh environments, offering a deeper understanding of human-environment interactions throughout history.

2132. SEASONALLY OCCUPIED SETTLEMENTS IN THE DINARIC ALPS: A MULTI-PERIOD PASTORAL LANDSCAPE AT BUSOVAČA AND TARASOVAČA IN EASTERN HERZEGOVINA

**Contribution format:** Oral  
**Contribution authors:** Saša Caval (Institute for Anthropological and Spatial Studies, ZRC SAZU | Department of Archaeology and Heritage, University of Primorska) – Agni Prijatelj – Rok Turniški – Marko Zupan (Centre for Soil and Environmental Research, Biotechnical faculty, University of Ljubljana)

The multi-period pastoral settlements of Busovača and Tarasovača are located in a high-altitude valley at approximately 1,400 meters above sea level in eastern Herzegovina, where Crvanj mountain transitions into the Morine plateau. These settlements are marked by various archaeological remains, including multiple buildings, enclosures, and boundary walls. Our current geoarchaeological research is focused on understanding how human activities across different locations and periods have altered the geochemical characteristics of local soils at these two sites. In 2023 and 2024, we conducted soil augering and micromorphology sampling, surveying 69 locations using a combination of transects and a 5m x 5m grid. We analysed a total of 191 bulk soil samples from the A, AB and B horizons for the standard soil parameters, including pH, carbonates, soil organic matter, plant available phosphorus and potassium, and electrical conductivity. Additionally, pXRF spectrometry on the samples provided near-total concentrations of selected elements. A combination of principal component and GIS analyses revealed

spatial and temporal variation in the distribution of principal components, indicating diverse pastoral activities and varying intensities of land use over time. Moving forward, our research will integrate geoarchaeological data with radiocarbon dating, spatial and chronological analyses of archaeological features, architectural assessments, and historical and ethnographic synthesis. This interdisciplinary approach will facilitate an assessment of the extent and intensity of anthropogenic modifications at Busovača and Tarasovača during different occupational phases. Ultimately, our findings will contribute to the development of a finely calibrated research protocol for studying multi-period pastoral landscapes in the Western Balkans and beyond.

494. TRANSHUMANCE AND THE LONG-TERM SUSTAINABILITY OF MEDITERRANEAN LANDSCAPES

Contribution format: Oral  
Contribution authors: Francesco Carrer (Newcastle University)

Transhumance is one of the most important and iconic agricultural heritage systems in the world. This pastoral strategy contributes to the livelihoods of many communities throughout the Mediterranean, and is believed to foster the sustainable management of vulnerable ecosystems, like rangelands and mountain pastures. Understanding the complex history of transhumance is of crucial importance to assess the long-term influence of this practice on the rural landscapes of the Mediterranean. The PLAS project (Pastoralism and Landscape Sustainability) investigates the relationship between mobile animal farming and landscapes in different regions and historic periods. By combining archaeological, environmental and computer science with ethnographic methods, PLAS investigates the impact of pastoralism on vegetation, soil and landscape character. One of the case studies of PLAS is Aspromonte, in Calabria (Southern Italy). Here the PLAS team has investigated the environmental impact of pastoral activities during the first half of the 1900s and the consequences of the rapid abandonment of the area in the second half of the century. Preliminary results showed that the effects of transhumance on the territory are far more complex than initially thought, and that the legacy of historic transhumance is still visible in today's abandoned landscapes. The data from Aspromonte and other case studies suggest that long-term analysis is essential to support the protection of traditional pastoral knowledge while promoting the sustainable development of landscapes.

1559. OUT AND ABOUT –A NETWORK OF SHEPHERD PATHS, SETTLEMENTS AND PASTURES IN THE CONTEXT OF ARCHAEOLOGICAL FINDS OF SOUTHERN VELEBIT

Contribution format: Poster  
Contribution authors: Morana Vukovic (Archaeological Museum Zadar)

Velebit has been an area of active transhumant livestock farming, both in the past and today. Only a few families have continuously maintained this way of life, and recently younger generations have been coming back and choosing to return to their roots instead of urban life. At the same time, there is a growing interest among researchers in the Velebit area, its cultural heritage, both archaeological and ethnological, but also an increasing need for interpretation and presentation. Ongoing archaeological research, although still insufficient, continues to reveal details of life on Velebit in the past, with remains from later prehistoric periods being particularly dominant. Ever since prehistory, people have been living in this area, using every advantage it has and overcoming the disadvantages. This limestone area, marked by water scarcity, with its distinct karst features, is synonymous with a difficult and arduous life for today's man. At the same time, Velebit offers countless resources, and man has proven capable of adapting, getting the most out of it, and prospering, both in recent and prehistoric times. Here we will consider several questions: How was the coastal slope of Velebit used in prehistoric times in relation to the mountain's highlands and its relief, and what can traditions and remains from recent times reveal about this? Who used Velebit and for what purposes? Is this mountain a space of union or separation? Can we assume, based on recent transhumance traditions, how prehistoric communities on both sides of the mountain (Liburni and Iapodes) used this space? How do archaeological sites correspond to the remains of recent life, ethnological heritage, and oral traditions? In the end, the question arises, what exactly has changed from prehistoric times to the present day and in what way?

253 TRACKING THE BIOGRAPHY OF METAL JEWELLERY AND CLOTHING COMPONENTS: TECHNOLOGY, MATERIAL, AND (RE)USE

Session theme: 1. On artefacts and beyond  
Session format: Regular session  
Session keywords: jewellery, clothing components, biography of artefacts, metal (production) technology, traces of (re)use,  
Session organisers: Šárka Krupicková (Czech Academy of Sciences, Institute of Archaeology, Brno) – Orsolya

Heinrich-Tamáska (Leibniz Institute for the History and Culture of Eastern Europe (GWZO))

SESSION ABSTRACT

Metal artefacts, especially jewellery and clothing components, often boast remarkably long lifespans. Their biographies unfold through multiple stages, beginning with the selection of materials and the choice of production technologies. The initial phase of this life cycle offers invaluable insight into the socio-economic and cultural contexts of their time (see chaîne opératoire). However, production is merely the beginning of their existence. Once created, these objects enter a broader life cycle, defined by their use within the living society for which they were made. How were they used, and what traces of wear, repair, or functional transformation do they bear? These questions can be answered by tracking signs of usage, wear, and modification, each leaving valuable clues. The story of jewellery and clothing components does not end there. While many pieces were eventually recycled, some have survived through time in their original form, marked by degradation. Over time, these objects re-enter the archaeological record, with their destiny again intertwined with human activity. This renewed phase of existence adds further layers to their history – through cleaning, conservation, restoration, analytical examination, and exhibition preparation. This whole biography, encompassing every stage from production to rediscovery, is the central focus of our research. We are seeking collaborations with colleagues and teams who have expertise in examining the impacts of individual phases on metal archaeological artefacts. Our particular interest lies in jewellery and clothing components crafted from precious and non-ferrous metals across various periods of human history. We welcome studies exploring both scientific and restoration-related aspects of this research topic.

CONTRIBUTION ABSTRACTS

187. TWO EARLY MEDIEVAL GOLD JEWELS FROM BOHEMIA AND THEIR DIFFERENT (?) BIOGRAPHIES

Contribution format: Oral  
Contribution authors: Nadezda Profantová (Institute of Archaeology of the CAS, Prague, v.v.i.)

I show the problem of jewellery biography on the basis of two exclusive finds: a gold three-sided pendant with granulation from Sadská (7th cent.) and a gold bead decorated with filigree and pseudo-filigree from the production centre of Tismice, both in Middle Bohemia (CZ). The pendant probably from an earring is a highly sophisticated small work. It was made in the Late Roman Period or more probably in a Byzantine workshop. It was probably imported to Bohemia in the 7th century, or, less likely it could be a reuse of a Late Roman piece (4th -5th cent.). The pearl from Tismice was found near the place where a goldsmith's workshop operated in the 1st - 2nd third of the 9th century. The pearl, consisting of 12 components, was a local product, used in the 2nd third of the 9th century and lost at most in the 60s of 9th century.

834. JEWELLERY TYPE AS A „MENTAL CONCEPT“. THE SPREADING OF SELECTED TYPES OF BYZANTINE LUXURY JEWELLERY IN EARLY MEDIEVAL EUROPE

Contribution format: Oral  
Contribution authors: Šimon Ungerman (Czech Academy of Sciences, Institute of Archaeology, Brno)

The paper focuses on the very beginning of the manufacturing process of early medieval luxury jewellery. There was an indispensable precondition: the goldsmith had to have a precise idea, how the final product would look like (its size, shape, construction, decoration etc.). I propose to call this idea a „mental concept“ of the given piece of jewellery. The craftsman did not have to „invent every piece of jewellery from scratch“ – in a given region and period, there must have been a certain quantity of broadly shared mental concepts of jewellery. As a result, we are able to identify a range of jewellery types in the archaeological record. Of course, every archeological type is a scientific abstraction based on a few diagnostic features. Therefore, we should distinguish a mental concept of an early medieval craftsman from an archaeological type as a scientific category. In the second part of the paper, I devote my attention to three types of early medieval jewellery with supra-regional distribution: finger-rings with a hollow hemispherical bezel, earrings with four beads made of sheet metal and earrings with three basket beads made of filigree wire. These types were created in the Byzantine Empire and they spread from the eastern Mediterranean via the Balkans into Central and/or Eastern Europe. An inseparable part of this process was local adaptation when as a consequence of local production, the specimens of the discussed types acquired a specific decorative features, different sizes, etc. in each region. But, the overall form of these jewellery types was still respected, even across the vast geographical area – there must have been the widely shared mental concepts of these types. The different mechanisms and motivations of spreading of the types (or underlying mental concepts) can be discussed.

1112. THE NETWORKS OF THE HORNED HELMETS

Contribution format: Oral  
Contribution authors: Heide Noergaard (Moesgaard Museum)

In Denmark, the only real human-sized horned helmets were found in a bog in 1942. These helmets have been dated by archaeologists to the late Bronze Age for centuries. In 2019, new scientific AMS dates revealed that the helmets were most likely in use at the transition from the NBA IV to the NBA V, a period that saw huge changes in material culture and worldviews. New technological analyses of these bronze helmets have been carried out and should clarify once and for all whether the helmets were a local product or imported to Denmark. However, technological and archaeometallurgical research has revealed a much more detailed story. This presentation will provide a detailed insight into the manufacture of the helmets, revealing a multi-layered and long-term biography of a ritual object. By comparing the ornamental details and technological features of protective armour in Central Europe, it was possible to rule out the possibility that these helmets were derived from Central European helmets. A 3D scan and digital reconstruction made it possible to identify the individual components of the helmets and their origin. The archaeometallurgical and organic examination allowed the identification of the artisans behind the helmets, and the identification of specific technological patterns allowed the determination of the helmet’s place of origin. Through the presentation of a detailed technological biography, the story of the Viksø helmet will be told - a story of reuse, multiple identities and a new world view.

1207. NEW INSIDES TO THE SILVER FINDS OF ČAĎAVICA (CROATIA) FROM TH EARLY MIDDLE AGE

Contribution format: Oral  
Contribution authors: Orsolya Mariann Heinrich-Tamaska (Leibniz Institute for the History and Culture of Eastern Europe (GWZO)) – Stephen Merkel (University of Amsterdam)

In this paper we are going to present new insights to the finds from ČaĎavica (jewellery and belt components), which are mostly interpreted as objects from a grave of the 7th century AD. 2023 we had the chance to carry out archaeometallurgical investigations, based on the comprehensive and comparative analysis of the finds. It had three main research objectives: to identify the types of alloys and the origin of the used silver, to identify the surface treatments and/or modifications of the metal objects and to reconstruct the stages involved in the metallurgical and manufacturing process. This provides the starting point for identifying manufacturing attributes and for narrowing down the area of origin of these products. From a culture-historical point of view it is of fundamental importance to be able to locate the roots of such technical know-how. The analyses made it possible to answer associated questions to origin and to transfer of technology. The archaeometric data obtained provide the basis for future comparative research in the wider distribution area of contemporary silver and gold finds.

1345. ARCHAIC ELEMENTS IN 9TH-CENTURY GOLDSMITHING IN MORAVIA: MATERIAL RECYCLING OR RECEPTION OF IDEAS?

Contribution format: Oral  
Contribution authors: Lumír Poláček (Czech Academy of Sciences, Institute of Archaeology, Brno)

Although archaic elements are not frequently found in the archaeological record of 9th-century Moravian settlements and cemeteries, they do appear with relative regularity. This study examines materials of ancient origin that were repurposed as components of Great Moravian artistic craftsmanship. It seeks to address three key questions: (1) Were archaic elements intentionally or incidentally used in the 9th century? (2) Were Moravians aware of the archaic origins of these components? (3) Could they have attributed special significance to them? The aim of this study is to determine whether their presence reflects mere material recycling as part of the 9th-century resource base or rather the reception of ideas. Antique gems incorporated into early medieval decorative artefacts and jewellery serve as particularly suitable case studies for exploring these questions, as they are relatively easy to identify and date. Several luxury objects from early medieval Moravia feature gems prominently set into their visible surfaces. An intriguing detail is that some gems were placed with their engravings facing downward, an approach sometimes interpreted as an attempt by Christian artisans or patrons to conceal pagan motifs. However, such a practice would contradict the true purpose of these objects, as it would diminish their representative and aesthetic value. This raises doubts as to whether Moravian elites (apart from ecclesiastical circles) possessed an awareness of the archaic, specifically antique, roots of their own culture. A comparison of gem application in Moravian jewellery with similar practices among the Avars and the Franks may provide deeper insights into the mindset of the inhabitants of 9th-century Mojmířid Moravia. This study was supported by the Czech Academy of Sciences, within the research programme Strategie AV21.

1433. “OBJECT BIOGRAPHIES“ OF GOLD-, SILVER- AND COPPER-ALLOY EARRINGS FROM AVAR-PERIOD ARCHAEOLOGICAL CONTEXTS (6TH TO 9TH CENTURY AD)

Contribution format: Oral  
Contribution authors: Birgit Bühler (Vienna Institute for Archaeological Science (VIAS), University of Vienna)

Archaeometallurgical research can be essential for identifying cultural traditions and technology transfer in archaeological contexts. Frequently, within a given framework of technological necessities for creating a particular effect in metalworking, a number of choices were available to metalworkers: The technical decisions taken in each case depended on the craftsperson’s skills, personal preferences, and cultural background, as well as on the demands of the customer regarding motifs, style, material and ornamental techniques of the finished product. The material culture of the Avar empire in the Carpathian Basin (late 6th to early 9th century AD) can be perceived as a mixture of diverse cultural influences, reflecting the heterogeneous, multi-cultural population of the Avar realm: In particular, “Avar” and “Byzantine” jewellery production appears to have been closely linked, with high prestige attributed to top-quality products imported from the Byzantine realm. The aim of this paper is to discuss several “object biographies“ of gold-, silver- and copper-alloy earrings from Avar-period archaeological contexts (6th to 9th century AD), with a focus on the production technology of a variety of pyramid-shaped and spherical earring types.

1538. TRACES OF USE ON CHASED SHEET-METAL SPHERICAL BUTTONS (9TH CENTURY, CZECH REPUBLIC) FROM AN EXPERIMENTAL PERSPECTIVE

Contribution format: Oral  
Contribution authors: Šárka Krupicková – Michał Płygawko – Martin Fořt – Tomáš Vlasatý (Czech Academy of Sciences, Institute of Archaeology, Brno)

Jewellery and clothing accessories represent a significant cultural phenomenon within early medieval material culture, embodying the integration of diverse cultural influences and serving as an important aspect of regional identities, particularly among elites. Sheet-metal spherical buttons with chased decoration are a regionally specific type of artefact primarily associated with grave finds from Central Europe. Due to the absence of written sources or iconographic evidence, uncertainties persist regarding their application to garments and their functional role in a living society. Therefore, surface analysis is crucial for understanding traces of use. A targeted interdisciplinary experimental study was conducted to address questions related to the use of these buttons. This research involved a team comprising an archaeologist, a jeweller, an SEM analyst, and reenactors. Scientific replicas of the buttons, faithfully reproduced using original jewellery-making techniques and corresponding to the material composition of the originals, were tested in a controlled experiment. The study included their application, presumed manipulation, and wearability assessment. This contribution will introduce the findings of the experiments carried out so far and discuss their significance for understanding the early medieval Central European elite and its clothing traditions. The research is supported by the Czech Academy of Sciences grant programme Strategy AV21.

2230. OBSOLETE JEWELLERY IN BARBARIAN BURIALS OF THE ROMAN TIME IN THE NORTH PONTIC REGION

Contribution format: Oral  
Contribution authors: Yevheniia Velychko (National Museum of the History of Ukraine)

Jewellery and elite objects much older than the burial itself are frequently found in the graves of barbarians of the Roman period in the North Pontic region. The grave of the Sarmatian princess in the Nohaichynskiy Kurgan is a striking example of this - the burial of the 1st century AD was accompanied by luxurious Hellenistic jewellery. It is far from the only case for Sarmatian sites of the 1st - first half of the 2nd centuries AD, often accompanied by centuries-older decorations. Some of these jewellery have traces of repair; some were completed, and some were remade or reused as a part of new adornments. What was the reason for overstaying? Were these objects an inheritance passed down from mother to daughter over a long period? Or were they a kind of reflection of the political life in the region: these decorations could be a part of the luxurious gifts with which barbarian leaders were appeased? Although this jewellery was out of fashion in the Roman world, it was ideally suited to barbarian tastes, who loved bright polychromy. Was the repair of such jewellery evidence that it had exceptional value for its owners, or were they being remade for reuse in barbarian fashion? In some cases, the remade directly points to the last; sometimes, it is even possible to assume that it was connected with local beliefs and rituals.

2373. “SHABBY CHIC”: OVERWORN, REPAIRED AND TRANSFORMED JEWELLERY FROM THE EASTERN PART OF THE CARPATHIAN BASIN IN THE 6TH CENTURY AD

**Contribution format:** Oral  
**Contribution authors:** Eszter Horváth (Institute of Archaeology, Eötvös Loránt University, Research Centre for the Humanities) – Viktória Mozgai – Bernadett Bajnóczi (HUN-REN Research Centre for Astronomy and Earth Sciences)

During the first two thirds of the 6th century AD, the territory of the Carpathian Basin was ruled by two Germanic tribes, the Eastern-Germanic Gepids and the Western Germanic Langobards. In spite of their different roots and histories, the two peoples were linked by a period spent in each other’s neighbourhood, marked by wars and alliances. Jewellery and clothing accessories, decorated with various colourful gemstones and goldsmith’s techniques to produce colour effects, were a representative part of their material culture. The polychrome artefacts usually manifest the high-end arts and crafts. Their production required a high level of knowledge, organisation, and networking, preferring precious raw materials, obtained even through long-distance trade links, and sophisticated manufacturing processes, carried out by skilled craftsmen, relying on a well-developed infrastructure. Despite their general similarity, the polychrome metalwork pieces from the two Germanic kingdoms differ in many aspects, not only in the way they are made and decorated, but also in the degree of wear. Traces of prolonged use, intensive wear, repair and functional transformation are not occasional but common features of artefacts unearthed from the territory of the Gepidic Kingdom. The question arises as to why excessively worn objects are so over-represented in this period and region. In order to answer this question, a dozen of examples, mostly brooches or other clothing accessories transformed from them were selected for scientific study. Optical microscope observations and analytical measurements revealed a correlation between the technological and material characteristics and the wearability of the objects. This study presents the selected artefacts, focusing on their general features and the typical traces of use, repair and transformation. By interpreting the results of our analysis, we outline possible reasons for their generally worn condition and shed light on the socio-economic and cultural context of the phenomenon.

1761. REST WITH PIECES? WORN AND FRAGMENTED METALWORK ON A VIKING AGE BURIAL SITE

**Contribution format:** Poster  
**Contribution authors:** Bo Jensen (Kroppedal Museum)

Six of the 46 Viking Age inhumation graves excavated at Snubbekorsgård, Zealand, contain fragmented but recognisable metal objects. These graves also contain half the examples of animal bones on-site (three of six), two of the three richest graves, and both examples of filed teeth. These distinct features suggest a distinct social group, with its own a ritual practices. One of these graves also contains a pair of extremely worn oval brooches, which must have been used in at least three different sets of jewellery. We can see parallels to this continued use of very worn jewellery in the Lille Karleby hoard, found some 25 km to the west. Based on these parallels, I argue that artefact biographies and personal and community biographies were deeply entangled with each other, but that the fragmentation hypothesis (Chapman 2000, Chapman & Gaydarska 2007) does not adequately explain the totality of the evidence. This poster is a preliminary presentation of on-going research.

2232. IDENTIFICATION OF CRAFTING TRACES BASED ON SELECTED EXAMPLES OF WOMEN’S JEWELRY FROM THE C ZONE OF THE WIELBARK CULTURE SETTLEMENT

**Contribution format:** Poster  
**Contribution authors:** Irena Podolska-Rutkowska (University of Lodz Doctoral School of Humanities)

The poster presents partial results of research on jewelry produced by the Wielbark culture population, discovered in women’s graves dated to the 2nd and 3rd centuries AD. The proposed project is related to part of the C zone of the Wielbark culture settlement, whose territorial range corresponds to several contemporary regions of Poland (Greater Poland Lakeland, Krajna Lakeland, Tuchola Forest). The C zone is associated with the occurrence of Wielbark culture cemeteries containing rich graves with women’s jewelry made of copper, silver, and gold alloys (fibulas, S-shaped buckles, pendants, beads, bracelets, pins, rings). The chronology of the phenomenon dates back to the beginnings of the settlement of this zone by the Gothic population in phase B2a, gradually abandoned and ending in phase C1b. During studies of Wielbark craftwork, a traceological method of artifact analysis was applied, based on micro- and macroscopic analyses. The use of these methods plays a key role in interpreting production traces, including tool marks and usage traces. Examining the object under magnification reveals both crafting errors and similarities in the traces left by tools. Another positive aspect of this method is the ability to identify the specific characteristics of the goldsmith’s workshop inventory. Finding identical flaws or missing elements in the ornamentation on different artifacts provides information about the undeniable use of the same tool. The result of the research work is a more precise understanding of the craftsman’s (goldsmith-caster-blacksmith) production strategy and the identification of the techniques used to achieve a satisfactory result

– the finished object. The totality of the features detected during the research allows for a broader understanding of the biography of the studied objects.

256 METALLURGY, TIMBER AND CHARCOAL

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Regular session  
**Session keywords:** Metallurgy, Mining archaeology, Forest exploitation, Timber, Charcoal production, Landscape heritage  
**Session organisers:** Oliver Nelle (Baden-Württemberg State Office for Cultural Heritage, Tree-ring Lab Hemmenhofen) – Aleksandra Fostikov (Institute of History Belgrade) – Mirko Vranić (University of Belgrade, Department of Archaeology, Laboratory for Bioarchaeology)

SESSION ABSTRACT

Mining activities with the aim of metal ore sourcing needed timber for constructions, and processing the ore needed charcoal as fuel and reducing agent. The increased demand for these products have led to changes in the landscape due to deforestation. Thus, the history of mining and metallurgy is closely connected to forest exploitation and relates to traditions of forest workers and charcoal burners, and connects to their heritage as well as the landscape memory. In this session, we welcome contributions addressing aspects of mining archaeology, investigations of timber sourcing, dendrochronology of mining timbers, and charcoal production, may these insights come from surveys, excavations, text explorations, material analysis or – ideally – a combination of several of them in an interdisciplinary approach. Contributions presenting connections of archaeological investigations, heritage valorisation. and museum exhibitions in the field of metallurgy are also very welcome. The idea is to bring together scholars working on different aspects of the theme and raise awareness of the interconnectedness of the different resources, in the discussion of (pre-)historic overexploitation and sustainability. The session will include an update about the work that was started during the previous EAA (EU-COST-action „PoTaRCh“: production and heritage legacy of charcoal, tar, resin and potash, [www.cost.eu/actions/CA22155](http://www.cost.eu/actions/CA22155)), especially with data from the Balkan region as a comparative review between South East and Central Europe. This territory, with the continuity of mining and metallurgy from their beginnings to the present, can provide new information about wood species used in charcoal production, as well as about the production itself. In addition, we want to discuss methodological problems concerning the finding of the charcoal production sites that have a connection with metal production, the status of Potarch in museums and heritage, as well as the idea for a database for Potarch production that we started for our CA22155.

CONTRIBUTION ABSTRACTS

780. THE USE OF TIMBER AND CHARCOAL IN MINING CENTERS OF MEDIEVAL SERBIA: A CASE STUDY FROM BRSKOVO AND RUDNIK

**Contribution format:** Oral  
**Contribution authors:** Mirko Vranic (University of Belgrade, Faculty of Philosophy, Department of Archaeology) – Aleksandra Fostikov (Institute of History Belgrade)

Previous research on medieval mining in the central Balkans, within the borders of medieval Serbia, provided a small amount of physical evidence on the use of timber and charcoal. These fragments were obtained through modern geological research, which cut old mining works with preserved wooden construction, as well as archaeological excavations of shafts and furnaces for ore smelting and charcoal production. Additionally, charred remains were discovered inside the mining and trading settlements, representing remnants of the wooden building structure. For this study, anthracological analysis was conducted on several samples from the most extensively researched centers, Brskovo (northeastern Montenegro) and Rudnik (central Serbia), where intensive medieval mining activities took place from the mid-13th to the mid-15th century. By determining the tree species or genus and comparing it with present-day forest vegetation, as well as using comprehensive data concerning other types of evidence, we aim to reconstruct the appearance, species, and segments of timbers used for these activities, thereby contributing to a deeper understanding of their role and purpose in medieval Serbia. Furthermore, the previous knowledge regarding charcoal production in the mining and metallurgical industries of medieval Serbia will be highlighted, along with directions for future research.

1869. WOOD CONSUMPTION AND IRON PRODUCTION: INSIGHT INTO CHARCOAL USE ALONG THE DRAVA RIVER VALLEY DURING LATE ANTIQUITY/EARLY MIDDLE AGES

Contribution format: Oral  
Contribution authors: Tena Karavidovic – Tajana Sekelj Ivančan (Institute of Archaeology, Zagreb)

Wood consumption played a vital role in ancient societies, serving various everyday purposes such as building, fueling fires, crafting objects, and producing charcoal for metallurgical purposes. An anthracological analysis of charcoal samples unearthed at settlement sites and iron production workspaces in the Drava River Valley (Podravina region, NW Croatia), dating back to Late Antiquity and the Early Middle Ages, reveals distinct patterns in the types of wood utilized. These patterns can be linked to the archaeological context—whether habitational or workspace—and indicate a deliberate selection of wood driven by technological and economic considerations for charcoal production and its use in iron production processes, such as smelting and smithing. The archaeological records of workspaces dedicated to iron production and processing illustrate various activities, including resource preparation, roasting of iron ore, and charcoal production, which were all carried out on-site. By analyzing the natural conditions that support the growth of wood species identified in the archaeological record, along with the formation of bog iron ores in the broader Drava floodplain and the nearby Bilogora Hills, we can infer areas of past resource exploitation. The findings indicate that the organization of iron production and the selection of workspace locations are closely connected to the availability of resources—both wood and ore—and the technological choices made during the iron production process.

1229. A NEW APPROACH FROM PYROTECHNOLOGY: MANAGEMENT FUEL FOR THE PRODUCTION OF COPPER IN THE ATACAMA DESERT, CHILI

Contribution format: Oral  
Contribution authors: Daniela Grimberg (Université Paris 1 Panthéon-Sorbonne | Universidad Católica del Norte | UMR 8068 Temps) – Ariadna Cifuentes (Universidad de Chile) – Valentina Figueroa (Instituto de Investigaciones Arqueológicas y Museo R.P. Gustavo Le Paige S.J. | Universidad Católica del Norte)

Recent studies on metallurgy and pyrotechnology at the Catarpe Túnel archaeological site (1402-1450 cal AD), have shown that procurement and use of woody fuel was a specialized activity adapted to a hyper-arid environment (Grimberg et al., 2024). Indeed, the Atacama Desert, the driest desert in the world, contains and specific natural vegetal resources adapted to different microenvironments, where humidity and water availability vary according to altitude. For the metallurgical furnaces of Catarpe Túnel, in operation during the Inka Period, anthracological and carpological studies have demonstrated a preferential use of carob tree wood, followed secondarily by aquatic grasses and branches of resinous shrubs, all species with remarkable calorific potential and adapted to an extremely dry climate. Likewise, from the analysis of the structural evidence of the metallurgical furnaces studied, it was possible to verify the existence of an area destined for the elaboration of charcoal for metal reduction activities. Apparently, this would have been obtained thanks to the incorporation of lama guano, which allows for the maintenance of constant temperatures for a prolonged period of time, without causing the total combustion of the woody material. In this paper we present new evidence regarding the use of woody fuel from a furnace at the Catarpe Túnel site, approaching it from a pyrotechecnology methodological perspective, from excavation to laboratory analysis. More precisely, we focus on the recording and recovery of anthracological material, in order to understand the strategies used by specialists in metal smelting and the use of fire in an extremely arid environment. Acknowledgements: Fondecyt 1201603, Fondecyt Postdoctoral 3240369, Núcleo Milenio Andes Peat.

517. HISTORIC MINING AND METALLURGY: TIMBER SOURCING AND CHARCOAL PRODUCTION IN THE BLACK FOREST REGION, SW-GERMANY

Contribution format: Oral  
Contribution authors: Oliver Nelle – Sebastian Million (State Office for Cultural Heritage Baden-Württemberg)

The low mountain range of the Schwarzwald (Black Forest) in SW-Germany is rich in metal ores, which were exploited since medieval times. The mines needed timber to stabilise the tunnels and the shafts, and other constructions, as well as wood for fire setting. Wooden remains enable dendrochronological dating of the mining systems. Charcoal was needed to smelt the ore and reduce metals. Especially for iron, a huge quantity of charcoal was produced first in pits during the medieval period, and later in upright mounds covered with a layer of soil material, and their legacies are present in today’s woodland in vast quantities. The charcoal remains in the soil of these production sites, analysed wood-anatomically, are used to investigate the historic tree composition of the woodlands, and its exploitation. With Lidar technology more than 20 000 sites are now known in the Black Forest. The presentation will give an overview of historic mining activities and known historic charcoal production sites in the region.

1906. EXPLORING CHARCOAL AND METAL PRODUCTION IN VITOSHA MOUNTAIN, BULGARIA: THE ROLE OF ETHNOGRAPHY IN ARCHAEOLOGICAL RESEARCH

Contribution format: Oral  
Contribution authors: Mila Andonova-Katsarski (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences)

This study examines the ethnographic knowledge related to metallurgical activities in the Vitosha Mountain area, adjacent to the Bulgarian capital Sofia, and investigates how this information can enhance archaeological site surveys linked to past metallurgy. Ethnographic sources indicate that gold and iron production have taken place in various mountainous regions for over a century. Gold extraction is primarily associated with gold-bearing river sands, while iron production typically occurs in forested areas where charcoal was produced in designated pit-like structures. These charcoal production sites, known locally as zhizhnya, can still be identified in the mountain landscape due to their specific naming and the evidence of extensive deforestation that resulted from these activities. Similarly, iron ore extraction sites are marked by chimney-shaped kilns, referred to as vidnya, which are commonly found along riverbanks. The preservation of these sites often reflects the specific topography of the area, as they were strategically positioned near sources of magnetite sand that were sieved from the rivers. The interplay between these metallurgical practices highlights unique insights into how raw materials and resources were perceived, including efforts for “forest protection” during the final years of Ottoman rule, as well as attempts to manage these interconnected resources holistically. The continuity of metallurgy and its related industries in the area may serve as a guideline when discussing past metallurgy and charcoal production and most of all – when planning a survey for the identification of archaeological sites, linked to those activities.

2324. ENVIRONMENT OF CHARCOAL BURNING: LEARNING FROM PRACTICE AND ARCHIVE ETHNOGRAPHICAL SOURCES

Contribution format: Oral  
Contribution authors: Anna Varga (Department of Vegetation Ecology, Czech Academy of Sciences, Brno) – Ádám Thiele (Department of Materials Science and Engineering, Budapest University of Technology and Economics)

Charcoal burning is a biodiversity-dependent activity, with consequent significant environmental impacts in both the short and long term. Most of the studies are concerned with the current vegetation of former charcoal kilns or with analysing used wood for burning found in the remains of abandoned production sites. However, there has been scarce information on the environmental impact of active charcoal burning, which would be essential for the reconstruction of former charcoal burning practices and the vegetation and environment surrounding the sites. The aim of this study was to provide information to understand the relationship between charcoal burning and the environment, such as air, soil, water and biodiversity. The first part of research focused on the analysis of written ethnographic sources and archival photographic material. Both source materials refer mainly to the first half of the 20th century and the middle of the 20th century, mainly to Hungary and Hungarian-speaking communities in Romania. The second part of the research is a case study, in which we burned charcoal ourselves and observed step by step the role of the environment and the impact of our activities on it. Generally, the purpose of coal burning determines its relationship with the environment, so it is important to consider the purpose for which the charcoal was burned in site reconstruction. Furthermore, the study of the practice of charcoal burning, like other experimental archaeological practices, is an excellent opportunity to explore the details and hiding aspects.

327. EXPLORING CHARCOAL PRODUCTION IN THE HINTERLANDS OF JEDOVNICE IRONWORKS

Contribution format: Poster  
Contribution authors: Tomáš Pavlon (Institute of Archaeology of the CAS, Brno)

The presented poster showcases a research project on regional charcoal production in relation to its consumption in ironworks. The peak of production is linked to the late modern period and the first century of the industrial era. The research adopts an interdisciplinary approach, combining archaeological and historical methods. The foundation of the study is the evaluation of a digital terrain model and the accompanying localization of relics in the field, sampling of selected relics, dendrochronological dating, metal detector prospection, and archival research. In the current phase of the research, a clear link is evident between charcoal production and a specific area of the former estate, whose owners, the noble Salm family, were operators of iron production. The research focuses on the immediate vicinity of a specific ironworks near the village of Jedovnice, located in the central part of the Drahaný Highlands. Archival sources allow the tradition of professional charcoal burners to be localized to the village of Senetářov, which lies at the heart of regional charcoal production. The charcoal tradition is not well known to the public in the region, and an important part of the project is communication of the outputs to the local communities through articles in local newspapers, public lectures and through a static presentation in the landscape.

258 EMBRACING THE EXTRAORDINARY: MANAGING AND MODELING NON-CONFORMING DATA

Session theme: 2. Intertwined Epistemologies: Transcending the Data – Theory Divide  
Session format: Round table  
Session keywords: data modeling, metadata schema, interpretation, multisensory archaeology, more-than-human archaeology, semantic web  
Session organisers: Chiara Giovannetti (Sapienza University of Rome) – Aida Fadioui – Natalie De Schuytener (University of Antwerp) – Duygu Tarkan (Koç University)

SESSION ABSTRACT

We aim to explore the decision-making processes of modeling archaeological data, the power dynamics inherent to it, and the adequacy of current metadata schemas. Where does erratic, peculiar data fit? How can we work to make our data richer and more expressive? - 1. Politics of data and standards Modeling data is a process where the power is held by the modelers: they decide what should be included or not. Whether it is because categories in standards are not precise enough or not genera. enough, or because we encounter types of information we believe should be recorded but never have been, current metadata schemas feel inadequate. Who should decide what to include/exclude in data models? How do we decide which information is “useful”? How do we represent uncertainty in our data? 2. Materiality and multisensory data Archaeology is an embodied practice; we establish a relationship with the material record that provides unique insights: we perceive colors, textures, smells, but also memories or associations. This abundant information shapes our interpretations, but we do not have the tools to model it. What space do the affective/physical qualities of objects find in our reports? How do we account for individuality while aiming at interoperability? 3.More-than-human approaches Archaeologists are increasingly working to include non-human perspectives, challenging distinctions between culture and nature, subject and object. We acknowledge that landscapes, animals, plants, and even microorganisms shaped human experiences. What type of data should we collect to represent these interactions? How can we model such complex phenomena in a structured way? Are there useful metadata schemas from other disciplines? - We embrace the oddities and peculiarities and promote inclusiveness. Be mindful and respectful of others: this should be a safe place, especially for young researchers, to discuss data modeling, seek advice, and ideate new projects.

259 CLIMATE CHANGE, SETTLEMENT ADAPTATION, FLUVIAL RESPONSES IN PIEDMONT, RIVERINE AND ESTUARINE ENVIRONMENTS

Session theme: 7. Climate Change in the Past and Present  
Session format: Regular session  
Session keywords: fluvial systems, sediment archive , settlement archaeology, geosciences, landscape archaeology  
Session organisers: Laszlo Ferenczi (Univerzita Karlova/Charles University, Prague) – Bergamo Martina – Jacopo Paiano (Ca’ Foscari University of Venice) – Csilla Zatykó (HUN-REN Institute of Archaeology, Research Centre for the Humanities) – Rowin Van Lanen (The Cultural Heritage Agency of the Netherlands)

SESSION ABSTRACT

Human interference in riverine environments extends back to thousands of years. Since the Late Holocene, anthropogenic impact on fluvial eco-systems manifested on landscape-level scale, – affecting the hydrological budget of river systems, sediment transports, geomorphology and connectivity –, and with the advent of Anthropocene, climate conditions too. Thus, the dynamics of fluvial systems were increasingly influenced by a variety of factors, which determined the adaptation strategies of human communities, posing also considerable challenges. The investigation of sediment archives (geoarchaeological evidence) in fluvial landscapes are excellent for exploring the intertwined anthropogenic and geogenic changes and responses, the study of which requires integrated eco-system based approaches, synthesising archaeological, historical, ecological, geomorphological and hydrological data (see e.g. Ghosh et al 2022 – Fluvial systems in the Anthropocene). Advances in geosciences, remote sensing techniques, and GIS modelling provide suitable tools for complex analyses addressing these questions. This session . in line with last year’s session entitled Historical Archaeologies of the Coastal and Fluvial Anthroposphere – invites multidisciplinary and multiscale approaches, case studies, focusing on piedmont, riverine and estuarine landscapes, combining spatial topographical research and geoarchaeological perspectives, and applying a range of techniques (LiDAR, settlement archaeological, sedimentological, geochemical, pollen, OSL, radiocarbon, dendrochronological analyses, etc.) in order to identify different natural and anthropogenic forcing mechanisms

on fluvial systems, to study climate change and human adaptation – with regard to the changing intensity/scale of settlement expansion/contraction and related land use/land cover changes (deforestation, agricultural activities), water management (construction and hydraulic engineering) and fluvial adjustment (stream power, rate and type of erosion/deposition/alluviation processes) within floodplains

CONTRIBUTION ABSTRACTS

1527. (UN)SETTLING WETLANDS: INFRASTRUCTURE AND HUMAN ADAPTATION IN THE VENETIAN LAGOON BETWEEN ROMAN TIMES AND EARLY MIDDLE AGES

Contribution format: Oral  
Contribution authors: Martina Bergamo (Ca’ Foscari University of Venice) – Jacopo Paiano (University of Trento) – Diego Calao (Ca’ Foscari University of Venice)

The contribution aims to analyse human adaptation strategies to the constantly evolving environment of the Venetian Lagoon, focusing on land reclamation and elevation techniques to reshape wetlands into habitable areas preserved over time, preventing flooding and erosion. This issue holds particular significance in the alluvial plain of the western upper Adriatic, which was (and still is) continuously impacted by subsidence, especially in lagoonal areas. Several case studies will be investigated to provide insight into the human-environment relationship from a diachronic perspective, highlighting trends during the transitional period between the Roman era and the Early Middle Ages. Our primary focus will be on two key lagoonal sites studied by the Ca’ Foscari University of Venice, such as the Roman maritime villa of Lio Piccolo and the early medieval emporium of Torcello. These will be compared with other excavated settlements and sites across northeastern Italy. Shedding light on land management techniques and their interactions with aquatic environments can present valuable data for understanding social, economic, and cultural dynamics. As essential infrastructural elements requiring substantial effort, land reclamations and waterfront construction reflect the elites’ ability (and willingness) to invest in shaping the landscape. Furthermore, details about the construction of these reclamations and landfills extending and raising ground levels offer crucial insights into reconstructing the everyday relationship with water in antiquity from an anthropological perspective.

268. LIVING ON RIVER TERRACES: SETTLEMENT DYNAMICS IN THE LOWER WEST MORAVA FLOODPLAIN (SERBIA)

Contribution format: Oral  
Contribution authors: Uglješa Vojvodic – Ivan Bugarski – Milica Radišić (Institute of Archeology, Belgrade) – Marin Bugar (National Museum, Kruševac)

The existence of key routes within established road networks, along with the overall favorable conditions for settling, has resulted in the continuous habitation of the fertile plains and river terraces surrounding the course of the West Morava River from the Paleolithic to the modern era. However, due to the relatively limited archaeological exploration of the area, it has not been possible to determine the existence of potential settlement systems or the dynamics of their changes across different historical periods. Although life along the river and its fertile plains was of exceptional, perhaps even crucial importance for the overall development of settlements in the past, this watercourse contributed to natural hydrological disasters until the modern era. In certain historical periods, such events may have been catastrophic for the existing settlements and detrimental to economic development of society, particularly through their impact on agriculture. To test the hypothesis that frequent flooding of the fertile plains was a key factor in the selection of settlement locations in the past, the authors launched a three-year archaeological survey of the study area in 2018. The results of the surveys, supplemented by data from previous archaeological investigations, as well as recent prospection and rescue excavations that preceded the construction of a motorway there, have to some extent added to the existing knowledge about life along the banks of the West Morava during prehistoric and historical periods. In this context, this study aims to determine the degree to which changes in the river flow and flooding of the West Morava influenced the establishment of permanent and seasonal settlement systems in its lower course. The analysis is based on archaeological research and surveys conducted to date, complemented by the application of 2D and 3D hydraulic modelling in GIS.

505. LANDSCAPE AND LAND USE IN THE LOWER SOMEȘ VALLEY DURING THE MIDDLE AGES

Contribution format: Oral  
Contribution authors: Sebastian Belbe (Satu Mare County Museum)

This paper examines the medieval landscape of the Lower Someș Valley and the settlement patterns in the region. The primary objective is to explore the role of water as natural resource in the daily life of the communities that developed there. The study begins by analyzing information from historical written sources, which is then compared with archaeological data and field observations. These findings are subsequently documented and

mapped using GIS database. Historically, the region was characterized by extensive marshlands and waterways, as attested by both written records and later cartographic evidence. These environmental features significantly shaped the daily lives of the area s inhabitants, often posing challenges to local communities. The establishment, relocation or even abandonment of villages was not uncommon, with archaeological evidence, place names, and historical documents offering insight into these dynamics. The exploitation of rivers and local water resources is documented as early as the 13th to 15th centuries, along with accounts of the adverse effects of such activities.

**1071. FLUVIAL PROCESSES AND MEDIEVAL LANDSCAPE TRANSFORMATION: INTEGRATED LANDSCAPE ANALYSIS OF DESERTED VILLAGES IN THE CZECH REPUBLIC**

**Contribution format:** Oral  
**Contribution authors:** Lukáš Holata (Charles University)

Medieval agriculture reshaped piedmont landscapes, altering soil redistribution and hydrology. This study examines two deserted medieval villages in Central Europe, where well-preserved field systems—protected under woodland canopies—serve as natural archives for studying fluvial processes in medieval agricultural landscapes. Both sites are located at springs, where erosion from medieval fields directly influenced headwater environments, affecting stream development at their sources. A landscape-scale geoarchaeological approach was applied, integrating lidar analysis, paleoenvironmental and pedological proxies. Findings reveal that fluvial processes resulted from natural hydrodynamics and human-induced soil loss. Fields on steep slopes (>20°) were highly susceptible to episodic erosion shaping field boundaries and gradual soil depletion over time. Sedimentation from these fields significantly modified upper stream reaches, influencing hydrology and landform evolution. According to OSL and C14 dating, significant fluvial processes began almost immediately after settlement origin in the 11th/12th century, with substantial soil loss occurring until the mid-14th century. However, written sources and pottery evidence indicate that the area remained in use until the 15th century despite the absence of further significant soil loss. This challenges assumptions that environmental degradation directly caused settlement abandonment and provides a high-resolution perspective on erosion-driven transformations in medieval landscapes.

**348. FISHPONDS, MILLPONDS AND CLIMATE CHANGE RESILIENCE IN THE MEDIEVAL PERIOD? EXAMPLES FROM CZECHIA AND HUNGARY**

**Contribution format:** Oral  
**Contribution authors:** Laszlo Ferenczi (Charles University, Prague)

The paper problematizes the hydrological impact of fishpond and mill construction as a potential response to the deterioration of climate in the Late Medieval Period. Historical evidence from Czechia, Poland and Hungary similarly suggest that during the 14th – 15th centuries the construction of fishponds and mills intiensified. Many references pertain to those monastic estates, which were situated in marginal landscape zones, where medieval settlement expansion led to significant change in land-use cover and potentially increasing erosion phenomena. Comprehensive LiDAR surveys are now available to assess relict and active fishponds, study their morphology and distribution, an. comparatively assess the value of LiDAR data versus cartographical evidence (mostly dating from the last two hundred years, thus representing the more modern state of the landscape). On the one hand, our analysis will build on case studies, exploring the landscape setting of individual sites, and illustrating how the site selection of such facilities could be influnced by natural aspects – in addition to socio-economic considerations. On the other hand, a large-scale GIS analysis will illustrate landscape level patterns, which will provide the opportunity to reflect on the importance of soil archives and sedimentation dynamics ‘responding’ to the above described trend.

**1102. TRANSFORMATIONS OF THE SETTLEMENT NETWORK AS A PROXY FOR CHANGING WATER REGIME (THE EXAMPLE OF BÉKÉS COUNTY, HUNGARY)**

**Contribution format:** Oral  
**Contribution authors:** Beatrix F. Romhányi (Károli Gáspár University of the Reformed Church in Hungary | HUN-REN Archaeological Institute Lendület BASES Research Group)

The settlement network of Békés County and the neighboring medieval counties, especially the western part of Zaránd County, underwent several significant changes in the Middle Ages between the 10th and 16th centuries. The villages of the population that gradually settled after the establishment of the kingdom and continued to practice agriculture were destroyed during the Mongol invasion (1241/1242) and most of them were not repopulated in the second half of the 13th century. In this area, hardly any parishes were recorded in the papal tithe list (1332-1337), although early churches can be located both by archaeological research and by the analysis of early place names. However, the establishment of the Gyula Domain in the 1410s signals another change, which led to the establishment of many new parishes over the next ~130 years. Besides the parish churches, the presence of mendicant friaries that required grain as alms also testifies to the change in land use. In addition to the

Franciscan friary of Gyula, which had existed since the early 15th century, an attempt was made to establish a second Franciscan friary in nearby Gerla in 1531. According to the surviving documents of the Gyula Domain, grain was the main source of income in the first half of the 16th century. The transformation of the settlement network and the associated form of agricultural production (livestock breeding vs. arable farming) ultimately relates to changes in water conditions. Apparently, the changed water regime in this landscape rich in rivers and wetlands influenced both the density of the settlement network and the location of central places. The paper focuses on these transformations, paying particular attention to the shifts of central places that can be reconstructed from written and archaeological sources, thus adding new aspects to the assessment of wetlands.

**1324. SETTLEMENT DYNAMICS IN FLUVIAL LANDSCAPES: A MULTI-PERIOD ANALYSIS OF HUMAN ADAPTATION IN THE TISZA AND KÖRÖS RIVER REGIONS, HUNGARY**

**Contribution format:** Oral  
**Contribution authors:** Csilla Zatyko – Zsófia Masek (HUN-REN RCH Institute of Archaeology) – Gábor Mesterházy (Hungarian National Museum Public Collection Centre, National Institute of Archaeology)

Before the 19th-century river regulation works, the wetlands along the rivers of the Hungarian Great Plain were vast, ecologically sensitive landscapes that significantly influenced both the social and economic activities of past communities. In this presentation, we examine settlement patterns in fluvial landscapes at multiple scales, ranging from individual sites to micro-regions, within the waterlogged environments of the Tisza and Körös Rivers in Eastern Hungary. This paper aims to examine the settlement dynamics of communities and their transformations across specific periods—the Sarmatian period, the Árpáadian Age, and the Late Medieval period. Through a comparative analysis of settlement patterns and settlement forms, we intend to identify the economic, social, and environmental factors that influenced settlement choices and to determine the key parameters used in selecting suitable habitation sites in different periods. Furthermore, we seek to understand the adaptive strategies employed by communities in response to the environmental conditions and their changes, such as river course shifts, flooding, or climate fluctuations. Our research employs a multifaceted methodological approach, integrating large-scale field survey data, geophysical surveys, remote sensing techniques, analysis of botanical remains, together with predictive modelling. By combining these methods, we aim to reconstruct the spatial organization of past landscapes and provide insights into how human-environment interactions shaped settlement structures in these highly dynamic riverine regions.

**2072. IMPROVING THE DATA RESOLUTION OF ENVIRONMENTAL MODELS: AN ANALYSIS OF LONG-TERM TRANSFORMATIONS IN THE KOKAD MIRE REGION OF EASTERN HUNGARY**

**Contribution format:** Oral  
**Contribution authors:** Gábor Mesterházy (Hungarian National Museum, National Institute of Archaeology | ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography) – Ilona Pál – Enikő Magyari (ELTE Eötvös Loránd University, Department of Environmental and Landscape Geography)

The advantages of concurrently examining long-term archaeological settlement patterns alongside environmental changes have proven to be beneficial over the past few decades. Analyses of pollen and multi-proxy palaeoecological data have illuminated how human activities have shaped the landscape, as well as how shifting environmental conditions have necessitated and constrained human adaptation. This study seeks to improve the spatial resolution of palaeoecological models and integrating archaeological settlement patterns into a comprehensive long-term model in the vicinity of Kokad, Eastern Hungary. Our methodology is founded on the premise that land cover classes within the landscape are influenced by environmental factors, allowing for the analysis of various land cover types such as forests, pastures, wetlands, and arable lands. The calculations for optimal land cover were based on the distribution of land cover types of the Second Military Survey of the Habsburg Empire. To assess the environmental attributes of the different land cover types, we utilized landform classification, wetness index, geological data, soil characteristics, and aspect layers in a multi-scale spatial modelling approach. The two-tier weighting technique of the Analytic Hierarchy Process facilitated the determination of probability values for the land cover types at a resolution of 25x25 meters across the entire study area. The precisely dated Holocene pollen record from Kokad mire in the eastern part of the Great Hungarian Plain revealed fluctuations in land cover types and their respective proportions. Using REVEALS modelling of the pollen data, we determined forest, open land and arable land in about 30 km radius of the site. By weighting the individual land cover probability maps, we have emphasized the most suitable land cover for various archaeological periods. Furthermore, the spatial quality of the models was enhanced by integrating archaeological settlement patterns through a multi-scale weighting approach to pinpoint the areas that were most affected.

2045. Δ<sup>13</sup>C AND Δ<sup>18</sup>O STABLE ISOTOPE ANALYSIS ON WATERLOGGED WOOD: A PIONEERING APPROACH TO RECONSTRUCTING MIDDLE HOLOCENE CLIMATE VARIABILITY

**Contribution format:** Poster  
**Contribution authors:** Silvia D'Aquino (Department of Cultural Heritage, University of Salento) – Giuseppe Egidio De Benedetto (Department of Cultural Heritage, University of Salento | Analytical and Isotopic Mass Spectrometry Laboratory) – Cristiano Nicosia (Department of Geosciences, University of Padua) – Milena Primavera (Department of Cultural Heritage, University of Salento)

Reconstructing past climatic conditions, especially short-term variations, poses significant archaeological challenges; often, these events, had very important impact on landscape development, on past human societies, on their socio-economic structures, and on settlements patterns. The recent PRIN funded project entitled The Lord of the Rings (LOTR) aims to produce very detailed reconstructions of the past variations in moisture, rainfall and temperature that occurred in the Middle Holocene (6.5-3.0 cal ka BP interval). In order to address this goal, dendro-isotopic curves are being constructed, i.e. curves representing the annual variations of stable isotope ratios (δ18O and δ13C) obtained from the analysis of single, dendro-dated tree rings. The key study of this research includes an important waterlogged archaeological site dated to the Early-Middle Bronze Age: Oppeano-Via Isolo (VR). This site, located in north-eastern Italy, is known for the optimal conservation of organic material, including many wooden remains such as poles and planks used for the construction of the structures. Our study introduces and evaluates innovative laboratory techniques for the chemical preparation of waterlogged archaeological wood samples prior to isotopic analysis. While the extraction of α-cellulose is a well-established method for dry and charred wood, its application to waterlogged material remains unexplored, with no standardized protocols currently available in the literature. This work is therefore pioneering in its attempt to assess the feasibility of stable isotope analysis on waterlogged wood, addressing key methodological challenges such as cellulose degradation due to prolonged burial. To ensure the reliability of isotopic data, we evaluate the yield of α-cellulose in archaeological samples and assess its purity using infrared spectroscopy (IR). By establishing and refining protocols for the isotopic analysis of waterlogged wood, this study opens new avenues for high-resolution paleoclimatic reconstructions from previously untapped archaeological materials.

260 ARCHAEOLOGY AND HERITAGE SCIENCE. RESEARCH INFRASTRUCTURE NETWORKS AS A PATH TO A SUSTAINABLE FUTURE OF THE SECTOR

**Session theme:** 6. Intertwining archaeology, heritage, and museums  
**Session format:** Discussion session  
**Session keywords:** research infrastructure networks, sustainable growth, heritage science, strategic planning, partnerships, social engagement  
**Session organisers:** Lana Nastja Anzur (Heritage Science Laboratory Ljubljana, University of Ljubljana) – Richard Higham (Institute for Sustainable Heritage University College London) – Brina Zagorc (Department of Evolutionary Anthropology, University of Vienna)

SESSION ABSTRACT

The European Commission defines research infrastructures (RI) as facilities providing resources and services to support research communities in conducting studies and fostering innovation. These include major equipment, scientific data infrastructures, computing systems, and communication networks. Since the 1920s, large-scale research infrastructures have become increasingly vital to scientific progress, particularly in the natural sciences. In the humanities, this trend is marked by the rise of digital platforms, such as the ARIADNE for archaeology. Recent years have seen a shift towards interdisciplinary collaboration within cultural heritage, exemplified by initiatives like the European Research Infrastructure for Heritage Science (ERIHS). Archaeologists play a key role in this field, as evidenced by 2024 ERIHS survey that identified access to research infrastructures, funding, professional organization, and formal training as critical needs within the sector. It also highlighted a significant gap: early-career researchers emphasized the need for greater public engagement, media coverage, and social media presence to highlight the role and impacts of research for the wider public. Based on these findings, it is crucial for the archaeological community to adapt and strengthen its practices to meet evolving needs. This includes leveraging RIs to promote interdisciplinary collaboration, partnerships, formal education, and the development of new funding opportunities while embracing social engagement and responsibility. Addressing these needs in a timely and effective way is essential for the sustainable future of the sector. We invite speakers from heritage science and archaeology to share their insights on leveraging RIs as resources for advancement within broader social and professional contexts. We will highlight strategies for archaeologists working with evolving RIs, focusing on the needs and goals of our sector. Presentations (6 slides in 6 minutes) will foster focused discussions,

aiming to identify gaps, propose innovations, and enhance archaeology’s role in interdisciplinary and societal contexts for a sustainable future of the sector.

CONTRIBUTION ABSTRACTS

1421. E-RIHS (EUROPEAN RESEARCH INFRASTRUCTURE FOR HERITAGE SCIENCE) - IMPRESSIONS FROM SLOVENIAN NODE

**Contribution format:** Oral  
**Contribution authors:** Lana Nastja Anzur (University of Ljubljana)

E-RIHS (European Research Infrastructure for Heritage Science) is a distributed research infrastructure network aimed at supporting the science of interpretation, preservation, and management of cultural heritage. The national node E-RIHS.SI will be established, consisting of mobile and stationary laboratories with accompanying national research infrastructure, a digital laboratory, and access to material collections/archives. The E-RIHS.SI consortium was founded through an agreement between the Institute for the Protection of Cultural Heritage of Slovenia (ZVKDS) and the University of Ljubljana (UL), with additional members joining, including the Jožef Stefan Institute (IJS), the National Institute of Chemistry (KI), the National and University Library (NUK), the University of Maribor (UM), the University of Primorska (UPr), and the Slovenian National Building and Civil Engineering Institute (ZAG). E-RIHS.SI strengthens the leading role of Slovenian heritage science and its international involvement, providing Slovenian cultural and archival institutions with access to research infrastructure for the study and handling of cultural heritage objects—resources that are rarely available and limited in scope. The establishment of E-RIHS.SI promotes collaborative, interdisciplinary research and provides access to state-of-the-art equipment, methodologies, data, and highly skilled personnel. The initiative supports the study of both tangible and intangible heritage, including the conservation, processing, interpretation, and optimal use of data. Heritage science is grounded in natural sciences such as chemistry, physics, biology, computer science, environmental studies, and engineering, but also requires close collaboration with socio-economic sciences and the humanities. Due to its interdisciplinary nature, it demands laboratory, archival, and digital infrastructure. Strategic planning ensures the avoidance of equipment duplication, enhancing the competitiveness of European heritage science. E-RIHS builds on existing initiatives, including IPERION CH, ARIADNE, PARTHENOS, and other project clusters that support E-RIHS integration.

1618. HERISCI: ADVANCING HERITAGE SCIENCE THROUGH INTERDISCIPLINARY COLLABORATION

**Contribution format:** Oral  
**Contribution authors:** Brina Zagorc (Department of Evolutionary Anthropology, University of Vienna | Institute of Anthropological and Spatial Studies, Slovenian Academy of Sciences and Arts | Human Evolution and Archaeological Sciences, University of Vienna) – Lana Anžur (Faculty of Chemistry and Chemical Technology, University of Ljubljana)

HeriSci – Young Professionals in Heritage Science Slovenia is a dynamic organization dedicated to fostering interdisciplinary research and collaboration in heritage science. As the Slovenian branch of the European Association for Students and Young Professionals in Cultural Heritage, HeriSci provides a platform for knowledge exchange, professional networking, and hands-on project engagement. Supported by the ERIH-S platform, HeriSci is involved in a range of initiatives, including the BArCh-Wood project, which examines the impact of environmental changes on the decomposition of archaeological wood in the Ljubljansko barje wetlands. Additionally, the society has played a key role in the documentation and conservation planning of the Church of St. Anthony in Šepulje, employing photogrammetry and conservation assessments in collaboration with national heritage institutions. Through projects like HeriQuest, which explores public perceptions of heritage values, and participation in international forums—including the establishment of an international youth organization for heritage science—HeriSci actively contributes to shaping the future of heritage research. With a strong focus on interdisciplinarity and youth engagement, the organization aims to bridge gaps between research, conservation practice, and public awareness. This presentation will introduce HeriSci’s mission, ongoing projects, and future plans, emphasizing the importance of networking and funding opportunities for young professionals in heritage science.

1990. EXPLORING THE FUTURE OF HERITAGE SCIENCE INFRASTRUCTURES: INSIGHTS FROM BIBLIOMETRIC AND DEMOGRAPHIC ANALYSES

**Contribution format:** Oral  
**Contribution authors:** Richard Higham (University College London)

This presentation explores potential futures of engagement with Heritage Science infrastructures, using results from a forthcoming publication to understand possible futures of the discipline. The publication consists of four studies which investigate the now well-established field of Heritage Science from different perspectives, using

different techniques. The first study presented is a bibliometric study on the expansion of the discipline using machine learning, this is followed by a bibliometric analysis of the interdisciplinary impact of the field. Thirdly a summary of case study looking into the carers of Heritage Science graduates is presented , as are, the key findings of a sector-wide questionnaire on the demographics of Heritage scientists. The results these studies are presented to show how the rapidly expanding field of Heritage Science has evolved over time and has vast interdisciplinary impacts. These findings are then used to identify key issues and further areas of focus for Heritage Science as a discipline, ending with suggestions on how these issues and areas can potentially be addressed through engagement with research infrastructures such as the European infrastructure for Heritage Science.

1459. HARD AND SOFT. DARIAH RESEARCH INFRASTRUCTURE FOR POLISH ARCHAEOLOGY

**Contribution format:** Poster  
**Contribution authors:** Marcin Maciejewski (Institute of Archaeology, Maria Curie-Skłodowska University) – Julia Chyla – Arkadiusz Sołtysiak (Faculty of Archaeology, University of Warsaw) – Wojciech Fenrich (Interdisciplinary Centre for Mathematical and Computational Modelling, University of Warsaw) – Kamil Filipek (Center for Artificial Intelligence and Computer Modeling, Maria Curie-Skłodowska University)

The DARIAH-PL (Digital Research Infrastructure for the Arts and Humanities) consortium is part of the international DARIAH ERIC infrastructure, which has been operating in Poland since 2014. Its aim is to develop digital research and infrastructure that ensures broad, free access to its tools. This not only enables progress in the research itself but also extends the distribution and absorption of knowledge about European cultural heritage by every person living in Europe. Since 2021, projects have been carried out to build research infrastructure across various disciplines.. In the case of archaeology, this infrastructure includes both so-called hard tools, i.e. research equipment, for non-invasive surveys, landscape analysis (including the use of Geographical Information Systems), digital documentation, development of heritage digital twins, digitisation of archival resources, as well as software solutions. The main current challenge is the development of a digital research data repository integrated with a set of tools facilitating data search (chatbot) and analysis of variable archaeological data gathered by Polish archaeologists across the globe. This poster is part of the DARIAH-PL Digital Research Infrastructure for the Arts and Humanities (KPOD.01.18-IW.03-0013/23) project funded by the European Union NextGenerationEU, Poland's National Recovery and Resilience Plan A2.4.1 Investment in the development of research capacities Scheme A: Research Infrastructure - projects from the Polish Map of Research Infrastructure (PMIB).

261 THERE IS LIFE OUTSIDE THE BOX: ALTERNATIVE CAREER PATHS IN ARCHAEOLOGY

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Workshop  
**Session keywords:** professional development, transferable skills, wellbeing, precarity, freelancing, academia  
**Session organisers:** Alexandra Dolea (Freelance | European Mentoring and Coaching Council | Professional Women Network) – Laura Coltofean (EAA Education, Training and Professional Development Advisory Committee | Archaeology and Gender in Europe (AGE) Community of the EAA | Early Career Archaeologists (ECA) Community of the EAA) – Daniela Hofmann (University of Bergen | EAA Education, Training and Professional Development Advisory Committee) – Maria Mina (University of the Aegean | EAA Education, Training and Professional Development Advisory Committee | Archaeology and Gender in Europe (AGE) Community of the EAA)  
**Session speakers:** Rosie Bonté (Brepols Publishers) – Maxime Brami (University of Mainz | Early Career Archaeologists Community of the EAA) – Laura Coltofean (EAA Education, Training and Professional Development Advisory Committee | Archaeology and Gender in Europe Community of the EAA | Early Career Archaeologists Community of the EAA) – Alexandra Dolea (Freelance) – Daniela Hofmann (University of Bergen | EAA Education, Training and Professional Development Advisory Committee) – Maria Mina (University of the Aegean | EAA Education, Training and Professional Development Advisory Committee | Archaeology and Gender in Europe Community of the EAA) – Jona Schlegel (Freelance) – Polona Janežič (Slovenian Academy of Sciences and Arts, Institute of Archaeology | Freelance) – Paulina Szymańska (Independent reasearcher)

SESSION ABSTRACT

This workshop invites archaeologists to think outside the box and reflect on the diverse field that archaeology has become today – not in terms of the richness of archaeological subfields and research themes, but in terms of the multitude and often unacknowledged career possibilities that exist within it. It challenges common and traditional perceptions within the archaeological community according to which the profession is – and should be – mainly practiced in academic, museum or commercial contexts and that these are the only valid trajectories that bring professional and personal fulfilment, opportunities and recognition, and (eventually) a more or less satisfying income. The workshop brings awareness to the pressing current realities that contradict these perceptions, e.g., the crisis and precarity on the archaeological job market, the increasing number of reports of toxic work relationships and environments, and the personal and professional struggles that all these generate and are often experienced in silence and isolation. It argues for the normalization of the idea that alternative and non-linear professional paths in archaeology are as valid and fulfilling as the traditional ones. These paths can be an option for those who are trying to find their voice and place within the field, consider changing their professional status or transitioning to work outside academia, or wish to craft a professional life that is better adapted to their abilities and needs of wellbeing. The workshop brings together archaeologists of various cultural backgrounds and career stages who discuss their experiences of working in freelancing, science communication, publishing, filmmaking, consultancy and coaching, among other fields, and answer questions about transferable skills and following non-traditional paths in archaeology. The workshop is organized with the support of the EAA's Education, Training, and Professional Development Advisory Committee, its Archaeology and Gender in Europe Community and its Early Career Archaeologists Community.

264 EXPLORING THE BUILDING BLOCKS FOR ARCHAEOLOGICAL TRAINING AND SKILL ACQUISITION

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Round table  
**Session keywords:** Skills, Training , Methods, Standards  
**Session organisers:** Cara Jones (Chartered Institute for Archaeologists) – Pirjo Hamar. (Museovirasto)  
**Session speakers:** Cara Jones (Chartered Institute for Archaeologists ) – Pirjo Hamari (Museovirasto) – Anna Welch (Chartered Institute for Archaeologists) – Jesús Brufal (Ciències de l'Antiguitat i de l'Edat Mitjana) – Anna Bach Gomez (Universitat Autònoma Barcelona)

SESSION ABSTRACT

We know that targeted training and skill development initiatives can support individuals on a sustainable pathway to and through a career in archaeology, but we also know that it is a challenge to make these initiatives accessible to all. Developing firm foundations or building blocks which can underpin mechanisms like training schemes, CPD events and formal qualifications can help benchmark every training intervention against a recognisable standard and can go some way to supporting a co-ordinated approach to skill acquisition. However, developing those foundations or ‘blocks’ can be a challenge in itself – challenges which include resource, capacity and even the skills and knowledge it takes to create these standards. Organised by members of the EAA Community for teaching and training of archaeologists, this discussion session seeks to

- Explore the foundations or ‘blocks’ that may exist in your individual areas of practice which help benchmark training interventions
- Understand how the foundations or ‘blocks’ can support sustainable pathway development for careers by underpinning qualifications, micro-credentials, CPD events and work-based training
- Identify mechanisms for creating these foundations or ‘blocks’ which can then go on to form a framework for skill development initiatives
- Discover how we, as skill development practitioners, can ensure that these foundations or ‘blocks’ are sustainable
- Discuss how we identify the skill gaps and skill needs required to inform the guiding principles and maintenance of these foundations or ‘blocks’

267 INTERTWINED CROP HISTORIES: A MULTIDISCIPLINARY APPROACH

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** agricultural diffusion, crop evolution, agricultural history, archaeobotany, ethnobotany, archaeological science  
**Session organisers:** Daniel Fuks (—) – Rachele Pierini (CTR, Saxo Institute, University of Copenhagen)

SESSION ABSTRACT

In the contemporary context of global food security and sustainability, studying ancient and recent trajectories of cultivated plants is as relevant as ever. Multidisciplinary approaches to crop histories have a long historiography but are often lacking in contemporary research. This session, organized in collaboration with the newly formed Crop History Consortium, seeks to illuminate the value of interdisciplinary and mixed methods approaches in tracing the diffusion and evolution of agricultural crop plants. We invite contributions that demonstrate innovative methods, applications or synergies across fields such as archaeobotany, ethnobotany, linguistics, historical studies, stable isotope analyses, ancient DNA and other biomolecular analyses, additional archaeological sciences and other fields. We are particularly interested in the cultivation, utilization and movement of crops in historical periods, mostly of the past 3,000 years, although we welcome all studies exploring post-domestication crop histories. This session aims to foster dialogue among scholars to enhance our collective insights into agricultural diffusion, crop evolution, and the intertwined narratives of human civilization.

CONTRIBUTION ABSTRACTS

1343. THE ISLAMIC GREEN REVOLUTION 50 YEARS ON

**Contribution format:** Oral  
**Contribution authors:** Daniel Fuks (—)

Last year, Andrew Watson passed away, 50 years after the publication of his pioneering 1974 article, which offered the first comprehensive argument that the early Islamic caliphates transformed agriculture across the Middle East and Mediterranean, ca. 700–1100 CE. His “Islamic Green Revolution” (IGR) described a unique Islamicate contribution to long-term agricultural change that involved unprecedented dispersal of sub/tropical crops, along with associated agricultural knowledge, technology, infrastructure, and impetus. Today, the IGR is one of a handful of canonical agrarian “revolutions” in history and Watson’s ideas continue to influence scholarship widely. In a paper entitled “Innovation or Preservation?”, originally presented at the 2018 EAA in Barcelona, I presented guidelines for assessing archaeobotanical evidence for new introductions, with relevance to understanding the Islamic Green Revolution (IGR) and agricultural transformations in general. That paper advocated applying these guidelines to a multi-regional, crop-by-crop approach to assessing the evidence for the IGR. Seven years later, this paper takes stock of the progress made in this direction, presenting a bird’s eye view of current evidence for the IGR and first millennium CE crop diffusion in the Middle East and Mediterranean. In particular, it will summarize insights gleaned from the regional synthesis papers on first millennium CE crop introductions published in the “Moving Plants” special issue of *Vegetation History and Archaeobotany*. Some key research questions and a proposed agenda for future work on this topic will also be presented.

1334. A TALE OF TWO AGRICULTURAL REVOLUTIONS: CROP INTRODUCTIONS IN THE LONG FIRST MILLENNIUM CE SOUTHERN LEVANT

**Contribution format:** Oral  
**Contribution authors:** Annette Hansen (Vrije Universiteit Brussel | University of Groningen) – Frits Heinrich (Vrije Universiteit Brussel) – Dafna Langgut (—) – Ehud Weiss (—) – Daniel Fuks (—)

This paper aims to provide a robust regional synthesis of crop diffusion in the southern Levant, with the objective of ascertaining the significance of first millennium CE introductions, including those associated with Roman Agricultural Diffusion (RAD) and the Islamic Green Revolution (IGR). It does so by integrating published archaeobotanical data and written evidence from multiple periods to identify the earliest attestations of crop taxa. We present the earliest evidence for 80 crops in the region from the Neolithic until the medieval period, focusing on ‘the long first millennium CE’. We will not only consider first finds, but also, where possible, the qualitative evidence for adoption and entrenchment of these crop plants in this region. Our findings indicate that RAD crops are numerically more significant than IGR crops, although the difference is greater in the archaeobotanical record compared with the textual evidence. Nearly half of the 80 crops surveyed were introduced to the southern Levant in the first millennium CE, indicating the unprecedented extent of crop introduction during this period.

519. HOW WOOD SUPPLY CHANGES THROUGH TIME (1ST MILLENNIUM BC-7TH CENTURY AD) OF SETTLEMENTS OF THE NORTH-EASTERN OF IBERIAN PENINSULA

**Contribution format:** Oral  
**Contribution authors:** Eva Maria López Castillo – Raquel Piqué Huerta (Universitat Autònoma de Barcelona) – Pere Castanyer Masoliver (Grup de Recerca Arqueològica del Pla de l’Estany) – Oriol

López Bultó (Museu d’Arqueologia de Catalunya) – Ann Barberà Berrocal (Universitat Autònoma de Barcelona) – Joan Frigola Torrent (Grup de Recerca Arqueològica Pla de l’Estany) – Joaquim Tremoleda Trilla (Grups de Recerca Arqueològica Pla de l’Estany) – Enriqueta Pons Brun (Museu d’Arqueologia de Catalunya)

As part of the research in the doctorate’s program, a database is being developed and presented here. The database contains anthracological and dendrological remains, recovered from archaeological sites in the north-eastern Iberian Peninsula, from the Iberian, Roman to Late Antiquity periods, providing new insights into the forest provisioning strategies and forest resources. Many of different settlements in this area, such as Empúries (L’Escala, Girona, Spain), Mas Castellar (Pontós, Girona, Spain), Vilauba (Camós, Girona, Spain) and Can Ring (Besalú, Girona, Spain) are providing some evidence about changes in forest management by the charcoal analysis. Its analysis examines and highlights the use of different wooden species through time, among which oak (*Quercus* sp. deciduous), holm oak (*Quercus* sp. sclerophyllous) and Mediterranean shrubs such as heather (*Erica* sp.) and strawberry tree (*Arbutus unedo*) are the predominant. The results indicate that these species would have grown near the settlements, although the anthracological data also reveal some changes in provisioning activities, with wood supplies being collected at a greater distance from the settlements. Wood was used for different purposes, such as construction, fuel and to make objects. An evolution in collection practices is observed between pre-Roman and Roman times, with an intensification in the use of tree species and an expansion of collecting areas, carrying a wide deforestation. Despite limitations, there is evidence of the selection of other species to promote selective growth for specific uses, such as food, medicines, basketry... This active interaction with the environment is evidence of an adaptation to growing economic needs when arriving the Roman period onwards.

1495. ETRUSCAN CROPS: MOVING BEYOND ‘THE MEDITERRANEAN TRIAD’

**Contribution format:** Oral  
**Contribution authors:** Frijda Schmidt (University of Cambridge)

In the vibrant political landscape of the first millennium BCE, when most notably the Mediterranean Sea developed from a natural barrier into a sphere of interaction for bordering regions, the Etruscans emerged in central Italy as an early urban complex, deeply entangled in the wider networks. Crop husbandry has in this context long been acknowledged as a central economic mainstay, not only to feed the people of the growing cities, but also for feeding surpluses into regional and trans-regional exchange. So far studies have principally relied on artefactual evidence, including consumption, storage, and transport vessels. These have identified important trends in the developments from subsistence to market production and nuanced the social role of consumption - but also resulted in an unilateral focus on wine and oil, as these leave the most visible and attributable traces through their characteristic ceramics. Macrobotanical evidence on the other hand has only rarely been integrated into more general discussions, despite the existence of a rich record, notably encompassing several waterlogged and mineralized assemblages that offer unique insights into past plant diversity. Over 50 years after the first systematic retrieval of plant remains from an Etruscan site this paper aims for the first time to summarize the existing legacy records of cereals, legumes, fruits, and nuts into a regional and diachronic synthesis. This data allows to reassess but significantly also to move beyond the Mediterranean triad of grain, grapevines, and olives, and investigate trends in crop exploitation from the Iron Age to the Roman conquest, observing them in context of urbanization, crop diffusion, and the transformation from gathering to cultivation.

1469. NON-CEREAL CROPS IN ASSYRIA: AN ANALYSIS OF TEXTUAL EVIDENCE AND RESEARCH PERSPECTIVES FOR A CROP HISTORY OF THE NEO-ASSYRIAN PERIOD

**Contribution format:** Oral  
**Contribution authors:** Salvatore Gaspa (University of Padua)

This paper will discuss legumes and other vegetables in the archival documents of the Neo-Assyrian Empire, thus from the perspective of the state agricultural policy of which the texts are an expression. The history of the Neo-Assyrian empire (9th to 7th cent. BCE) represents a crucial phase in the history of Iron Age crops. Leguminous and other horticultural plants were minor crops compared to cereal crops, which were the main agricultural investment and food resource in the empire’s economic system. The terminology of this agronomic sector is found in several texts of the Neo-Assyrian period, but only for some names of cultivated plants is identification certain or plausible. The representativeness of legumes and other crop plants in the written sources of the Neo-Assyrian archives and the factors influencing their presence or absence in the texts will be evaluated from different perspectives of analysis. To better understand non-cereal agriculture in Assyria, the study will also review the written evidence of vegetable gardens in Neo-Assyrian sources, as these were the places where legumes and other vegetable plants were regularly grown, both in institutional farmsteads and in family-based households. Archaeobotanical research can confirm and supplement textual information, and offer a more precise documentary framework for a reconstruction of the history of these crops in the period in question.

Although legumes and horticultural plants are less represented in both textual and archaeobotanical records, they certainly played a significant role in both the food system and the agricultural choices of the elite and the rural population of the world’s first empire.

2105. LINKING ARCHAEOBOTANY AND BEYOND: BIAD AS A TOOL FOR MULTIDISCIPLINARY CROP HISTORY RESEARCH

**Contribution format:** Oral  
**Contribution authors:** Natalia Ryabogina (University of Gothenburg) – Claudia Speciale (University of Gothenburg | Catalan Institute of Human Paleoecology and Social Evolution) – Adrian Timpson (University College London)

The Big Interdisciplinary Archaeological Database (BIAD <https://biadwiki.org/>) standardises and consolidates a wide range of archaeological data, providing a pan-European perspective on prehistoric processes from the Balkans to Scandinavia and from the Atlantic coast to the Urals. BIAD data follow a specific template, collecting qualitative and quantitative information from publications and linking it to site data to ensure accuracy and consistency over time. We have made significant progress in collecting archaeobotanical datasets in BIAD and harmonising them for comprehensive analytical research specifically related to crop plants. BIAD is not just an archaeobotanical repository, but a fully fledged interdisciplinary relational database. Plant remains are linked to other data - C14, isotopes, strontium, faunal data and, of course, archaeological information about the site - location, chronology, type, material culture, material objects, human data (burials, individual characteristics, diseases and link to DNA). These links are crucial to understanding the context of plant cultivation and use. BIAD will offer new analytical possibilities for dietary reconstructions, agricultural studies, the study of exchange networks and regional economic variations, all of which are relevant to tracing crop histories. This multidisciplinary approach provides a powerful tool for investigating the cultivation, use and movement of crops over the last few thousand years.

2054. UNRAVELING THE ENIGMA OF DATE PALM CULTIVATION IN THE SOUTHERN LEVANTINE REGION BASED ON ANCIENT SEED MORPHOMETRIC ANALYSIS

**Contribution format:** Oral  
**Contribution authors:** Ernesto Teste (DIADE, University of Montpellier, CIRAD, IRD) – Guy Bar-Oz – Roy Galili (School of Archaeology and Maritime Cultures, University of Haifa) – Daniel Fuks (—) – Roei Shafir (School of Archaeology and Maritime Cultures, University of Haifa) – Meirav Meiri (The Steinhardt Museum of Natural History, Tel Aviv University) – Muriel Gros-Balthazard (DIADE, University of Montpellier, CIRAD, IRD)

Date palm (*Phoenix dactylifera* L.) cultivation in the southern Levant presents a complex history. This study investigates the evolution of date palm cultivation in the Negev desert through comprehensive morphometric analysis of 2,294 archaeological seeds from nine sites spanning Hellenistic to Early Islamic periods (300 BCE - 800 CE). We compared these specimens with 287 archaeological seeds from Egypt and Libya, and approximately 8,000 modern seeds representing cultivated, feral, and wild *Phoenix* populations. Using both linear measurements and geometric morphometrics through Elliptic Fourier Descriptors (EFDs), we identified distinct morphological patterns across sites and periods. Results reveal the Negev’s unique position as a botanical crossroads, evidenced by a balanced ratio of African to Asian morphotypes (1.6:1) compared to North African sites’ strong African dominance (4:1). This pattern reflects the region’s role in connecting African, Arabian, and Asian trade networks. Archaeological seeds showed significant morphological diversity, with 42% matching cultivated morphotypes, 18% wild types, 8% *Phoenix* wild species, and 6% feral types, while 25% remained unclassified. The presence of unclassified specimens could suggest extinct varieties or lost diversity. Notably, sites like Nahal Omer (Early Islamic) and Mezaad Rahel (Hellenistic-Early Roman) yielded exceptionally large and diverse assemblages, indicating intensive local cultivation alongside active trade participation. This study provides new insights into the complex relationship between trade networks, agricultural practices, and cultural exchange in shaping the botanical landscape of the ancient Levant.

2357. LATHYRUS CULTIVATION IN GREECE THROUGH THE AGES: INTEGRATING ARCHAEOBOTANICAL, ETHNOGRAPHIC AND TEXTUAL EVIDENCE

**Contribution format:** Oral  
**Contribution authors:** Soultana Maria Valamoti (School of History and Archaeology, Aristotle University of Thessaloniki, Greece)

Several *Lathyrus* species have been cultivated since the emergence of the first farming communities in Greece and current accounts of traditional agriculture show that they continue to be cultivated in different parts of

mainland Greece and the islands. This paper presents a wealth of archaeobotanical evidence on *Lathyrus sativus*, *Lathyrus clymenum* and *Lathyrus ochrus* from prehistoric and early historic Greece exploring the prehistory and history of these crops in the study region. Based on both archaeobotanical and ancient textual evidence, the presentation discusses the use of these crops in the ancient Greek world and using ethnographic and agromonic evidence of recent years showcases the resilience of these three crops and their survival in modern Greek small scale agriculture and cuisine. The paper offers a *longue duree* examination of the history of these three marginal, crops in this part of southeastern Europe and the East Mediterranean in terms of their significance in people’s agricultural practice and diet,

2280. MYCENAEAN DYE PLANTS: THE MANY LIVES OF KA-NA-KO ‘SAFFLOWER’ (CARTHAMUS TINC-TORIUS L.)

**Contribution format:** Oral  
**Contribution authors:** Rachele Pierini (CTR, Saxo Institute, University of Copenhagen)

Mycenaean tablets in Linear B (1450–1200 BCE) provide written evidence of the term ka-na-ko (*Carthamus tinctorius* L.), commonly known as ‘safflower’ or ‘false saffron.’ The Linear B texts distinguish between two types of ka-na-ko: ‘red’ (e-ru-ta-ra) and ‘white’ (re-u-ka). The red variety, associated with weight measurements, likely refers to the plant’s flowers, while the white variety, measured in dry units, probably pertains to the seeds. This differentiation highlights the Mycenaeans’ diverse uses of safflower, including applications in food, perfume production, medicine, and potentially as a textile dye. This paper focuses on ka-na-ko as a dye plant, specifically its role as a more affordable alternative to saffron for producing a yellow hue. This is possible because safflower contains a water-soluble yellow dye. However, it also contains an alkaline-soluble red dye, making ka-na-ko a potential source of red dyes as well. Given these properties, safflower may have played a significant role in Mycenaean textile production, offering a cost-effective and versatile dyeing material.

1569. CITRUS FRUIT IN THE ANCIENT MEDITERRANEAN: THE IMPACT OF THE ROMAN AGRICULTURAL DIFFUSION (RAD)

**Contribution format:** Oral  
**Contribution authors:** Geoffrey Kron (University of Victoria)

This talk will outline recent research into the origins of citrus fruit cultivation in the Mediterranean, showing that aside from the attested introduction of the sweet orange (*C. sinensis*), and perhaps the pomelo (*C. Maxima*) in the early Islamic period, most of the widely disseminated citrus varieties now found in this region were introduced in the Roman Republic and early Empire, leading to their spread throughout the region. A series of new archaeobotanical analyses of citrus pollen and seeds from Roman Italy, studied using the most up-to-date methods, including scanning electron microscope imaging of pollen, seeds and rinds, and statistical computer modelling of seed morphology to compare archaeological samples with ‘archaic’ modern cultivars has not only provided further clear proof for lemon cultivation, but has also provided strong archaeobotanical evidence for a greater diversity of citrus fruit, with the presence, alongside the lemon (*C. limon*), of sour or Seville orange (*C. aurantium*), lime (*C. aurantifolia*) and mandarin (*C. reticulata*) in Roman Italy. I will also discuss iconographic evidence as well as general historical considerations and results of recent genetic studies corroborating a Roman creation or introduction of the most important cultivars of a range of citrus fruit now found widely distributed throughout the Mediterranean, as well as of other citrus species either definitely or probably introduced by the Romans, including a variety of prized cultivars of the citron (*C. medica*), the chinotto (*C. myrtifolia*), the bergamote (*C. bergamia* Risso & Poit.), the limonette of Marrakech (*C. limetta* Risso) and the Tunisian Chiiri lime.

923. CRACKING THE CODE OF CRYPTIC POLLEN: CAN CHEMOTAXONOMY HELP US UNPACK CEREAL CULTIVATION?

**Contribution format:** Oral  
**Contribution authors:** Faidra Katsi – Matt Kent – Alastair Wills – Michela Mariani – Matt Jones (University of Nottingham) – Phil Jardine (University of Münster) – Wes Fraser (Oxford Brookes University) – Warren Eastwood (University of Birmingham) – Barry Lomax (University of Nottingham)

Since the first evidence of domestication, cereals have been the most common and wide-spread crops used continuously by societies. Our knowledge about the use, cultivation and geographic spread of cereals is primarily based on archaeobotanical macro-remains, which allow for high taxonomic resolution but are patchily distributed through time and space. In contrast, pollen provides continuous records that can be directly linked to palaeoclimate and landscape changes, yet they contribute fairly little to the discussion of cereal cultivation. This is due to some taxonomic uncertainty of cereal pollen; causing challenges to confidently discriminate/identify between pollen from domesticated species and their respective wild relatives using morphological criteria alone. We explore

another avenue for determining the taxonomy of domesticated and wild cereals using the chemical signatures of pollen wall of Poaceae, also known as chemotaxonomy. We were able to classify modern pollen samples with an accuracy of 90%, demonstrating the existence of a strong taxonomic signal. The signal strength suggests that chemotaxonomy might also be a powerful tool for classifying subfossil pollen, assuming that the subfossils exhibit chemical signatures analogous to their modern counterparts. For the first time, we used this method to classify subfossil Poaceae pollen recovered from the sediments of Lake Nar in Türkiye. Here we discuss the potential of this method for classifying cryptic pollen assemblages and its future applications in palaeoecological research. We believe that chemotaxonomy of subfossil pollen will help us reveal not only the adaptation of cereal cultivation in time periods with limited textual sources but also the diffusion of cultivated cereals in prehistory, perhaps beyond the potential of what is possible with archaeobotanical macro-remains.

75. STATUS, DIET AND INTENSIFICATION OF CULTIVATION IN LATE IRON AGE LUISTARI, EURA, SOUTHWESTERN FINLAND

**Contribution format:** Oral  
**Contribution authors:** Tiina Väre (Laboratory of Chronology, Finnish Museum of Natural History, University of Helsinki | Archaeology, University of Oulu) – Heli Etu-Sihvola (Laboratory of Chronology, Finnish Museum of Natural History, University of Helsinki) – Ulla Nordfors (Museum Centre Vapriikki, Tampere | University of Turku) – Elina Sahlstedt (Natural Resources Institute Finland) – Laura Arppe (Laboratory of Chronology, Finnish Museum of Natural History, University of Helsinki)

In the multiperiod burial site of Luistari, Eura, Southwestern Finland, both elaborately and meagerly decorated burials have been identified. A possible connection was examined between the bone and dentin collagen  $\delta^{13}\text{C}$ - ja  $\delta^{15}\text{N}$ -values and the status of the individuals (n=22) based on the value of their grave goods. Pearson CC revealed a negative correlation between the  $\delta^{15}\text{N}$ -values and a status score, which had been previously assigned to 16 of the studied individuals. Additionally, the 22 individuals were divided into two groups: those with elaborate and those with modest graves. As demonstrated by T-testing, individuals with modest graves had significantly higher  $\delta^{15}\text{N}$ -values. These results are in contrast with the usual assumption that high-status individuals had elevated collagen  $\delta^{15}\text{N}$ -values due to consumption of food containing more animal-protein, thus considered of better quality, while common people leaned more heavily on plant nutrition. The studied individuals date to the period of gradual intensification of early cultivation activities in the area. In the north, forests, fisheries, and livestock were safer options to keep hunger at bay. For cultivation to become a reliably productive source of livelihood in the north took much longer compared to the temperate climatic zone and rather than necessity, the adaptation of cultivation in the early phase could have been a manifestation of entrepreneurial spirit and organized by those whose wealth allowed for experimentation. Perhaps in climatically challenging areas, within populations dating to the phase of early intensification of cultivation, the high-status individuals were the ones to produce and consume most of the novel products of cultivation. The commoners could have mostly eaten easily obtainable foods such as fish, elevating their collagen  $\delta^{15}\text{N}$ -values.

1434. ECONOMIC PLANTS FROM MEDIEVAL ISLAMIC SOUTHERN IBERIA: THE ARCHAEOBOTANICAL RECORD

**Contribution format:** Oral  
**Contribution authors:** Antonio Peralta-Gómez (Spanish National Research Council | University of Granada) – Leono. Peña-Chocarro (Spanish National Research Council)

The study of plant remains from Al-Andalus is of particular interest for the study of societies in which Muslims, Christians and Jews coexisted, and is a valuable source of data for the analysis of dietary habits. According to written sources and a limited amount of archaeobotanical data, the plant diet in Iberia during the Middle Ages consisted mainly of cereals, legumes and a large group of fruit trees. The arrival of Islamic communities in the 8th century triggered an agricultural transformation in which new species and technologies were introduced. In this presentation we will focus on the economically important species that have been identified in Islamic sites in southern Iberia and that contribute to our knowledge of agricultural and dietary systems. We will discuss the main cereals, legumes and fruits that have been found, including the presence of new crops that have not been previously recorded in the archaeobotanical record.

1250. ANALYTICAL REASSESSMENT OF ONE OF EUROPE’S LARGEST ARCHAEOLOGICAL BROOMCORN MILLET DEPOSITS AT THE MORTENI SITE (ROMANIA)

**Contribution format:** Poster  
**Contribution authors:** Ana García-Vázquez (ArchaeoScience Division. Research Institute of the University of Bucharest (ICUB)) – Mihaela Golea (“Vasile Pârvan” Institute of Archaeology. Romanian

Academy) – Cristina Mircea (Babeş-Bolyai University) – Marin Cârciumaru (Valahia University of Târgoviște | Museum of Human Evolution and Technology in Paleolithic, Targoviste) – Gabriela Sava (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering, Măgurele) – Ana Ilie (National Museum Complex “Curtea Domnească”, Târgoviște) – Cătălin Lazăr (ArchaeoScience Division. Research Institute of the University of Bucharest (ICUB))

Broomcorn millet grains (*Panicum miliaceum*) recovered from the Morteni tell (Romania) reveals one of Europe’s largest archaeological deposits, totalling approximately 150 kg. Initially ascribed to the Chalcolithic period and the Gumelnița culture, our radiocarbon dating has shifted the chronology considerably, dating the deposit between 361 and 61 cal BC. This places the grains squarely within the Iron Age period, when broomcorn millet was an established staple across the region. In addition to this analytical approach, we have examined these grains from diverse perspectives, exploring both their morphology and aspects of cultivation management using stable isotope methods. The uncharred, desiccated grains exhibit heterogeneous preservation. While some specimens retain isotopic signatures similar to those of modern, fresh millet, others show clear evidence of nitrogen loss due to diagenetic processes. Notably high  $\delta^{15}\text{N}$  values indicate the application of intensive manuring practices, underscoring the agricultural importance of millet during this era. In addition, the integration of isotopic measurements with FTIR-ATR (Fourier Transform Infrared Spectroscopy with Attenuated Total Reflectance) has enabled a robust assessment of diagenetic alterations affecting the grains, thereby reinforcing the value of multidisciplinary approaches in archaeobotanical investigations. These findings highlight the necessity of incorporating radiocarbon dating to avoid misinterpretations based solely on stratigraphic context. By doing so, the study not only refines the chronological framework for the deposit but also enhances our understanding of ancient agricultural practices in prehistoric Europe.

2393. INTEGRATING ARCHAEOBOTANICAL DATA WITH HISTORICAL RESEARCH ON MEDIEVAL DIET AND AGRICULTURE IN SERBIA

**Contribution format:** Poster  
**Contribution authors:** Ana Smuk (Groningen Institute of Archaeology (GIA), Faculty of Arts, University of Groningen)

Archaeobotanical research in Serbia began in the 1970s at the well-known tell site of Gomolava in the northern part of the country. Since then, the focus has primarily been on prehistoric sites, with occasional data from Roman, Early Byzantine, and Medieval sites. In recent years, several medieval sites have been systematically sampled, offering valuable insights into how people interacted with their environment, cultivated, gathered, and utilized plants in their daily lives. The evolving interaction between established historical sources and newly discovered archaeobotanical data has opened a new chapter within both fields. However, archaeobotanical findings are already challenging historians’ work, calling for more precise use of taxonomy and accurate referring to plant groups. These discoveries have also revised the timelines for the introduction and use of certain plant species in the region, attracting more attention from historians. Key aspects such as diet and widespread economic activities such as agriculture in medieval Serbia, which were often neglected in historical studies, have gained prominence through archaeobotanical research. This paper aims to identify the gaps and challenges within fields, presenting the current state of knowledge from an archaeobotanical perspective while integrating historical sources.

2413. TRACING PLANT DIVERSITY AT THE PREHISTORIC SETTLEMENT OF KOIMISIS IN THIRASIA - AN INTERDISCIPLINARY APPROACH

**Contribution format:** Poster  
**Contribution authors:** Evangelia Stavridou (Department of Botany, School of Biology, Faculty of Sciences, Aristotle University of Thessaloniki) – Eugenia Gkatzogia – Antigoni Mavromati (Laboratory for Interdisciplinary Research in Archaeology, Department of Archaeology, AUTH | PlantCult Lab and Center for Interdisciplinary Research and Innovation, AUTH) – Nikolaos Psonis – Despina Vassou – Nikolaos Poulakakis (Ancient DNA Lab, Institute of Molecular Biology and Biotechnology (IMBB)) – Panagiotis Madesis (and Technology-Hellas 5 Institute of Applied Biosciences, Centre for Research and Technology-Hellas) – Konstantinos Sbonias (Department of History, Ionian University) – Konstantinos Athanasiou (Department of Architecture, Polytechnic School, Aristotle University of Thessaloniki)

This study presents the preliminary results of sedimentary ancient DNA (sedaDNA) metagenomics analysis for the identification of prehistoric plant taxa on the excavation site of the Early and Middle Bronze Age settlement at Koimisis, Thirasia (Greece), with a primary focus on the past plant diversity. Analysis of sedaDNA has been

used in paleoecology as one of the primary methods for reconstructing past environments. We employed a combined approach of targeted sequencing and ancient metagenomic analysis to identify prehistoric plant taxa from ancient DNA extracted directly from the freshly excavated prehistoric layer of the settlement. As one of the first sedaDNA studies conducted in a volcanic region with arid thermal conditions, this research demonstrates the feasibility of recovering plant DNA from challenging soil environments. Archaeobotanical evidence of plant and wood charcoal macro-remains was incorporated to verify the sedaDNA findings and enrich our knowledge of the past vegetation. By examining both crop and non-crop plants, the study enhances our understanding of the prehistoric flora of the settlement. The results are expected to contribute to broader discussions on plant diversity in prehistoric Thirasia and serve as a valuable reference for future research on environmental history in similar contexts.

268 ARCHAEOLOGY, ARTIFICIAL INTELLIGENCE, AND IMAGE ANALYSIS

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Discussion session  
**Session keywords:** Artificial intelligence, Neural networks, Data analysis, Image analysis, Image classification  
**Session organisers:** Sebastian Wärmländer (Stockholm University) – Olga Zagorodnia (The British Museum, London)

SESSION ABSTRACT

Advances in computer-based analysis and classification of images, by using neural networks or artificial intelligence (AI) algorithms, are re-shaping many aspects of digital archaeology. The transformative capacities and possibilities of AI systems are currently evident in the general society, and need no further introduction. This session welcomes full-length papers where artificial intelligence approaches are used to investigate images, in order to answer archaeological questions. A particular focus is the use of AI algorithms to study and/or classify images, either in 2D or 3D format. An important question for archaeological applications is how well AI systems can handle images corresponding to archaeological typologies. Both case studies and methodological studies are welcome. AI and neural network analysis of non-image data could also be accepted, if the results or methods could be extended to investigations of images. Papers on all time periods, geographical regions, and different aspects of archaeology are welcome. We particularly encourage students and young researchers to present their work, and for these participants also short papers can be accepted.

CONTRIBUTION ABSTRACTS

208. AUTOMATED 3D SCANNING OF ARCHAEOLOGICAL ARTEFACTS: A ROBOTIC APPROACH TO HERITAGE DOCUMENTATION

**Contribution format:** Oral  
**Contribution authors:** Arianna Traviglia – Selene Frascella (Istituto Italiano di Tecnologia)

Museums and research centres face significant challenges in documenting archaeological heritage through 3D scanning, primarily due to the time-consuming process and the need for specialised personnel. Moreover, ongoing excavation activities continuously expand collections, often introducing also large quantities of fragmented materials This creates a gap between the number of properly documented artifacts (or fragments) and the volume of new items added to collections each year, or the number of properly catalogued fragments stored. As a result, valuable historical and cultural information is lost from uncatalogued finds, while access to heritage remains limited for both the public and researchers. To address this challenge, the Centre for Cultural Heritage Technologies (CCHT) at the Italian Institute of Technology (IIT) has developed an innovative platform for the automated scanning of archaeological objects, or their fragments. This solution is part of the House of Emerging Technologies–Genoa Project (CTE) and combines an automated digitisation system with robotic artifact handling. The system uses two robotic arms: one, equipped with a gripper, manipulates and rotates the tray on which the objects are placed for scanning, while the other, fitted with a structured light scanner, moves around the artifact to capture a full 360° scan. The resulting data is processed in the cloud, generating high-quality 3D scans of the objects Laboratory tests conducted on Roman-era materials demonstrate that the platform can produce high-resolution scans within a few minutes, showcasing the potential of robotics in archaeological heritage digitisation. By automating the scanning, this technology significantly reduces both the processing time and personnel effort compared to traditional methods. Furthermore, it facilitates the acquisition of large volumes of metadata about cultural heritage objects that might otherwise be lost. Finally, this approach enhances the accessibility of collections, ensuring that crucial information about artefacts can be shared with specialists and the general audience.

967. AUTOMATED ARCHAEOLOGICAL IMAGE ANNOTATION: AI-ASSISTED OBJECT RECOGNITION AND METADATA ENRICHMENT

**Contribution format:** Oral  
**Contribution authors:** Petr Pajdla – Ronald Harasim (Institute of Archaeology of the Czech Academy of Sciences, Brno) – David Novák (Institute of Archaeology of the Czech Academy of Sciences, Prague) – Olga Lečbychová (Institute of Archaeology of the Czech Academy of Sciences, Brno)

The ongoing digitisation of archaeological image archives presents significant opportunities for knowledge discovery, yet also poses considerable challenges, as processing vast amounts of visual data remains a time-intensive task well suited for automation. The application of artificial intelligence (AI) and distant viewing methods offers a scalable solution to enhance the usability, accessibility, and interoperability of large archaeological image archives. Without such automation, achieving comparable results would require years of manual processing. This paper presents a workflow for automatic image annotation, developed to improve (meta)data quality in the Archaeological Map of the Czech Republic (AMCR) repository and discovery services. We outline the training process and pilot implementation of a deep learning model fine-tuned for archaeological datasets, employing ResNet architecture. The workflow enables segmentation and annotation of archaeological images using domain-specific controlled vocabulary terms, facilitating the identification of artefact types and other relevant visual elements. To address the diversity of archaeological photography, we train the model on two distinct image categories: (1) single artefact/find images, typically photographed on standardised backgrounds with scales, and (2) excavation and fieldwork photographs, capturing a wide range of archaeological contexts, from entire excavations and sites to individual trenches and burials. The planned outcomes of this research are: (1) a documented workflow adaptable for similar applications, (2) a ground-truth dataset for training and benchmarking archaeological image recognition models, (3) the implementation of automated annotation into the metadata creation process, particularly for non-professional data providers and the bulk processing of (legacy) data, and (4) enhanced metadata quality in the AMCR repository and discovery services, improving the searchability and accessibility of archaeological images.

1285. EXPLORING DEVELOPMENTAL ASYMMETRY IN THE ADULT ILIAC AURICULAR SURFACE THROUGH ARTIFICIAL INTELLIGENCE

**Contribution format:** Oral  
**Contribution authors:** Michela Amendola (Research Centre for Anthropology and Health (CIAS), University of Coimbra | Centre for Functional Ecology (CFE), University of Coimbra) – David Navega (Research Centre for Anthropology and Health (CIAS), University of Coimbra | Centre for Functional Ecology (CFE), University of Coimbra | National Institute of Legal Medicine and Forensic Sciences (INMLCF, I.P.), Coimbra) – Francisco Curate – Álvaro Monge Calleja (Research Centre for Anthropology and Health (CIAS), University of Coimbra)

The iliac auricular surface plays a crucial role in transmitting axial load from the upper to the lower limbs during human bipedal movement, making it a focal point of anatomical and anthropological research. Shaped by a combination of genetic factors and environmental influences, this joint has recently been described as asymmetrical from fetal development through adolescence. Also, along puberty, it showed a marked change in laterality, where differing tendencies between females and males were also observed. Since the causes, developmental trajectories, and implications for adulthood remain poorly understood, this study aims to investigate whether these trends persist into adulthood. A sample of one hundred adult individuals with well-preserved right and left auricular surfaces from the Coimbra Identified Skeletons Collection (University of Coimbra, Portugal) was analyzed. High-resolution photographs were taken, and geometric morphometric techniques quantified shape differences. Principal Component Analysis (PCA) was conducted on the shape coordinates to identify major patterns of variation. Machine learning algorithms, including exploratory models, classified and predicted asymmetry patterns between sides and their variation by sex. This study refines analytical methods for assessing iliac auricular surface asymmetry, evaluating its potential as a diagnostic tool for sex estimation in forensic and bioarchaeological contexts. It underscores the critical role of identified collections in advancing our understanding of human development, adaptation, and variation. Through the analysis of the iliac auricular surface, this research provides valuable insights into how this structure reflects the complex interplay of biological, biomechanical, and environmental factors throughout an individual’s life. Expanding research to incorporate additional identified collections may further enhance these findings and broaden their applicability.

2282. A MACHINE LEARNING APPROACH TO ESTIMATION OF BURN TEMPERATURE FROM IMAGES OF BURNT TEETH

**Contribution format:** Oral  
**Contribution authors:** Sebastian Wärmländer (Stockholm University)

Determining the burn temperature of burnt bones and teeth is a long-standing problem in both bioarchaeology and forensic science. Different approaches have been tried. Some success has been achieved by using spectroscopic techniques (employing infrared and/or x-ray wavelengths) to monitor heat-induced changes in the microstructure of the bone/tooth mineral (apatite). However, the most obvious feature of bone/teeth that changes with heat treatment is color. Even though this has been known for a long time, quantifying numerical values for color change is not straight-forward. It has therefore proven difficult to include color changes in statistical approaches for estimation of burn temperature. Here, we have tried to address that problem by using a machine learning approach. First, controlled experiments were used to burn animal (pig) teeth at different temperatures. Next, color photographs of the burnt teeth were used to train an algorithm for estimation of burn temperature. The results and lessons learned from these experiments are critically evaluated and discussed.

**2139. FROM WETLAND TO WOODLAND: UNRAVELLING THE RECLAMATION HISTORY OF THE CAMPINE AREA (BELGIUM) THROUGH AI-DRIVEN DIGITISATION OF HISTORICAL MAPS**

**Contribution format:** Poster  
**Contribution authors:** Pieter-Jan Reynaert – Seb Verlinden (KU Leuven) – Pieter Roggemans (Flemish Agency for Agriculture and Fisheries)

Post-medieval reclamation activities - including drainage and agricultural exploitation - have drastically reshaped the appearance of the Campine area, a sandy region in northern Flanders (Belgium). Once dominated by extensive heathlands and marshes, these landscapes have now almost entirely disappeared. Although an abundance of historical sources is available on these reclamation efforts, key uncertainties persist about their spatial and temporal progress. Historical maps, with their detailed depictions of past land use, provide crucial insights to fill these gaps. This poster demonstrates how artificial intelligence can unlock the full potential of historical maps. Using OrthoSeg, a tool that enables map segmentation through deep-learning image classification, different types of land use were accurately vectorised and digitised. As part of interdisciplinary research on past landscape transformations, this case study illustrates how the AI-driven digitisation of historical maps allows for rapid and precise tracing and quantification of land use conversions, enhancing our spatiotemporal understanding of the reclamation history of the Campine area.

**269 KEEPING TOGETHER GEOSPATIAL DATA AND 3D MODELS. HOW TO BRIDGE THE GAP?**

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Discussion session  
**Session keywords:** interoperability, GIS&BIM, data management, Open Science  
**Session organisers:** Angela Bosco (Università di Napoli L’Orientale) – Federica Di Biase (University of Cyprus) – Marco Giglio (Università di Napoli L’Orientale)

**SESSION ABSTRACT**

Archaeological research increasingly relies on the structure of comprehensive data systems to manage and analyze large amounts of information. While repositories have advanced in organizing textual, geospatial, and 3D data, a significant gap remains in combining geospatial information with 3D models in a unified system. Current digital infrastructures tend to compartmentalize these types of data, making it difficult for researchers to access, visualize, and analyze spatial relationships in context. This session addresses the lack of integrated repositories that allow for the seamless merging of geospatial data with 3D models, emphasizing the need for an approach that can enhance both archaeological field and collection data management, as well as site interpretation. Special emphasis is also given to the need to make data accessible and thus discuss how to follow the FAIR guiding principles to support the Open Science movements. . In this session, we invite speakers to discuss on the necessity of creating such repositories, the challenges faced during the theoretical and practical digital infrastructures’ building process, and the current limitations of these repositories. We welcome contributions based on case study analysis as well as theoretical remarks in order to advocate for the development of systems capable of storing, managing, and linking heterogeneous data sets in a coherent and accessible manner.

**CONTRIBUTION ABSTRACTS**

**1684. ADVANCING FORENSIC ARCHAEOLOGY: INTEGRATING LASER SCANNING AND GPR IN THE INVESTIGATION OF A BRONZE AGE MASS GRAVE**

**Contribution format:** Oral  
**Contribution authors:** Marko Pantic (Reality Capture/Hexagon SGI Manager) – Ivan Macella (Segment Manager EMEA - Public Safety & Forensics | Hexagon Geosystems) – Krystian Wojciechowski (Business Development Manager EMEA Forensics)

The presentation focuses on presenting modern technology, a non-invasive survey of discovered burial sites or hidden remains. The tools used were GPR and 3D scanner. The selected example documents a cultural heritage site that has been discovered; however, in any case where a hidden, skeletonized corpse is found, the question must be asked whether a crime is involved. Digital documentation methods make it possible to obtain a precise model of the site without physical contact, which is crucial when investigating sites of exceptional historical and cultural value. The procedures for preparing the test site will be discussed. Necessary steps and practical tips to help in the proper use of ground penetration radar will be indicated. Next, the methodology of the measurement process using a 3D scanner will be discussed. As it is known, it performs a series of non-contact measurements, which makes it possible to collect a full “point cloud” reflecting the geometry and details of the object. The digital model obtained allows virtual reconstruction of the interior of the grave, identification of possible cavities, detection of artifacts and analysis of the technical condition of the structure. The presentation will also highlight the possibility of integrating 3D survey data with GPR results to provide a comprehensive picture of the investigated site. The aim of the presentation is to show that the use of non-invasive technologies, such as 3D scanning, clearly supports the work of forensic archaeologists, enabling detailed documentation and analysis without the risk of damaging valuable artifacts. Examples of international projects that confirm the effectiveness of this method in investigating the site of a deceased body will also be presented. The resulting models of the site or individual artifacts can be used for further independent and simultaneous examinations by appointed experts.

**1723. DEVELOPMENT OF AN ARCHIVE DOCUMENT MANAGEMENT SYSTEM FOR ARCHAEOLOGICAL INVESTIGATIONS IN CUPRA MARITTIMA (AP)**

**Contribution format:** Oral  
**Contribution authors:** Domenico Garzillo (Scuola Superiore Meridionale)

The primary goal of the project is the digitization of both existing and newly acquired archaeological data from the territory of Cupra Marittima in the Marche region (AP, Italy), which currently lacks a coherent system, making it difficult to access and consult. This information was gathered by examining bibliographic and historical archives, as well as the documentation from past excavations in the area. The data will contribute to the creation of georeferenced maps, phase plans of the city and its surrounding territory, and proposals for reconstructing the urban development of the ancient city. The data were integrated into an information system built on a GIS (Geographic Information System) platform. The software used is specifically QGIS (Quantum GIS). The creation of these products will provide valuable support for the planning of future interventions and research in the area, and will also help foster a productive relationship between the needs of the local community and the protection and enhancement of cultural heritage.

**1651. ARCHAEOLOGICAL DATA MEETS BIM: A STUDY ON THE INTEROPERABILITY OF IFC AND CITYGML**

**Contribution format:** Oral  
**Contribution authors:** Giovanni Angrisani (Università degli Studi di Napoli “Federico II”) – Olga Rosignoli (Politecnico di Milano) – Valeria Cera (Università degli Studi di Napoli “Federico II”)

This contribution presents a study conducted on the theme of semantic standards for the exchange of information. By analyzing what is available in the BIM, geospatial and construction sector, two standards fundamentally emerge: IFC and CityGML. The new versions IFC 4X3 and CityGML v.3 possess rich description of physique and spatial entities. While IFC 4.3 introduces specific classes for linear infrastructure, on the other hand, CityGML v.. has refined its core model which now focuses on two concepts of “space” and “spatial boundary” to improve semantics, unify representation, facilitate generalized reasoning about urban fabric, and an improved LOD concept to better support the interoperability with the IFC schema. However, as it often happens in the archaeological field, some of the typical features of vesuvian architecture are missing, from both standards. In the field of research, the project announced in 2022 “BIG\_SMAART - BIM & GIS for Spatial and Muldidimensional Archaeological Artefacts and Techniques” finds its identity, a research line that is part of the PRIN ministerial program. The project is part of the response to the need to satisfy a systematization of the information and documentary corpus for archaeological contexts on a national scale. Besides the semantic insufficiency, the dialogue between the standards is also discussed: it mostly happens through dedicated algorithm and/or software at the

end of an enclosed process, and, a part from very few exceptions, mostly on proprietary CDE. In this article we simulate the transfer of IFC data to CityGML and viceversa using the case study of the domus «casa/panificio» (Regio VIII.6.. 9-11) in the Archaeological Park of Pompeii, a palimpsest of history, spaces and architectural entities of the Roman world between the Republican and High Imperial ages, and highlight the shortcomings of the AEC workflow in use against the needs of Archeological assets.

1598. TOWARDS AN INTEGRATED DATA MODEL FOR ARCHAEOLOGICAL HERITAGE: BIM, GIS, AND ONTOLOGICAL FRAMEWORKS

**Contribution format:** Oral  
**Contribution authors:** Giovanni Borriello – Angela Bosco – Francesca Forte (Università “L’Orientale” di Napoli)

The digital integration of cultural heritage represents a crucial challenge, such as in the context of the Archaeological Park of Pompeii, where conservation and documentation require interoperable tools between BIM (Building Information Modelling) and GIS (Geographic Information Systems). The BIG\_SMAART Project analyses the interoperability between these two systems, highlighting the information loss that arises in digitization and semantic standardization processes. In addition to identifying differences in how architectural entities and materials are represented, which are essential aspects for archaeologists, the research develops a semantic mapping specific to Vesuvian architecture, creating a correspondence matrix between archaeological elements and the solutions provided by existing digital formats. The selected case study is the “Casa Panificio VIII 6,1/8-11” in Pompeii, chosen for its architectural, chronological, and functional complexity, making it a highly relevant testbed for the development of an integrated system. An in-depth analysis of ontologies and thesauri specific to the cultural heritage domain was conducted to simplify interoperability between GIS and BIM. These tools provide essential support in the identification of classes and properties to be integrated into the semantic framework of archaeological built heritage, addressing the conceptual gaps in BIM and GIS, which often do not fully meet the needs of archaeological documentation. The conceptual structure was formalized using specific semantic definitions and relations, identified within ontological models such as CIDOC CRM, particularly its CRMba extension, and ARCO, with its “Construction Description” ontology, as well as vocabularies such as “AAT – Art and Architecture Thesaurus” and “Iconclass”. Among the key results of the BIG\_SMAART Project is the need for a flexible data model, valid for various archaeological contexts, based on an integrated system that leverages diverse ontologies to define the semantics of built heritage.

650. 3D-STONE: A WORKFLOW FOR STRUCTURED LIGHT SCANNING AND DIGITAL TWIN MODELING OF STONE ARCHITECTURAL ELEMENTS IN ARCHAEOLOGY

**Contribution format:** Poster  
**Contribution authors:** Sara Bozza (CNR - Institute of Heritage Science)

The poster will introduce the 3D-STONE Workflow, a comprehensive methodology for structured light scanning and 3D modeling of stone architectural elements, developed and tested as part of the CHANGES Project (CNR-Institute of Heritage Science). The methodology was experimented using the Artec Eva scanner on marble blocks from the Basilica Iulia in the Roman Forum (Rome, Italy), addressing both archaeological and technical-practical challenges. The workflow encompasses all stages, from fieldwork scanning to the creation of high-resolution digital replicas, offering an efficient and reliable process specifically tailored for architectural blocks. These digital replicas are suitable for virtual reconstructions, morphological analyses, state-of-conservation mapping, and enhancing public engagement with monuments. The poster will illustrate the potential of the 3D-STONE workflow within a broader architectural study, exemplified by research on the Basilica Iulia. This monument has been digitally surveyed, resulting in a virtual twin that serves as a 3D repository for data archiving through the Extended Matrix method, ensuring transparency in interpretative processes (with T. Ismaelli, E. Demetrescu, S. Berto, E. Scopinaro, CNR-ISPC). Within this framework, the 3D models of architectural blocks act as digital proxies containing all relevant information while also being employed in a virtual environment for the stone-by-stone architectural reconstruction of the monument.

272 THE WELL-BEING OF ARCHAEOLOGISTS

**Session theme:** 4. De nobis fabula narratur: archaeological practice and a profession in flux  
**Session format:** Round table  
**Session keywords:** national regulations, union work, working environment  
**Session organisers:** Petra Nordin (Arkeologerna, Statens historiska museer) – Cara Jones (Chartered institute for Archaeologists) – Duncan Alexander (Arkeologerna, Statens historiska museer)  
**Session speakers:** Petra Nordin (Arkeologerna, Statens historiska museer) – Valentina Colagrossi (Slang-USB

Union, Mi Riconosci? Association) – Cara Jones (Chartered institute for Archaeologists)

SESSION ABSTRACT

Many sessions focus on scientific findings often in the form of results from archaeological findings and presentations of theses from various universities. The working environment of archaeologists and the working conditions at sites are seldom discussed at conferences. A good relation between union representatives and employers is essential to creating better conditions for a long-lasting, safe and sustainable career in the field. Knowledge of the national laws combined with assistance from agencies and institutions is crucial. This session is focused on workers union responsibilities and the role of the safety officer, in order to achieve better conditions for archaeologists in general and for a sustainable working life within the profession. Regulations and laws in different countries can support efforts from the employer’s side. The goal is to bring together union-interested archaeologists from a range of countries to increase knowledge of the different systems and to contribute to a better working environment for all archaeologists in the long term.

273 CERAMIC TECHNOLOGY AND KNOWLEDGE TRANSMISSION: ANALYTICAL APPROACHES TO UNDERSTANDING CULTURAL PRACTICES AND SOCIAL TRANSFORMATIONS

**Session theme:** 5. Finding the way! Archaeological sciences and opening new research perspectives  
**Session format:** Regular session  
**Session keywords:** Ceramic technology, knowledge transmission, archaeology, cultural practices, analytical techniques  
**Session organisers:** Sonia Pujals Blanch (University of Barcelona) – Judith Peix Visiedo (Institut Català d’Arqueologia Clàssica) – Clàudia Ortega Palacios (University of Barcelona) – Kelly Christodoulou (CCM Group, INN, NCSR Demokritos) – Júlia Coso Álvarez (Pompeu Fabra University (CGM Research Group))

SESSION ABSTRACT

In recent decades, the integration of advanced analytical techniques in archaeology has provided valuable insights into past societies, particularly through the study of ceramics. This session focuses on the technological approaches used to investigate ceramics across different time periods. Moving beyond provenance studies, we explore the significance of ceramic technology in understanding broader cultural, social, and economic dynamics, including the production techniques, material recipes (such as the use of grog and shell tempering), and knowledge transmission across generations. By employing analytical methods, including both non-destructive and multi-technique approaches, scholars can now examine the nuances of ceramic production processes and the underlying cultural shifts that influenced them. These analyses reveal how ancient communities adapted production practices, which, in turn, reflects patterns of social behavior, technological adaptation, and knowledge sharing. Furthermore, this session emphasizes how the study of ceramic technology aids in reconstructing past societies, offering insights into the social roles of craftspeople and the continuity of cultural traditions within the changing landscape. This session invites papers that present new findings and methodological advances in archaeometry, with an emphasis on how technology and transmission of craft knowledge shaped cultural continuity and transformation. By gathering perspectives from diverse chronological frameworks, we aim to foster a comprehensive dialogue on the evolving methods for understanding ceramic artifacts as both material and cultural resources.

CONTRIBUTION ABSTRACTS

1854. THE TRANSMISSION OF CRAFT KNOWLEDGE THROUGH SOCIAL CHANGE IN THE CARPATHIAN BASIN: EXAMINING INNOVATION AND ORGANIZATIONAL SHIFTS THROUGH TECHNICAL CERAMICS

**Contribution format:** Oral  
**Contribution authors:** Lauren Brown (University College Dublin)

This work explores the effect of social and organizational changes on the transmission and application of knowledge through the lens of bronze craft. These transformations are studied through the analysis of the material properties and the chaîne opératoire of technical ceramics (i.e., crucibles, moulds, cores, furnaces) in the context of significant spatial and organizational transformations seen in the Eastern Carpathian Basin pre- and post-16th c BC. Spatial and archaeometric studies are employed to discuss the organizational and technological shifts between these periods. The circulation of craft knowledge as a social actor is a major theme in archaeological

study. However, it is only recently that the effect of “significant” social change on its continuous transmission has been explored beyond ideas of loss and decreased complexity. These more nuanced discussions incorporate themes of choice, resilience, and transformation within cultural practices. A catalogue of all settlements with technological ceramics used in bronze production in both the periods is used in the spatial study. Pre- 16thc ceramic samples come from the sites of Feudvar (Serbia) and Rabe (Serbia). Post- 16th c samples come from Șagu (Romania). Thin-section petrography and XRPD are employed to determine paste recipes and production processes of each ceramic type. Fabric groupings are identified and the specificity or variety of use across artefact types and any modification of new groupings between the two periods will be discussed. The fabric composition, production, and use of domestic ceramics (e.g., pots, furnace linings, daub) are compared to technical ceramics to discuss cross-craft interaction. Groups of the ceramic types from both the pre- and post- periods are compared to discuss the continuation, change, or disuse of production process in social and technological contexts. Modern studies of teaching and learning are applied to flesh out the sensory and cognitive contexts of knowledge transfer.

**2086. KNOWLEDGE TRANSMISSION FROM POTTERY PERSPECTIVE: THE CONTRIBUTION OF EARLY NEOLITHIC WARES FROM THE EASTERN BALKANS (BULGARIA)**

**Contribution format:** Oral  
**Contribution authors:** Tanya Dzhanfezova (St Cyril and St Methodius University of Veliko Tarnovo)

This paper explores the technological approaches of Neolithic craftspeople and communities, encoded in the ways of producing high-quality Early Neolithic ceramic ware. Fragments of such vessels, discovered in the region of the Eastern Balkans (namely settlements located in present-day Bulgaria) shape the main body of evidence. The study aims at a better understanding of the main factors that underlie certain technological choices, as well as at a more comprehensive view on the various technical modes of doing, with special focus on the preference for specific ‘recipes’. The use of clays and pigments, and specifics of the surface treatment, are studied at macro- and micro levels (microscopic and chemical analyses), thus providing new insights into Neolithic pottery technology. The complexity of the processes of introduction (and further development) of pottery technology is tackled by analysing materials from long-lived, multi-layer settlements, located in the focal region. Explored in the broader context of Neolithization, these shape the basis to identify the mechanisms of adoption/adaptation of new technologies and serve as a proxy for the modes of sharing technical knowledge within and among prehistoric communities.

**1018. APPLYING CORRESPONDENCE ANALYSIS TO POTTERY DECORATION MOTIFS: A CASE STUDY FROM THE BISKUPICE SITE 18 (SOUTHERN POLAND)**

**Contribution format:** Oral  
**Contribution authors:** Anna Glod (Institute of Archaeology and Ethnology Polish Academy of Sciences) – Magdalena Moskal-Del Hoyo – Marta Korczyńska-Cappenberg (W. Szafer Institute of Botany, Polish Academy of Sciences)

Statistical methods have been successfully used in archaeology for many years and have many applications. Statistical analyses allow archaeologists to verify research questions and observe new relationships between analyzed artifacts. One such method is correspondence analysis, a well-known technique used to date and interpret archaeological context. Pottery fragments are among the most commonly encountered artifacts at prehistoric settlement sites, and ceramic seriation is one of the primary tools used by archaeologists to establish chronologies. In our presentation, we demonstrate the application of correspondence analysis to a significant assemblage of pottery remains discovered at Biskupice (Southern Poland), dating by the early Neolithic period, precisely the Linear Pottery Culture (LBK) of the first farming communities in Poland. Radiocarbon dating results confirmed the settlement’s existence towards the end of the 6th millennium BCE . However, the plateau effect is evident, with the majority of dating results falling within a broad range spanning from 5200 to 5000 cal. BCE. The results of correspondence analysis of LBK pottery decoration motifs allowed for a chrono-functional interpretation of a context.

**685. UNRAVELING CERAMIC PRODUCTION, DISTRIBUTION, AND SOCIAL IDENTITY IN NEOLITHIC ALBANIA USING PXRF: A CASE STUDY**

**Contribution format:** Oral  
**Contribution authors:** Hanna Murphy (University at Buffalo (SUNY))

Portable X-ray fluorescence spectrometry (pXRF. is a non-destructive archaeometric method that archaeologists are increasingly incorporating into archaeological research on craft production and exchange. One important class of artifacts that pXRF analyses are beginning to help understand are ceramics. During the Neolithic in the Balkans, ceramic items were a focal point of individual and group lifeways and contribute to our knowledge of prehistoric daily life and symbology. Black-burnished and red-burnished ceramics are frequently associated with Middle Neolithic ceramic assemblages. These ceramic items played a significant role in daily life in food

preparation and serving, and determining how they were manufactured can provide insight into the scale of production and potential inequality in Neolithic villages. In this presentation, we discuss the results of pXRF analyses designed to determine the source and organization of production in the Middle Neolithic of the Korça Plain in Southeast Albania. The Korça Plain is an area with a rich Neolithic history, including two key sites at Luadisht and Podgori. We analyzed ceramic and daub assemblages from these two sites, as well as from surface collections generated through pedestrian survey elsewhere in the Korça Plain. We explore the variability in geochemistry within and between these assemblages to reconstruct the organization of ceramic production during the Middle Neolithic. This case study demonstrates how archaeologists can use pXRF of ceramics to investigate craft specialization, household production, and identity in prehistoric communities.

**113. CERAMIC TRADITIONS AND TRANSITIONS: TECHNOLOGICAL INSIGHTS INTO NEOLITHIC POTTERY FROM WEST LITHUANIA**

**Contribution format:** Oral  
**Contribution authors:** Eglė Štavičė – Adomas Butrimas – Marius Iršėnas (Vilnius Academy of Arts, Institute of Art Research)

The emergence of pottery in the East Baltic region marks the beginning of the Neolithic period, reflecting significant social and cultural transformations. For decades, archaeological cultures have been distinguished primarily by pottery – the shapes and decoration of ceramic vessels. However, recent research has shifted the focus to technological aspects, including ceramic paste recipes, production techniques, and firing practices. Methods such as SEM-EDS, XRF, XRD, and FTIR have been employed to examine the distinctive features of the pottery and develop hypotheses about raw material selection and technological choices. Insights gained through microstructural, geochemical and mineralogical approaches reveal different ways of cultural interaction and knowledge transmission. This presentation examines Neolithic pottery from the Daktariškė 5 settlement in West Lithuania, revealing diverse ceramic paste recipes with tempers ranging from plant materials and shells to crushed granite and grog. It also highlights variations in vessel shapes, coiling techniques, and firing regimes. Notably, this settlement exhibits a remarkable continuity of existence, spanning from the 6th to the 2nd millennium BC and encompassing the entire Neolithic period. These findings shed light on the social and economic transitions within hunter-gatherer-fisher communities (Narva Culture) and their interactions with early farming groups, including those of the Globular Amphora and Corded Ware Cultures. The technological diversity observed within a single settlement underscores processes of knowledge transmission, cultural exchange, and the persistence of ancient traditions amidst shifting landscapes. By analyzing ceramic technological patterns, this study provides new insights into the dynamics of cultural boundaries, the continuity of traditions, and the economic and social transformations of the Neolithic period.

**2091. EXPLORING THE TECHNOLOGICAL FEATURES OF THE INDUS TERRACOTTAS!**

**Contribution format:** Oral  
**Contribution authors:** Sutapa Lahiri (University of Calgary)

The Indus craft industry includes a variety of objects made from different materials. During the Mature phase of the Indus period (2600 to 1900 BCE), there was a remarkable expansion and diversification within the craft sector. This development not only enhanced the economy but also provided significant insights into the identity and culture of the Indus civilization. Among the many crafted products, terracotta objects held particular significance. These artifacts have been an enduring element of the Indus craft tradition, appearing consistently across numerous Indus settlements. Despite their prevalence, research on the specific manufacturing techniques and the processes of knowledge transmission associated with Indus terracotta remains relatively limited. In this presentation, I will demonstrate that these artifacts display a range of technological choices and can be analyzed using non-destructive methods like morphological analysis, applied decorative techniques and XRF analysis on the artifacts. The findings of this study offer compelling evidence of complex and interconnected learning networks among artisans, underscoring the importance of shared knowledge and skills in the crafting process. Furthermore, I will explore the cross-crafting techniques essential in maintaining the Indus cultural identity through terracotta work. This interaction fostered diverse styles and techniques in crafting terracotta objects and contributed to a shared cultural heritage that crossed beyond individual households.

**2221. FUNCTIONS OF BRONZE AGE CERAMIC SCOOPS FROM SW POLAND. PRELIMINARY RESULTS OF USE-WEAR STUDIES**

**Contribution format:** Oral  
**Contribution authors:** Aleksandra Gawron-Szymczyk (Doctoral College of Archaeology, Art and Culture, University of Wrocław)

Archaeological ceramic surfaces often display traces of mechanical or chemical origin, which have not received

much interest until recently. This paper presents the preliminary results of microscopic observations of use-alteration traces found on ceramic scoops (n=23) from three Bronze- and early Iron Age cemeteries and settlement dated between 1100 and 550 BC. A series of experiments was necessary to interpret the microtraces, such as abrasion, scratches, or chemical attritions. The experiments involved grinding and mixing solid substances in experimental vessels. The traces vary depending on the shape of the grains ground in them. The finer and rounder the grains, the more parallel and less chaotic the scratches. The experiments allowed for the interpretation of the traces as being formed during the grinding of perhaps some seeds inside. In the settlement scoops, a solid substance was mixed or crushed, and my experiments showed that it could have been poppy seeds (*Papaver somniferum*) or other seeds of similar size and shape. Not all traces could be interpreted. The traces inside the vessels from cemeteries have a different character, and they were not used for grinding or mixing seeds. My research shows that scoops from different contexts, despite their similarities in shape and size, could have served entirely different functions. Studies are supported by the National Science Centre (NCN), Poland, decision No: 2023/49/N/HS3/00203.

**1496. RETHINKING THE EARLY IBERIAN PERIOD: AN ARCHAEOMETRIC STUDY OF THE EARLIEST WHEEL-MADE IBERIAN CERAMICS FROM CASTELLÓ (SPAIN, 550–500 BCE)**

**Contribution format:** Oral  
**Contribution authors:** Tania Freixas Roig (Grup de Recerca en Arqueologia Protohistòrica (Universitat de Barcelona)) – Clàudia Ortega Palacios (Cultura Material i Arqueometria UB (ARQUB, GRACPE, Universitat de Barcelona) | Institut d’Arqueologia de la Universitat de Barcelona (IAUB)) – David Garcia I Rubert (Grup de Recerca en Arqueologia Protohistòrica (Universitat de Barcelona)) – Jaume Buxeda I Garrigós (Cultura Material i Arqueometria UB (ARQUB, GRACPE, Universitat de Barcelona) | Institut d’Arqueologia de la Universitat de Barcelona (IAUB))

The emergence of the cultural phenomenon known as Iberian Culture in the northeastern Iberian Peninsula has been placed around the mid-6th century BCE. The Early Iberian period, considered the initial phase of this cultural stage, spans from this time until the mid-to-lat. 5th century BCE (c. 550-400 BCE). A key marker of this period has traditionally been the appearance of wheel-made productions in the archaeological record, commonly regarded as local productions directly linked to the rise of Iberian Culture. This phenomenon is particularly evident in the region of Castelló (Valencian Country, Spain). However, given the absence of evidence for ceramic workshops in this context, the possibility arises that these wheel-made ceramics were not local, as traditionally assumed, but rather imported from other regions of the Iberian Peninsula. This scenario calls for a reassessment of what defines the Early Iberian period, including a revision of the sociocultural concepts associated with the emergence of Iberian Culture and the chronology of its formation. To address this issue, this study presents a preliminary archaeometric analysis of 18 sherds from the onset of the Early Iberian period (550-500 BCE), recovered from various sites in Castelló. The analysis includes chemical characterisation through X-ray fluorescence (WD-XRF) and mineralogical characterisation via X-ray diffraction (XRD). A subsample has also been examined at the microstructural level using scanning electron microscopy (SEM). This research is part of a broader project extending to southern Catalonia and the province of Teruel. The results reveal significant heterogeneity in both composition and technology, indicating different products with distinct origins. Furthermore, comparisons with the ARQUB database have identified connections with other sherds recovered in nearby areas, belonging to the immediately preceding period. Moreover, our findings suggest the existence of an extensive trade network, challenging traditional assumptions and underscoring the need for a reassessment of this period.

**1754. THE RISE OF BLACK GLOSS POTTERY IN THE ITALIAN PENINSULA: ARCHAEOMETRIC EVIDENCE FOR ITS PRODUCTION AND DISTRIBUTION**

**Contribution format:** Oral  
**Contribution authors:** Clàudia Ortega Palacios (University of Barceleona) – Marisol Madrid I Fernández (University of Barcelona) – Alejandro G. Sinner (University of Victoria)

As Attic pottery declined in the 4th century, black-gloss pottery emerged and rapidly developed across the Italian Peninsula, becoming a large-scale industry that spread throughout its territory and beyond. These new productions originated in two main areas: the Etruscan region, where high-quality pottery had been produced since the 8th century BC, and in Campania, close to Magna Graecia, where Greek colonists introduced Attic-style pottery into their daily lives as early as the 7th century BC. Potters from these regions transmitted the knowledge and technology needed to produce high-quality black-gloss pottery elsewhere. The success of this new tableware category, combined with the skill of the ceramists, resulted in the manufacturing of similar products in various workshops across Italy. Their uniformity, especially at the macroscopic level, makes it difficult for archaeologists to distinguish their place of origin. Thanks to the archaeometric characterisation through X-ray fluorescence (XRF) and X-ray diffraction (XRD) of 156 ceramic individuals from Populonia and Cosa (Etruria), Gabii (Latium), and Pompeii (Campania), 11 distinct products have been identified, making the traditional classification of Camp A,

B, Boïde, and Cales outdated. These studies allow for the correlation of these products with specific chronologies, certain geographic areas, and their evolution over time, suggesting a shift in production that may be linked to the relocation of economic centres as Rome expanded and grew. The interpretation of this data provides insights into the technology employed by potters during the production process over a period spanning from the late 4th century BC to the early 1st century BC. It also enhanced our understanding of the processes of clay selection, paste preparation, and firing techniques that resulted in a final product so similar in appearance that the naked eye cannot distinguish it.

**1174. PRELIMINARY RESULTS OF THE ARCHAEOMETRIC CHARACTERISATION OF THE IBERIAN POTTERY FROM PUIG CASTELLAR DE BIOSCA (LLEIDA, CATALUNYA)**

**Contribution format:** Oral  
**Contribution authors:** Paula Sánchez (UAB) – Marisol Madrid – Roberta Montesana (Universitat de Barcelona)

During the 2nd century BC, Rome deployed the first military contingents that allowed it to advance its territorial control towards the centre of the Iberian Peninsula and began to build strategic settlements and military garrisons. The construction of these settlements has led the scientific community to consider how they were inhabited, and what their political and economic activity was. This paper will present the preliminary results of the archaeometrical characterisation of 30 fragments of Iberian pottery belonging to a military complex active between 180 BC and 120 BC, Puig Castellar de Biosca, a settlement that controlled part of the territory of the central plane of the north-east of the Iberian Peninsula. Methodologically, the ceramics analysed are individuals of Iberian wheel pottery and coarse pottery (slow wheel and handmade) that have been characterised by different analytical techniques to obtain the most information possible about their origin and production technology. XRF has been used to determine the chemical composition and to carry out provenance studies. Complementary, MO by thin sections has been used for raw materials. To find out the firing temperature and the development of the microstructure during firing, XRD and MER were used. Finally, observations of the material at the macrostructural level have been carried out using the binocular microscope to relate the colour, texture and inclusions of the material to the data obtained by the different analytical techniques. To summarize, the aim of this study is to show the potential of pottery to measure the apparent presence of an important contingent of indigenous people in a nucleus of Italic origin. Secondly, archaeometry will allow us to delve deeper into aspects related to the origins of the locally produced materials used in the settlement, which will inform us about the forms of social and economic relationship between the two contingents.

**2043. ELEMENTAL COMPOSITION OF CERAMIC ASSEMBLAGES FROM THE SANCTUARY OF KALAPODI: A COMPARATIVE STUDY USING PXRF COMBINED WITH CLAYEY RAW MATERIAL**

**Contribution format:** Oral  
**Contribution authors:** Kelly Christodoulou (INN, NCSR Demokritos) – Dimitris Grigoropoulos (DAI, Athens) – Alexandra Von Miller (Institute of Classical Archaeology, Eberhard Karls University Tübingen) – Anno Hein (NCSR Demokritos)

This study offers an elemental analysis of four distinct ceramic assemblages from the sanctuary of Kalapodi, spanning a wide chronological range. These are categorized into two types: coarse and fine ceramic categories dating from Mycenaean to Geometric, as well as Roman period. Additionally, twelve selected clay samples from surrounding regions—East Phokis (Kalapodi, Elateia, Exarchos) and ancient Opous in East Lokris (modern Atalanti)—will be analyzed. The aim is to compare their elemental composition, shedding light on local raw material sources and the organization of pottery production. The fine decorated pottery reveals an interesting trend: East Phokian and Opountian ceramics appear at Kalapodi, suggesting a regional network connecting these areas. While these ceramics seem locally produced, evidence of imports also stands out, illustrating the interaction of local craftsmanship with external influences. This blend highlights a region actively engaged in the exchange of ideas, styles, and materials. As for the coarse ceramics, two main clusters contain Mycenaean and Geometric types, indicating the use of same raw materials from the surrounding region. Interestingly, Mycenaean cooking wares form a distinct cluster, alongside Roman cooking ceramics, suggesting the use of different local clay. This diversity in materials and techniques highlights the potters’ ability to exploit the available raw materials for the production of specific ceramic categories. It also sheds light on the social and political conditions within which these ceramics were produced and distributed during different chronological phases.

**1222. RESISTANCE AND CHANGE DURING COLONISATION: CONTINUED USE OF GROG IN INDIGENOUS POTTERY AT SANTA FE LA VIEJA (1573-1660 CE)**

**Contribution format:** Oral  
**Contribution authors:** Helen Thompson (University of Sheffield) – Jaume Buxeda I Garrigós (Cultura Material i Arqueometria UB (ARQUB, GRACPE), Universitat de Barcelona) – Peter Day (Institute of

Nanoscience and Nanotechnology, NCSR “Demokritos”) – Caroline Jackson (University of Sheffield) – Gabriel Cocco – Leticia Campagnolo (Museo Etnográfico y Colonial “Juan de Garay”)

Santa Fe la Vieja was established by Spanish conquistador Juan de Garay in 1573 on Indigenous land in the Rio de la Plata basin, Argentina. Indigenous settlements inhabited the region for at least 1500 years before the arrival of the Spanish and had a rich tradition of pottery production known as Goya-Malabrigo. During the colonial period, Indigenous people continued to produce pots for Spanish consumption, taking on aspects of Spanish forms, known as Hispanic-Indigenous pottery. Finally, during colonisation, the Spanish re-located Guarani people, an Indigenous group from the north, who also had distinct pottery traditions. This project undertakes a comparative study of Goya-Malabrigo, Guarani, and Hispanic-Indigenous pottery to understand the continuity and change of cultural practices over time, the transmission of craft knowledge, and social transformations as seen in pottery production. The samples were studied primarily by thin-section petrography with supplemental analytical insights from chemical analysis by XRF to determine provenance and technology. The results demonstrate an extensive tradition of the use of grog temper from before the arrival of the Spanish, extending through the colonial period, which indicates a transmission of craft technology to the Guarani people. The continued use of grog temper in Indigenous ceramics at Santa Fe la Vieja suggests the retention of key traditions and a subtle cultural resistance in the face of Spanish colonisation.

**1131. TRACING TECHNOLOGICAL TRADITIONS AND KNOWLEDGE TRANSMISSION IN THE HIGHLANDS OF NARIÑO AND CARCHI: A MULTI-ANALYTICAL APPROACH TO CERAMIC PRODUCTION**

**Contribution format:** Oral  
**Contribution authors:** Catherine Klesner (McDonald Institute for Archaeological Research, University of Cambridge) – Lina María Campos-Quintero (Museo del Oro, Banco de la República) – Felipe Cárdenas Arroyo (Peabody Museum of Archaeology and Ethnology, Harvard University) – Rosie Crawford (McDonald Institute for Archaeological Research, University of Cambridge) – María Camil. Maya Cabrera (Instituto Colombiano de Antropología e Historia (ICANH)) – David Alejandro Pérez Fernández (Sacyr Concesiones Colombia | Universidad del Cauca) – Juanita Sáenz-Samper – María Alicia Uribe-Villegas (Museo del Oro, Banco de la República) – Jasmine Vieri (McDonald Institute for Archaeological Research, University of Cambridge) – Marcos Martínón-Torres (McDonald Institute for Archaeological Research, University of Cambridge | Department of Archaeology, University of Cambridge)

In the highland region of Nariño (Colombia) and Carchi (Ecuador), three overlapping pottery styles, Tuza, Piartal and Capulí, were produced in the pre-Hispanic period. While these wares have been recovered and discussed frequently in past literature, their context (recovered mostly from burials) and lack of prior technical studies has prevented any conclusive inferences about their technology, craft organisation, or diachronic evolution. Through a comparative analysis of the chaînes opératoires of three decorated wares using geometric morphometrics, bulk chemistry, microscopy, and microanalysis on a large sample from multiple sites, we are beginning to disentangle these ceramic traditions and identify key technological traits which inform about the connections between the makers of these different styles. Capulí and Piartal ceramics exhibit shared decorative techniques and production processes, reflecting the direct transmission of technological knowledge between potters and underscoring dynamic networks of craft interaction. The continuity in vessel morphology and clay selection between Piartal and Tuza ceramics suggests sustained technological traditions, while the adoption of new decorative techniques in Tuza pottery are strongly indicative of exogenous influences. Pioneering analyses of intra-vessel shape variation allow us to identify different skills and idiosyncratic artisanal traits, contributing to our understanding of craft organization, learning, and the production of funerary assemblages. This study presents an integrated analytical model for examining decorated ceramic traditions, demonstrating how technological choices, craft organisation, and knowledge transmission contribute to our broader understanding of socio-cultural transformations in pre-Hispanic communities.

**1410. IN GROG WE TRUST. ETHNOARCHAEOMETRY OF CERAMIC MATERIAL FROM THE REGION OF OLD DONGOLA (SUDAN)**

**Contribution format:** Oral  
**Contribution authors:** Boguslaw Franczyk (Faculty of Archaeology, University of Warsaw)

The ethnoarchaeometric approach involves using archaeometric methods to analyze ceramic materials obtained from excavations, as well as ceramics from contemporary local pottery workshops. This presentation will focus on a detailed analysis of non-plastic inclusions visible in the fabric, particularly grog and rock grains. The main goal is therefore to gain a better understanding of the pottery techniques used in the Old Dongola region

by addressing the following research questions, which fall into two main topics. The first topic examines the phenomenon of mineral temper in the form of talc-chlorite schist grains. Key questions include: How did the steatite admixture vary, and can its origin be traced to one or more outcrops of this rock? Does the use of this temper in kitchen vessels indicate that potters had specific knowledge of its physicochemical properties? Should we consider knowledge exchange, the trade of entire vessels, or focusing solely on the mineral temper? The second topic pertains to the relatively diverse grog that must have been accessible to potters. Questions in this area include: What was the availability of grog near the pottery workshop? Can we identify the presence of grog from earlier Makurian ceramic vessels? Was there intention behind the selection of grog? Is the contemporary morphology of grog similar to that of grog found in the vessels rom the past? Lastly, can we infer past techniques by observing the grog processing methods used today?

**353. RESEARCH INTO THE 11TH-CENTURY CERAMIC FINDINGS OF THE ELITE RESIDENCE OF THE VISEGRÁD-SIBRIK-DOMB SITE**

**Contribution format:** Oral  
**Contribution authors:** Dóra Csepregi Horváth (Pázmány Péter Catholic University)

Ceramics are the main source of information for researching the 11th-century sites in Hungary. The examination of this period’s ceramic presents a challenge in many aspects. In this period, trade in vessels was not yet typical, so they must be examined region by region. As a result, the vessels show regional differences and are characterized by the uniqueness and high variability of their forms and decorations. The early castle of Visegrád-Sibrik-bomb site, which is located in the northern part of Hungary and flourished in the 11th century, offers a great opportunity to examine the ceramics from this period. This power centre was built on the remains of a Roman fortress and was inhabited from the 8th-9th century until the 11th century. It lost its significance in the 12th century. Furthermore, the settlement of the Visegrád-Várkert site was located around it and had a strong relationship with the centre. The examination of one of the castle’s large elite buildings may shed light on several research questions related to ceramics and ceramic technology. Firstly, a comparison of the ceramics from the earlier periods and of the 11th century found at the site may reflect on whether there was a technological inheritance from the 9th to the 11th century. The comparison of the ceramics from the Visegrád-Sibrik-domb site and from the surrounding settlement, as well as the ceramics from other contemporary sites in the region, may highlight the differences in the ceramic materials of the elite sites and the settlements located farther from the centres.

**1479. A MULTI-ANALYTICAL STUDY ON ARCHAEOLOGIC CERAMIC MATERIALS FROM THE EXCAVATION AT VASALAKIS PLOT, GROTTA NAXOS (GREECE)- PRELIMINARY DATA**

**Contribution format:** Poster  
**Contribution authors:** Anna Tsoupra (HERCULES Laboratory, University of Évora | In2Past) – Pedro Barrulas (HERCULES Laboratory, University of Évora | In2Past | Department of Chemistry, School of Science and Technology, University of Évora) – Eleni Nodarou (Institute of Aegean Prehistory-Study Center for East Crete (INSTAP-SCEC)) – Irini Legaki – Anastasia Aggelopoulou (Ephorate of Antiquities of Cyclades, Hellenic Ministry of Culture) – Patrícia Moita – José Mirão (HERCULES Laboratory, University of Évora | In2Past | Department of Geosciences, School of Science and Technology, University of Évora)

The archaeological site of Grotta, located directly beneath and adjacent to the main square of Chora in Naxos, exhibits a continuous history of occupation from antiquity to the present day. A recent rescue excavation was conducted in a private plot, situated at the westernmost end of Grotta in close proximity to the sea. This excavation uncovered significant archaeological remains, including ceramic artifacts and earthen structures. This study presents preliminary analytical results concerning archaeological ceramics dated to end of the Neolithic period and the beginning of the Early Bronze Age (end of 4th -beginning of 3rd millennium B.C.) as well as to the Late Bronze Age (2nd millennium B.C.). A multi-analytical methodology was employed, incorporating X-ray diffraction (XRD), X-ray fluorescence (XRF), petrography, and Variable Pressure Scanning Electron Microscopy with energy-dispersive spectroscopy (VP-SEM-EDS). The objective of this research is to characterize the ceramic materials, determine the composition of the raw materials utilized in their production, and investigate the technological processes involved in their manufacture. As part of the project “MATCH: contextualizing ceramic raw MATerials exploitation and pottery distribution, a transdisciplinary approaCH”, this research aims to contribute to broader discussions on ceramic production technologies, distribution networks, and exchange systems in the Cyclades during the Neolithic and the Bronze Age.

2491. CERAMIC TECHNOLOGIES AND SOCIAL DYNAMICS IN THE IRON AGE NECROPOLIS OF CASTELLONS AND SEBES (FLIX, CATALONIA)

**Contribution format:** Poster  
**Contribution authors:** Judith Peix Visiedo (ICAC-Catalan Institute of Classical Archaeology) – David Jimeno Jiménez (GRACPE- Research Group on Archaeology of Complex Societies and Processes of Social Change | University of Barcelona) – Maria Carme Belarte (ICAC-Catalan Institute of Classical Archaeology | ICREA-Catalan Institution for Research and Advanced Studies) – Jaume Noguera Guillén (GRACPE- Research Group on Archaeology of Complex Societies and Processes of Social Change | University of Barcelona)

This study investigates the technological and cultural practices underlying a set of cinerary ceramic urns from the Castellons and Sebes necropolis (Flix, Catalonia), dated to the Early Iron Age (6th–5th centuries BC). Both sites have been fully excavated by the GRACPE and ICAC research teams. The urns exhibit two distinct production techniques: wheel-made and hand-built. Preliminary hypotheses suggest that the wheel-made ceramics may reflect Phoenician influence, while the hand-built pieces likely indicate local production traditions. The notable predominance of hand-built urns over the limited presence of wheel-made examples offers insights into social differentiation and stratification within these communities. Using analytical methods, including X-ray fluorescence (XRF) and X-ray diffraction (XRD), we aim to determine the provenance of these ceramics and assess their cultural implications. The results will be compared with the ARQUB (GRACPE, UB) database to assign the ceramics to defined reference groups, allowing us to distinguish locally produced pottery from imports. Additionally, XRD analyses will provide insights into technical production aspects, such as equivalent firing temperatures (EFT), helping to discern different manufacturing techniques employed for vessels with similar functions. These analyses form part of a broader interdisciplinary study on necropolises in the northeastern Iberian Peninsula. By integrating archaeometric analyses with the archaeological context, this research enhances our understanding of ceramic technology transmission and its implications for cultural interaction, social organization, and identity during a period of significant social transformation.

274 GENERAL SESSION

**Session theme:** —  
**Session format:** Regular session  
**Session keywords:** Archaeology, Heritage, Research, Methods, Innovation, Interdisciplinary  
**Session chair:** Selena Vitezovic (Institute of Archaeology, Belgrade | Belgrade Scientific Committee, European Association of Archeologists)

SESSION ABSTRACT

This session is organised by the EAA rather than external session organisers and is chaired by a selected EAA Member, representing the Belgrade Scientific Committee. The session does not focus on a specific theme but instead brings together contributions on a variety of topics, providing authors with the opportunity to share their research with a broad audience.

CONTRIBUTION ABSTRACTS

911. AURIGNACIAN SENSU LATO – OR NOT? THE TECHNO-TYPEOLOGICAL IDENTITY OF THE FIRST UPPER PALAEOLITHIC INDUSTRY IN THE IBERIAN MEDITERRANEAN BASIN

**Contribution format:** Oral  
**Contribution authors:** Álvaro Martínez-Alfaro – Aleix Eixea – Valentín Villaverde (Universitat de València)

Initially identified by E. Lartet in the mid-19th century, the Aurignacian industry was regarded as the first phase of the Upper Palaeolithic by H. Breuil in the early 20th century. Since then, the sequences in south-west France have provided the reference framework for organising the technocomplex into distinct phases and for the industrial characterisation of each. However, debate continues over the suitability of the Aquitaine sequence as a benchmark for defining and understanding archaeological sites beyond south-western France. Rather than delineating distinct regional characteristics through critical assessment, most studies of the industries developed during the Aurignacian period have focused on extending the French model. Nevertheless, an increasing body of research is revealing considerable technological variability, thereby challenging the straightforward application of the Aquitaine model. One should avoid imposing a parallel with the high-resolution sequence of Aquitaine, since its identity must reflect regional contexts that are not necessarily replicated elsewhere. Instead, research should focus on identifying any distinguishing industrial characteristics and on assessing the extent to which these correlate

with the broadly accepted industrial definition of the assemblages ascribed to the technocomplex. In the central Iberian Mediterranean region, the earliest Upper Palaeolithic industry has been categorised under the umbrella term Aurignacian. In this communication, we offer a critical evaluation of the lithic industries associated with the Evolved and Late Aurignacian phases. Our analysis of the assemblages reveals a shared substrate with the industrial traits typical of Aquitaine, as indicated by the occurrence of Dufour Roc-de-Combe and Caminade bladelets. However, there are also technological differences, such as the minimal role of knapping on burin-cores and the predominance of exploitation on carinated cores of the end-scraper type. Drawing on lithic techno-typology, we assess whether adopting new designations would be preferable or whether the continued use of the term “Aurignacian” is justified.

1139. FRACTURE WING ANALYSIS IN FLINT FOR IDENTIFICATION BETWEEN BLADE LITHIC REDUCTION TECHNIQUES. IS THE TRANSITION FROM OBSIDIAN TO FLINT POSSIBLE?

**Contribution format:** Oral  
**Contribution authors:** Marcos Barba Pérez (Departament de Prehistòria. Universitat Autònoma de Barcelona) – Javier Fernández González (Departament de Ciència de Materials i Química Física. Universitat de Barcelona.) – Juan Antonio Marin De Espinosa Sanchez (Sílex. Arqueología y Difusión del Patrimonio S.L.)

Fracture wings have been widely studied and have been shown to be visible microscopic marks on the fracture surfaces of glass-ceramic materials. These marks are usually V-shaped with their apex pointing towards the direction of fracture propagation and usually originate from an impurity in the material. Since the formation of fracture wings, triggered by the passage of a fracture wave, is largely determined by the crack velocity and the substance of the material, their identification directly contributes to a better understanding of lithic reduction technology. Their study is particularly relevant to extract data such as crack velocity m/s, which can vary according to different forms of blade reduction such as: direct percussion, indirect percussion and pressure. Studies carried out by other researchers demonstrated a strong association between cracking velocity and lithic reduction techniques, contributing to the understanding of lithic technology and production practices of different cultures and periods. The purpose of this work is to present the identification of fracture wings in a little-explored material such as flint. Through a multiscale microscopic analysis with different microscopy techniques in the study of an experimental protocol with controlled variables that includes the production and study of various techniques of lithic reduction of blades produced by a researcher and expert flintknapper, giving rise to a comparative study between 3 materials: obsidian, a material widely studied previously by other researchers on which this analysis methodology is based, and flint, studied in this protocol in 2 different flint variants. This study could expand the theoretical framework of wing fractures and their identification in other materials, allowing to extend the analysis of flake techniques by studying a series of experiments that could be applicable to archaeological records with similar productions, such as Mesolithic or Neolithic blade reduction contexts.

1807. FROM EXPERIMENT TO INTERPRETATION: ADVANCING OCHRE RESIDUE ANALYSIS ON LITHICS FROM BLOMBOS CAVE

**Contribution format:** Oral  
**Contribution authors:** Jasmin Culey – Elizabeth Velliky (University of Bergen) – Karen Van Niekerk (University of Bergen, University of the Witwatersrand) – Francesco D’Errico (Université Bordeaux, University of Bergen)

The exploitation of ochre in Africa is widely regarded as a key behavioural feature for understanding the cultural evolution of Middle Stone Age populations. Blombos Cave, South Africa, boasts a large ochre assemblage of over 8,000 pieces, found in layers dated to between 110,000 and 70,000 years ago. Alongside this assemblage, numerous lithic artefacts bearing ochre residues are distributed throughout the entire sequence. While ochre has been associated with both symbolic and functional applications, the distinction between anthropogenic applications and natural alterations as well as processes behind the formation, transformation, and preservation of these residues has yet to be systematically explored. To begin addressing these gaps, this study experimentally replicated ochre residue deposition on lithics and how these residues transform taphonomically. Ochre was applied in powder and compound forms using different methods, and the artefacts were subjected to controlled experiments simulating post-depositional processes over time. The next phase of this research focuses on applying criteria derived from the experimental collection to document and interpret ochre residues on archaeological lithics from Blombos Cave dated to around 110,000-90,000 years ago. By integrating experimental archaeology with residue analysis, this study aims to provide new insights into the relationship between ochre and lithic technology in the Middle Stone Age. This approach contributes to broader interpretations of environmental adaptations, technological choices, and potential symbolic behaviours at Blombos Cave and beyond.

879. FROM RECORDING TO INTERPRETATION: PLACES WITH SEGMENTED CIRCLES IN THE IBERIAN NORTHWEST, ANALYSED THROUGH THE NEW METHODOLOGICAL APPROACHES

**Contribution format:** Oral  
**Contribution authors:** Diogo Marinho (Fundação para a Ciência e Tecnologia (FCT). University of Minho (Lab2PT/IN2PAST)) – Ana Bettencourt (Lab2PT/IN2PAST and History Department, University of Minho) – César González-García (Institute of Heritage Sciences, Spanish National Research Council (INCIPIT, CSIC))

The study of rock art has seen significant advances, driven by the development of digital tools that enable more detailed analyses and innovative methodologies. This research focuses on the segmented circle, a geometric motif that, although not particularly frequent, appears in various archaeological contexts. Previous studies (Bettencourt, 2017, 2019, 2023; Marinho, 2020, 2022, 2023) have extensively analysed this engraved motif in Northwestern Portugal, employing methodologies grounded in Contextual and Interpretative Archaeology. These included the description of engraved surfaces, the analysis of motif orientation, and the use of digital tools such as photogrammetry and Geographic Information Systems (GIS). Spatial Archaeology methods, including Visibility Analysis and Site Catchment Analysis, were also applied. The findings indicate that segmented circles date to the Bronze Age and are associated with contemporary settlements. Their orientation suggests a correlation with the winter and summer solstices, raising the hypothesis of solar symbolism. Furthermore, an Atlantic origin is considered, with potential connections to the Norse-inspired mythology of the solar horse/boat, given the presence of similar engravings in northern regions. The research is now expanding to the Northwestern Iberian Peninsula, incorporating advanced Archaeoastronomy methodologies to further investigate the relationship between these motifs and celestial phenomena. The use of clinometers will enable more precise measurements, while software such as Stellarium, Horizon, and PeakFinder will assist in validating astronomical correlations and reconstructing the night sky in different chronological periods. GIS will continue to play a central role, now applied to the analysis of land use and the identification of areas with archaeological potential for future excavations. Photogrammetry will remain essential for the documentation and analysis of engravings. This multidisciplinary approach will significantly enhance the study of rock art in Northwestern Iberia.

305. HOW ROCK ART IS SEEING? VISUAL ATTENTION PATTERNS UNDERLYING THE OBSERVATION OF PREHISTORIC DEPICTIONS

**Contribution format:** Oral  
**Contribution authors:** María Silva Gago (Instituto de Ciencias del Patrimonio (INCIPIT), CSIC) – Marcos García-Díez (Universidad Complutense de Madrid) – Manuel Santos-Estevéz (Instituto de Ciencias del Patrimonio (INCIPIT), CSIC) – Emiliano Bruner (Museo Nacional de Ciencias Naturales (MNCN), CSIC) – Luis Martínez (Instituto de Neurociencias, CSIC) – Felipe Criado-Boado (Instituto de Ciencias del Patrimonio (INCIPIT), CSIC)

From a cognitive point of view, the observation of visual art can provide valuable insights into the mechanisms of human vision and perception, as viewing art is a complex process involving perception, attention and decision-making, among other cognitive and affective capacities. Prehistoric art is a structured graphic language, designed to be perceived and interpreted by members of the original human group, with the potential for lasting impact beyond the moment of creation. However, the first process of art perception involves visual exploration through rapid eye movements, known as saccades, which occur between small pauses called fixations. This fixation-saccade system provides information about patterns of attention and information processing and can be analysed using eye-tracking technology. Although some studies have analysed the visibility and position of representations from multiple approaches, the distribution of attention within a representation has not been analysed in a large number of sites. We propose the application of eye-tracking technology to investigate visual perception during the observation of prehistoric rock art. We have developed several experimental studies involving Palaeolithic paintings and post-Palaeolithic engravings in different geographical and cultural contexts to avoid WEIRD (Western, Educated, Industrialized, Rich and Democratic) biases. Our results suggest that attention was directed primarily to the figures, and specifically to the head, rather than to other surface features. In addition, incomplete figures were observed as if they were fully depicted. We suggest that representation generally indicates how to be observed independently of cultural context, directing attention primarily by semantic processing or figure identification aided by Gestalt principles and other top-down mechanisms.

2106. TRACES OF METALLURGY: A COMPARATIVE STUDY OF ITS IMPACT ON ANIMALS IN THE PAST OF NORTH-EASTERN SERBIA

**Contribution format:** Oral  
**Contribution authors:** Danica Grujić (Institute of Archaeology in Belgrade) – Mirjana Čujić (Vinča Institute of Nuclear Sciences)

Human and animal bones found at archaeological sites serve as a unique bio-archive, preserving vital information about the organisms themselves, such as lifestyle, diet, health status, and living conditions of past populations. In addition to this, bones can also retain information about the environment in which people and animals lived. One crucial piece of information that bones can reveal is the level of environmental pollution caused by metallurgical activities conducted by people in the past. As these activities release heavy metals into the environment, studies have shown that prolonged exposure to these pollutants can lead to the accumulation of heavy metal particles in various parts of living organisms, including bones and teeth. Previous studies of this kind have predominantly focused on human remains, while research on archaeozoological material remains scarce. Addressing this gap, the TraceMet project, funded by the Serbia Accelerating Innovation and Growth Entrepreneurship (SAIGE) initiative, has focused on analyzing archaeozoological material. The analysis was conducted on the bones of domestic animals from several archaeological sites in northeastern Serbia. The analyzed material spanned various periods, from the Late Neolithic, through the Bronze Age, Iron Age, Roman period, and the Middle Ages. The analysis was performed using Inductively Coupled Plasma Mass Spectrometry (ICP-MS) in collaboration with the Vinča Institute of Nuclear Sciences. The TraceMet project is pioneering in nature and aimed to compare the obtained results both among different sites and chronologically.

499. THE END OF THE EGYPTIAN NEW KINGDOM IN COLONIAL NUBIA: NEW PERSPECTIVES ON CULTURAL AND SOCIETAL TRANSFORMATIONS

**Contribution format:** Oral  
**Contribution authors:** Julia Budka (LMU Munich)

The Bronze Age collapse concerns in Egypt the so-called 20th Dynasty, the late Ramesside period. While the wars and campaigns of the Ramesside kings (especially of Ramesses III) against the Libyans and Sea Peoples are usually referred to as the main events, this lecture aims to change the perspective. From the beginning of the New Kingdom, an Egyptian colony was established south of Egypt in Nubia (modern Sudan), which was administered mainly thanks to foundations of new temple towns which functioned as administrative, religious and economic centres. Complex and dynamic developments regarding the population can be observed over the time of the 18th Dynasty, whereby cultural entanglements between Egyptians and Nubians were an essential feature, transforming identities and established social structures. Using a bottom-up approach from the perspective of colonial Nubia, this lecture addresses the question of whether and if so which social and economic changes can be recognised from 1200 BCE onwards. The focus will be on developments in the urban administrative centres, but also in rural areas, taking Sai Island, Amara West and the Attab to Ferka region as the main case studies in the Middle Nile. In a joint analysis of archaeological finds, material culture, textual evidence and historical data, aspects of transformation and resilience in the late New Kingdom in Nubia are discussed, which are also highly relevant for the subsequent epoch, the so-called Pre-Napatan era in Nubia and the Libyan Period in Egypt.

355. THE KEEPERS OF THE ASH: OSTOTHEKAI FROM THE MIDDLE STRYMON VALLEY, ROMAN PROVINCE OF MACEDONIA

**Contribution format:** Oral  
**Contribution authors:** Philip Kolev (National Archaeological Institute with Museum, Bulgarian Academy of Science)

The Middle Strymon Valley is located in southwest Bulgaria. The region is a clearly defined geographical area surrounded by high and medium mountains. This geographical feature has contributed to the development of a distinct cultural identity and a relatively autonomous historical development. A distinctive feature of the region is the presence of numerous funerary monuments, among which the ostothekai are particularly prominent. The ostothekai are marble urns in which the ashes of the deceased were stored following cremation. These monuments bear a striking resemblance to sarcophagi in terms of function. The provenance of these monuments is located in Asia Minor, where their production first emerged during the Hellenistic period under the influence of local sarcophagus craftsmen. The total number of specimens from Middle Strymon Valley that are known to exist either in an intact state or as fragments is 26. The ostothekai are of two types: rectangular and circular. Both types are adorned with garlands, which are supported by Erotes, ram-heads or ox-heads, portraits and standing figures. It is hypothesised that the monuments from Middle Strymon Valley are of local provenance, being the product of artisans hailing from Asia Minor. The earliest monuments were dated from the second quarter of the 2nd century to the end of the first quarter of the 3rd century AD.

2064. BENEVENTUM – NUCERIOLA: A COMPLEX SYMBIOSIS ALONG THE VIA APPIA

**Contribution format:** Oral  
**Contribution authors:** Daniela Musmeci (University of Salerno)

The colony of Beneventum (Benevento, Campania, Italy) and its southeastern territory offer a significant example

of the symbiotic complementary relationship between “urban” and “rural” settlements in the Roman period. The Ancient Appia Landscapes project, carried out by the University of Salerno - playing a key role in the recognition of the Via Appia as a UNESCO World Heritage site - has been investigating this area since 2011. The project has built a comprehensive dataset through archaeological excavations, geophysical prospections, aerial photo-interpretation, historical cartographic analysis and archaeo-morphological surveys. Approximately 6 km from Beneventum, a significant settlement has been identified in Masseria Grasso, with an occupational span from the 4th century BC to the 6th century AD. This site has been identified as Nuceriola, mentioned in the Tabula Peutingeriana at the IV mile along the Via Appia. The site fulfilled multiple functions - administrative, economic, and religious - making it a focal point within the settlement dynamics of the region over the centuries. Before the Roman period, the settlement was already structured, but it flourished later, becoming an economic hub and a landmark within the centurial system, especially since the Triumviral-Augustan colony (42-1 BC). As a projection of the city into the territory, Nuceriola also served as a link between the urban centre and the countryside, where a network of smaller settlements (villae, farms, necropolis) has been identified up to Ponte Rotto on the Calor flumen (modern Calore river), also mentioned in the Tabula Peutingeriana. This paper aims to provide an updated analysis of the distribution of rural settlements and their relationship with the city, enhanced by the connecting role of the Via Appia. The objective is to move beyond the traditional dichotomy between “urban” and “rural” by highlighting how these spaces were interdependent and part of a network of development.

1777. EARLY IMPERIAL COINS IN THE PROVINCES OF LOWER MOESIA AND THRACE

**Contribution format:** Oral  
**Contribution authors:** Renata Ciolek (University of Warsaw Faculty of Archeology)

This paper explores the circulation of early imperial coins in the provinces of Lower Moesia and Thrace, focusing on numismatic finds from archaeological contexts, particularly those recovered from legionary camps. The study is based on an original catalog of coin finds, including both commonly circulating types and unique specimens, such as countermarked coins. By analyzing these materials, the research aims to reconstruct the patterns of coin distribution in these two Danubian provinces during the reign of the Julio-Claudian dynasty. A crucial aspect of the study is the comparison between the circulation of coins within military settlements and their presence in civilian contexts. The role of local mints, particularly in supplying monetary demand in frontier regions, will be examined. Additionally, the presence of coins from different mints across the empire will be considered in relation to the mobility of troops, economic activities, and administrative structures in the region. The study will also address the significance of countermarked coins as evidence of monetary control and revaluation practices. This research provides new insights into the monetary economy of Lower Moesia and Thrace in the early imperial period, contributing to a broader understanding of coin circulation in provincial and frontier economies of the Roman Empire.

713. COUNTRY AND CITY IN THE NORWEST OF THE IBERIAN PENINSULA

**Contribution format:** Oral  
**Contribution authors:** Francisco Folgueira Rios (University of Santiago de Compostela) – Diego Machado (Universidade do Minho)

The northwest of the Iberian Peninsula during Roman rule is characterized by low urbanization, which was traditionally interpreted as a clear reflection of the supposed little impact that the Roman Empire would have in this region. Thus, the Northwest tended to be seen as a territory marked by a strong continuity of social and economic practices, where the cities founded by Rome after the conquest, which took place after the end of the Cantabrian Wars in 19 BC, would be perceived by researchers as small Roman redoubts in an indigenous rural world, which would remain unchanged until at least the Late Antiquity and the arrival of Christianity. But this view can only be sustained if we understand the city and the countryside as two completely opposite concepts, which have no relationship to each other. This study aims to align with the latest research on the Iberian Northwest, which seeks to break away from the traditional paradigm. In doing so, it views the three capitals of the Roman conventus as part of a broader network that supported the administration, management, and exploitation of the territory. In this way, we will analyse the three convent capitals and the different settlements connected to them through the wide network of roads that were built, despite the supposed slight urbanization that suffered this territory. We believe this conceptual change on “urban” and “rural” can provide a new perspective and accordingly analyse the territory and the population that inhabited, produced and lived in it since the 1st century BC until the 5th century AD.

83. POINTED CROSS VAULTS AND LIGHT: THE GOTHIC CHURCH OF SAN LORENZO IN VICENZA (13TH CENTURY)

**Contribution format:** Oral  
**Contribution authors:** Angelo Passuello (Marie Skłodowska-Curie Postdoctoral Fellow - Archaeological Research Unit of the University of Cyprus)

In Gothic architecture, light holds a profound symbolic and spiritual significance, closely aligned with Neoplatonic thought. It is perceived as a medium that reflects divine presence, elevating the soul of the faithful toward God. The roofing systems employed in the Gothic cathedrals of Northern Europe – characterized by cross vaults and pointed arches – enable the construction of lighter walls, allowing for the inclusion of large windows that let in abundant natural light. This paper, developed as part of the CaMeRoofs project, funded by the EU under the Marie Skłodowska-Curie Actions (101104788), explores the architectural history of the Franciscan church of San Lorenzo in Vicenza (Veneto Region, Northeastern Italy), whose construction began in 1281. The study focuses on the relationship between the church’s light sources and its roofing systems. San Lorenzo, designed following a Cistercian layout, combines pointed arches and cross vaults systematically, enabling the inclusion of sizable windows that enhance natural lighting. The light is not concentrated in a single focal point but is evenly distributed through the rhythmic arrangement of ogival and round windows, partially diverging from the traditional sobriety of Italian Gothic churches. In such churches, windows tend to be smaller and often replaced by frescoed wall surfaces. In San Lorenzo, however, there is a notable openness to natural light, with windows that, while not as grand as those in French Gothic cathedrals, achieve a richer and more balanced illumination, avoiding the dazzling effect typical of Northern Gothic styles. San Lorenzo’s innovative design proved influential, particularly among the Dominican friars, who occasionally supplanted the Franciscans in advancing Gothic architecture in the Veneto. Between the 13th and 14th centuries, churches such as Sant’Agostino in Padua, Santa Anastasia in Verona, and San Nicolò in Treviso drew inspiration from San Lorenzo, engaging in a creative dialogue with French Gothic models.

253. CONSTRUCTING BRITTANY: THE 19TH-CENTURY INVENTION OF THE BRETON NATION AND MODERN REASSESSMENTS

**Contribution format:** Oral  
**Contribution authors:** Gerard Matser (UMR 6566 CReAAH Rennes 2)

The prevailing notion that Brittany remained independent until the marriage of Anne of Brittany to King Charles VIII of France is a widely accepted response among Bretons when discussing the region’s loss of autonomy. This argument has been reiterated and adapted across various historical narratives, depending on the author and contextual considerations. The origins of this perspective can be traced back to the 19th century when Arthur de la Borderie translated medieval texts related to Brittany, such as the Chronicles of Nantes into french. These translations framed the historical interactions between the Breton people and the Franks within a contemporary nationalist discourse, leading to the conceptualization of a distinct Breton “nation” emerging in the early Middle Ages. However, modern scholarship has introduced significant nuances to this interpretation. Recent archaeological and historical research suggests that previous studies have been influenced by nationalist ideologies that sought to depict Brittany as a long-standing defender of its independence. These ideological biases have shaped historical narratives, often at the expense of a more objective analysis. This paper will critically examine the various conceptions of the so-called “Breton Kingdom” as proposed in the 19th and 20th centuries. It will explore the origins and motivations behind these interpretations and assess their historiographical impact. Lastly, this study will present an alternative perspective, arguing that Brittany may never have been an independent nation in the conventional sense—nor even distinctly “Breton” in the way it has been traditionally conceived. These claims will be supported by recent archaeological findings and newly emerging historical analyses.

1177. IDENTITY AND LIVED SPACES IN TĀNO’ LĀGUAS YAN GĀNI (MARIANA ISLANDS, MICRONESIA): FROM LATTE TO COLONIAL PERIOD (10TH-18TH CENTURIES)

**Contribution format:** Oral  
**Contribution authors:** Luis Berrocal-Maya (Universitat Pompeu Fabra)

Tāno’ Lāguas yan Gāni (Mariana Islands) is an archipelago located in the north-west of the Pacific Ocean. The Inhabitants of the islands, called CHamoru, reached the region c. 1500 b.C. In the 10th century, It is observed the emergence of domestic architecture marked by the use of megalithic pillars, known as Latte. The characterization of these structures seems to indicate the predominance of a relational, community identity. However, from the 16th century onwards, the contacts with Spanish colonialism and, especially, with the Jesuits (17th-18th centuries), forced the abandonment of these buildings. This coercive process unleashed the so-called “Guerras Hispano-Chamorras”. Through them, the Catholic religion was established as a key identity element. Moreover, the situation was consolidated with the imposition of “reductions”. This type of urban settlement transformed the

living spaces in which the CHamoru carried out their daily lives through the modification of domestic, worship and necropolis spaces. Likewise, this dynamic led to the relocation of indigenous populations in delimited areas of Guåhån (Guam, Mariana Islands), therefore changing their relationship with the environment and nature. The result was the imposition of a new identity marked by the values of Western modernity, such as individual-ity and rationality.

1918. BLUE SHIELD AS AN INSTRUMENT FOR CULTURAL HERITAGE PROTECTION: IMPLEMENTING THE 1954 HAGUE CONVENTION IN CONTEMPORARY CONFLICTS

Contribution format: Oral  
Contribution authors: Carl L. Thunberg (Västernorrland’s Museum)

As armed conflicts continue to endanger cultural heritage worldwide, the urgency of effective protective mechanisms has never been greater. The 1954 Hague Convention for the Protection of Cultural Property in the Event of Armed Conflict remains the cornerstone of international efforts to safeguard cultural property, yet its practical implementation relies on proactive actors who bridge the gap between legal frameworks and real-world challenges. This article examines Blue Shield’s role as a key implementer of the Hague Convention, analyzing how it translates legal obligations into actionable strategies for cultural property protection. Founded on principles of neutrality and independence, Blue Shield operates at the intersection of cultural preservation, humanitarian action, and security policy. Through case studies of conflicts where cultural heritage has been threatened or destroyed, this study explores how Blue Shield, in collaboration with international actors, has contributed to risk assessment, emergency response, and capacity-building. At the same time, it critically examines constraints that limit its effectiveness, including political resistance, security threats, funding shortages, and the increasing complexity of modern warfare. The deliberate destruction of cultural heritage is increasingly used as a weapon of ideological, ethnic, and religious persecution, raising critical questions about its link to cultural genocide. In this context, Blue Shield’s work extends beyond site protection to preserving the material traces of cultural identity, which are often targeted during conflicts. By analyzing Blue Shield’s evolving strategies and broader significance, this article argues that the organization not only reinforces the Hague Convention’s implementation but also helps shape the future of heritage protection in conflict zones. In an era where heritage destruction is both a tactical and symbolic act, Blue Shield’s efforts highlight the urgent need for stronger international cooperation, more adaptive legal mechanisms, and renewed commitments from states, institutions, and civil society to safeguarding humanity’s shared past.

63. PROJECT CIRCE. APPROACHING ECONOMIC CIRCULARITY IN ANTIQUITY WITH A LONGUE DURÉE AND MULTI-SITE PERSPECTIVE

Contribution format: Poster  
Contribution authors: Emanuele Intagliata (University of Milan) – Diana Dobрева (University of Verona)

Circular economy refers to those economic systems in which products or goods at the end of their life cycles are reintroduced into society by means of recycling, repair or reuse practices. The study of how these practices were implemented in antiquity has grown steadily throughout the past two decades, thanks to advances in ‘hard sciences’ in archaeology. This has created a wealth of studies dedicated to conservative or generative economic practices that are often limited to specific sites or periods and are usually difficult to compare because they use different methodologies. Over the past two years, Project CircE has attempted to overcome the fragmentation that has characterised the study of circular economy in antiquity by exploring this topic with a longue durée and multi-site perspective and using both a qualitative and quantitative approach. So far, the project has explored sites in northern Italy – and specifically in the provinces of Cremona and Verona – and focusing on a chronology between the end of the 1st century BCE and the 6th century CE. The aim of the poster is to present the methodology used by the project’s team and the results achieved using this approach until now, with a specific focus on the differences identified in the dataset between rural and urban sites.

185. THE ČIKAT BAY MODERN SHIPWRECK, ISLAND OF LOŠINJ – UNDERWATER CULTURAL HERITAGE. A VALUABLE CULTURAL PRODUCT

Contribution format: Poster  
Contribution authors: Zrinka Ettinger Starcic (Lošinj Museum) – Pavle Dugonjic (Croatian Conservation Institute)

An intact modern shipwreck has been discovered in Čikat bay in 2022 by Neno Starčić from the diving centre Subseason from Lošinj. The Lošinj Museum conducted the initial investigation on the reported site, and in 2023 began the systematic research in cooperation with the Croatian Conservation Institute, Department for Underwater Archaeology. The aim of the research was to define the spread of the ship’s construction and the overall extent of the site. The excavated section of the site included visible elements of the ship’s construction (mast, double

ribs, stringer, futtocks and planks), the ship’s anchor, five iron artillery pieces, numerous pieces of ship’s pottery and glassware (cups, stoppers, bottles), several cannon balls and musket shots, remains of rope, as well as two scattered clusters of regular stones, which might have been the ship’s ballast. The wooden construction points towards an extremely sturdy ship with double ribs, probably 30 meters of length. The artillery pieces are poorly conserved and overgrown, which prevents reading their characteristics or dating, but the preliminary identification of the stamp found on several ceramic vessels indicate their origin from northern Italy, most likely from the second half of the 18th century. By accepting underwater sites as an indispensable part of cultural heritage and identity of some destination, the area of the perception of cultural heritage is being spread from land to underwater. Underwater archaeology is one of the most important disciplines within the framework of archaeology in general. The island’s underwater cultural heritage makes the backbone of the island’s cultural heritage. Along with sites on land it offers a complete view of historic events. This makes heritage a valuable source, a cultural „home made“ product that is, for the development of cultural tourism and local economy.

235. THE SOCIAL ROLE OF DOGS IN THE NEOLITHIC AND BRONZE AGE SOCIETIES OF THE CENTRAL ASIAN STEPPE

Contribution format: Poster  
Contribution authors: Emma Usmanova (Saryarka Archaeological Institute of Karaganda Buketov University | Margulan Archeological Institute) – Polina Frikke (Independent) – Ilya Merts (Margulan Research Center of Archeological Studies, Toraighyrov University) – Kosintsev Pavel (Al-Farabi Kazakh National University)

The earliest dog remains in the Central Asian steppe are known from Neolithic and Bronze Age. Archaeologists record them in different contexts.

1. Within sacrificial complexes in settlements. Whole skeletons and individual bones of dogs may had been placed in individual pits or on the ancient surface.  
- in front of the entrance to a settlemen.  
- inside or at the entrance of a dwellin.  
- within the metal production site.  
Perhaps this ritual practice was meant to symbolize dogs as protectors of residential and metallurgic spaces.
2. Within kitchen remains. In some cases, the surface of the bones shows evidence of high temperature due to their thermal treatment before using dog meat as food.
3. Within sacrificial complexes in burial grounds. This pattern is common Steppe pastoralist Sintashta-Andronovo culture. in the late 3rd millennium BC. During this time, the steppe zone of this area is characterized by intensive development of livestock breeding and transition to a meat and dairy diet. Livestock became the basis of human subsistence. In this connection, the social significance of the dog was not limited by hunting wild animals and protecting the living space. The dog was engaged by humans into livestock grazing. This kind of activity raised the status of dogs. Accompanying humans to the afterlife, the dog took a dominant place in sacrificial complexes relative to other animals (cattle, sheep and goat, horse). Burials with dogs were often supplemented with prestige metal (axes, clubs, adzes, spearheads), stone (pestles for ore processing) and bone (harpoons) objects. That shows the high social status of deceased persons, who were accompanied by dogs.

445. TOPOGRAPHY OF THE AFTERLIFE. BURIALS IN THE CHURCH OF SAINTS FIDENZIO AND TERENCEIO (BASSANO IN TEVERINA, LATIUM, ITALY)

Contribution format: Poster  
Contribution authors: Viola Cecconi (Department of Odontostomatological and Maxillofacial Sciences, Sapienza University of Rome | Bioarcheology Service, Museum of Civilizations, Rome) – Eveline Guidi (Department of Ancient World Studies, Sapienza University of Rome | Bioarcheology Service, Museum of Civilizations, Rome) – Federica Iovino (Bioarcheology Service, Museum of Civilizations, Rome) – Rachele Pavan (Independent Archaeologist) – Margherita Rinaldi (Department of Asia, Africa and the Mediterranean, University of Naples “L’Orientale”) – Carlotta Schwarz (SABAP per la provincia di Viterbo e per l’Etruria Meridionale) – Alessandra Sperduti (Bioarcheology Service, Museum of Civilizations, Rome | Department of Asia, Africa and the Mediterranean, University of Naples “L’Orientale”)

Recent investigations of the Church of Saints Fidenzio and Terenzio in Bassano in Teverina (Latium, Italy) uncovered 45 inhumations dating from the 3rd to the 19th century A.D. This long-term occupation provides an opportunity to reconstruct the evolution of funerary dynamics related to historical events and the Christianization process.

The earliest evidence (3rd-5th century A.D.) comprises eight tombs featuring diverse burial types and including individuals of various ages. Following the Lombard invasion and the establishment of a diocesan organization in the area, a rural church was probably built. However, no clear trace has been recognized yet. This phase (6th-9th century A.D.) yields ten ovoidal-shaped pit graves of infants along the same orientation, and a single logette tomb revealing the remains of an adult individual. The first construction of the church can be dated back to the 10th-11th century A.D., characterized by a small, single-nave structure, beneath which two subadult burials were found. The building retained its funerary function in the subsequent centuries, with only brief interruptions; the graves closely followed the architectural development of the church occupying the newly built spaces. This pattern continued until the final phase of use (18th-19th century A.D.), when trapezoidal wooden chest-type burials of infants, children, and adults were placed within the church. The reconstruction of funerary dynamics and mortuary practices offers a comprehensive diachronic perspective on the customs of this small community, identifying patterns of continuity and discontinuity. Although the demographic composition, topography, orientation, and types of burials vary over time, the long-term use of the site and the respect for earlier burials reflect a remarkable preservation of the community’s identity.

914. QUARTZ TOOL USE AND COMPOSITE TECHNOLOGY AT THE MESOLITHIC WETLAND SITE OF DAGSMOSSE: FIRST RESULTS FROM AN ONGOING USE-WEAR ANALYSIS

**Contribution format:** Poster  
**Contribution authors:** Jon Lundin (Societas Archaeologica Upsaliensis) – Sebastian Boström (Kulturen i Lund)

Recent excavations at the Mesolithic wetland site of Dagsmosse, Östergötland, Sweden, offer a rare opportunity to investigate quartz tool use and lithic technological practices. This paper presents the initial results of an ongoing use-wear analysis of 50 quartz artifacts, providing fresh insights into technological and subsistence activities at Mesolithic wetland sites in northern Europe. High-powered microscopic analysis has revealed a diverse range of micro-wear traces, demonstrating that quartz was regularly used in the processing of hide, wood, and bone. These findings suggest a dynamic tool economy in which quartz played a key role in everyday tasks. One of the most significant discoveries within this assemblage is a slotted composite bone point with quartz inserts, recovered in a damaged state from the floor of a possible dwelling structure. The quartz inserts display clear micro-linear impact traces (MLIT) alongside additional wear patterns that indicate their use as part of a composite implement. This discovery strengthens the hypothesis that Mesolithic groups systematically incorporated quartz into composite tools, highlighting the adaptability of hunter-gatherer technological strategies. Initial residue analysis has identified a range of organic remains on the artifacts, including charred material, intact plant tissue, phytoliths, fungal residues, and possible animal tissue. The breadth of preserved residues underscores the considerable potential of residue analysis for understanding Mesolithic tool use. However, further work is required to effectively distinguish taphonomic processes from functional residues and to refine interpretations of organic material preservation. This ongoing research contributes to wider discussions on Mesolithic technological adaptations, offering new perspectives on the integration of lithic and organic components. These findings enhance our understanding of prehistoric toolkits and the exploitation of wetland resources in northern Europe.

276 EFFICIENT ARCHAEOLOGICAL DATA MANAGEMENT WITH ARCHEOBASE: FROM DIGITAL DATA ENTRY TO ANALYSIS AND PUBLICATION

**Session theme:** 3. Exploring methods in research, education and communication  
**Session format:** Workshop  
**Session keywords:** Digital archaeology, Data management, FAIR data, GIS integration, Collaborative workflows, Archaeological publication  
**Session organisers:** Emmanuel Clivaz – Jean-Philippe Clivaz (ArcheoBase)

SESSION ABSTRACT

This workshop introduces ArcheoBase, a robust digital platform developed to address the key challenges facing archaeological documentation today: limited resources, fragmented workflows, lack of interoperability, and publication bottlenecks. Drawing on extensive research including interviews with cantonal services, universities, museums, and private institutions, ArcheoBase was designed as an end-to-end solution for archaeological data management. Participants will be guided through the entire documentation process, from structured digital recording in the field using customizable dynamic forms (via mobile or tablet), through post-excavation analysis, all the way to publication and public dissemination. Practical exercises will include the creation of stratigraphic units, sectors, Harris matrices, and site plans, demonstrating ArcheoBase’s integration of GIS, images, and structured metadata. A highlight of the workshop is a preview of the forthcoming web-based georeferenced drawing

tool, enabling collaborative vector-based documentation directly in the browser. Further modules will showcase how to manage publication workflows (with version control), enable multilingual web publication via IFrames, and ensure long-term archival preservation in compliance with FAIR data principles. This session is ideal for archaeologists, researchers, and institutions seeking to modernize their workflows, improve collaboration, and ensure the accessibility and durability of their digital heritage data.

## INDEX OF FIRST AUTHORS, SESSION ORGANISERS & SPEAKERS

The index below lists all first authors of contributions, session organisers, and session speakers, arranged alphabetically. It includes the ID(s) of the session(s) in which they are involved. Co-authors are not included.

| Name                          | Session(s)  | Name                        | Session(s)   | Name                         | Session(s) |
